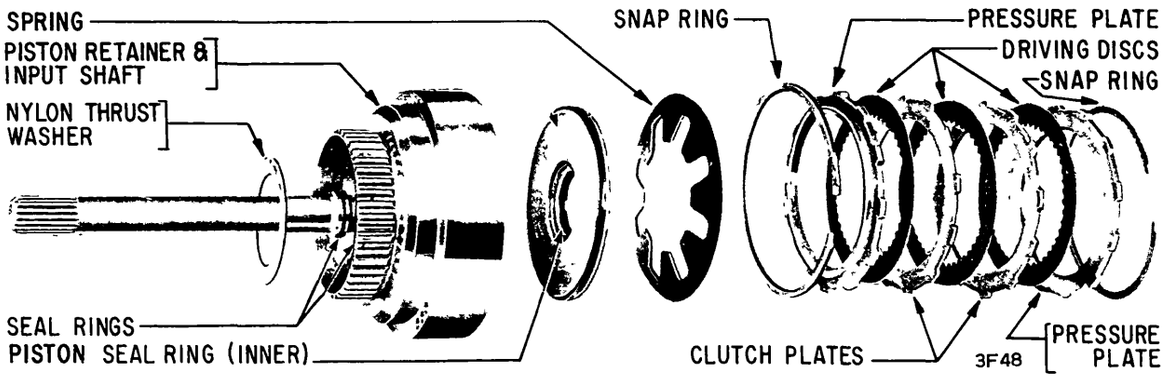
Replacement (TorqueFlite Six) - Procedures are same as for TorqueFlite Eight except that Tool SP-3631, SP-3633 and SP-1191 are used for bushing removal. Use Tool SP-3635 for bushing installation.

Front Clutch

Disassembly (TorqueFlite Six) - Same as for TorqueFlite Eight except that compressor, Tool C-3575 is used.
Retainer Bushing Replacement (TorqueFlite Six) - Same as for TorqueFlite Eight except that Tool SP-3627 and SP-3626 is used for removal and installation.
R ass mbly (T rqu Flit Six) - The number of clutch plates used vary with the engine. Install the same same number of plates and discs that were used in original assembly.

SPRING RETAINER LOCATION

Rear Clutch



Disassembly (TorqueFlite Six) - Remove large snap ring securing pressure plate in clutch piston retainer, then remove pressure plate, clutch plates, and inner pressure plate from retainer. Install compressor, Tool C-3760 over piston spring and compress spring just enough to clear snap ring, then remove snap ring. Remove compressor and piston spring, then invert clutch retainer assembly and bump on a wood block to remove piston. Remove seal rings from piston. If necessary remove snap ring and press input shaft from piston retainer.
Reassembly (TorqueFlite Six) - Reverse disassembly procedure and note the following: Rear clutch-to-front clutch thrust washer thickness should be .043-.045". Replace if not within limits. Lubricate all parts as installed and make sure that lip of seals face toward head of clutch retainer. Inner pressure plate should be installed in retainer with raised portion of plate resting on the spring. Install clutch plates, starting with a lined plate followed by a steel plate until all plates are installed. With clutch completely assembled, clearance between pressure plate and snap ring should be .018-.036". If not within limits, install a snap ring of proper thickness.
INPUT SHAFT BUSHING REPLACEMENT NOTE (TORQUEFLITE SIX) - This bushing is not r placeable on TorqueFlite Six Transmissions.

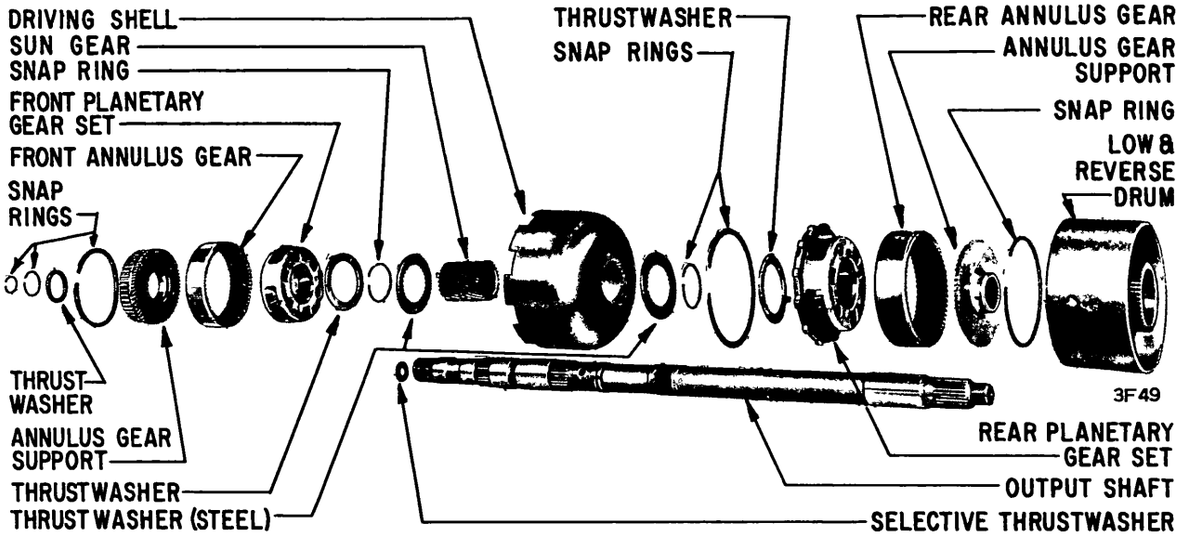
Planetary Gear

Planetary Gear Assemblies, Sun Gear, Driving Sh ll (TorqueFlite Six) - Disassembly - Before removing these parts from output shaft, place assemblies in an upright position with rear annulus gear support pushed downward on output shaft, then measure clearance between rear annulus gear support hub and shoulder on output shaft (see illustration). Clearance should be .006-.046". Remove thrust washer from end of output shaft and slide planetary assembly off shaft. Remove snap ring and thrust washer from forward hub of front planetary gear unit, then slide front annulus gear and support off planetary gear set. Remove thrust washer from rear side of planetary gear set. If necessary, remove snap ring from front of annulus gear to separate support from annulus gear. Slide sun gear, driving shell, rear planetary assembly with low and reverse drum off output shaft. Lift sun gear and driving shell off rear planetary unit, then remove snap ring and steel washer from sun gear (rear side of driving shell). Slide sun gear out of driving shell, and remove snap ring and steel washer from opposite end of sun gear if necessary. Remove thrust washer from forward side of rear planetary assembly and remove planetary gear set from rear annulus gear to separate the support from annulus gear.

Reassembly - Install annulus support in gear and install snap ring. Position rear planetary gear assembly in rear annulus gear and place thrust washer on front side of planetary gear assembly. Insert output shaft in rear opening of rear annulus gear, then carefully work shaft through annulus gear support and planetary gear assembly, making sure shaft splines are fully engaged in splines of annulus gear support. Install steel washer and snap ring on one end of sun gear, then insert sun gear through front side of driving shell and install rear steel washer and snap ring. Carefully slide driving shell and sun gear assembly on output shaft, engaging

(Continued)

TORQUEFLITE SIX REAR CLUTCH ASSEMBLY



sun gear teeth with rear planetary pinion teeth. Place front annulus support in annulus gear and install snap ring. Position front planetary gear assembly in front annulus gear, then place thrust washer over planetary gear assembly hub and install snap ring. Position thrust washer on rear side of planetary gear assembly. Carefully work front planetary and annulus gear assembly on output shaft, meshing planetary pinions with sun gear teeth. With all components properly positioned, install retaining snap ring on front end of output shaft

Overrunning Clutch

Cam R plac m nt (T rqu Flite Six) - If overrunning clutch cam or spring retainer are damaged, they can be replaced with a service cam, spring retainer, and retainer bolts. To install, drive rear pump body rearward out of case with a wood block and hammer, then center punch rivets **xactly** in the center of each rivet head. Drill through each rivet head with a 3/8" drill, *being v ry car ful n t to drill into transmission case.* Chip off rivet heads with a small chisel, then drive rivets and cam from case with a blunt punch of proper size.

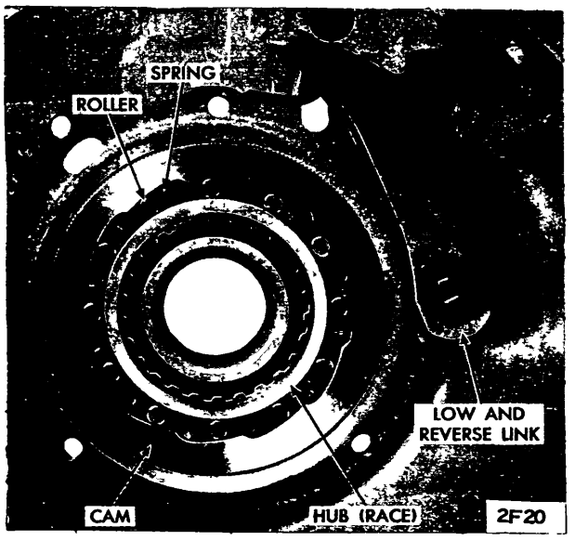
TORQUEFLITE SIX PLANETARY GEAR ASSEMBLIES

Carefully enlarge rivet holes in case with a 17/32" drill and clean out all chips and burrs. To install new unit, position cam and roller spring retainer in case and align cam bolt holes with holes in case, then thread all five retaining bolt and washer assemblies into cam a few turns. *NOTE - Belleville washer must be installed so its inner diameter is coned toward bolt head.* Tap cam firmly into position, then draw bolts down evenly and tighten to 100 inch pounds.

TRANSMISSION UNIT INSTALLATION (TRANSMISSION REMOVED)



See 1962 TorqueFlite Eight Transmission in 1962 Final Data, Page 465. Procedures are the same for 1963 TorqueFlite Six and TorqueFlite Eight with the following exceptions.

Overrunning Clutch

TorqueFlite Six - Place low and reverse thrust washer inside overrunning clutch cam, then install clutch hub (race) with its undercut end (inner diameter) next to thrust washer. Install springs and rollers as shown in illustration.

Rear Oil Pump

TorqueFlite Six - Same as for TorqueFlite Eight except that aligning sleeve, Tool C-3762 is used.

OVERRUNNING CLUTCH

FORD MOTOR CO. 2-SPEED AUTOMATIC TRANSMISSION

Fordomatic

Fairlane, All Models (1963)
Falcon, All Models (1963)
Ford Pass. Cars, Exc. 390",406" & 427" Eng. (1963)

Merc-O-Matic

Comet, All Models (1963)
Mercury Meteor, All Models (1963)
Mercury Monterey, Exc. 390",406" & 427" Eng. (1963)

PUSHING (TO START) & TOWING

Pushing Car To Start Engine

Keep transmission selector lever in "N" (neutral) until car reaches a speed of 20 MPH, then move selector lever to "LO". Depress accelerator pedal to half throttle position until engine starts. *NOTE - On ice or snow where traction is not good, move selector-lever to "DR" position to crank engine.*

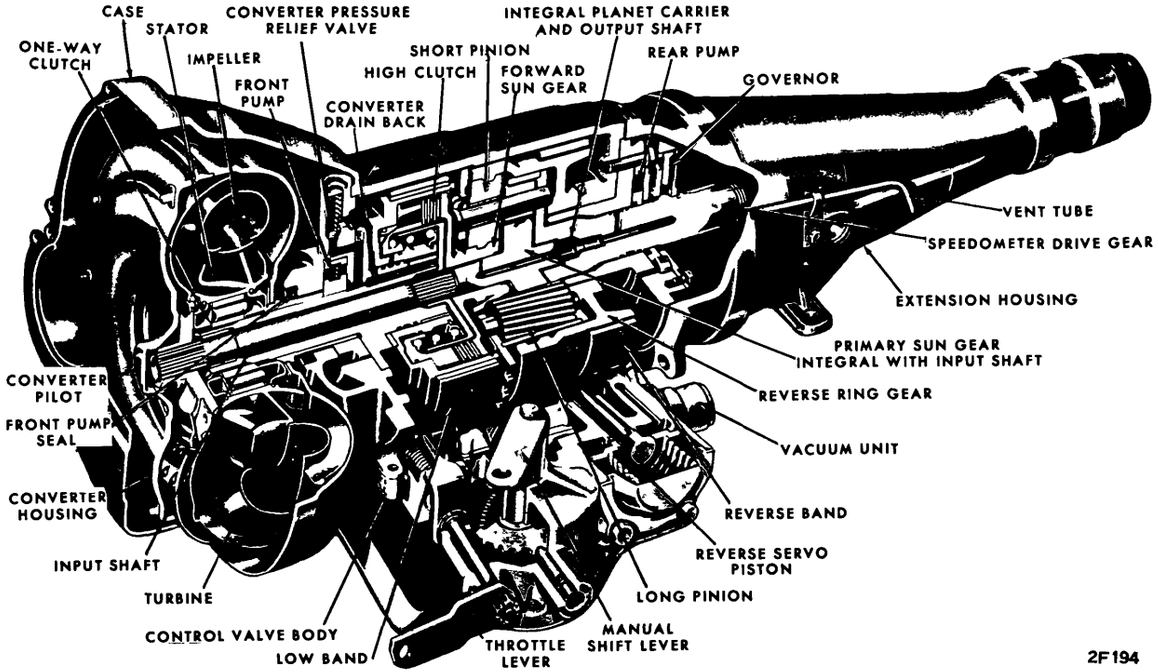
Towing Or Pushing Car

CAUTION - Do not tow (or push) at speed greater than 40 MPH and observe following precautions:
Transmission Operating Properly - Place transmission selector lever in "N" (Neutral) position. Car can be towed normally for distances not to exceed 15 miles. **For greater distances, use same procedure as for inoperative transmission.**
Transmission Inoperative - Tow car with rear wheels lifted off ground, or disconnect and remove propeller shaft. *NOTE - Protect rear end of transmission from entry of dirt.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 MOMENTARY CLUTCH DISENGAGEMENT & TRANSMISSION "HUNTING" CONDITION (CAR SPEED OVER 65 MPH) CORRECTION:* On early transmissions with date code "2H" stamped on transmission identification tag (this code is located on lower line of tag, following engine displacement stamp), a 3/16" high clutch piston ball check was used in place of a 1/8" ball check. To correct the above condition, install correct clutch piston assembly Part No. CODP-7A262-A (144" Eng.); C1DP-7A262-A (170" Eng.); COAP-7A262-A (221" Eng.); COAP-7A262-B (260" Eng.). Transmissions with "2H" date code that have been corrected during production are identified by an "Orange" colored tag.

►*1963 MAIN CONTROL VALVE ASSEMBLY CHANGE (PARTIAL PRODUCTION):* A compensator spring adjusting screw has been added to lower body cover plate on some transmissions. These adjusting screws are properly adjusted during production and should require no further adjustment in service unless a new regulator and (or) compensator spring is installed. *See "Overhaul" below for adjustment procedure.*



►*1963 221" & 260" ENGINE OVERSPEEDING (DURING 1-2 & 2-1 SHIFT) CORRECTION:* Check and adjust fluid level, then adjust front band **(back adjusting screw off 1½ turns instead of 2 turns).** With car stopped and engine running at idle speed, make twenty neutral-to-drive (low gear) engagements to pump all air out of servo cavity.

2) To determine if all air is removed, road test car by driving at a constant speed of 35 MPH with selector lever in "L" position, then move selector lever to "D". An upshift should occur within 1½ seconds. Repeat pumping procedure if necessary.

3) If second attempt does not exhaust all air, remove servo cover (tighten front band adjusting screw to keep strut from falling out of position), then check position of check valve in servo piston. Check valve must be in the range of 11 o'clock to 1 o'clock position and the ball must operate freely. Install servo cover and adjust front band, then again pump down front servo.

4) If transmission is equipped with an adjustable compensator, readjust idle pressure to 65-70 lbs. (see "Overhaul" below for adjustment procedure).

5) On transmissions without an adjustable compensator (or on transmissions with an adjustable compensator which were not corrected by readjusting the idle pressure), proceed as follows: Replace front servo release spring with a lighter spring, Part No. C20Z-7A003-B (one light blue stripe, 1 3/4 coils, 3.11" long, .187" wire diameter) and replace the vacuum diaphragm assembly, Part No. C1AP-7A377-B (yellow stripe around can). When installing servo spring, make sure servo piston is properly installed.

FORD MOTOR 2-SPEED AUTOMATIC TRANSMISSION

6) If the above corrections do not eliminate engine overspeeding, disassemble transmission and check for worn, damaged, or incorrect parts and for internal leakage.

►*1963 144" ENGINE TRANSMISSION CLUTCH ASSEMBLY NOTE:* Some transmissions have been equipped with an additional external splined clutch plate, Part No. B9A-77573-A and a thinner piston, Part No. C1DP-7A262-A. If necessary to replace a clutch piston in one of these assemblies, either the clutch piston, Part No. C0DP-7A262-A or C1DP-7A262-A may be used. However, when Part No. C0DP-7A-262-A is used for replacement in one of these assemblies, one B9A-77573-A external splined plates must be removed for necessary clearance.

►*1963 TRANSMISSION FILLER TUBE ATTACHING NUT TIGHTENING CAUTION (TO PREVENT CRACKED CASE):* Filler tube to case nut must not be tightened in excess of 45-55 ft. lbs.

DESCRIPTION

Same design as used on 1962 models with vacuum controlled throttle and control pressures.

Transmission Identification

Serial number prefix stamped on identification tag attached under one of the servo cover bolts. The three letter prefix ("PCM" as an example) will have an additional letter and possibly a figure indicating appli-

(Continued)

cation and detail changes Refer to transmission serial prefix for service and parts replacement

Transmission Identification

Model	Engine	Serial Prefix
Falcon & Comet.	144"	PCL-D
Comet	144"	PCL-E
Falcon & Comet	170"	PCM-E
Comet	170"	PCM-F
Fairlane & Meteor	170"	PCM-G
Fairlane & Meteor	221"	PCN-B
Fairlane & Meteor	260"	PCP-B
Galaxie	223"	PCH-B
Galaxie	260"	PCP-C
Galaxie	260"	PCP-D
Galaxie	289"	PCP-E
Galaxie	289"	PCP-F

LUBRICATION

Checking Fluid Level

Check fluid level every 6000 miles With transmission at normal operating temperature and engine at normal idle speed, shift transmission through all ranges, then place in "P" (Park) position Check fluid level on dipstick and add recommended fluid as required to bring level up to "F" (Full) mark on dipstick. *CAUTION - Do not overfill.*

Draining & Refilling

NOTE - Periodic draining and refilling not required except at time of overhaul. To fill dry transmission, install 5 qts of recommended fluid, then start engine and shift transmission through all ranges, finally placing selector lever in "P" (Park) position. Check fluid and if necessary, add enough fluid to bring level up to "F" mark. DO NOT OVERFILL. When partial drain and refill is required (due to front band adjustment or minor service) proceed as follows: To drain transmission, remove oil pan bolts and allow transmission to drain. Install oil pan and a new gasket On Falcon and Comet, add one quart of fluid, then run engine at idle speed for 2 minutes On other 2-speed transmissions, add fluid to bring level up to full mark on dipstick. On all models, run engine at fast idle speed with transmission in "N" (Neutral) until transmission is at normal operating temperature. *CAUTION - Do not race engine.* Shift selector lever through all ranges, then place selector lever in "P" (Park) and check fluid level. If necessary, add fluid to bring level up to "F" (Full) mark on dipstick.

Recommended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A").

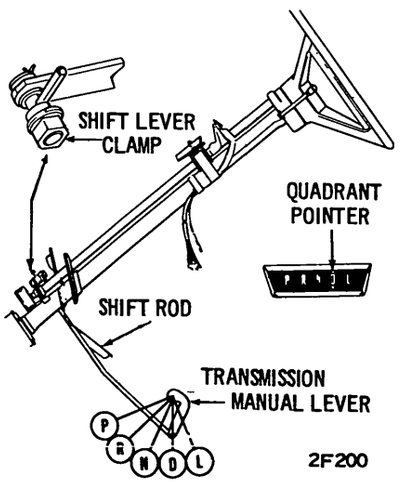
Capacity (Refill)

6½ qts. (Comet & Falcon); 6¼ qts. (Fairlane & Meteor); 9¼ qts. (Galaxie). *NOTE - These capacities are approximate. Check fluid level on dipstick and adjust.*

ADJUSTMENT

Throttle Linkage

See *CARBURETOR on Car Models pages.*



Manual Shift Linkage

Steering Column Shift - With engine stopped, loosen clamp nut at shift lever so that shift lever rod is free to slide in clamp at lower end of steering column Position selector lever so that pointer lines up with "D", then shift manual lever at transmission into corresponding detent (second from rear) Tighten clamp at shift rod on lower end of steering column and check pointer for alignment in all selector lever positions

Floor Shift - With selector lever in "N" (Neutral) position, align the step in button assembly at top of shift lever so it is flush to .030" above top of shift knob *NOTE - Make sure shift rod is tightened securely to shift lever.* Tighten setscrew in top of lock button securely. With transmission manual lever on transmission in "D" detent (third from rear) and selector lever against the "D" stop, tighten locknut on shift rod to 15-20 ft lbs

Neutral Safety Switch

Steering Column Shift - Located under instrument panel on steering column Loosen steering column-to-switch attaching screws and position switch so starter circuit is closed when selector lever is in "N" or "P" positions, then tighten attaching screws Starter circuit should be open in all positions except "N" or "P" **Floor Shift** - Remove shift lever detent button, spring, and knob assembly from lever Remove console top chrome trim panel, then place selector lever in "N" and remove quadrant indicator assembly Remove bulb socket, being careful not to scratch quadrant cover Loosen switch attaching screws, apply service and parking brakes, then turn ignition key to start position and move switch until starter operates. Tighten switch screws and check for starting in "P" position. Check operation of back-up lights. Tape detent rod to shift lever to hold rod in position, and reassemble console and shift lever assembly.

MANUAL LINKAGE ADJUSTMENT

Front Band

Periodic adjustment not required Check band adjustment each time oil pan is removed and adjust as necessary Loosen locknut on left side of transmission case, then tighten adjusting screw with Tool T59P-77370-A or B, or Tool 7345 until tool handle snaps (breaks) over center *NOTE - These tools are preset torque wrenches which overrun when torque on screw reaches 10 ft. lbs* **Back off adjusting screw exactly two full turns.** Hold adjusting screw at this point and tighten locknut to 35-40 ft lbs

Rear Band

Periodic adjustment not required Check band adjustment each time oil pan is removed and adjust as necessary- With oil pan removed, remove screen, then loosen rear servo piston rod locknut and adjusting nut Install adjusting tool as follows: If Ford Tool T59P-77409 is used, place tool on rear servo rod so the two forks straddle band apply lever *NOTE - The inner fork must engage flat on servo piston rod. The outer fork is a ¼" spacer and must be inserted between piston rod seat and adjusting nut.* If Mercury Tool 7355-A is used, insert tool between adjusting nut and piston rod-to-actuating lever seat, with opposite end of tool resting on raised boss on control valve assembly With wrench, Ford No. T59P-77423-A or Mercury No 7355-B, tighten adjusting nut until wrench handle snaps (breaks) over center. *NOTE - These tools are preset torque wrenches which overrun when torque on nut reaches 45-50 inch pounds.* **Back off adjusting nut exactly two turns.** Hold adjusting nut at this position and tighten locknut to 15-18 ft. lbs. Remove tools from servo piston rod. Install oil pan and screen using a new gasket, then refill transmission with recommended fluid .

TESTING

Stall Test

STALL TEST NOTE - Make separate stall test in "D" (Drive), "L" (Low), and in "R" (Reverse). **With parking and service brakes applied and selector lever in "D", "L" or "R", open throttle through detent and note pressure and vacuum gauge readings and engine RPM. Vacuum should drop below 1.5" Hg. and the pressure should reach maximum limits as indicated in "Hydraulic Control Pressure Table" below. Engine speed at stall should be as indicated in "Engine Stall Speed Table."** ***CAUTION – Do not stall test for more than 5 seconds. Between tests, run engine for at least 2 minutes at 1000 RPM with transmission selector lever in "N" (Neutral) to prevent overheating.*** **If engine runs away on a stall test in "D" or "L", but is held within limits in "R", the low band is slipping. If engine runs away in "R" during a stall test, but is held within limits in "D" or "L", the reverse band is slipping.** *NOTE – Transmission "high" clutch cannot be tested since the clutch applies at road speeds above 15 MPH.*

(Continued)

ENGINE STALL SPEEDS

Engine	Low Limit–RPM–High Limit
144" 6 Cyl	1600 – 1800
170" 6 Cyl	1750 – 1950
221" V8	1600 – 1800
223" 6 Cyl	1300 – 1500
260" V8	1800 – 2000
352" V8	1550 – 1750

Air Pressure Test

Raise car on a hoist, then remove transmission oil pan and control valve assembly. Proceed as follows:

Clutch Apply - Apply pressure to front clutch passage (see illustration). A dull thud indicates that clutch is operating. Retain air pressure in passage several seconds to check for leakage.

Low & Reverse Servos - Apply pressure to "Low Band Apply" and "Reverse Band Apply" holes in case (see illustration). Band operation can be observed.

Shift Test

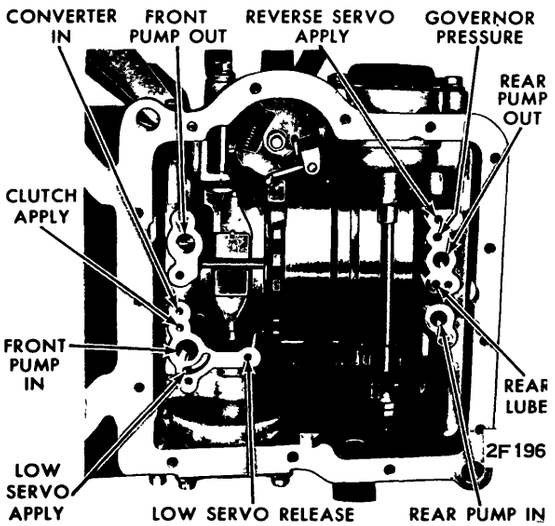
Shift points and low gear operation should be as indicated in "Shift Speed Table" below. *NOTE - Indicated speeds are approximate .*

Pressure Rise Test

With engine and transmission at normal operating temperature, connect a suitable pressure gauge (300 lbs.) to pressure take-off hole on left side of transmission case above shift levers, then proceed as follows:

1) During operation of engine from idle to wide open throttle (stall test), with selector lever in "D", "L" or "R", control pressure should rise as indicated in draulic Control Pressure Table."

n "D" position, if this rise does not occur, there three possible causes (throttle and compensator ssures, pump capacity, and excessive leakage). Before control valve body or transmission is removed for inspection, make the following checks.



3) Install a vacuum gauge in vacuum line (preferably at diaphragm). Vacuum reading and pressure should be as indicated in control pressure table. If control pressure is low (below specifications), vacuum diaphragm and connecting lines are probably all right. If control pressure is high (above specifications), disconnect tube from rear of diaphragm unit and alternately plug and free end of tube. Engine should slow down and speed up as this is done. If engine speed does not vary, check line for leakage between diaphragm and intake manifold. Also check for restrictions in line. If vacuum line is all right, remove diaphragm unit and rod, then replace unit without the rod. Control pressure should now remain at idle specifications regardless of manifold vacuum. *CAUTION – Do not run engine under load for more than five seconds with diaphragm rod removed.* Start engine and check control pressure at engine idle speed with selector lever in "D" position. If control pressure is still too high, trouble is in transmission control system. If pressure is now within limits, diaphragm unit is not operating properly and should be replaced.

4) Check control pressure in "D", "L" and "R". If pr ssure rise is normal in any one position, throttle and compensator pressures, and pump capacity are normal. The probable cause f no pressure rise in other positions is leakage in hydraulic system ahead f manual valve.

HYDRAULIC CONTROL PRESSURE TABLE

Thr ttle P sition	Manifold Vacuum (" Hg.)	Shift L v r P siti n	CONTROL PRESSURES 144" Eng.	170" Eng.	Others
Closed	Above 15.0"	All	40-48 lbs.	46-63 lbs.	54-70 lbs.

Wide Open 𝔗	Below 1.5"	"D", "L", "R"	145-170 lbs.	175-200 lbs.	170-210 lbs

𝔗 - Through detent. ℭ - Pressure starts to rise.

TRANSMISSION CASE OIL PASSAGES

TROUBLE SHOOTING & DIAGNOSIS

Harsh Shifting

Vacuum supply tube disconnected. Throttle valve sticking. Vacuum diaphragm loose in transmission case. Engine idle speed too high. Engine operation faulty, resulting in loss of vacuum.

Engine Overspeeds

During 1-2 Upshift & 2-1 Downshift - *See "Changes, Cautions, Corrections" abov .*

Harsh Initial Engag ment

Check engine idle and transmission fluid level.

Slips Or Chatters

In "D" or "L" - Check fluid level, throttle linkage, control pressure, low band adjustment. Make an air pressure check. Inspect for worn or loose engine and transmission mounts. Check operation of low servo and band. Check for leakage in low apply circuit.

In "R" - Check fluid level, throttle linkage, control pressure, reverse band adjustment. Make an air pressure check. Inspect for worn or loose engine mounts. Check operation of reverse servo . Check for leakage in reverse servo apply circuit.

(Continu d)

Momentary Lockup

During 1-2 Upshift - Check fluid level, throttle linkage, control pressure and low band adjustment. Low servo and band not operating properly. Check high clutch for malfunction. Check for possible broken low servo return spring.

S vere 2-1 Downshift

During Coastd wn - Check engine idle speed and throttle linkage. Check control valve body for malfunction. Make a control pressure test.

No Shift

N 1-2 Upshift in "D" - Check fluid level. Check fluid odor for possible burned clutch plates. Check manual linkage adjustment. Check for improperly operating governor. Check for leakage in control pressure main circuit. Check high clutch and low servo and band for improper operation.

N 2-1 F rc d D wnshift (Kickdown) - Check throttle linkage adjustment. Check control valve body for malfunction. Check for leakage in control pressure main circuit.

N 2-1 Shift During C astdown - Check for malfunction in control valve body or governor.

Delayed 1-2 Upshift

Check throttle linkage. Check for improperly operating governor. Check for leakage in control pressure main circuit.

Fluid Leakage

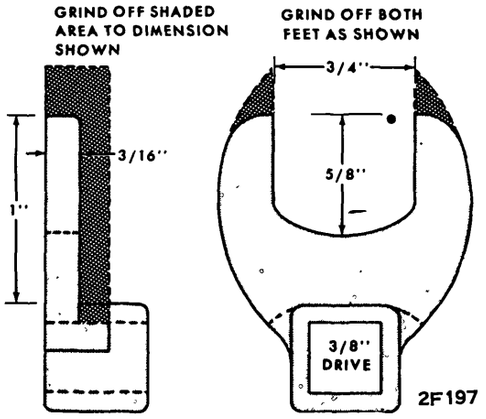
Fluid F rc d Out Of Fill r Tube or Vent - Check fluid for contamination by engine coolant. Transmission external vent plugged. Check fluid for aeration.

Acceleration Abnormal

Converter one-way clutch not operating properly.

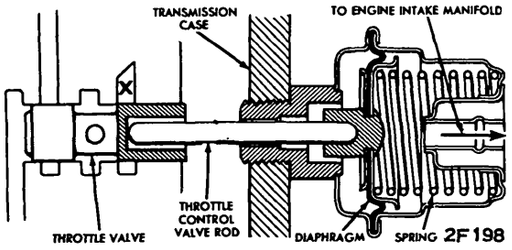
Engine Will N t Push Start

Check fluid level and manual linkage adjustment. Check for malfunction in control valve body. Rear pump not operating properly. Check for leakage in control pressure main circuit.



Parking Lock N t Holding

Check manual linkage adjustment. Check parking linkage.



MINOR REPAIRS (TRANSMISSION IN CAR)

Vacuum Diaphragm

Rem val - To remove diaphragm assembly without removing oil pan and throttle valve body, modify a ⅜" "Crow-foot" wrench as illustrated (see "Vacuum Diaphragm Wrench") and use it on "hex" portion of diaphragm to turn diaphragm assembly out of case. *NOTE* - The diaphragm assembly can also be removed by removing oil pan, throttle valve assembly and throttle valve control rod, then insert a 3/16" Allen

VACUUM DIAPHRAGM WRENCH

TRANSMISSION CONTROL VACUUM DIAPHRAGM

wrench into end of diaphragm assembly from inside transmission case and turn diaphragm assembly out. *CAUTION - Do not apply any pressure to diaphragm housing.*

Installation - Reverse removal procedure and tighten diaphragm assembly to 15-18 ft. lbs.

Control Valve Body

Removal - Remove oil pan and gasket. Remove fluid screen retaining clip and screen. Remove six bolts attaching control valve body to transmission case, then lower control valve body and work the manual shift valve link out of manual valve.

Installation - Position control valve assembly in transmission case, then connect manual valve shift link to manual valve, and position the throttle valve lever between downshift valve and the stop plate on upper valve body. Install control valve attaching screws and tighten to 8-10 ft. lbs. Install fluid screen and oil pan, using a new gasket. Tighten attaching bolts to 10-13 ft. lbs. Install drain plug and tighten to 10-13 ft. lbs. Refill transmission with recommended fluid and adjust throttle linkage and manual linkage.

Front Servo Pist n Assembly

R m val - Remove control valve assembly, disconnect fluid filler tube from transmission case. Remove two opposing bolts from front servo cover, then install two longer bolts (5/16" - 18 x 2") and nuts to hold cover in position against servo spring tension while removing remaining servo cover bolts. Remove servo cover by slowly unscrewing nuts on long bolts until all servo spring tension is released from cover. Remove the long bolts, nuts and servo cover. *NOTE - Before removing servo cover, note position of front band actuation struts. This will aid in reassembly in case struts are dislodged.* Remove servo piston assembly and servo spring from transmission case and remove servo piston seal ring from piston.

Installation - Inspect front servo piston for nicks, burrs and a warped or bent condition. Inspect servo piston bore for burrs, wear, and scoring. Install new seal ring on servo piston and install servo piston spring and piston assembly in servo bore with air bleed hole toward top of case. Clean servo cover and mounting face and position new "O" ring seal on cover, then place servo cover on servo piston. Retain servo cover in place with the two long bolts used at disassembly (5/16" - 18 x 2"), and nuts. Pull servo cover partially into position by turn the nuts on long bolts to compress servo spring. Install regular cover attaching bolts in the open threaded holes. Remove both long bolts and nuts and install remaining two cover attaching bolts. *NOTE - Check position of front band actuating strut while tightening servo cover bolts to assure that servo piston rod enters actuating strut properly. If struts have been dislodged, loosen front servo band adjusting screw and position them correctly.* Tighten servo cover attaching bolts evenly to avoid distorting cover, then when cover is firmly seated, tighten bolts to 12-15 ft. lbs. *CAUTION - Use care when positioning "O" ring seal and servo cover to prevent future leakage.* Install main control valve assembly, then connect manual shift valve link to manual valve and position throttle lever between downshift valve and stop plate on upper valve body. Tighten control valve attaching bolts to 8-10 ft. lbs. Adjust front and rear bands (see "Adjustments" above). Install fluid screen and transmission oil pan and refill transmission. Adjust Linkage.

► *FRONT SERVO COVER GASKET REPLACEMENT:* Remove low band adjusting screw locknut and tighten adjusting screw with wrench, Tool T59P-77370-A (Ford), Tool 7345 (Mercury) until wrench overruns. Loosen cover capscrews approximately two turns each, then tighten band adjusting screw until wrench overruns. Repeat this procedure until servo cap is removed (low band strut will be seated against bottom of servo casting and will be held in place). To install cover, use two 5/16" - 18 x 1¼" hex head bolts in place of the regular bolts, then place servo cover over piston and start the two bolts. Tighten bolts snugly to bring cover into contact with piston and to position piston stem in band strut (piston stem will be back in position in cup face of band strut). Loosen band adjusting screw tw turns, then tighten servo cover capscrews approximately two turns or until they are snug (band will again be tight against drum). Repeat this procedure until cover is drawn close enough so that regular cover capscrews can be installed in rest of cover holes, then

(C ntinued)

remove the two temporary bolts and replace them with regular bolts. Continue to repeat the above procedure until cover is fully installed. Install low band adjusting screw locknut and adjust the band.

Rear Servo Piston Assembly

Removal - Disconnect accelerator pedal rod, then remove main control valve (see above). Remove rear servo cover, "O" ring seal, and servo piston spring. *CAUTION - Servo cover is spring loaded.* Remove locknut, adjusting nut, and half-ball rod seal from rear servo piston rod. Remove rear engine mount from under transmission housing, then lower extension onto frame crossmember. Remove piston rod from transmission case. Remove servo piston and seal ring from piston bore. *NOTE - Push outward on piston stem from inside transmission case or apply air pressure to reverse servo apply passage in transmission case to remove piston.* Remove seal ring from piston.

Installation - Inspect piston, stem and rod for nicks or burrs. Check rod for wear or for a bent or warped condition. Inspect piston bore, for burrs, wear and scoring. Install new seal on piston, then install piston assembly into bore in case. Push piston to bottom of bore. Install piston rod through piston, then position band operating lever and install the half-ball rod seal, adjusting nut, and locknut loosely. Raise transmission from frame crossmember and install rear engine mount. Install new "O" ring seal on servo cover, then install servo cover, maintaining pressure against cover while tightening the attaching bolts. Tighten bolts slowly and evenly until cover is firmly seated, then tighten bolts to 12-15 ft. lbs. Adjust front and rear bands (see "Adjustments" above). Install main control valve assembly, fluid screen, transmission oil pan, and drain plug. Refill transmission (see "Draining & Refilling" above). Connect accelerator rod and adjust pedal to 3½" above floor. Adjust throttle and manual linkage.

Extension & Governor

Removal - Drain transmission, then disconnect the driveshaft at rear universal and remove driveshaft. Remove bolts attaching rear engine support to transmission, then use a transmission jack and raise transmission until extension housing clears rear engine support and frame crossmember. Remove extension housing from transmission case. To remove governor, remove snap ring from output shaft and remove governor and governor drive ball. *NOTE - Replace output shaft seal if worn or damaged.*

Installation - Reverse removal procedure.

►*EXTENSION HOUSING BUSHING & SEAL REPLACEMENT NOTE: Replaceable with suitable tools. Coat seal with non-hardening compound.*

REMOVAL & INSTALLATION

Removal

NOTE - Transmission and converter are removed as an assembly.

1) Place car on a hoist, then disconnect battery and remove starter motor. On six cylinder engines, remove two "Z" bar bracket retaining bolts from top of converter housing. On all models, raise car and drain transmission (see "Draining & Refilling" above).

2) Remove dust shield from bottom of converter housing, then disconnect cooler lines if so equipped. Disconnect drive shaft at rear and remove from transmission. Disconnect manual and throttle linkage, speedometer cable, and vacuum line at transmission. Disconnect parking brake cable from rear support, then disconnect front parking brake cable from equalizer bar.

3) If so equipped, remove bolts attaching engine rear support spring to extension housing. On all models, place a transmission jack under transmission and raise it slightly to take weight off engine rear support member. On Comet & Falcon, remove bolts attaching engine rear support to underbody and move support aside. On other models, remove transmission-to-crossmember bolts, then remove crossmember-to-body bolts and remove crossmember.

4) Lower transmission and engine, then support engine with a jack stand. Remove nuts attaching converter to drive plate, and remove converter housing-to-engine block bolts. Work converter housing off engine dowel pins, and work converter pilot out of engine crankshaft. Secure converter to converter housing and lower transmission.

►*V8 ENGINE REMOVAL NOTE: On some models it may be necessary to remove part of engine exhaust system in order to remove transmission assembly.*

Installation

Reverse removal procedure and note the following. Tighten all bolts and nuts to proper torque (see *"Tightening Specifications" below*). With transmission completely installed and filled with fluid, run engine at idle speed and shift selector lever from "N" to "D" and from "D" to "N" at least twenty times to bleed air out of low servo release cavity. Adjust manual and throttle linkage.

GALAXIE & MONTEREY

Removal

NOTE - Transmission and converter are removed as an assembly.

1) Raise car and drain transmission and converter, then disconnect drive shaft at pinion flange and remove shaft. Install extension housing seal replacer in extension housing seal (*see "Extension Housing Bushing and/or Seal Replacement" above for tool number*).

2) Disconnect manual and throttle linkage at transmission, then disconnect speedometer cable from extension housing. Disconnect oil cooler lines at transmission, then remove lines from clamp at engine block. Disconnect oil filler tube at transmission case.

3) Remove starter from converter housing and disconnect parking brake cables at the equalizer. Remove two engine rear support bolts from extension housing and remove support clamp.

4) Position a transmission jack under transmission and raise it slightly to take weight off crossmember. Support rear of engine in this position with an engine support bar or stand, then remove crossmember.

5) Remove bolts attaching converter-to-flywheel and remove converter housing-to-engine block bolts. Secure converter to transmission so it will not fall out when transmission is separated from engine, then work transmission off engine block dowel pins and toward rear until converter pilot clears crankshaft. Lower transmission and remove it from car.

Installation

Reverse removal procedure and note the following: Tighten all bolts and nuts to proper torque (see *"Tightening Specifications" below*). With transmission completely installed and filled with fluid, run engine at idle speed and shift selector lever from "N" to "D" and from "D" to "N" at least twenty times to bleed air out of low servo release cavity. Adjust manual and throttle linkage.

TRANSMISSION OVERHAUL

See 1959 Final Data, Page 452, or later Manual editi n and note the following:

Control Valve

Disassembly - 1) Remove manual valve, then remove control pressure regulator valve spring retainer, spring, spring seat, and valve. Remove hold-down plate near compensator cut-back valve cover, then remove cover. Remove compensator cut-back valve spring and valve from lower body.

2) Remove 1-2 shift valve governor plug cover and governor plug. At opposite side of lower body, remove compensator and control pressure regulator cover plate. *CAUTION - Maintain pressur n this plat (against spring pressure) until all scr ws are removed.* R move compensator valve spacer, spring and valve. *NOTE - Temporarily install hold-down plat and scr w so that separator plate is held on upp r body.*

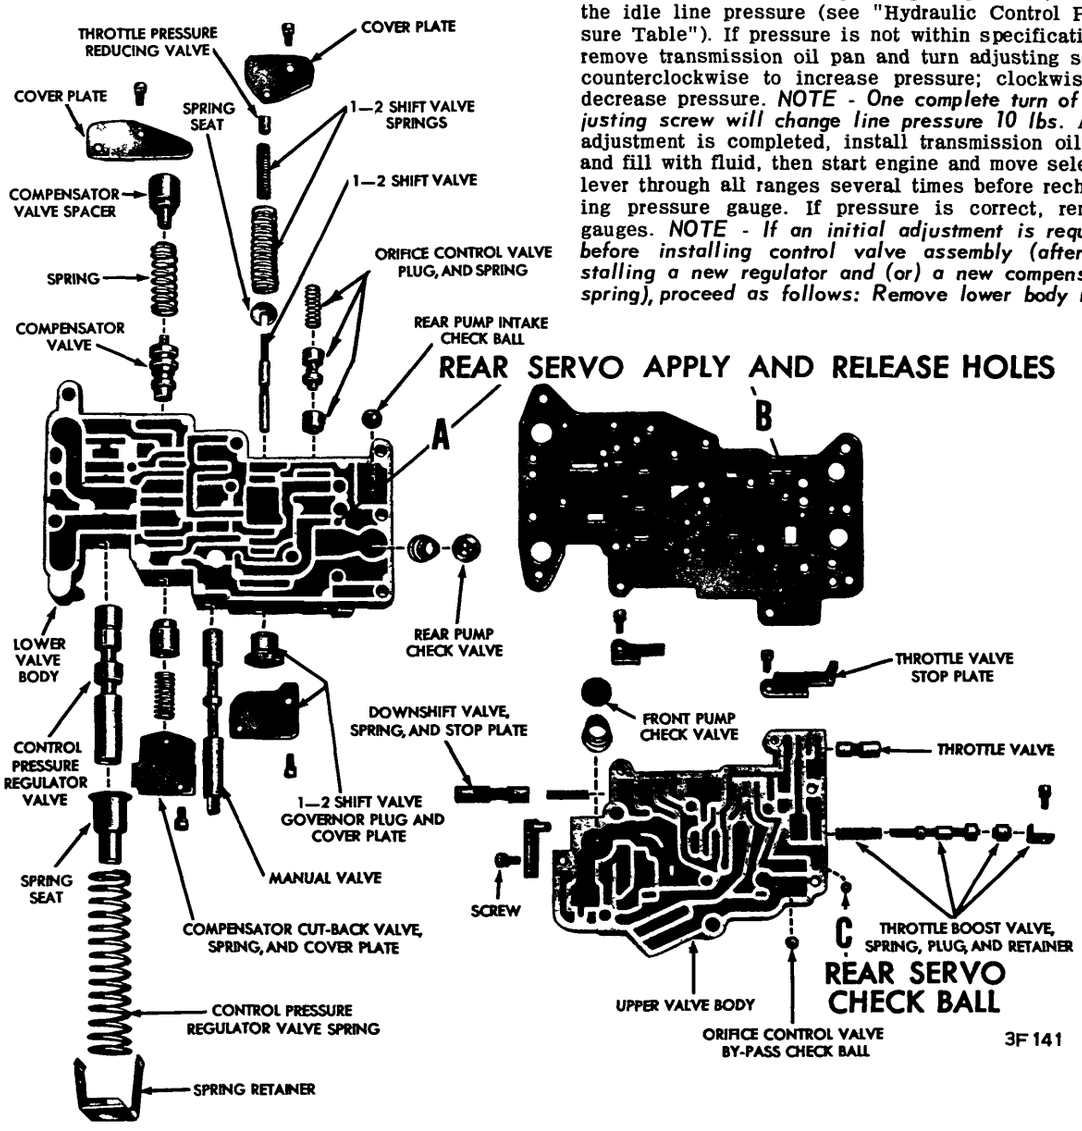
3) Remove orifice control valve cover plate. Remove throttle reducing valve and spring and orifice control valve spring, valve, and plug. From upper body, remove downshift valve stop plate, then remove downshift valve and spring.

4) Remove throttle valve stop plate and throttle valve from opposite end of upper body. Remove throttle boost valve retainer, plug, throttle boost valve and spring. Remove three screws and five bolts holding upper body, separator plate, and lower body together.

5) Lift upper body and separator plate from lower body, then remove rear pump check valve and spring. Remove rear pump check ball from lower body. To remove 1-2 shift valve from lower body, compress 1-2 shift valve spring in direction of throttle reducing valve, then remove spring seat with needle nose pliers. With spring seat removed, the 1-2 shift valve can be removed through throttle reducing valve hole. Remove 1-2 shift valve spring.

6) Turn upper body and separator plate over so separator plate is up, then remove hold-down plate and lift separator plate from upper body. Remove front pump check valve spring and valve from upper body. Remove orifice control bypass check ball and rear servo check ball.

Reassembly - Reverse disassembly procedure (see illustration) and note the following: Tighten valve body screws and bolts to proper torque (see *"Tightening Specifications" below*).

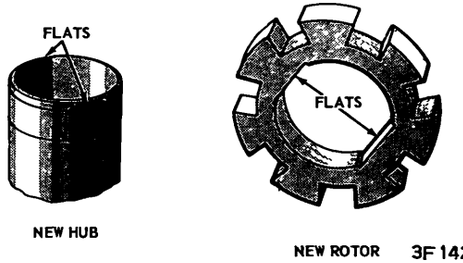


Compensator Valve Spring

NOTE - An adjusting screw is provided on some transmission control valve assemblies (lower body cover plate) to adjust the compensator valve spring. Thes screws are properly adjusted during production to provide the correct "idle line pressur " and no further ad-

(Continued)

justment is required in servic unless a new regulator and (or) compensator spring is installed. DO NOT r mov adjusting screw when ov rhauling control valve assembly.



Adjustm nt - Connect pressure gauge to transmission (see "Pressure Rise Test" above), then connect a vacuum gauge to vacuum diaphragm line. *NOTE - Vacuum gauge is used to make sure that no vacuum leak exists to cause a false line pressure reading.* With transmission at normal operating temperature, record the idle line pressure (see "Hydraulic Control Pressure Table"). If pressure is not within specifications, remove transmission oil pan and turn adjusting screw counterclockwise to increase pressure; clockwise to decrease pressure. *NOTE - One complete turn of adjusting screw will change line pressure 10 lbs.* After adjustment is completed, install transmission oil pan and fill with fluid, then start engine and move selector lever through all ranges several times before rechecking pressure gauge. If pressure is correct, remove gauges. *NOTE - If an initial adjustment is required before installing control valve assembly (after installing a new regulator and (or) a new compensator spring), proceed as follows: Remove lower body right front cover plate from control valve ass mbly and turn adjusting screw until it protrudes through c v r plate approximat ly .060" (approximately 1½ turns wh n starting from a flush position).*

MAIN CONTROL VALVE ASSEMBLY

Converter & Front Pump

A new converter incorporating a front pump drive hub with two flats 180° apart instead of two drive lugs is used. Front pump rotor has been revised to match the flats on converter hub. *NOTE - The new convert r can be used for service replacement on previous transmission models which have the dual port solid slipper type pump. A new rotor having the two flats must b installed in pump when using it with the new type converter.*

CONVERTER HUB & FRONT PUMP ROTOR

Tightening Specifications

Location	Torque
Control Valve Screws (10-24)	20-30 Inch lbs.
Control Valve Bolts (¼"-20)	70-85 inch lbs.
Control Valve to Transfer Case	8-10 ft. lbs.
Gov. Body Cover	20-30 inch lbs.
Planet Gear Shaft Retainer	20-30 inch lbs.
Rear Pump Cover	50-60 inch lbs.
Oil Pan Screws	10-13 ft. lbs.
Front or Rear Servo to Case	12-15 ft. lbs.
Front Pump to Stator Support	12-17 ft. lbs.
Front Pump to Case	18-22 ft. lbs.
Rear Pump to Case	12-15 ft. lbs.
Extension Housing to Case	28-38 ft. lbs.
Manual Shaft Lever to Case	17-20 ft. lbs.
Outer Throttle Lever to Case	17-20 ft. lbs.
Rear Servo Piston Rod Seat	15-18 ft. lbs.
Front Band Lock Stop	35-40 ft. lbs.
Oil Filler Tube to Case Fitting	40-50 ft. lbs.
Diaphragm Assembly to Case	15-18 ft. lbs.
Oil Filler Tube to Case Nut	45-55 ft. lbs.
Oil Pan Drain Plug	10-15 ft. lbs.
Converter Drain Plug	20-28 ft. lbs.
Pressure Gauge Plug	10-15 ft. lbs.
Cooler Inlet or Outlet	10-15 ft. lbs.
Bypass Tube Fitting	9-12 ft. lbs.

FORD MOTOR CO. 3-SPEED AUTOMATIC TRANSMISSION

Cruise-O-Matic

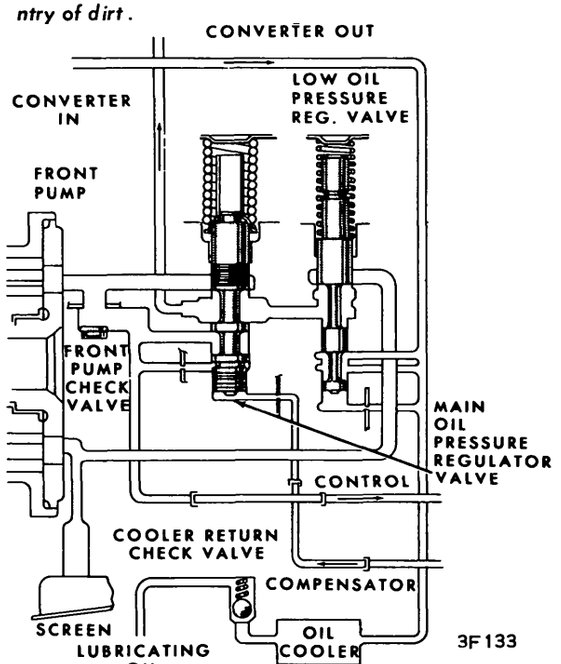
Ford Galaxie (1963)
Thunderbird (1963)
Ford Trucks (1963)

Multi-Drive

Mercury Monterey (1963)

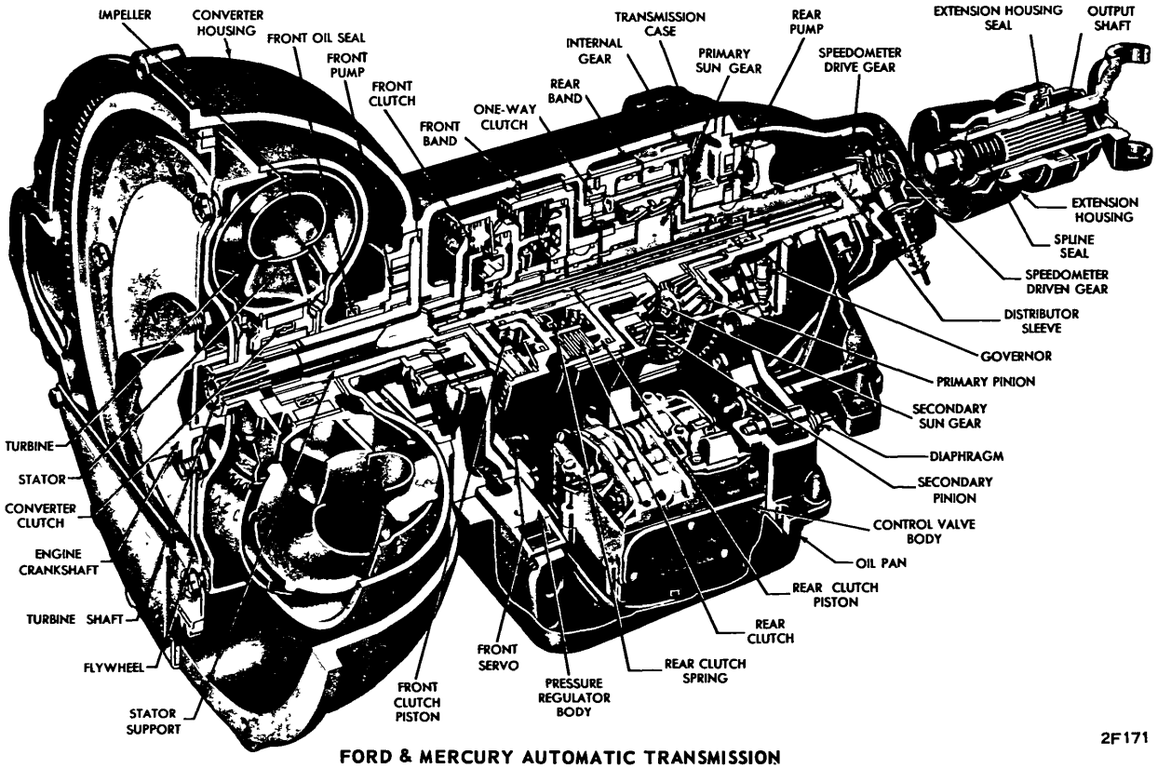
PUSHING (TO START) & TOWING

Pushing To Start Engine



Keep transmission selector lever in "N" (Neutral) until car reaches a speed of 20 MPH, then move selector lever to "LO". Depress accelerator pedal to half throttle position until engine starts. *NOTE - On ice or snow where traction is not good, move selector lever to "DR" position to crank engine.*

Towing Or Pushing Car



CAUTION - Do not tow (or push) at speed greater than 40 MPH and observe following precautions:

Transmission Operating Properly - Place transmission selector lever in "N" (Neutral) position. Car can be towed normally for distances not to exceed 12 miles. **For greater distances, use same procedure as for inperative transmission.**

Transmission Inoperative - Tow car with rear wheels lifted off ground, or disconnect and remove propeller shaft. *NOTE - Protect rear end of transmission from ntry of dirt.*

"SERIES" COOLING FLUID CIRCUIT DIAPHRAGM ("PCE" TRANSMISSIONS)

FORD & MERCURY AUTOMATIC TRANSMISSION

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 "PCE" TRANSMISSION (390" ENG.) PRODUCTION CHANGE FOR IMPROVED COOLING & LUBRICATION:* "Series Cooling" system replaced the former "Parallel Cooling" used on these transmissions. With "Series Cooling", lubricating oil is provided by "converter out" fluid which passes through the oil cooler, then through a cooler return check valve at rear of transmission case, and then by means of a tube to the lube passage in rear pump. Parts changes in transmission are as follows:

Input Shaft & Bushing - New input shaft bushing is equipped with "through grooves" to provide lubrication for front clutch plates (instead of "stopped grooves" used on previous "PCE" transmissions).

Front Clutch Sun Gear Assembly - Front clutch lube passage has been eliminated. In addition, the hole in gear which provided lube oil for rear clutch plates has been increased in size from 1/8" to 1/4".

Front Clutch Drum & Sun Gear Assembly - Rear clutch lube hole size is increased from 3/32" to 1/4".

Oil Pressure Regulator Assembly - Hole for lube oil is eliminated. *NOTE - This hole is cast but is not drilled through.*

Oil Pr ssur R gulator Separator Plat - This plate has been revised to remove the "low oil pressure regulator valve compensator feed" orifice, and replaced with a "converter out" feed orifice. In addition, a hole has been added to provide cooler flow regardless of low oil pressure regulator valve position.

Low Oil Pressure Regulat r Valv Spring - A new low oil pressure regulator valve spring is used.

Lubricating Oil Tube - This new tube slips into cooler return hole inside of case and into rear pump body to direct "cooler out" oil to lube passage in place of the oil cooler-to-sump tube formerly used.

Case Assembly - This assembly has been changed. *NOTE* - The new case assembly may be used to service "parallel cooling" models. A connector is required to adapt 3/8"-18 hole in case to the 1/2"-20 flare tube fitting on cooler return line.

Lube Connector Valve Ass mbly - This unit houses the cooler return oil check ball and spring. *CAUTION - This connector should be installed in case finger tight,* ***plus 1½ turns.*** *DO NOT tighten more than 2 turns. If desired, threads may be coated with a suitable sealing compound.*

►*1963 AUTOMATIC TRANSMISSION "NO PARK" CONDITION CORRECTION (EARLY CARS):* The parking pawl torsion lever rod clip may have fallen out of pin in parking pawl toggle operating lever assembly. Remove main control valve assembly and remove clip (clip may be found laying on top of main control valve). Reassemble rod to lever and install a 1/16" x 1/2" cotter pin in place of hairpin clip.

►*1963 HARSH 1-2 UPSHIFT CORRECTION "PCD" &*

(Continued)

"PCE" TRANSMISSIONS (EXC. 390" ENGINES WITH TRIPLE CARBS. & POLICE INTERCEPTOR): Install shift valve spring, Part No. C2AZ-7A288-A which will raise the 1-2 shift point sufficiently to cause the shift to occur at a slightly reduced line pressure.

DESCRIPTION

Same design as previous dual-range automatic transmissions having a vacuum controlled throttle valve (Pass. Cars); manual controlled throttle valve (Trucks).

Transmission Identification

Serial number prefix stamped on identification plate (except "PCE" models); tag ("PCE" models) attached to left side of transmission case. On all transmission models, except "PCE", an additional identification tag is fastened to one of the oil pan attaching bolts. The three letter prefix ("PCE" as an example) will have an additional letter and possibly a figure indicating application and detail changes. Refer to the transmission serial prefix for service and parts replacement.

Transmission Identification

Mdl	Engin	Serial Prefix
Ford Pass.	260"	PCT-A,B,F
Ford Pass.	289"	PCT-A,F

Mercury	390"	PCE-AA,AB,AD,AL,AM

LUBRICATION

Checking Fluid Level

Check fluid level every 6000 miles (Pass. Cars), 4000 miles (Trucks). *NOTE - If truck is used "Off Highway", check fluid very 500 miles.* With transmission at normal operating temperature and engine at normal idle speed, shift transmission through all ranges, then place in "P" (Park) position. Check fluid level on dipstick and add recommended fluid as required to bring level up to "F" (Full) mark on dipstick. *CAUTION - Do not ov rfill.*

Draining & Refilling

NOTE - P riodic draining and refilling not required except at tim of verhaul. To fill dry transmission, install 6 qts. of recommended fluid, then start engine and shift transmission through all ranges, finally placing selector lever in "P" (Park) position. Check fluid and if necessary, add enough fluid to bring level up to "F" mark. DO NOT OVERFILL. When a partial drain and refill is required (due to front band adjustment or minor service) proceed as follows: To drain transmission, remove fluid filler tube from transmission and allow to drain, then install filler tube. *NOTE - If equipped with a filt r, install a new filt r unit.* Add 3 qts. of fluid, then run engine at slow idle for 2 minutes. Increase engine RPM to fast idle speed with transmission in "N" (Neutral) and run engine until transmission is at normal operating temperature. *CAUTION - Do not race engine.* Shift selector lever through all ranges, finally placing selector lever in "P" (Park). Check fluid level and if necessary, add fluid to bring level up to "F" (Full) mark on dipstick.

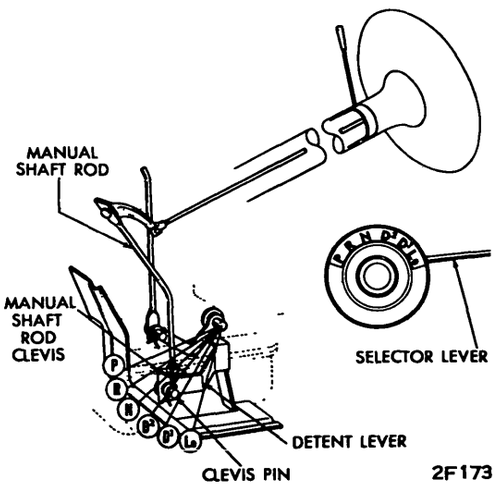
Recommended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity -

10 qts. (refill). *CAUTION - These capacities are approximate. Check fluid level on dipstick and adjust.*

ADJUSTMENT



Throttle Linkage

See CARBURETOR on Car Model pages.

Manual Shift Linkage

Ford Pass. Cars & Mercury (Steering Column Shift) - With engine stopped, loosen clamp nut at shift lever so that shift lever rod is free to slide in clamp at lower end of steering column. Position selector lever so pointer lines up with "D1", then shift manual lever at transmission into corresponding detent (second from rear). Tighten clamp at shift rod at lower end of steering column and check pointer for alignment in all selector lever positions.

Ford Pass. Cars & Mercury (Floor Shift) - With selector lever in "N" (Neutral) position, align the step on button assembly flush to .030" above top of shift knob. *NOTE - Make sure shift rod is tightened securely to shift lever.* Tighten setscrew in top of lock button securely.

MANUAL SHIFT LINKAGE

With transmission manual lever on transmission in "D1" detent (third from rear) and selector lever against the "D1" stop, tighten locknut on shift rod to 15-20 ft. lbs.

Thunderbird - With engine stopped, loosen nut at lower end of manual shift rod on transmission shift lever. Position manual shift lever so pointer is down against steering column stop in "D1" position (large green dot). Move shift lever on transmission to "D1" detent position (second from bottom), then tighten nut on shift rod and shift lever. Check pointer for alignment in all positions.

Ford Truck - With engine stopped, disconnect upper end of manual shift rod from selector lever, then position lever so pointer is down against steering column stop in "D1" position. Shift manual lever on transmission to second detent from bottom, then rotate adjusting sleeve on manual shift rod until pin can be easily inserted in lever. **Now lengthen rod by turning adjusting sleeve two full turns.** Lock adjusting sleeve in position and connect rod to selector lever. Check pointer alignment in all lever positions.

Neutral Safety Switch

Pass. Cars (Steering Column Shift) - Located under instrument panel on steering column. Loosen steering column-to-switch attaching screws and position switch so starter circuit is closed when selector lever is in "N" or "P" positions, then tighten attaching screws. Starter circuit should be open in all positions except "N" or "P".

Pass. Cars (Floor Shift) - Remove shift lever detent button, spring, and knob assembly from lever. Remove console top chrome trim panel, then place selector lever in "N" and remove quadrant indicator assembly. Remove bulb socket, being careful not to scratch quadrant cover. Loosen switch attaching screws, apply service and parking brakes, then turn ignition key to start position and move switch until starter operates. Tighten switch screws and check for starting in "P" position. Check operation of back-up lights. Tape detent rod to shift lever to hold rod in position, and reassemble console and shift lever assembly.

Trucks - Loosen screws attaching switch to bracket on steering column, then position switch so starter circuit is closed when selector lever is in "N" or "P" positions. *NOTE - Circuit must be open in all other positions.* Tighten switch attaching screws and check operation in all lever positions.

Front Band

NOTE - Adjust bands every 18,000 miles under normal operation. For severe operation, adjust bands m re frequently. Drain fluid from transmission and remove oil pan and screen. Loosen front servo adjusting screw locknut two turns and check adjusting screw for free rotation in operating lever. Pull adjusting screw end of operating lever away from servo body and insert a .250" gauge block between servo piston and adjusting screw. Tighten adjusting screw to 10 inch pounds, **th n back off adjusting screw xactly ne full turn.** *CAUTION - Transmission will be damaged if adjusting scr w is not back d off EXACTLY ne full turn.* Hold

(Continued)

adjusting screw stationary and tighten locknut to 20-25 ft. lbs., then remove gauge block. Install oil pan and refill transmission with fluid.

FRONT & REAR BAND ADJUSTING TOOL NOTE - Special tools as indicated below are available for front and rear band adjustment: **Ford** (Front & Rear Band) - Tool T58L-7195-A. **Mercury** (Front Band) - Tool 7225-C13-B; (Rear Band) - Tool 7195-C.

Rear Band

NOTE - Adjust bands every 18,000 miles under normal operation. For severe operation, adjust bands more frequently. On all models except Thunderbird, fold back floor mat at right side of floor pan and remove access hole cover. On Thunderbird, remove console and right side heater duct floor director, then remove access hole cover. Use suitable tools (see "Front & Rear Band Adjusting Tool Note" above) and loosen adjusting screw locknut, then tighten adjusting screw to 10 foot pounds. Back off adjusting screw exactly 1½ turns. *CAUTION - Transmission will be damaged if adjusting screw is not backed off EXACTLY 1½ turns.* Hold adjusting screw stationary and tighten adjusting screw locknut to 35-40 ft. lbs.

TESTING

Stall Test

NOTE - When making stall test, never hold throttle open longer than 5 seconds. With engine at normal operating temperature and at slow (hot) idle speed, install a tachometer on engine and apply service and parking brakes. Stall test transmission in each driving range at full throttle (do not depress accelerator through detent into kickdown position), and note engine speed (see Stall Speed Table below). *CAUTION - If engine speed exceeds maximum limits in table, release accelerator immediately.* Clutches and bands are applied in each selector lever position as follows: "**D1**" - Front clutch and one-way clutch engaged in all accelerator pedal positions. "**D2**" - Front clutch and front band applied at all accelerator pedal positions. "**L**" - Front clutch and rear band applied. "**R**" - Rear clutch and rear band applied. *NOTE - Engine overspeeding is an indication of clutch or band slippage.*

ENGINE STALL SPEEDS

Engine	Engine RPM
Pass. Car 260" Eng.	1500-1700
Pass. Car 352" Eng.	1600-1800
Pass. Car 390" Eng. (Std.)	1800-2000
Pass. Car 390" Eng. (Police)	1850-2050
Truck 223" Eng.	1400-1600
Truck 292" Eng.	1520-1720

Shift Test

1) Check light throttle upshifts in "D1". Transmission should start in first gear and shift to second, then to third as speed increases (see "Shift Table").

2) While transmission is in third gear, depress accelerator pedal through detent (to floor). The transmission should shift from third to second or third to first, depending on car speed (see "Shift Table").

3) Check closed throttle downshift from third to first by coasting down from about 30 MPH in third gear. Shift should occur as shown in "Shift Speed Table". *NOTE - A 3-2-1 shift may be experienced under the above conditions.*

4) Partial throttle downshifts in "D1" may be checked by using service brakes as a load. With transmission in third gear, "D1", and car speed at about 30 MPH, depress and hold throttle about half open. At the same time, apply service brakes to point where road speed is slowly reduced. The third to second and then second to first shifts should occur as speed decreases.

5) With transmission in third gear and road speed above 28 MPH, transmission should shift to second gear when selector lever is moved from "D2" or "D1" to "L". When the same manual shift is made below about 25 MPH, the transmission should shift from second or third to first.

TRANSMISSION SHIFT SPEED TABLE

ENGINE		APPROXIMATE SHIFT SPEEDS (MPH)								MANUAL

① - Exc. Police Interceptor. ② - Police Interceptor. ③ - Except F-250. ④ - F-250

Control Pressure Test

Pass. Cars - Attach tachometer and vacuum gauge to engine, then attach a pressure gauge to control pressure outlet at rear of transmission case. Apply parking brake and adjust idle speed to 450-475 RPM with transmission selector lever in "D1" or "D2" position. *NOTE - If idle speed cannot be brought within limits by adjusting carburetor throttle stopscrew, check throttle and downshift linkage for binding and check vacuum diaphragm unit for leakage.* With engine at indicated idle speed and engine vacuum at 18.0" Hg. (minimum), control pressure should be as indicated in table below. If control pressure is within these limits, place selector lever in "D1" or "D2" and apply service brakes. Advance throttle until engine vacuum drops below 16-13," Hg. As vacuum gauge reading drops through this range, transmission pressures should start to rise with throttle opening until maximum control pressure for stall in "D1" or "D2" is ,obtained. *NOTE - In "P", "L" or "R", control pressure ris is not depend nt on diaphragm unit. When sel ctor l ver is shifted into th s positions and engine speed is increas d, control pr s-sure should rise immediat ly and reach maximum before engine speed reaches stall RPM.*

Trucks - Install a pressure gauge to pressure take-off tube in engine compartment (located to rear of carburetor), then install a tachometer on engine and bring engine to normal operating temperature. Adjust engine to correct idle speed, then set hand brake and place selector lever in "D1" or "D2". Check idle pressure which should be within specifications (see table below). Increase engine speed and note control pressure indicated on gauge. If pressure is not within limits, adjust throttle control rod to obtain correct pressure, then recheck idle pressure. With selector lever in one of the above positions increase engine speed to stall condition and note pressure and engine RPM which should be within specifications.

CONTROL PRESSURES

Ford Pass. Cars, Thund rbird & M rcury (Except P lic Cars)

Engine Speed	Lever P siti on	Pr ssur
Idle	N, D1, D2	57-72 lbs.
Idle	P, R, L	57-213 lbs.
Stall	D1, D2	145-170 lbs.
Stall	R, L	201-213 lbs.

Polic Cars

Engine Speed	Lev r P siti n	Pr ssur
Idle	N, D1, D2	70-95 lbs.
Idle	P, R, L	70-228 lbs.
Stall	D1, D2	170-200 lbs.
Stall	R, L	212-228 lbs.

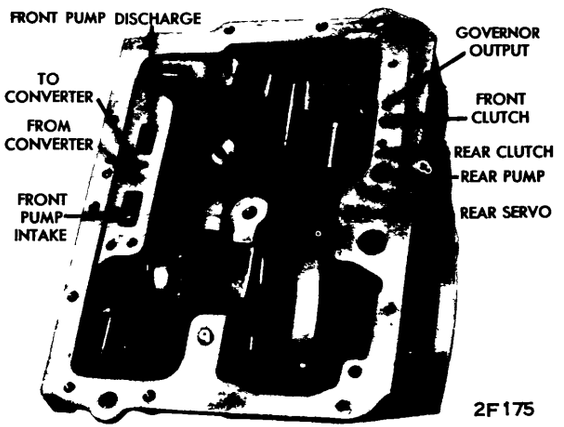
Trucks

Engin Sp d	L v r P siti n	Pr ssur
Idle Speed	All	57-67 lbs.
1000 RPM	D1, D2	80-85 lbs.
Stall	D1, D2	152-170 lbs.
Stall	R, L	203-214 lbs.

(Continued)

Air Pressure Tests

Raise car on a hoist, then remove transmission oil pan and control valve assembly. Proceed as follows:



Fr nt Clutch - Apply pressure to front clutch and governor input passage (see illustration). Listen for a dull thud which indicates that clutch is operating. Keep air pressure in passage for several seconds to check for leaks in this part of system.

G v rn r Valve - Remove governor inspection cover. Apply air pressure to the same passage as for front clutch (above). Listen for a click and also watch valve snap inward.

R ar Clutch - Apply air pressure to rear clutch oil passage (see illustration). Listen for a dull thud to indicate clutch is operating. Check for leaks in same manner as for front clutch (above).

R ar Band & Serv - Apply pressure to front servo apply tube (rear tube), and observe band application.

TESTING NOTE - If servos, bands, clutches, and governor operate with air pressure, then the no drive problems, erratic shift, or no upshift conditions indicate that the control valve assembly is the cause of trouble.

TRANSMISSION CASE OIL PASSAGES

TROUBLE SHOOTING & DIAGNOSIS

NOTE - Check and make corrections in the sequence shown, testing operation of transmission after each correction.

Severe Engagem nt

In "L ", "Dr" r "R" Ranges - Check engine idle speed and throttle linkage adjustments. Adjust rear band. Perform a control pressure test. Remove and clean main control valve assembly and pressure regulator valve.

Upshifts Faulty

1-2, 2-3 Shift P ints L w, High, r Erratic - Check fluid level. Adjust throttle and manual linkage. Check governor operation. Perform a pressure control test. Remove and clean control valve assembly and pressure regulator valve. Remove and inspect front servo.

S v r 2-3 Shift - Adjust throttle linkage. Adjust front band. Remove and clean control valve assembly and pressure regulator valve. Remove and inspect front servo.

2-3 Upshift Engine Overspeeding - Adjust front band. Remove and clean control valve assembly.

No 1-2 or 2-3 Upshifts - Remove and inspect governor. Remove and clean control valve assembly. Rear clutch slipping. Leakage in hydraulic system. Fluid distributor sleeve in output shaft is faulty.

Downshifts Faulty

No Forced Downshifts - Adjust throttle linkage. Perform control pressure test. Remove and clean main control valve assembly. Check operation of inner and outer throttle levers.

Severe 3-2 or 3-1 Shifts (Closed Throttle) - Check engine idle speed and throttle linkage. Remove and clean main control valve assembly.

No 2-1 Downshift - Adjust throttle linkage. Clean main control valve assembly. Rear servo not operating properly.

No 3-1 Downshift - Adjust engine idle speed and throttle linkage. Remove and clean main control valve assembly.

Slippage Or Chatter

In 2nd Speed - Check fluid level. Adjust throttle linkage. Adjust front band. Check control pressure. Clean main control valve and pressure regulator. Front servo not operating properly. Front clutch slipping. Leakage in hydraulic system.

In 1st Speed - Check fluid level. Adjust throttle linkage. Adjust rear band. Clean main control valve and pressure regulator. Check inner and outer throttle levers. Front clutch slipping. Leakage in hydraulic system. Fluid distributor sleeve in output shaft is faulty.

In Reverse - Check fluid level. Adjust throttle linkage. Adjust rear band. Check control pressure. Clean main control valve and pressure regulator. Front clutch slipping. Leakage in hydraulic system. Fluid distributor sleeve in output shaft faulty.

No Drive

In "D1" or "D2" - Adjust front band. Clean main control valve. Make an air pressure check. Front clutch slipping. Leakage in hydraulic system. Fluid distributor in output shaft faulty.

In "D1" - Adjust manual linkage. Rear pump not operating properly. Planetary one-way clutch not operating properly.

In "R" - Adjust rear band. Rear servo not operating properly. Clean main control valve. Make air pressure check. Rear clutch not operating. Leakage in hydraulic system. Fluid distributor sleeve in output shaft faulty.

In "L" - Adjust manual linkage. Adjust rear band. Rear servo not operating properly. Clean control valve assembly. Leakage in hydraulic circuit. Fluid distributor sleeve in output shaft faulty.

In Any Rang - Check fluid level. Adjust manual linkage. Check control pressure. Clean main control valve and pressure regulator. Make an air pressure check. Leakage in hydraulic system.

Lock-up

In "D1" & (r) "D2" - Adjust manual linkage. Adjust rear band. Rear servo not operating properly. Front servo not operating properly. Rear clutch slipping. Check parking linkage. Leakage in hydraulic system.

In "R" - Adjust front band. Front servo not operating properly. Front clutch slipping. Check parking linkage. Leakage in hydraulic system.

In "L" - Adjust front band. Front servo not operating properly. Rear clutch slipping. Check parking linkage. Leakage in hydraulic system.

Parking Lock Faulty

Adjust manual linkage. Check parking linkage.

Engine Will Not Push Start

Check fluid level. Adjust manual linkage. Clean main control valve and pressure regulator. Rear pump not operating. Leakage in hydraulic system.

Transmission Overheating

Oil cooler and connections faulty. Clean pressure regulator assembly. Converter one-way clutch slipping or faulty.

Engine Runaway

On Forced Downshift - Adjust front band. Clean main control valve and pressure regulator. Front servo not operating properly. Leakage in hydraulic system.

Noise

In Neutral - Clean and inspect pressure regulator. Engine rear oil seal faulty. Front clutch not releasing properly. Front pump faulty.

In 1st, 2nd or Reverse - Clean and inspect pressure regulator. Faulty planetary assembly. Front or rear clutch faulty. Front pump faulty.

In Park - Clean and inspect pressure regulator. Front pump faulty.

When Coasting In Neutral (20-30 MPH) With Engin Off - Rear Pump faulty.

REMOVAL & INSTALLATION

See 1962 Final Data, Page 478 for removal and installation procedure on all models.

TRANSMISSION OVERHAUL

See 1962 Final Data, Page 480 and note the following changes in transmission design and overhaul procedur .

Front Pump Oil Seal

A new 1/8" narrower seal is used which requires a new installing tool, T63L-77837-A.

Speedometer Gear

A nylon drive gear which is a .004-.010" shrink fit on output shaft is being used in production to replace the former steel gear. To remove and install the nylon gear, proceed as follows: Remove output shaft from transmission, then remove oil distributor tubes from

(Continued)

sleeve. Remove speedometer gear snap ring from shaft and pry oil delivery sleeve toward rear of shaft with a hammer handle. *CAUTION - Apply pressure on governor counterweight, and not against governor valve body.* Slide oil delivery sleeve toward front of transmission, then use a small hammer and brass drift, gently tap gear evenly and alternately off the shaft. To install gear, dip it in transmission fluid and place it on an illuminated 100 watt light bulb for five minutes, then turn gear over and heat other side for five minutes. Make sure lock ball is in place on shaft, then quickly slide gear into place. Install snap ring and replace output shaft.

Output Shaft Thrust Washer

"PCE" Model Transmission (390" Engine) - A new needle thrust washer is used on the output shaft which requires a counterbore in rear pump to accommodate the thrust bearing race.

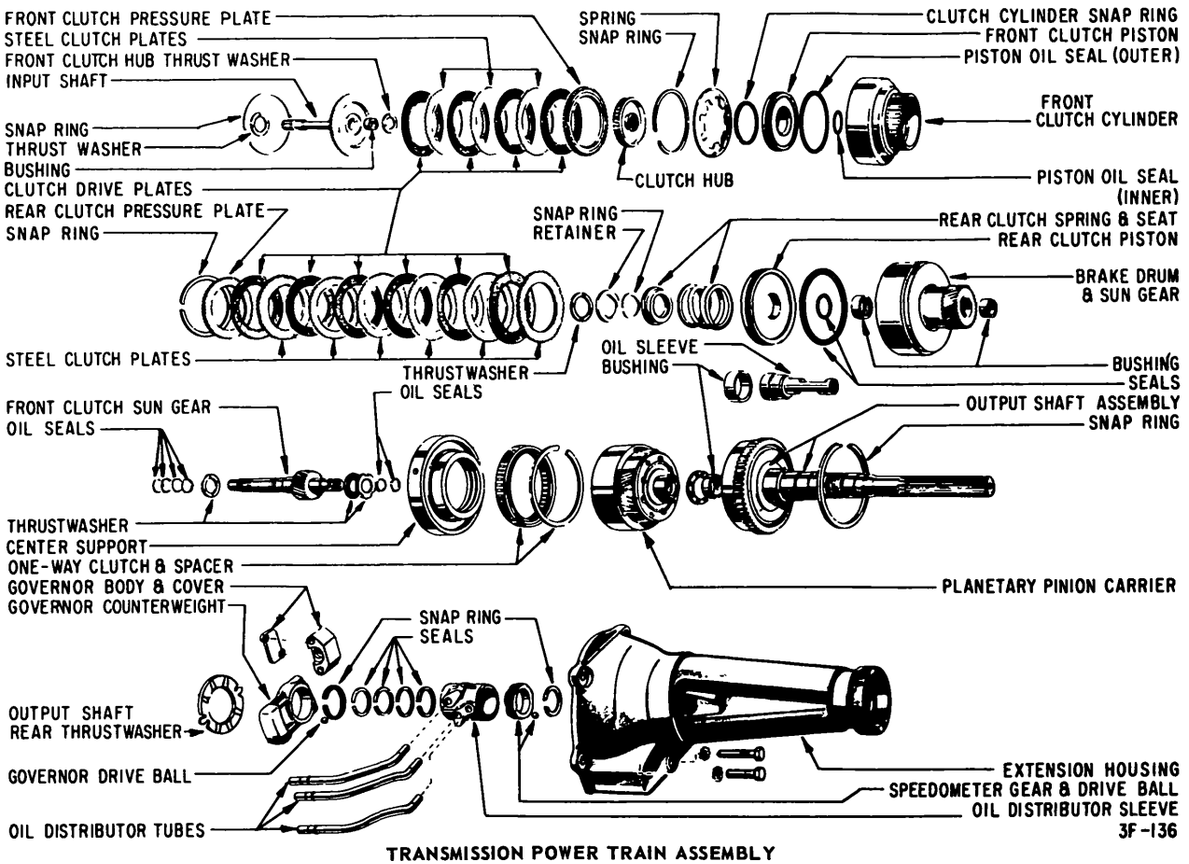
Torque Converter

The torque converter has been modified to replace the sprag type clutch with a roller type clutch. Bronze and aluminum thrust washers have been replaced with aluminum coated stamped thrust washers and flat steel retainers. A new longer locking rod, Tool T63P-7092-A, is required for use with the present converter clutch checking tool.

Front Servo

The accumulator piston and related parts have been eliminated in 1963 models. Servicing remains the same as in previous models except for the eliminated parts.

Converter Housing



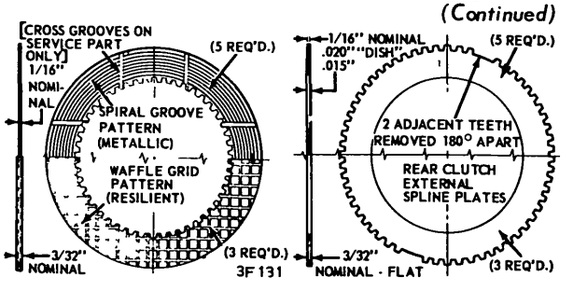
A new converter housing and converter is used to accommodate the new .075" thick engine rear cover plate. The new converter housing will have the starter pilot eliminated (piloting of starter is accomplished by the engine rear cover plate). The new converter assembly has longer flywheel mounting stud pads and a longer crankshaft pilot.

Parking Linkage

This linkage is a new design requiring different replacement procedures as follows: To replace toggle lever shaft, press it out of case after all of the parking pawl linkage has been removed. Press a new shaft into case until end of shaft is flush with case. With the shaft in position, toggle lift lever should be centered on toggle link pin, when in the applied position.

Rear Clutch Plates

"PCD" & "PCT" Model Transmissions (260" & 352" Engin s) - New material used in rear clutch drive (friction) plates allows the number of plates to be reduced from five to three (drive plates), and allows driven (coned steel) plates to be replaced with three flat steel plates. Other transmission parts that are affected with this change include front clutch cylinder, front brake drum and sun gear assembly, rear clutch pressure plate and main control assembly. When installing new plates, soak in transmission oil for fifteen minutes prior to assembly. If plates are to be reused, they must not be washed or cleaned in any solvent, but wiped clean with a lintless cloth only. *See "Rear Clutch Plates" illustration.*

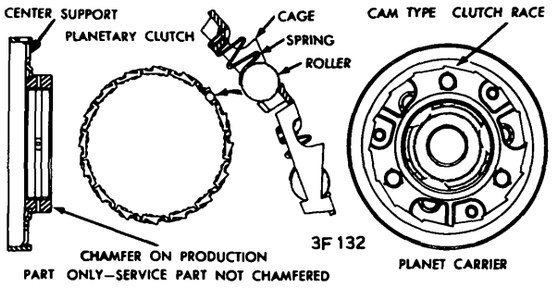


TRANSMISSION POWER TRAIN ASSEMBLY

Planetary Clutch

A new "roller" type one-way clutch has replaced the "sprag" type one-way clutch. In conjunction with this change, a new planet carrier with a "cam" type clutch race is used which also requires a new type center support. The new center support used in production is chamfered at rear of clutch race for use with the "roller" type clutch only. A new service replacement center support is not provided with a chamfer, however, it can be used with either a "sprag" or "roller" type clutch. *CAUTION - Do not us a "chamfered" support with the "sprag" type clutch.* Installation procedures for "roller" type clutch on a center support with a "chamfered" edge is different from a support with a "square" edge as follows:

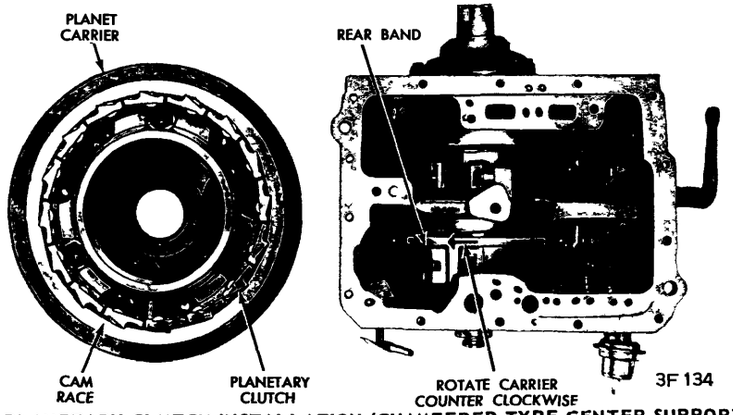
Chamfered Edge Support - Install center support and rear band in case, then install primary sun gear rear thrust bearing race and bearing in planet carrier using petroleum jelly to retain them in place. Lubricate bearing surface on center support, rollers of planetary clutch, and the cam race with petroleum jelly, then install planetary clutch in carrier. Carefully position



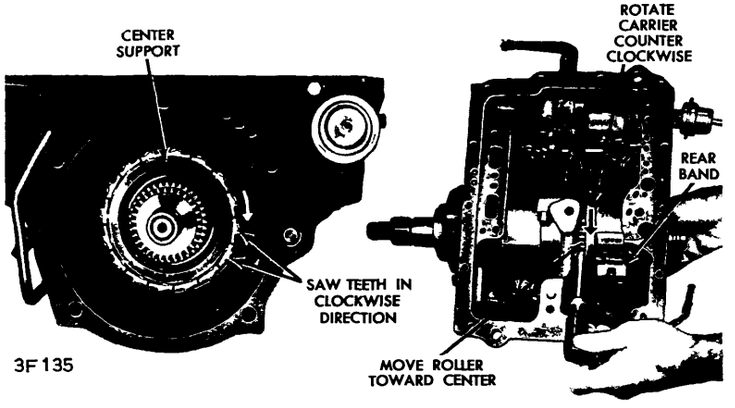
(Continued)

REAR CLUTCH PLATES ("PCD" & "PCT" TRANSMISSIONS)

planet carrier on center support, then move carrier forward until clutch rollers are felt to contact bearing surface of center support While applying forward pressure on planet carrier rotate it counterclockwise (as viewed from rear) This will cause clutch rollers to roll toward the large opening end of cams in the race, compressing the springs slightly, so that roller will ride up the chamfer on planetary support and onto inner race Push planet carrier all the way forward, then check operation of planetary clutch by rotating carrier counterclockwise It should rotate with a slight drag while rotating it counterclockwise (viewed from rear) and it should lock up when attempting to rotate it in a clockwise direction



Square Edge Support - Install center support and rear band in case, then install primary sun gear thrust bearing race and bearing in planet carrier using petroleum jelly to retain them in place Lubricate bearing surface on center support, rollers of planetary clutch, and the cam race in center support with petroleum jelly Install planetary clutch on center support with the "saw teeth" of clutch cage pointing in clockwise direction as viewed from rear *CAUTION - Make sure that all rollers are in the cage* Push planet carrier forward until rollers are felt to contact surface of cam race, then while applying forward pressure on carrier, rotate it counterclockwise (viewed from rear) This will cause roller to roll toward the large opening end of cams in race, compressing the springs slightly so that rollers will enter cams *NOTE - Some of the rollers may become cocked preventing their entry into outer race Th se rollers must be positioned individually with a small screwdriver by pushing rear of rollers toward center of transmission and into cam race (keep pressure applied to carrier at all times)* After all rollers have been started into cam race, rotate the carrier counterclockwise while pushing it forward (again straighten any rollers which still may be in a cocked position preventing carrier from sliding onto support) Make sure that all springs are entered in cam race before attempting to push carrier on support Push carrier all the way forward and check operation of clutch by rotating it in a counterclockwise direction The carrier should rotate counterclockwise with a slight drag and should lockup when attempting to rotate it in a clockwise direction



ROLLER TYPE ONE-WAY CLUTCH

PLANETARY CLUTCH INSTALLATION (CHAMFERED TYPE CENTER SUPPORT)

PLANETARY CLUTCH INSTALLATION (SQUARE TYPE CENTER SUPPORT)

LINCOLN AUTOMATIC TRANSMISSION

Lincoln Continental (1963)

PUSHING (TO START) & TOWING

Pushing Car To Start Engine

Place selector lever in "N" (Neutral) and obtain a speed of approximately 25 MPH. Depress accelerator and turn ignition ON, then move transmission selector lever to "L" (Low).

Towing Or Pushing Car

NOTE - Do not tow car at speeds greater than 40 MPH and observe the following precautions.

Transmission in Operating Condition- With transmission in "N" (Neutral) position, car can be towed or pushed normally for distances not to exceed 12 miles. *For greater distances, use same procedure as for inoperative transmission.*

Transmission Not In Operating Condition - Tow car with rear wheels lifted off ground or with propeller shaft removed. *CAUTION - If propeller shaft is removed, protect rear of transmission so dirt will not enter.*

DESCRIPTION

Three speed hydraulically controlled planetary transmission and torque converter of same design used on previous models.

LUBRICATION

FLUID LEVEL CAUTION - Transmission fluid level must not be allowed to drop to more than ONE PINT below normal FULL level.

Checking Fluid Level

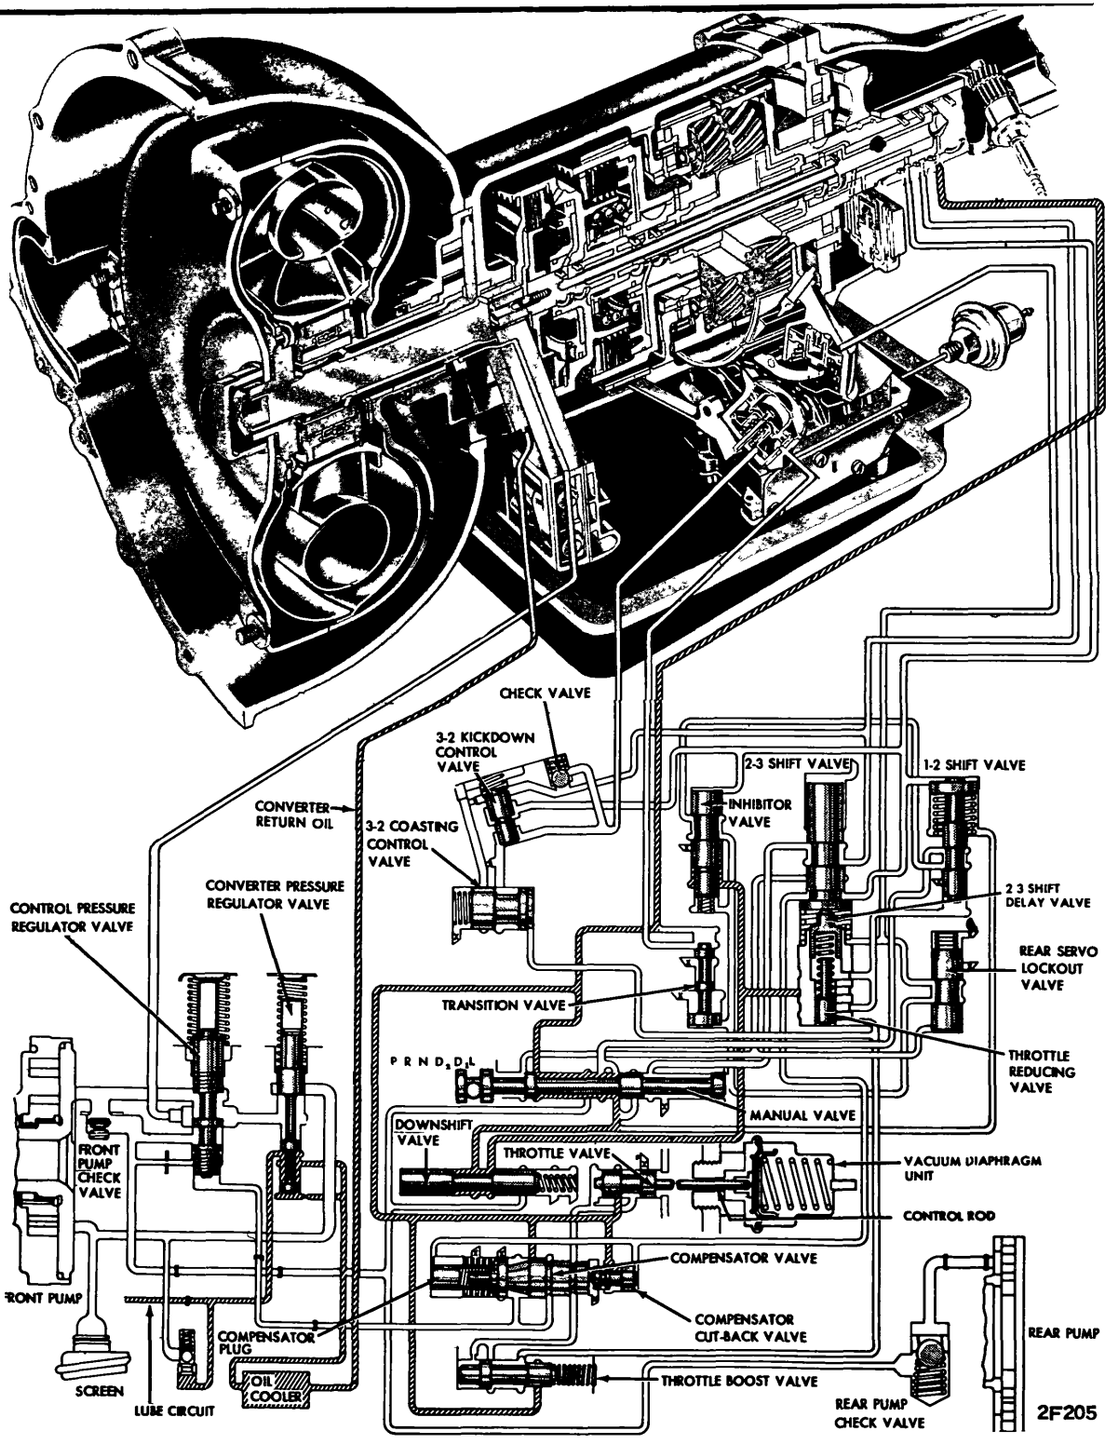
Check fluid level every 6,000 miles. With transmission at normal operating temperature and engine at normal idle speed, shift transmission through all ranges, then place in "P" (Park) position. Check fluid level on dipstick and add recommended fluid as required to bring level up to "F" (Full) mark on dipstick. *CAUTION - Do not overfill.*

Draining & Refilling

Periodic draining and refilling is not required (only at time of service or overhaul). To fill dry transmission, install 6 qts. of recommended fluid, then start engine and shift transmission through all ranges. Place transmission selector lever in "P" (Park) position and check fluid level. If necessary, add enough fluid to bring level up to "F" (Full) mark on dipstick. *CAUTION - Do not overfill.*

Recommended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A").



Capacity

10 qts. (approximate). *Check fluid level on dipstick and adjust as necessary.*

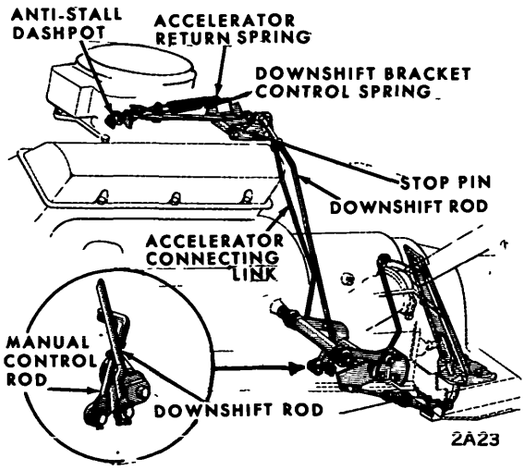
ADJUSTMENT

Throttle Linkage

See CARBURETOR on Car Mod I page.

LINCOLN AUTOMATIC TRANSMISSION HYDRAULIC CIRCUITS

Downshift Rod



Loosen locknut on downshift rod, then disconnect rod from ballstud on bellcrank assembly and slide spring clip off end of rod. Moveable outer bracket on bellcrank must be up against stop pin on inner mounting bracket on bellcrank assembly Pull upward on rod and hold against transmission internal stop, then adjust length of rod until hole in rod is aligned with ballstud on bellcrank assembly. Lengthen downshift rod one turn and position it on ballstud and lock rod to ballstud and tighten locknut. *NOTE - Make sure bellcrank outer bracket remains against stop pin. If it is not against stop pin, lengthen rod an additional turn.*

Manual Linkage

With engine off and transmission selector lever in "D1" position against stop, raise car and remove splash shield. Disconnect adjustable link from transmission manual shift lever on transmission and make sure lever is fully engaged in second detent from bottom. Loosen locknut on adjustable link, then pull downward on link to hold selector lever against stop. Adjust rod length as necessary until hole in link aligns with stud on manual lever, then **lengthen link one-half turn additi nal.** Connect to transmission shift lever and check selector lever through all positions. *CAUTION - Do not mak a compensating adjustment in manual linkag to ov rcom misalignment of selector lever indicator or starter neutral safety switch.*

Neutral Safety Switch

Remove lower radio speaker and grille, then remove hood release handle from instrument panel. On convertible models, remove top control switch from instrument panel. On all models, remove lower left instrument panel cover and lower section of left vent. Remove wire connector from neutral safety switch, then position transmission selector lever in "D1" or "D2" range and loosen screws attach ng switch to steering column. Connect a self-po ere test lamp to lower two terminals (back-up lamp) on neutral safety switch. Position selector lever in "R" and pull switch to its furthest downward position. Slowly move switch upward until test lamp goes out. Attach test lamp lead to upper two terminals and shift selector lever to "P" or "N" position Test lamp should not go out. Tighten switch attaching screws and connect wire connector to switch, then install vent extension, lower instrument panel cover, hood release handle, and radio lower speaker and grille

LINCOLN CONTINENTAL THROTTLE LINKAGE

Front & Rear Bands

NOTE - Adjust bands every 12,000 miles under normal operation. For severe operation, adjust bands every every 6,000 miles.

Front Band - *NOTE - Front band adjustment screw is located on left side of transmission case above plug for line pressure check. It is not necessary to remove oil pan for front band adjustment.* Remove transmission linkage splash shield, then clean and oil adjusting screw threads. Loosen adjusting screw locknut, then install Tool 7345 and tighten adjusting screw until handle "breaks" over center. *CAUTION - If adjusting screw is tighter than wrench capacity (10 ft. lbs.) loosen a justing screw and readjust.* **Back off adjusting screw exactly three full turns.** Hold adjusting screw stationary and tighten locknut to 35-40 ft. lbs. *CAUTION - Damage may result to trar smission if adjusting screw is not backed off exactly three full turns. FRONT BAND ADJUSTING TOOL NOTE - Tool 7345 consists of two parts, adjusting screw locknut wrench, and adjusting screw ratchet wrench. Adjusting screw wrench is designed to be inserted through locknut wrench.*

Rear Band - *NOTE - Rear band adjusting screw is located on right side of transmission and is accessible through a hole in floor pan.* Fold back floor mat on right side and remove cover from access hole in floor pan. Clean and oil threads of adjusting screw, then loosen adjusting screw locknut with Tool 7195-C. Use T-handle of tool and tighten adjusting screw until wrench overruns. *CAUTION - If adjusting screw is tighter than wrench capacity (10 ft. lbs.), loosen adjusting screw and readjust.* **Back off adjusting screw exactly 1½ turns** and tighten locknut to 35-40 ft. lbs. *CAUTION - Damage may result to transmission if adjusting screw is not backed off exactly 1½ turns.*

TESTING

Stall Test

When making stall test, never hold throttle open longer than 5 seconds. With engine at normal operating temperature and at slow (hot) idle speed, install a tachometer on engine and apply service and parking brakes. Stall test transmission in each driving range at full throttle (do not depress accelerator through detent into kickdown position), and note engine speed, which should be 1600-1800 RPM. *CAUTION - If engine speed exceeds maximum limits, release accelerator immediately.* Clutches and bands are applied in each selector lever position as follows: "**D1**" - Front clutch and one-way clutch engaged at all accelerator pedal positions. "**D2**" - Front clutch and front band applied at all accelerator pedal positions. "**L**" - Front clutch and rear band applied. "**R**" - Rear clutch and rear band applied. *NOTE - Engin overspeeding is an indication of clutch r band slippage.*

SHIFT SPEEDS (MPH)

Range	Shift	Minimum Throttle	Full Throttle	F rc d Downshift	Manual D - Lo
D1	1-2	8-11	41-50		.
D1	2-3	12-25	68-81		
D1	3-2			63-75	
D1	3-1	7-9		21-33	
D1	2-1	.		21-33	
D2	2-3	12-25	68-81		
D2	3-2	7-12		63-75	
D1&D2	3-2				Above 19-28
D1&D2	3-1	.	.		Below 19-28

Shift Tests

Select a smooth road for tests, then make tests outlined below and refer to "Shift Speed Table" for correct speeds where shifts should occur.

1-2, 2-3 Upshift (Minimum Throttle) - Place selector lever in "D1" range, and starting from a standstill, transmission should start in first gear and upshift to second, then a higher speed, upshift to third.

2-3 Upshi mum Throttle) - Place selector lever in "D2" ra and starting from a standstill, transmission should start in second gear and upshift to third.

1-2, 2-3 Upshift (Maximum Throttle, Through Detent) - Place selector lever in "D1" range, then depress accelerator through detent and hold there. Transmission should upshift at speeds indicated. *NOTE - 2-3 Upshift with selector lever in "D2" range will occur at same speed as for "D1" range.*

3-2, 2-1 Downshift (F aced) - With transmission in third gear, depress accelerator pedal to floor (through detent). Transmission should shift from third to second, or from third to first, depending on car speed.

3-1 Downshift (Minimum Throttle) - Coasting down from approximately 30 MPH in third gear, transmission should downshift from third to first. *NOTE - A 3-2-1 downshift may be experienced under the above conditions.*

"DR" to "LO" (Manual Shift) - With car speed at approximately 50 MPH, shift selector lever from "D1" or "D2" to "LO". Transmission should shift from third to second. When car speed is reduced within range indicated in table, transmission should shift to first gear.

Control Pressure Tests

Attach a tachometer and vacuum gauge to engine, then attach a pressure gauge to control pressure outlet on side of transmission (directly below front band adjusting screw on left side of case). Apply parking brake and adjust idle speed to 450-475 RPM with transmission selector lever in "D2" position. With engine at indicated idle speed and engine vacuum above 16" Hg, and with transmission in either "D1", "D2" or "Lo", pressure should be 57-72 lbs. In "P", "N", or "R", pressure should be 57-213 lbs. If control pressures are within limits, apply service brakes and place transmission selector lever in "D1" or "D2", then increase engine speed slowly until pressure starts to rise. At this point, manifold vacuum should be 16.0" to

(Continued)

13.7" Hg. As vacuum reading passes through this range, transmission control pressure should start to rise and continue to rise with throttle opening, reaching a maximum pressure of 145-170 lbs. At maximum pressure, vacuum reading should be 1.5" Hg. *CAUTION - Do not hold transmission under stall conditions for more than five seconds.* If control pressures are not correct, erratic, or fail to rise with increased speed, see *"Trouble Shooting & Diagnosis"*.

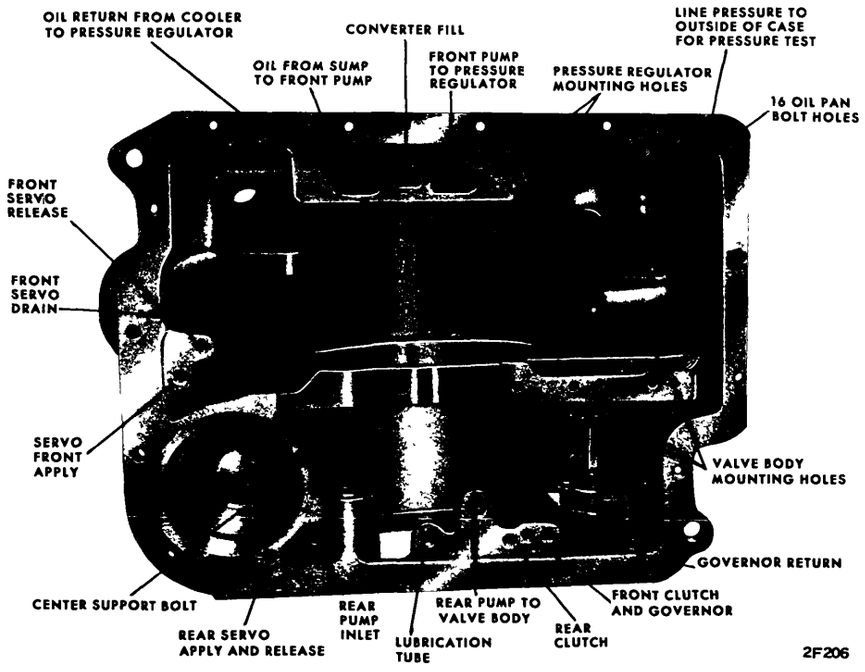
Air Pressure Tests

NOTE - Raise car and remove transmission oil pan and control valve assembly, then proceed as follows:
Front Clutch - Apply pressure to front clutch and governor input passage (see illustration). Listen for a dull thud which indicates that clutch is operating. Keep air pressure in passage for several seconds to check for leakage in this part of system.
Governor Valve - Remove governor inspection cover, then apply air pressure to same passage as for front clutch (above). Listen for a click and also watch valve snap inward.
Rear Clutch - Apply air pressure to rear clutch oil passage (see illustration) and listen for a dull thud to indicate clutch is operating. Check for leakage in same manner as for front clutch (above).
Rear Band & Servo - Apply pressure to rear servo oil passage (see illustration) and check band application.
Front Band & Servo - Apply pressure to front servo apply hole and check band application.

TROUBLE SHOOTING & DIAGNOSIS

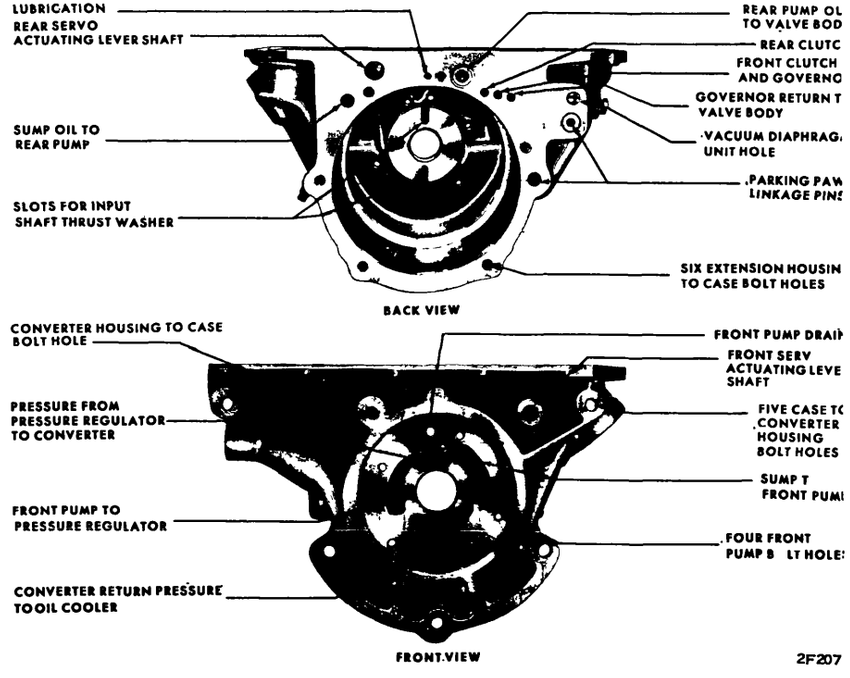
CONTROL PRESSURE LOW: If pressure is low at idle speed in all selector lever positions, check for excessive leakage in front oil pump, case, and control valve body. *NOTE – Control pressure in "P", "L", & "R" is regulated entirely by control pressure regulator valve and its spring.*

CONTROL PRESSURE HIGH: If control pressure is high at idle speed with transmission selector lever in "N", "D1" & "D2", trouble may be in diaphragm unit or its connecting tubes or hoses. Check engine manifold vacuum. Check diaphragm pushrod for bends and for corrosion. Install diaphragm unit with pushrod removed and recheck control pressure in "N", "D1" or "D2". If control pressure is still too high, trouble is in transmission control system. If pressure is within limits, diaphragm unit is not operating properly.



CONTROL PRESSURE DOES NOT RISE WITH THROTTLE OPENING: If control pressure does not rise in "D1" or "D2" as engine vacuum falls below 16–13.7" Hg, check transmission pressure rise capacity by shifting to "L" or "R". In these positions, maximum control pressure should be obtained at not more than engine stall RPM. If pressure rise is normal in "R" & "L", remove hose from diaphragm unit and check hose and tube. *NOTE – To check, hold thumb over end of hose and check for vacuum. If engine speeds up when hose is disconnected and slows down as thumb is held against end of hose, vacuum source is satisfactory.* If vacuum reading at end of hose is 18" Hg or greater, change diaphragm unit and recheck pressure rise with throttle opening in "D1" or "D2". If control pressure does not rise now, trouble is in transmission. Check for internal leakage in components that have pressure in them in "D1" and "D2" but do not have pressure in them in "R" or "L".

CONTROL PRESSURE IS EXTREMELY ERRATIC: If control pressure is erratic in "N", "D1" and "D2", check diaphragm unit tubes, hoses and diaphragm pushrod (see "Control Pressure High" above). If vacuum is satisfactory, replace diaphragm unit and retest control pressure. If no improvement noted, clean and inspect control valve body and pressure regulator.



ROUGH INITIAL ENGAGEMENT: Adjust engine idle speed. Check throttle linkage, manifold vacuum and vacuum diaphragm unit. Check control pressure. Adjust front and rear bands.

SHIFT POINTS INCORRECT OR NO SHIFT POINTS: Check transmission fluid level. Check throttle linkage, manifold vacuum and vacuum diaphragm unit. Check for sticking governor valve or plug. Check control pressure. Check position of valves in control valve body (Check control pressure at each detent position during road test).

ROUGH SHIFT POINTS: Check engine idle speed, throttle linkage, manifold vacuum and vacuum diaphragm. Check control pressure. Check for sticking governor valve or plug. Check control valve body. Adjust front band. Check rear servo accumulator.

TRANSMISSION CASE PASSAGES (BOTTOM VIEW)

TRANSMISSION CASE PASSAGES (FRONT & REAR VIEWS)

SLIPPAGE DURING SHIFTS: Check transmission fluid level. Check throttle linkage, manifold vacuum and vacuum diaphragm. Check for sticking governor valve or plug. Check control valve assembly. Adjust front band. Check front servo circuit (air pressure check). Check rear clutch and circuit (air pressure check).

SLIPS (INITIAL ENGAGEMENT "D2", "D1" & "Lo": Check transmission fluid level. Check throttle linkage, manifold vacuum and vacuum diaphragm. Check control pressure. Check front clutch and circuit (air pressure check).

SLIPS (REVERSE ONLY – OR NO REVERSE): Check control pressure. Adjust rear band. Check rear servo circuit (air pressure check). Check control valve body. Check rear clutch and circuit (air pressure check). Check for turned oil distributor sleeve in output shaft.

SLIPS ("D1" LOW GEAR ONLY – OR NO DRIVE IN "D1"): Check operation of planet carrier one–way clutch. Check adjustment of manual and transmission linkage.

LOSS OF INTERMEDIATE GEAR IN "D1" & "D2": Check front band adjustment. Check front servo circuit (air pressure check). Check control valve body.

SLIPS IN REVERSE (OR IN HIGH GEAR IN "D1" & "D2"): Check rear clutch and circuit (air pressure check). Check control valve body. Check control pressure. Check for turned oil distributor sleeve in output shaft.

NO CLOSED THROTTLE DOWNSHIFTS: Check for sticking governor valve or plug. Check control pressure. Check control valve body.

NO FORCED DOWNSHIFT: Check for correct accelerator pedal height. Check throttle linkage, manifold vacuum and vacuum diaphragm. Check control valve body.

ENGINE RUNAWAY ON FORCED DOWNSHIFT: Check control pressure. Check control valve body. Check front servo circuit (air pressure check). Adjust front band. Check operation of planet carrier one–way clutch.

CAR CREEPS EXCESSIVELY (SELECTOR LEVER IN ANY DRIVING RANGE): Excessive engine idle speed.

CAR MOVES FORWARD IN NEUTRAL: Check manual and transmission linkage adjustment. Check front clutch and circuit (air pressure check).

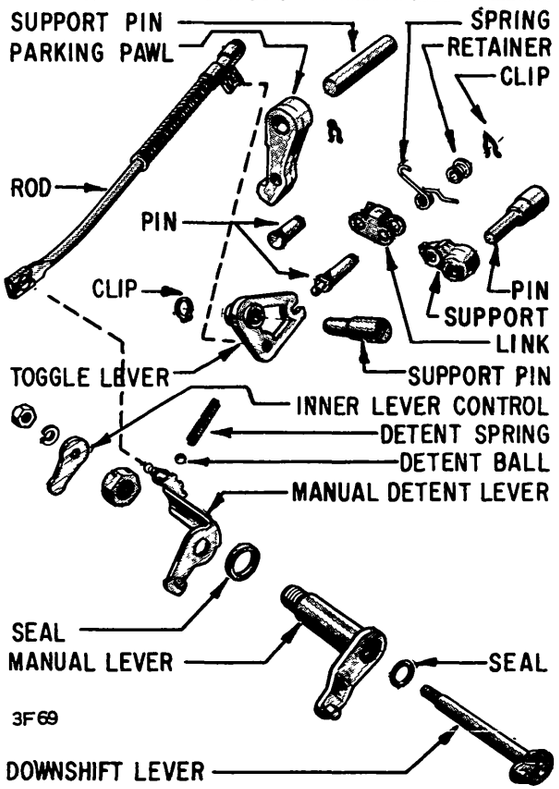
NO DRIVE IN ANY RANGE: Check transmission fluid level. Check manual and transmission linkage adjustment. Check control pressure. Check for broken converter lugs or input shaft.

COMPLETE LOCK–UP IN ANY RANGE: Check for wrong clutch and/or band application. Check control valve body. Check operation of planet carrier one–way clutch. Check for turned oil distributor sleeve in output shaft. Check front clutch and circuit (air pressure check). Check rear clutch and circuit (air pressure check). Check for release of parking linkage.

UNABLE TO START BY PUSHING: Check transmission fluid level. Check rear pump assembly. Check for broken converter lugs or input shaft. Check front clutch and circuit (air pressure check).

PARK LINKAGE WILL NOT HOLD: Check manual and transmission linkage adjustment. Check parking linkage.

TRANSMISSION OVERHEATS: Check transmission fluid level. Check control pressure. Check for restricted or leaking oil cooler and lines. Check converter one–way clutch operation. Check front band adjustment. Check rear band adjustment.



POOR ACCELERATION (MAXIMUM SPEED TOO LOW): Check transmission fluid level. Check operation of converter one–way clutch. Check engine performance.

TRANSMISSION NOISY ON COASTING 40–20 MPH: Check rear pump assembly.

MINOR REPAIRS (TRANSMISSION IN CAR)

Parking Pawl Replacement

Loosen locknut on rear band adjusting screw and tighten screw with Tool 7195-C until wrench overruns (this will hold planet carrier, front and rear clutch assemblies in place during parking pawl replacement). Raise car on a hoist and support front of transmission with a jack stand and wooden block, then drain transmission oil pan. Mark drive shaft and rear companion flange (for reassembly at same location), then remove drive shaft. Remove oil pan and screen. Remove three short tubes from main control valve that directs rear clutch, front clutch and governor return pressure to case. Remove cross member at extension housing and remove extension housing. Remove distributor sleeve snap ring and move distributor back until rear clutch, front clutch and governor return tubes are removed from case. Remove output shaft and rear pump, then remove toggle return spring from lever pin, and remove .328" diameter washer and pin. Remove parking pawl support pin with a magnet and remove parking pawl parts. To reassemble, reverse disassembly procedure using new gaskets. Adjust rear band and fill transmission case with fluid.

LINCOLN AUTO. TRANS. INTERNAL LINKAGE

Governor Replacement

Raise car and remove inspection cover from extension housing. Rotate drive shaft until governor is in line with inspection hole, then remove two governor valve body retaining bolts and governor from counterweight. *CAUTION - Do not drop any parts into extension housing.* Make sure all parts are thoroughly cleaned and that governor valve moves freely in valve body before valve body assembly is assembled to counterweight. Install governor valve assembly to counterweight so that valve body cover is faced toward rear of car, then tighten attaching bolts to 50-60 inch pounds. Install a new gasket on inspection cover and install cover.

TRANSMISSION & CONVERTER (REMOVAL & INSTALLATION)

Removal

NOTE - Transmission and converter must be removed as an assembly. One additional converter housing-to-transmission case bolt is located behind converter assembly where it is not accessible until after converter is removed.

1) Remove upper converter housing–to–engine bolts (from under hood), then install starter remote control so engine can be rotated from under car. Place transmission selector lever in "N" (Neutral), then raise car and drain transmission oil pan.

2) Remove converter access cover from front of converter housing and remove transmission linkage splash shield. Mark drive shaft and rear companion flange for installation in same position and remove drive shaft.

3) Remove parking brake equalizer bar retracting spring and disconnect parking brake cables and equalizer assembly. Disconnect transmission downshift rod and manual linkage parts at transmission levers, then disconnect vacuum line hose at vacuum diaphragm and speedometer cable at transmission.

4) Remove engine stabilizer bar from converter housing and converter–to–flywheel retaining nuts. *NOTE– As converter is rotated, remove converter drain plugs and drain converter.* Turn front wheels fully to right and remove starter motor, then disconnect oil cooler lines at transmission and at radiator and remove lines. Remove transmission filler tube and underbody reinforcing plate.

5) Position transmission jack, with Adapter Kit 7000–EG and Bracket Kit 7000–LC, under transmission and raise transmission slightly. Remove rear support crossmember and brackets from extension housing and car underbody.

6) Detach vacuum line at converter housing, then remove manual linkage equalizer assembly mounted between transmission and underbody. Remove remaining converter housing–to–engine retaining bolts and move transmissi n and converter toward rear and from under car.

Installation

Reverse removal procedure and tighten all bolts and nuts to specifications *(see "Tightening Specifications" below).*

Converter & Housing

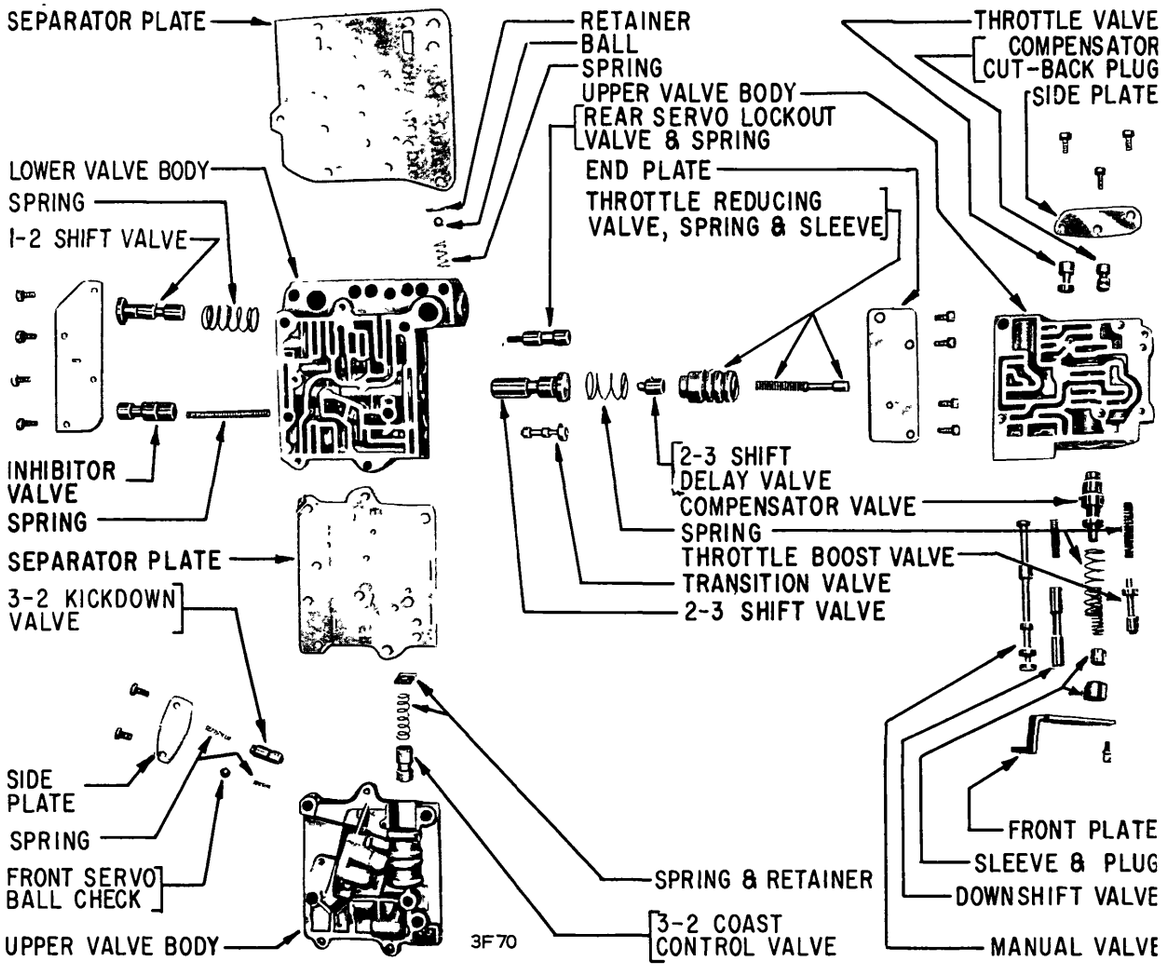
Removal - With transmission removed from car, hold converter assembly with both hands and pull converter directly forward. *CAUTION - To prevent damage to front pump seal, do not rock converter from side to side.* Remove one bolt from inside converter housing (holding converter housing to transmission case). Remove remaining five bolts holding converter housing to transmission and remove housing.

Installation - Position converter housing on case and install five bolts and washers from outside converter housing and one self-locking bolt from inside housing. Install converter so drive lugs on converter are between lugs on front pump drive gear. *CAUTION - Do not move converter from side to side or up and down when it is being installed.*

OVERHAUL

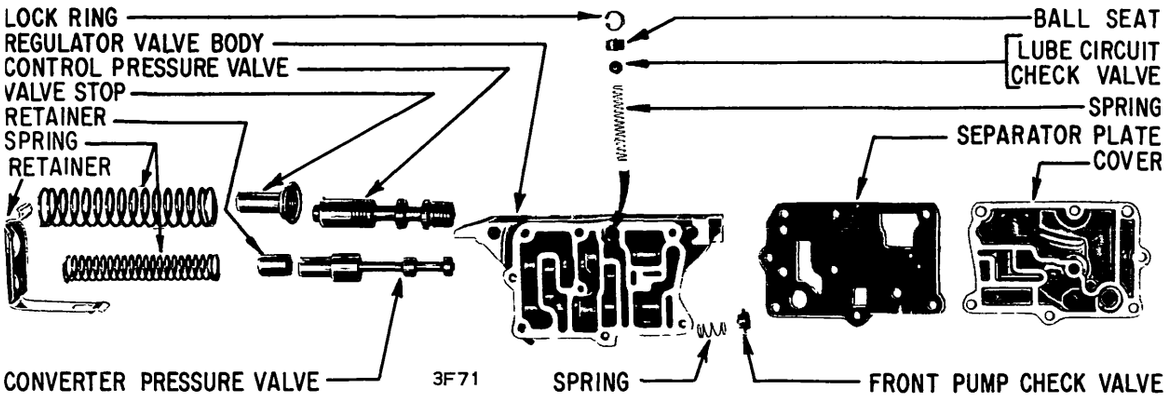
TORQUE CONVERTER NOTE - This is a welded unit and cannot be disassembled.

Transmission



See 1961 Final Data, Page 462.

Tightening Specifications



Location	① Ft. Lbs.

LINCOLN AUTOMATIC TRANSMISSION CONTROL VALVE

LINCOLN AUTOMATIC TRANSMISSION PRESSURE REGULATOR

3-SPEED (4-STAGE) HYDRA-MATIC TRANSMISSION

Oldsmobil 88, Super 88, & 98 (1963)
Pontiac Catalina & Grand Prix (1963)

PUSHING (TO START) & TOWING

Pushing Car To Start Engine

The engine cannot be started by pushing or towing car. If necessary, a booster battery must be used.

►*BOOSTER BATTERY CAUTION:* Connect negative (-) terminal of booster battery to negative terminal of car battery. Alternator will be damaged if battery is connected improperly.

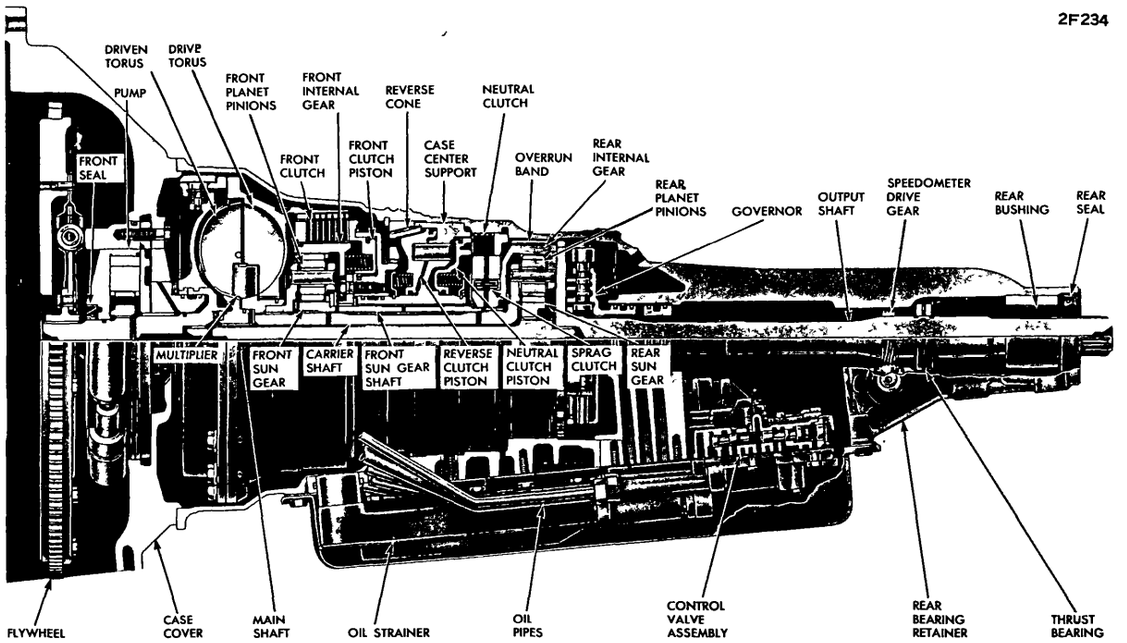
Towing Or Pushing Car

Car may be towed at speeds up to 30 MPH for distances up to 50 miles if there is nothing wrong with transmission. When towing at speeds above 30 MPH or if transmission is known to be out of order, disconnect propeller shaft from transmission. *CAUTION - After towing, check fluid level and if necessary, bring to proper level.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 PONTIAC "PG" & "PAH" MODEL TRANSMISSION GOVERNOR PRODUCTION CHANGE:* A new governor assembly, Part No. 8622645 is used in production beginning with transmission serial number PG-63-14580 and PAH-63-1033 to assist in eliminating the possibility of not obtaining a full-throttle 3-4 Upshift. The new governor, which reduces the full-throttle 3-4 upshift point approximately 3 MPH, should be used for service replacement on 1962-63 "PA" model transmissions.

DESCRIPTION



Three speed (4-Stage) "split torque" type hydraulically controlled automatic transmission of same design used on 1962 models. *For description of transmission operation, s e 1962 Final Data, Page 496.*

Transmission Identification

A serial number prefix which is stamped on a colored serial number plate attached to left side of transmission case identifies the transmission model. References in this text may be made to serial number prefix to indicate changes or differences in transmission models.

S rial Numb r Prefix & Plate Color

Serial No. Prefix	Car Make	Serial No. Plate Color
O63	Oldsmobile	Black
OC63	Oldsmobile	Aluminum
OA63	Oldsmobile	Dark Brown
OB63	Oldsmobile	Yellow
OCH63	Oldsmobile	Tan
P-63	Pontiac	Light Blue
PA-63	Pontiac	Orange
PB-63	Pontiac	Light Green
PC-63	Pontiac	Yellow (Diagonal)
PE-63	Pontiac	Yellow (or Red)
PG-63	Pontiac	Aluminum
PAH-63	Pontiac	Pink
PEH-63	Pontiac	Dark Blue

3-SPEED (4-STAGE) HYDRA-MATIC TRANSMISSION

LUBRICATION

Checking Fluid Level

Check fluid level every 4,000 miles (Oldsmobile); 6,000 miles (Pontiac). With car on a level floor, transmission at normal operating temperature, engine idling, and transmission selector lever in "P" (Park) position, check fluid level on dipstick located at right rear of engine. Add recommended fluid as necessary to bring level to FULL mark on dipstick. *NOTE - 1 pint of fluid is required to bring level from ADD mark to FULL mark.* With transmission cold, fluid level should be at ADD mark. DO NOT OVERFILL.

Draining & Refilling

Oldsmobile - Drain and refill every 24,000 miles. With transmission at normal operating temperature, remove oil filler pipe from transmission and drain fluid. Replace filler pipe and add 5 qts. of recommended fluid to transmission. then place selector lever in "P" (Park) position and start engine. Add fluid to bring level to FULL mark on dipstick. *NOTE - Recheck fluid level after transmission is warm.*

Pontiac - Drain and refill every 30,000 miles. *NOTE - Drain fluid immediately after operation before it has an opportunity to cool.* Disconnect fluid filler pipe from right side of transmission oil pan and allow transmission to drain. Remove oil pan and strainer and thoroughly clean, then install strainer using a new "O" ring seal on pump intake pipe. Install oil pan and a new gasket and tighten bolts to 12-15 ft. lbs., then connect oil filler pipe to oil pan and tighten securely. Pour 4 qts. of recommended fluid into transmission. *NOTE - If valve body removed, pour in 5 qts. If transmission overhauled, pour in 8 qts. for initial fill before starting engine.* Start engine and run at slow idle with selector lever in "P" (Park). With transmission warm and engine idling, recheck fluid level and add fluid as required to bring level to FULL mark on dipstick. DO NOT OVERFILL. Replace dipstick and turn handle 1/8 turn to lock it in filler tube.

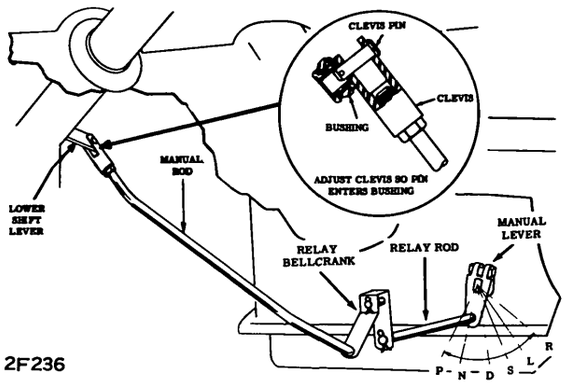
Recommended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity

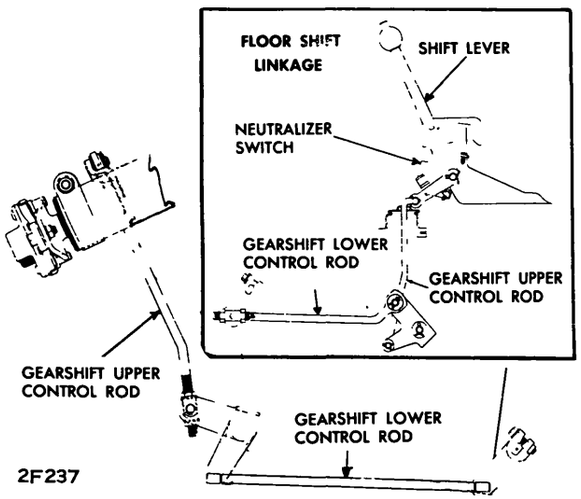
Oldsmobile - 5½ qts. (after drain); 6½ qts. (after pan removed); 9 qts. (after overhaul).
Pontiac - 6 qts. (after drain & pan removal); 8¾ qts. (after overhaul).

ADJUSTMENT



Throttle Linkage

See CARBURETOR on Car Model pages.



Manual Shift Linkage

Steering C lumn Shift (Oldsm bil) - Place manual lever on transmission in "N" (Neutral) detent, then disconnect manual rod from lower shift lever (on column). Hold lower shift lever (on column) upward so selector lever is positioned against stop in upper steering column *(NOTE - Do not raise lever).* Adjust manual rod end so pin will enter approximately 1/8" into lower shift lever bushing (on lower end of steering column) with selector lever against stop, **then lengthen clevis on manual rod 2½ turns.** Connect manual rod to lower shift lever (on column) and tighten clevis locknut.

Steering Column Shift (Pontiac) - Place transmission selector lever on steering column in "P" (Park) position, then back off locknuts on upper control rod trunnion (at equalizer) so they are free of trunnion. Place manual lever on transmission in "P" (Park) detent, then pull upper control rod down toward transmission as far as possible. While holding rod in this position, run trunnion upper locknut down to just contact trunnion. Run lower locknut up to contact trunnion and tighten locknuts securely. After making adjustments, check parking lock with car on an incline for positive locking.

OLDSMOBILE MANUAL SELECTOR LINKAGE (EXC. FLOOR SHIFT)

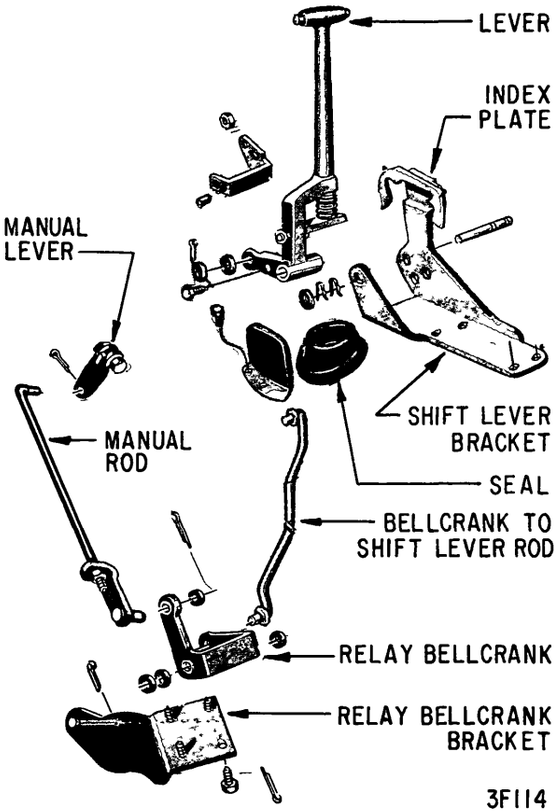
PONTIAC MANUAL SELECTOR LINKAGE

Floor Shift (Oldsmobile Star Fire) - Place selector lever in "N" (Neutral), then disconnect manual rod from manual lever on transmission. Place manual lever on transmission in "N" (Neutral) detent position. Loosen locknut on manual rod, then with selector lever held against its stop in "N" (Neutral) position and transmission manual lever in neutral detent position, adjust manual rod length for free entry into hole in transmission manual lever. **Lengthen manual rod 4 turns.** Check for alignment, then connect to transmission manual lever and install washer and cotter pin Tighten locknut on manual rod.

Floor Shift (P ntiac Grand Prix) - Place selector lever in "P" (Park) position, then loosen both trunnion nuts on gearshift lower control rod and back them away from trunnion. While holding lower control rod toward rear of car to remove slack from linkage, run rear nut up to contact trunnion. Run forward nut down to contact trunnion and lock securely in place.

Neutral Safety Switch

Oldsmobile - *NOTE - Switch is mounted on mast jacket (Exc. Starfire); inside console (Starfire).* On Starfire models, remove console control panel. On all models, loosen switch attaching screws, then with selector lever in "N" (Neutral), position switch so that a .090" gauge pin can be inserted through hole in switch arm and into hole in face of switch. Tighten switch attaching screws and remove gauge pin. Check to make sure engine will not start when selector lever is in any position other than "N" or "P". On Starfire models, install console control panel.



Pontiac - *NOTE - There is no adjustment for neutral safety switch on cars with steering column mounted selector lever. Neutral switch should allow engine to be started in "P" (Park) or "N" (Neutral).* On cars with floor shift, remove console compartment box, then remove console center bracket-to-floor screws. Remove four remaining screws attaching console, then remove compartment light switch, indicator bulb, courtesy light connections and shift lever knob. Lift console over shift and remove toward rear of car. Loosen two neutral safety switch attaching screws and adjust switch so engine starts only with shift lever in "N" (Neutral) or "P" (Park). Install assembly by reversing removal procedure.

TESTING

► *STALL TEST CAUTION: Do not stall test transmission under any conditions.*

Road Test

Operate car over a test route and note performance and shift speeds. Select a test route that will provide for all types of operation. *NOTE - Make sure engine is operating at peak performance.* See "Shift Speed Tables" below for correct shift speeds under different operating conditions.

OLDSMOBILE MANUAL SELE CTOR LINKAGE (FLOOR SHIFT)

Shift Speed Tables (MPH)

Selector Lever	Throttle Position	2-3 Upshift	3-4 Upshift
"D Left" ①	Mininum	14-18	18-23
	Full	33-40	76-89
"D Right" ②	Minimum	14-18	
	Full	33-40	76-89
"Lo'	Minimum		
	Full		76-89

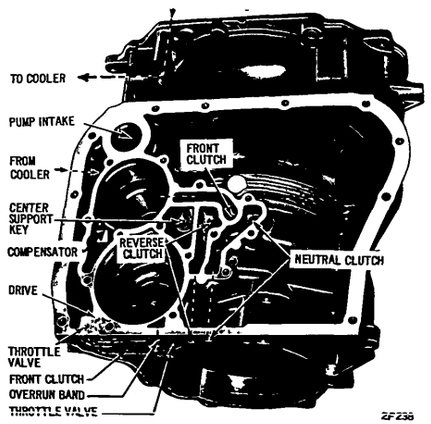
Selector Lever	Throttle Position	4-3 Downshift	3-2 D wnshift
"D Left" ①	Closed	20-15	16-13
	Full	84-68	29-25
"D Right" ②	Closed	84-72	16-13
	Full	84-72	29-25
"Lo"	Closed	84-72	52-46
	Forced	84-72	52-46

① - "D" position on floor shift models.
② - "S" position on floor shift models.

NOTE - Minimum throttle denotes a fixed throttle opening only sufficient to provide acceleration enough to accomplish each of the shifts.

Oil Pressure

With oil pressure gauge connected to the upper of the two test holes on left hand side of rear bearing retainer, check the oil pressure while on road test with selector lever in "D Right" ("S" on floor mounted shift models) position and with transmission in second speed at approximately 25 MPH. Minimum pressure should be 98.6 lbs. Maximum pressure should be 111.4 lbs. If not within specifications, check the following:



Low Oil Pressur - Oil level is too low. Booster plug is the wrong one or is stuck. Pressure regulator valve not operating properly. Strainer and "O" ring are leaking. Manual valve is misaligned with quadrant. Fluid is foaming or cavitation is occurring. Internal leakage. Stuck valve in control valve assembly. Front pump slide is stuck causing low output.

High Oil Pressure - Pressure regulator valve is stuck. Booster plug is the wrong one or is stuck. Manual valve is misaligned with quadrant. Stuck valve in control valve assembly. Front pump slide is stuck causing high output.

TROUBLE SHOOTING & DIAGNOSIS

No Upshift

"G-1" valve in governor is sticking closed or the 1-2 shift valve train in control valve assembly is sticking. *NOTE - To determine if "G-1" valve is sticking, drive car between speed of 15-20 MPH, then very carefully attempt to momentarily engage the reverse position to see if reverse blocker piston is working. If selector lever can be moved beyond "Lo" range position, reverse blocker is not operating properly, due in most cases to a stuck "G-1" valve. Replace governor assembly. When making the above test DO NOT fully engage selector lever in "R" position or leave lever in partial "R" position.*

TRANSMISSION CASE OIL PASSAGES

No Drive in "D" (or "S") Range

Check neutral clutch, sprag assembly (or race), fluid coupling, oil level and pressure, manual linkage, control valve assembly, sticking reverse cone, and for restricted passages.

Drive in "N" (Neutral)

Check operation of neutral clutch, and for manual linkage adjustment.

No Reverse

Check manual linkage adjustment, fluid level, restricted passages. Check operation of reverse cone clutch and neutral clutch.

Drive in "D Right" or "Lo" Only

Check operation of sprag assembly and neutral clutch.

Drives Forward in "R"

Check manual linkage and operation of neutral clutch.

Reverse Drive in "N"

Check operation of reverse cone clutch.

Drive in 3 & 4 Only

Check operation of reverse cone clutch.

Drive in 1, 2 & 4 Only

NOTE - This condition may be reported as a 2-3 Slip-page. Check for malfunction in control valve assembly or fluid coupling.

Drive in 1, 2, & 3 Only

Check operation of governor and for malfunction in control valve assembly.

Slipping 2-3 Shift

NOTE - This condition may be reported as "Drive in 2 or 4 Only". Check operation of front clutch or accumulator, malfunction in control valve assembly, and for accumulator body assembly not operating properly. Check throttle valve linkage adjustment and check for low oil pressure. Check for restricted 2-3 oil passages.

Slipping 3-4 Shift

Check for malfunction in fluid coupling and in control valve assembly. Front clutch not operating properly. *NOTE - If transmission is slipping in all ranges, check for low oil pressure.*

Rough 2-3 Shift

Accumulator, compensator body assembly, or front clutch not operating properly. Malfunction in control valve assembly or in fluid coupling. Throttle valve linkage not adjusted properly. Front clutch passage restricted.

Erratic Shifts

Governor assembly or control valve assembly not operating properly.

High or Low Upshifts

Throttle valve linkage not properly adjusted (if too short, upshifts will be high; if too long, upshifts will be low). Control valve assembly or governor not operating properly. Throttle valve lever bent, governor oil passage restricted. Throttle valve or line pressure not correct.

No Engine Braking

Overrun band or servo not operating.

No Part Throttle or Detent Downshift

Check throttle valve linkage adjustment and accelerator travel. Control valve assembly or governor not operating properly.

Lever Will Not Go Into "R"

Check manual linkage adjustment, operation of governor, and reverse blocker valve.

Lever Will Not Go Into "P"

Check parking linkage and adjustment of manual linkage.

TRANSMISSION REMOVAL & INSTALLATION

►*TRANSMISSION REMOVAL & INSTALLATION PROCEDURE NOTE: See Page 475 in 1961 Final Data.*

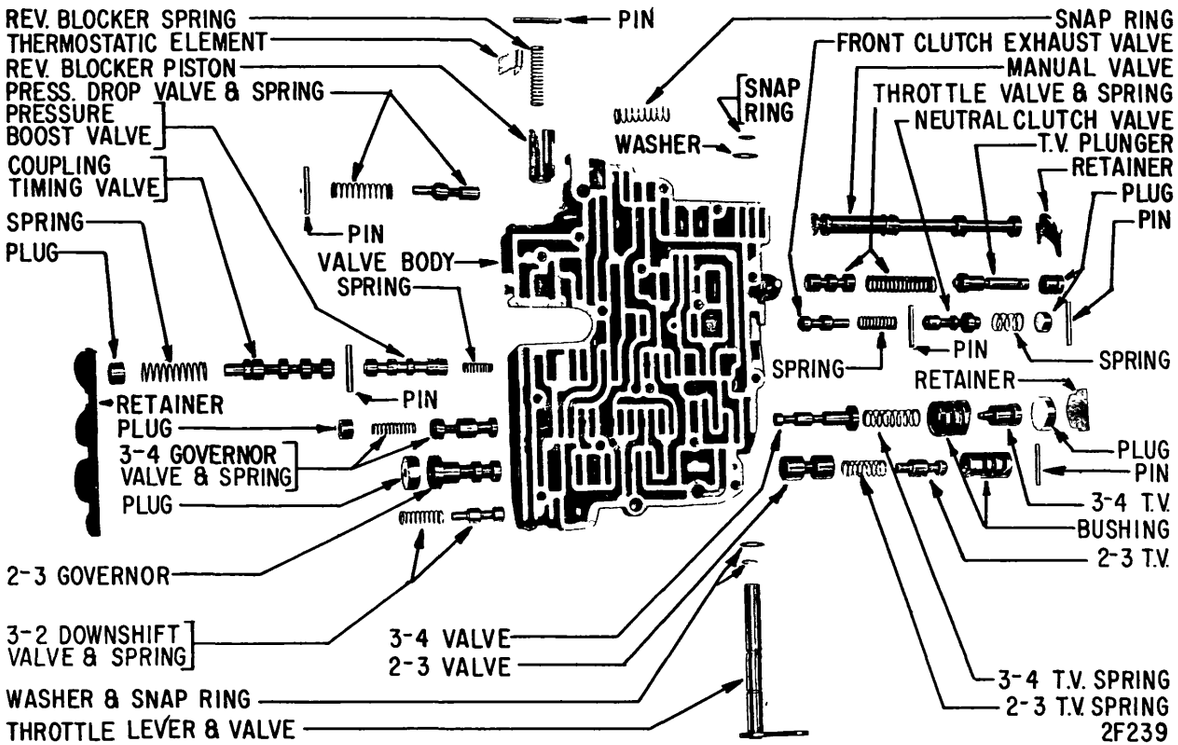
TRANSMISSION OVERHAUL

See 1961 Final Data, Page 475 and note the following changes.

Control Valve Body

NOTE - An inner and outer throttle valve spring is used on some models in place of the single spring.

Disassembly - 1) Remove channel body from valve body assembly (two screws on valve body side and thirteen screws on channel plates side), then remove neutral clutch bypass valve from cored side of channel plate. Remove front clutch bypass valve.



2) If necessary to remove pressure relief valve and spring, proceed as follows: Turn channel plate over to casting side and remove retaining pin. *CAUTION – Pin is under extreme pressure.* Remove pressure relief valve spring and ball. After cleaning and inspection, reassemble channel plate by installing pressure relief ball, spring and retainer, neutral clutch bypass and front clutch bypass valve, then set channel plate aside and continue with valve body disassembly.

3) Remove channel plate–to–valve body spacer and place on channel plate and check alignment of bypass valves. Remove two check balls and throttle valve thermostatic element. Remove throttle valve plunger guide retainer located in cored passage near throttle valve adjusting screw. Position control valve assembly with cored side up and throttle valve lever positioned on top right hand side.

DISASSEMBLY NOTE: Refer to valve body illustrati n and n t th foll wing:

4) Remove multiple valve plug retainer (plugs are under spring tension), then remove 2–3 downshift valve and

(Continued)

CONTROL VALVE ASSEMBLY

spring. Remove valve bore plug from adjacent bore by inserting snap ring pliers in hole in plug.

VALVE PLUG REMOVAL NOTE: Valve plugs are non-operating plugs used in valve bores. Remove and install with snap ring pliers.

5) Remove 2–3 governor valve, then remove 3–4 governor valve plug and 3–4 governor valve. Remove plug from coupling timing valve bore and remove spring and coupling timing valve. Remove pressure boost valve retaining pin from center of cored side of valve body (in coupling timing valve bore) and remove pressure boost valve.

6) From the opposite side of the valve body, remove the pin retaining 2–3 throttle valve bushing and the 2-3 throttle valve. From same bore remove 2-3 shift valve and springs. From the next bore, remove valve bore plug retainer and plug (plug is under spring tension), then remove 3–4 throttle valve, spring and bushing, and 3–4 shift valve and spring.

7) Remove retaining pin from neutral clutch valve bore, then remove plug, neutral clutch valve and spring. From the same bore, remove front clutch exhaust valve retaining pin on cored side of valve body (use a small screwdriver to relieve tension on pin for removal), then remove clutch exhaust valve spring and valve.

8) Mark throttle valve adjustment screw and **loosen exactly five turns.** Turn valve body over and remove throttle lever by removing outside "C" ring and washer, positioning shaft so that lever will clear throttle valve adjusting screw, then remove washer. Remove throttle valve plunger, guide, spring and valve.

9) If necessary, remove reverse blocker piston retaining pin, spring, and reverse blocker piston. Remove detent spring. *NOTE – Do not remove detent lever unless necessary to replace. If necessary to replace, drive pin out with a small punch. A new lever will be required at reassembly.* Remove pressure drop retaining pin, spring and valve.

Reassembly - *NOTE - All attaching screws must be tightened to 2.5-3.5 ft. lbs., and all attaching bolts to 6-8 ft. lbs.*

1) Install manual detent lever and pin, then install detent spring. Install reverse blocker piston, spring and pin. Install pressure drop valve (stem end of valve last), spring and retaining pin in top bore adjacent to detent spring.

2) Install throttle valve (round end first), spring, plunger and sleeve in throttle valve bore adjacent to manual valve bore. Place washer against "C" ring on throttle valve lever shaft, then install shaft through hole in valve body so throttle valve lever will index between plunger and throttle adjusting screw. Install washer and "C" ring securing lever assembly to valve body. Turn throttle valve adjusting screw back to original position **(exactly five turns).** Install throttle valve plunger guide retainer through cored side of valve body into annular groove in throttle valve plunger.

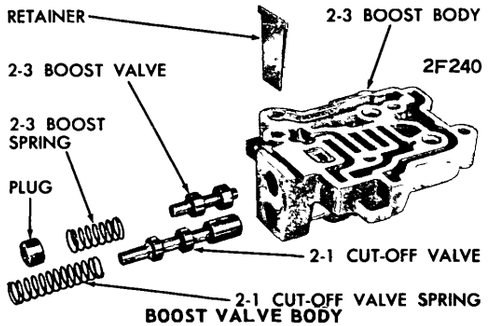
3) Install front clutch exhaust valve (land end first) and front clutch exhaust valve spring in bore adjacent to throttle valve bore. Install short retaining pin through cored side of valve body while compressing exhaust valve spring, then install neutral clutch valve and spring in same bore. Compress valve spring and install valve bore plug (threaded end out) and long copper retaining pin.

4) Install 3–4 valve and spring as a combination, then install 3–4 throttle valve spring into pocket of 3–4 valve. Install 3–4 throttle valve into 3–4 regulator bushing so that valve will completely enter bore of bushing. Install 3–4 throttle valve and bushing into 3–4 bore in valve body (small end of throttle valve first), then install 3–4 valve bore plug (threaded end out), and retainer.

5) Install 2–3 valve in bore adjacent to 3–4 valve trains and install 2–3 throttle valve and shift valve springs in same bore. Install 2–3 throttle valve into bushing with stem end out, then install 2–3 throttle valve and bushing into 2–3 bore (valve end first). Depress bushing and install short retaining pin from cored side of valve body.

6) In the bore adjacent to "U" shaped cutout, install pressure boost valve, using a brass rod to guide valve into bore (long land first). Install retaining pin through same bore from core face of body. Install coupling timing valve (land end first) into same bore, then install coupling timing valve spring over stem end of coupling timing valve. Install valve bore plug in valve body, compressing and partially installing multiple plug retainer. Install retainer in such a manner that only one corner of the plug is retained (this will permit installation of remaining valves).

7) Install 3–4 governor valve and spring into valve bore (flat end first), then install 3–4 valve bore plug against 3–4 governor valve, compressing plug against spring tension into bore and position retainer again so that edge of plug is secured and the adjacent bore hole is unobstructed by retainer.



8) Install 2–3 governor valve into 2–3 shift valve bore, then install bore plug in 2–3 bore, compressing the valve against spring pressure and position multiple retainer, making sure remaining bore is unobstructed. Install 3–2 downshift valve (land end first) into remaining bore, then place 3–2 downshift spring over 3–2 downshift valve. Compress spring and secure with multiple retainer.

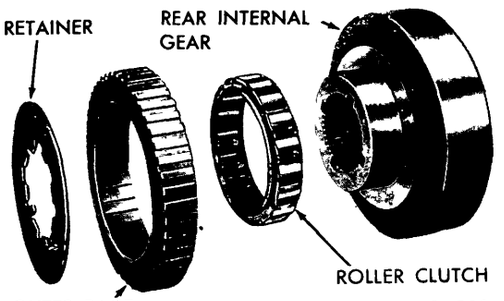
Rear Internal Gear & Roller Clutch

NOTE - Either a sprag type clutch or roller type clutch is used in production. For "Sprag Clutch" see 1961 Final Data, Page 483.

Roller Clutch

Disassembly - Remove roller clutch and outer race from rear internal gear, then carefully remove roller clutch assembly from outer race. Remove rollers and energizing springs from cage.

Inspection - Inspect rollers for pitting scratches, pick-up galling or flat spots Inspect springs for distortion cracks, permanent set or loss of tension Inspect outer race for pitting scratches, cracks, galling or broken ramp corners Inspect cage for bent or broken struts, broken or distorted corners or teeth



Reassembly - Install release springs on cage struts with upper tab on springs pointing in same direction as teeth or stops on race *NOTE - Be sure center spring tab snaps securely over strut to retain the spring* Install rollers into cage between springs in in such a way that the upper tab on the spring fits over rollers Carefully install roller clutch assembly into outer race so that rollers do not pop out *NOTE - Teeth or stops on cage should align with ramps in outer race* Place outer race or roller clutch assembly on bench with word "front" on roller clutch cage facing bench, then twist internal gear counterclockwise into roller clutch assembly

Front Clutch

Front clutch reassembly procedure is the same as for previous models except that the new composition drive plates which have driving lugs with bent tabs must be installed with ends of tabs facing toward clutch piston *NOTE - These new plates are used in all 1963 models and were installed in some late 1962 models When used in previous transmissions for service replacement, the original drive torus can be reused providing depth of wear in drive torus does not exceed 3/32" Make sure any burrs or sharp edges are removed from drive torus lugs before installing the new plates*

Rear Bearing Retainer

Installation - The cast iron type governor assembly used in 1963 transmissions makes it necessary that the following procedure be used when installing rear bearing retainer Position governor ring hook ends in a straight line so they can be seen as they are pushed down in the ring groove when bearing retainer is installed If necessary use petrolatum Be careful when positioning retainer over governor tower so that rings do not become unhooked or broken *NOTE - Cast iron type governors were used in some late 1962 production and may be used for service replacement on all previous models*

DUAL-COUPLING (4-SPEED) HYDRA-MATIC

Cadillac (1963)
Pontiac Star Chief & Bonneville (1963)

PUSHING (TO START) & TOWING

Pushing Car To Start Engine

The engine cannot be started by pushing (or towing) car. If necessary, a booster battery must be used.

►*BOOSTER BATTERY CAUTION:* Connect negative (−) terminal of booster battery to negative (−) terminal of car battery. Alternator will be damaged if battery is connected improperly.

Towing Or Pushing Car

Car may be towed at speeds up to 30 MPH for distances up to 50 miles if there is nothing wrong with the transmission. When towing at speeds above 30 MPH or if transmission is known to be out of order, disconnect propeller shaft from transmission. *CAUTION - After towing, check fluid level and adjust as required.*

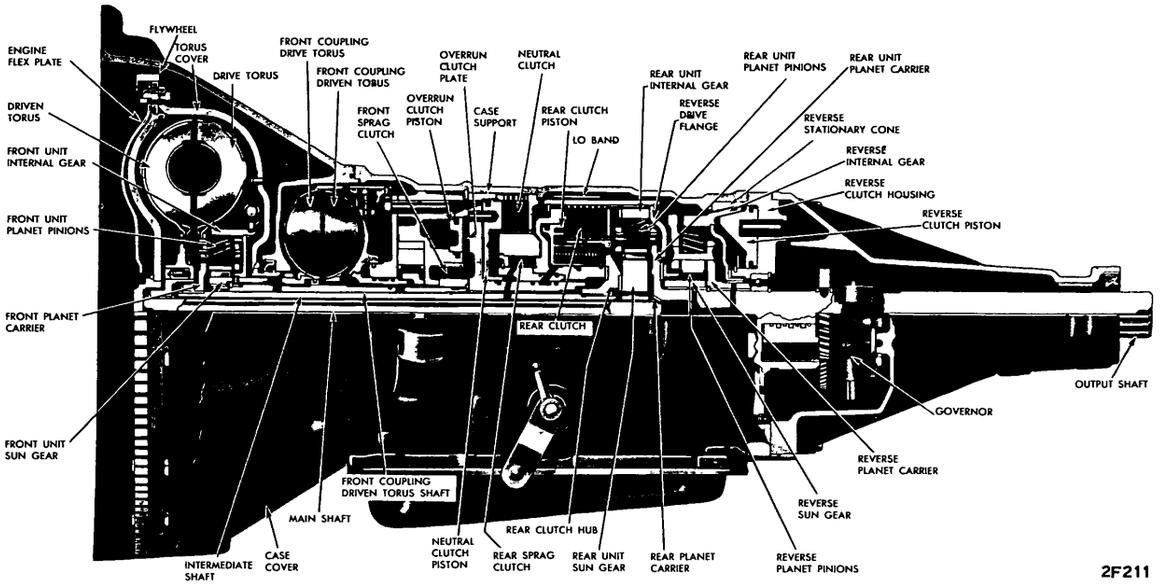
DESCRIPTION

Four-speed hydraulically controlled planetary type transmission of same design used on previous models.

Transmission Identification

A serial number prefix which is stamped on a colored serial number plate attached to lower left hand corner of transmission case rear face identifies the transmission model. References in this text may be made to serial number prefix to indicate changes or differences in transmission models.

Serial Number Prefix & Plate Color

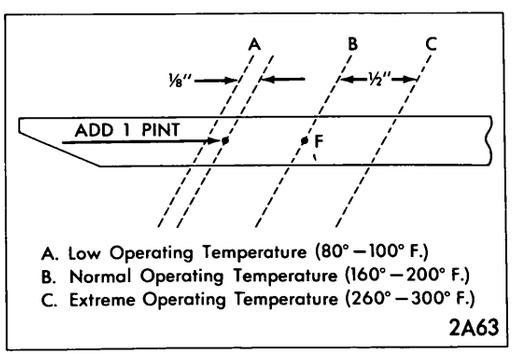


Serial No. Prefix	Car Make	Serial Number Plate Color
"C"	Cadillac	Black
"CA"	Cadillac	Orange
"PS"	Pontiac	Red
"PCS"	Pontiac	Dark Green (Diagonal)
"PAS"	Pontiac	Dark Brown
"PBS"	Pontiac	Tan
"PES"	Pontiac	Black

LUBRICATION

Checking Fluid Level

Cadillac - Check fluid level every 6,000 miles. With engine at normal operating temperature, transmission in "N" (Neutral) or "P" (Park) and engine at normal idle speed, fluid level should be at "F" mark on dipstick. *NOTE - At normal operating temperature, 1 pint of fluid is required to raise level from lower dimple on dipstick to "F" mark.*



Pontiac - Check fluid level every 6,000 miles. With transmission at normal operating temperature, selector lever in "P" (Park) position and engine idling at normal idle speed, fluid level should be at "FULL" mark on dipstick. *NOTE - These transmissions are very s nsitive to fluid level. Do not overfill.*

DUAL-COUPLING (4-SPEED) HYDRA-MATIC

Draining & Refilling

Cadillac - Drain and refill every 24,000 miles (normal service); 12,000 miles (severe service). Raise car and remove cover plate from bottom of flywheel housing, then remove drain plugs from transmission oil pan and torus cover. Replace drain plugs after complete draining and install housing cover. Lower car to floor and pour 7 qts. of recommended fluid into filler tube. Run engine at 800 RPM for 1½ minutes with transmission selector lever in "P" (Park). Reduce engine RPM to normal idle speed and add 1½ to 2 qts. of fluid to bring level on dipstick to proper point. *NOTE - With new fluid between 80°-100°F, transmission fluid will be at proper level when it is indicated on dipstick between lower dimple to 1/8" below lower dimple.*

CADILLAC FLUID LEVEL RANGES (AT VARIOUS TEMPERATURES)

Pontiac - Drain and refill every 30,000 miles. With engine and transmission at normal operating temperature, remove flywheel housing bottom cover and then remove hex head pipe plug from torus cover using a six-point socket (do not use a 12-point socket) and drain coupling. Disconnect filler pipe from side of transmission oil pan and allow transmission to drain. *NOTE - It is recommended that oil pan and strainer be removed and cleaned when fluid is changed. Install a new pump intake pipe "O" ring and a new pan gasket. Tighten pan bolts to 10-13 ft. lbs.* Reinstall fluid filler pipe on oil pan, then pour 8 qts. of recommended fluid into transmission. Place selector lever in "P" (Park) position and run engine at a speed equivalent to 20 MPH for 1½ minutes, then reduce engine speed to slow idle (off high step of fast idle cam). Recheck fluid level with transmission warm and engine at normal idle speed. Do not overfill. *NOTE - Turn dipstick 1/8 turn to lock it in filler tube.*

Recommended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity

Cadillac - 9 qts. (approximately). *CAUTION - Determine correct level by mark on dipstick rather than transmission capacity.*

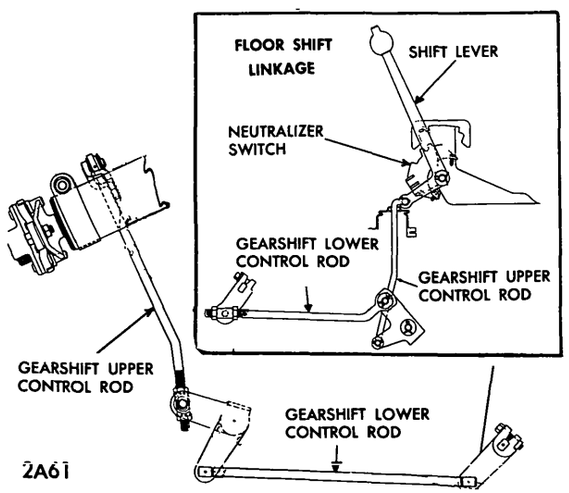
Pontiac - 8 qts. (refill after oil pan and torus cover drained); 10 qts. (after overhaul).

ADJUSTMENT

Throttle Linkage

See CARBURETOR on Car Model pages.

Manual Shift Linkage



Cadillac - Remove slush deflector, then remove clevis from manual lever on transmission manual rod and place manual lever on transmission in "Dr-4" position. Place selector lever on steering column in "Dr-4" position. Adjust length of manual rod until hole in manual lever lines up with hole in clevis, **then increase length f r d n full turn.** Install clevis on manual lever and tighten locknut.

P ntiac (Ste ring C lumn Mounted Shift Lever) - Place transmission lever on steering column in "P" (Park) position, then back off the locknuts on upper control rod trunnion (at equalizer) so they are free of trunnion. Place manual lever on transmission in "P" (Park) detent, then pull upper control rod down toward transmission as far as possible. While holding rod in this position, run trunnion upper nut down to just contact trunnion. Run lower locknut up to contact trunnion and tighten both nuts securely. Check parking lock with car on a grade or ramp for positive locking. Check pointer position with selector lever in "Dr. Right". To adjust, loosen locknut above ball stud and adjust by turning rod.

P ntiac (Fl r Shift) - Place selector lever in "P" (Park) position and disconnect gearshift lower control rod at forward end. While holding gearshift lower control rod, turn adjusting nut on control rod so it fits on outer shift lever stud while lever is in its detent position, then lock adjusting nut. Check engagement of parking lock by placing car on a slight grade.

Neutral Safety Switch

Cadillac - Located on steering column under instrument panel. To adjust, loosen mounting screw on top of switch and place transmission selector lever in "N" (Neutral). Insert a .090-.094" pin (or No. 90 drill) in adjusting hole in switch cover, then rotate switch counter-clockwise until slider block inside switch bears against pin or drill. Tighten adjusting screw.

PONTIAC MANUAL SHIFT LINKAGE

NOTE - Engine should start in "P" (Park) or "N" (Neutral) only.

P ntiac (Ste ring Column M unt d Shift L v r) - There is no adjustment for neutral safety switch. Switch should allow engine to be started in "P" (Park) or "N" (Neutral).

Pontiac (Floor Shift) - Remove console attaching screws, compartment light switch, indicator bulb, courtesy light connections and shift lever knob, then lift console over shift lever. Loosen switch screws and adjust neutral safety switch so engine starts only with selector lever in "N" (Neutral) or "P" (Park).

TESTING

Road Test

Operate car over a test route and note performance and shift speeds. Select a test route that will provide for all types of operation. See "Shift Speed Tables" below for correct shift speeds.

CADILLAC (ALL SERIES)

	(Engine Speed - RPM)		
UPSHIFTS:	**1-2**	**2-3**	**3-4**
"Dr4" (Min. Throttle)	850	1380	1270
(Full Throttle)	2810	3850	4170

DOWNSHIFTS:	**4-3**	**3-2**	**2-1**
"Dr Left" (Closed Throttle)	ℂ 18-15	ℂ 10-6	ℂ 8-3
(Full Throttle)	② 70-33	25-14	12-3
"Dr Right" (Closed Throttle)	74-68	10-6	8-3
(Full Throttle)	② 74-28	25-14	12-3
"Lo" (Closed Throttle)	70-60	48-44	8-3
(Full Throttle)	② 70-28	48-44	12-3

ℂ - When this shift occurs, transmission will freewheel and it is not possible to observe shift with throttle closed. To check for shift, decelerate, with throttle closed, to specified speed, then accelerate to determine which speed transmission is in.

② - Forced.

Oil Pressure

Connect oil pressure gauge J-2540-A (Cadillac); J-5907 (Pontiac) to takeoff hole at bottom of reverse clutch housing using a hose and fitting. Drive car until normal operating temperature is reached, then test as follows:

CADILLAC MANUAL SHIFT LINKAGE

Zero Throttle Pressure (Pontiac) - Check pressure in all ranges. Pressure should be 50 lbs. minimum in all ranges with a maximum variation of 10 lbs. (may be higher in reverse).

Drive "Right" Pressure (Pontiac) - With transmission selector lever in "Drive Right" position and car speed at approximately 25 MPH, pressure should be 90-100 lbs. *NOTE - Pressure at any speed is constant regardless of throttle pressure as throttle valve pressure is not used to modulate line pressure.*

Drive "Left" Pressure (Pontiac) - While driving at 25 MPH, move selector lever to "Drive Left" position so that transmission will shift into 4th Speed. Oil pressure should drop to 60-70 lbs. in 4th.

Zero Throttle Pressure (Cadillac) - Above 20 MPH in fourth speed with zero throttle, oil line pressure should be 60-70 lbs.

Full Throttle Pressure (Cadillac) - In any drive range, pressure should be at least 30 lbs. more than zero throttle pressure reading (see above).

Reverse Pressure (Cadillac) - With selector lever in "R" apply foot brake and increase engine speed to half throttle. Pressure range under these conditions should be 175-200 lbs.

TROUBLE SHOOTING & DIAGNOSIS

No Upshifts Or Erratic

Governor valves stuck. Broken governor rings. Sticking valves in valve body assembly. G-2 bushing turned. Front unit internal gear bushing seized on shaft.

Misses Shifts

2nd Speed - Governor boost valve stuck. Transition valve stuck away from plate. Sticking valves in valve body assembly. Governor sticking.

3rd, or 2nd, 3rd, 4th - Transition valve sticking. Sticking valves in control valve assembly. Throttle valve adjustment too long. Rear clutch or transition valve spring faulty.

Locks Up

In 2nd & 4th - Front sprag clutch broken. Overrun clutch applied or sticking.

In 3rd r 4th - Rear sprag clutch broken. Low band not releasing.

Rough Shifts

2-3 Shift - Accumulator valve stuck or accumulator piston stuck. Accumulator gasket broken or leaking. Restricted or leaking oil passages. Broken accumulator spring. Broken or leaking piston oil seal rings. Control valve faulty or throttle valve adjusted improperly. Rear clutch pack faulty. Case passages restricted or leaking.
Upshifts Rough - Throttle linkage adjusted short. Governor valves sticking. Broken governor rings. Sticking valves in control valve assembly. Leaking or restricted main line feed to governor.

Low Upshifts

Throttle linkage adjusted too long. Governor valves sticking. Broken governor rings. Sticking valves in control valve assembly. Leaking throttle valve oil.

No Reverse

Manual linkage not adjusted correctly. Manual valve not engaged with drive pin. Reverse piston apply restricted or leaking. Low oil pressure. Overrun clutch apply leaking. Pressure regulator faulty. Neutral clutch not released. Restricted neutral clutch exhaust port or manual body.

Selector Lever

If lever cannot be moved into reverse position, check for sticking governor valves or broken governor rings. Reverse blocker piston stuck. Manual linkage interference.

Reverse Drive In "N"

Check for a sticking reverse stationary cone.

Delayed 1-2 Shift

Coupling valve sticking. Governor boost valve sticking. G-1 valve sticking. Wrong spring on coupler valve.

Slippage

In 1st & 3rd ("Dr" Range) - Front sprag clutch slipping, or broken parts in sprag assembly.
In All "Dr" Ranges - Manual linkage improperly adjusted. Neutral clutch slipping or burned. Neutral clutch apply restricted or leaking (case support or valve body). Incorrect number of neutral clutch plates. Low oil pressure. Control valve faulty. Torus members or check valve faulty. Intake pipe "O" ring damaged or missing. Pressure regulator valve stuck in pump. Pump slide stuck.
Slips in or Misses 2nd & 4th - Front unit torus cover seals leaking. Front unit torus cover exhaust valves sticking or missing. Front unit torus cover feed restriction or leak. Low oil pressure. Coupling valve sticking. Sticking valves in control valve assembly. Coupling snap ring improperly installed or missing. Limit valve faulty. Coupling passage restricted or leaking. Front unit torus vanes damaged.
In 3rd or 4th - Rear clutch unit slipping or burned. Rear unit clutch apply restricted or leaking. Incorrect number of clutch plates (rear unit). Accumulator faulty. Center support leakage at 2-3 passage. Low oil pressure. Accumulator valve stuck (3rd only).
In 3rd in "Dr" (Right) n C ast - Overrun clutch slipping or burned. Overrun clutch apply restricted or leaking. Sticking valves in control valve assembly. Overrun clutch passages restricted or leaking.
In 1st & 2nd "Lo" Range n Coast - Low servo apply restricted or leaking. Low band not anchored to case or broken. Low servo piston and rod binding in case or servo and accumulator body. Band facing worn or loose. Anchor dowel pin loose or missing in case.

No Drive in "D" Range

Manual linkage incorrectly adjusted or manual valve not engaged with drive pin. Low oil pressure (pressure regulator stuck). Front pump intake pipe improperly installed. Front sprag broken (front pump bushing or front unit drive torus shaft). Front and (or) rear sprag not properly installed. Rear sprag broken. Rear sprag outer race broken. Neutral clutch plates burned. Neutral clutch piston, control valve or front pump not operating properly.

Drive in "Lo" Range Only

Rear sprag broken. Neutral clutch not applying.

No Forced Downshifts

Control valve faulty or linkage not properly adjusted.

2-3 Runaway or 2-1-3 Shift

2-3 passage in center support restricted or leaking. Plug out of accumulator. Rear clutch burned. Valve body faulty (transition valve or case passages in 2-3 circuit).

Will Not Go Into Park

Parking linkage broken. Mechanical interference. Manual linkage or parking pawl faulty.

Starts In 2nd

Valves sticking. Governor sticking or governor boost valve stuck.

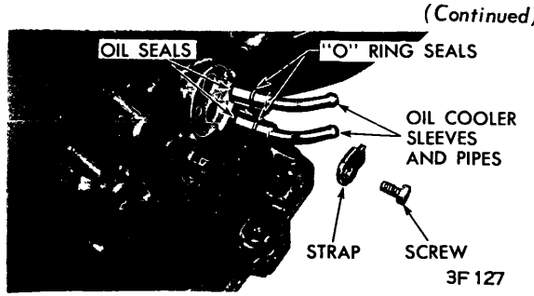
Drives Forward in "N" & "R"

Neutral clutch piston stuck in applied position.

Lunges Forward

This happens before backing up when placing selector lever in "R". G-2 plunger stuck in outward position. Restricted neutral clutch release oil supply.

TRANSMISSION REMOVAL & INSTALLATION
CADILLAC



Removal

1) Disconnect battery, then raise and support car. Remove starter motor and slush deflector, then remove front and lower flywheel housing covers. Drain transmission and torus cover and remove transmission filler pipe.
2) Disconnect brake cables from parking brake relay lever, then remove retracting spring and remove relay from frame. Remove propeller shaft assembly. Remove nuts securing the two engine side supports to flywheel housing and remove side supports from frame crossmember. Remove intermediate frame crossmember below flywheel housing.
3) Disconnect speedometer cable from extension housing and throttle valve and manual control rods from levers. Remove nuts from flywheel-to-drive plate screws, then place a suitable hoist under transmission and raise it just enough to take load off rear engine support.
4) Disconnect rear motor mount at support bracket and remove shims between rear cushion and crossmember. Remove rear engine support from frame, then remove and discard oil cooler hoses from rear oil cooler lines and sleeves at lower connections. *NOTE - Cap lines and sleeves to prevent leakage.*
5) Remove flywheel housing-to-engine screws and remove transmission and flywheel housing as a unit by moving assembly toward rear, disengaging housing from locating dowels on engine. Tilt front of unit downward and lower it from car.

Installation

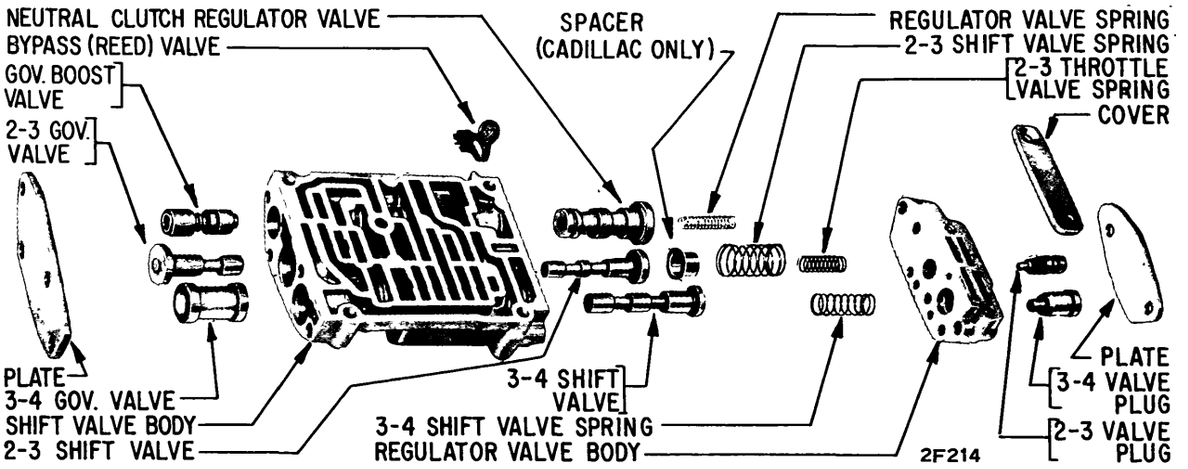
1) Raise transmission into position and align drive plate with four torus cover screws, and dowel holes in flywheel housing with dowels on engine. Install flywheel housing-to-engine screws and tighten to 50 ft. lbs. *NOTE - Make sure flywheel is as far forward as possible.*
2) Clean ends of cooler lines with solvent, then place new seals on each cooler sleeve tip and in one motion insert sleeve into transmission case. Avoid pulling back on sleeve once installation has been made in case. *CAUTION - If necessary to pull on sleeve, then completely remove sleeve from transmission case and reposition the seal to insure that seal is not damaged or mispositioned.* Connect cooler lines to sleeve hoses and secure with clamps. Tighten clamps to 20 inch pounds.
3) Lift engine and transmission to about one inch above normal height and install engine rear support bracket on frame. Tighten three bracket bolts on one side only (install bracket bolts on other side loosely). Lower transmission and insert shims (or shim) between rear cushion and crossmember. Position plate on bottom side of crossmember and loosely install rear cushion-to-crossmember screws. Remove transmission jack or lifting device. *CAUTION - Install the same number of shims that were removed.*
4) Install nuts attaching drive plate to flywheel and tighten to 20 ft. lbs. *NOTE - Tighten drain plugs to 7 ft. lbs. (torus cover); 40 ft. lbs. (oil pan).* Install flywheel housing front and lower covers, then install starter motor. Install filler tube in transmission with support bracket properly positioned on exhaust mani-

(Continued)

OIL COOLER SLEEVE ASSEMBLY

fold. Connect throttle valve and manual valve rods to transmission levers. Install speedometer cable and slush deflector, then tighten three remaining bolts on engine rear support bracket. Install propeller shaft assembly. Install parking brake relay and spring, then connect brake cables and adjust. Adjust throttle valve linkage and manual linkage (see "Adjustments" above).

5) Check torque of engine front cushion-to-frame nuts and make sure they are tightened to 90 ft. lbs. With rear cushion-to-frame crossmember attaching screws loose, pry transmission extension housing retainer up off crossmember to allow engine to move backward as far as possible. Scribe a line on underside of crossmember at rear edge of rectangular plate, then place a bar at rear of engine rear cushion front attaching screw and pry engine and transmission assembly as far forward as possible.



6) With engine in this position, scribe a second line on crossmember at rear of plate. Allow engine to move rearward until rear edge of plate is positioned halfway between the two scribed lines, then tighten rear cushion-to-frame attaching screws to 55 ft. lbs.

7) Install each engine side support cushion in frame slots, and loosely install flat washer, lockwasher and retaining nut. Slide each cushion support toward bell housing until cushion support just touches housing. *NOTE - Be sure that underside of cushion support bracket is flat against frame.* Scribe a reference line on frame adjacent to each bracket, then slide each bracket 1/16" inboard toward bell housing letting rubber cushion ride up bell housing. Tighten each retaining nut to 25 ft. lbs., compressing rubber cushion until bracket again lies flat on frame member. *NOTE - If either bracket is not 1/16" inboard of reference line after retaining nuts are tightened, repeat above procedure.*

8) Lower car to floor and connect battery, then install filler pipe bracket to exhaust manifold screw. Refill transmission.

SHIFT VALVE BODY ASSEMBLY

PONTIAC

Removal

1) Remove one battery cable and release the parking brake, then raise car and drain transmission (see "Lubrication" above). Disconnect oil cooler lines by either removing clamps and pulling hoses off or by cutting the hoses. Disconnect drive line from transmission output shaft, then remove complete drive line assembly.

2) Disconnect speedometer cable from drive gear and remove gearshift lower control rod. Remove cross shaft bracket, cross shaft lever and bushing from transmission. Remove lower end of throttle valve upper control rod (engine-to-transmission idler lever), then remove throttle valve lever control rod and throttle idler lever.

3) Remove both starter cables and remove starter and splash shield. Remove flywheel bottom cover and remove flywheel-to-flex plate attaching bolts. Position automatic transmission jack under transmission and and remove two rear support-to-frame crossmember bolts. Disconnect crossmember at each frame side rail and raise transmission so rear mount supports are clear of cross member, then rotate crossmember slightly in frame and remove parking brake return spring and cable guide rod from crossmember.

4) Remove crossmember, then lower transmission enough to remove flywheel housing-to-engine bolts. Work transmission rearward to disengage dowels from front flywheel housing and remove transmission

Installation

Reverse removal procedure (see above) and note the following: With transmission in position engaging dowels into engine and torus cover bolts into flex plate, install and tighten two flywheel housing attaching screws. *NOTE - If pilot on flywheel has entered end of crankshaft properly, flywheel and torus cover should move back and forth slightly.* Rotate flywheel to bring one flex plate mounting pad down to lowest position, then push flywheel forward slightly to seat it against crankshaft. Measure clearance between pad on flex plate and flywheel with a feeler gauge. Minimum clearance should be .015". If less, move transmission away from engine and install special spacer over flywheel pilot. Move transmission back into position and install two flywheel housing-to-engine bolts. When installing flex plate-to-flywheel attaching nuts, tighten nuts to 15 ft. lbs. using a torque wrench with extension, Tool No. J-6498.

TRANSMISSION OVERHAUL

See 1960 Final Data, Page 467, or later Manual edition and note the following:

Rear Clutch Hub-to-Rear Clutch Unit Thrust Washer - Position bronze thrust washer next to rear clutch hub, then position steel backing washer between bronze thrust washer and rear unit clutch cover with flange on backing washer toward clutch cover.

Flywheel-to-Crankshaft Spacer (Cadillac) - This spacer has been eliminated in 1963 production.

OLDSMOBILE F-85 3-SPEED HYDRA-MATIC

Oldsmobile F-85 (1963)

PUSHING (TO START) & TOWING

Pushing Car To Start Engine

The engine cannot be started by pushing (or towing) car. If necessary, a booster battery must be used.
► *BOOSTER BATTERY CAUTION:* Connect negative (−) terminal of booster battery to negative (−) terminal of car battery. Alternator will be damaged if battery is improperly connected.

Towing Or Pushing Car

Car may be towed at speeds up to 30 MPH if there is nothing wrong with transmission. When towing at speeds above 30 MPH or if transmission is known to be out of order, disconnect propeller shaft from transmission.

DESCRIPTION

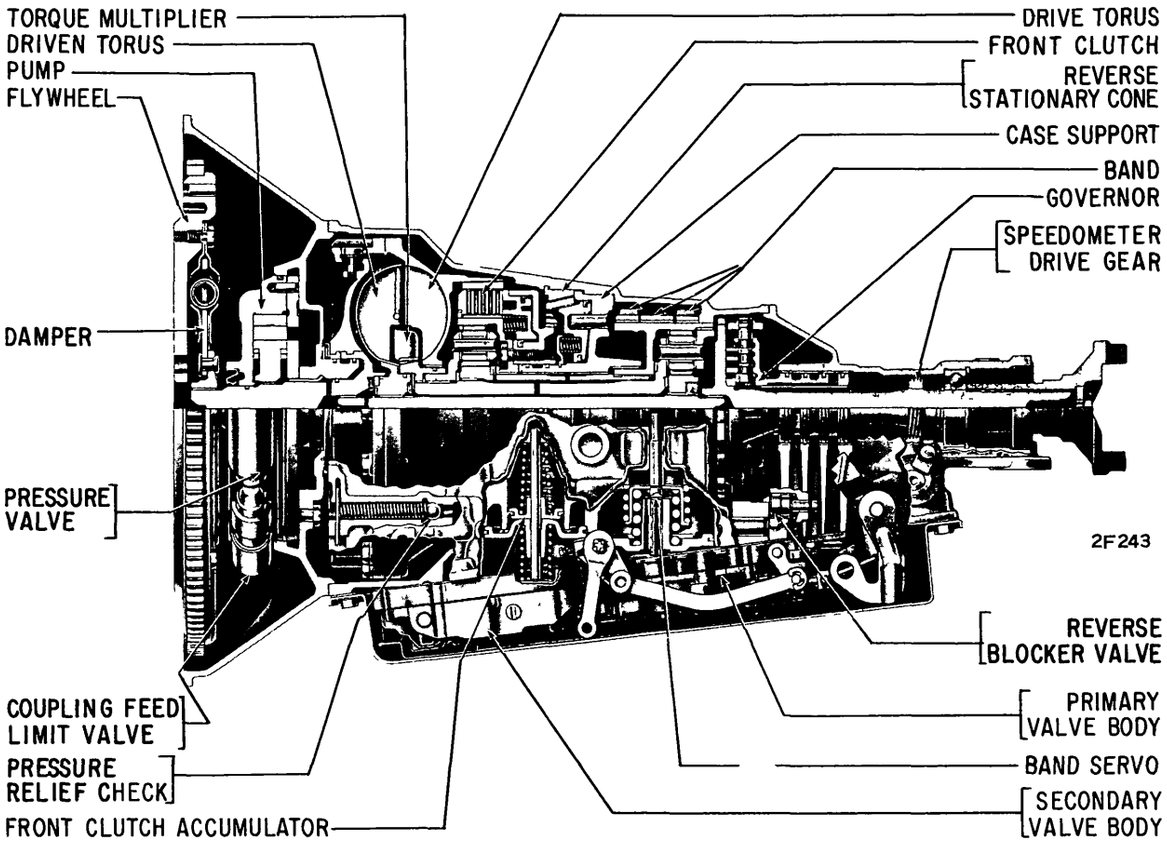
"Split-Torque" type 3-Speed (4-Stage) hydraulically controlled automatic planetary transmission and torque converter (fluid coupling and torque multiplier) of same design used on previous models. For a description of transmission operation, see 1962 Final Data, Page 501.

Transmission Identification

A serial number prefix which is stamped on a colored serial number plate attached to left side of transmission case identifies the transmission model. References in this text may be made to serial number prefix to indicate changes or differences in transmission model.

Serial Number Prefix & Plate Color

Serial No. Prefix	Serial Number Plate Color
"O"	Dark Green
"OD"	Red
"OE"	Pink
"OX"	Aluminum



LUBRICATION

Checking Fluid Level

Check fluid level every 6,000 miles. With engine at idle speed and transmission at normal operating temperature, place transmission selector lever in "P" (Park) position. Fluid level as indicated on dipstick should be at FULL mark. Add fluid as necessary. *CAUTION - Fluid level must be maintained at FULL mark. Avoid overfilling.*

Draining & Refilling

Drain and refill every 24,000 miles. With transmission at normal operating temperature, remove oil drain plug and drain fluid. Replace filler plug and add 3½ qts. of recommended fluid to transmission. Place transmission selector lever in "P" (Park) position and start engine, then add fluid to bring level up to FULL mark on dipstick. *NOTE* - Recheck fluid level after transmission is warm.

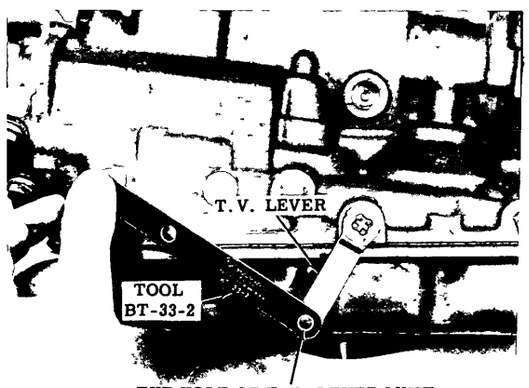
OLDSMOBILE F-85 HYDRA-MATIC TRANSMISSION

Recommended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity

4 qts. (after drain); 5 qts. (after oil pan removed); 7 qts (after overhaul).



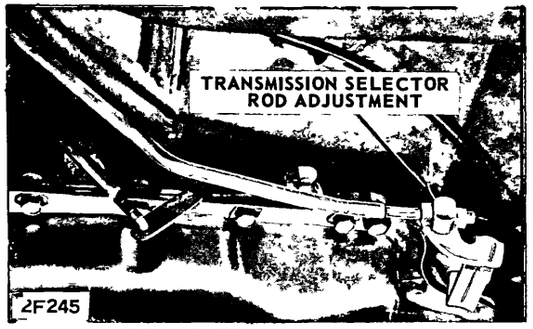
ADJUSTMENT

Throttle Linkage

See CARBURETOR on Car Model pages.

Throttle Valve Lever

Remove throttle valve rod from lever on transmission and place pin of gauge, BT-33-2 in threaded hole in case (located in boss on left side of transmission case at forward end). If hole in lever does not align WITHIN hole in gauge, bend throttle valve as necessary with Tool BT-7 to align center of hole WITHIN gauge hole.



THE HOLE OF T.V. LEVER MUST FALL WITHIN THE HOLE OF THE GAUGE WHEN PROPERLY ADJUSTED

THROTTLE VALVE LEVER ADJUSTMENT

Manual Shift Linkage

Steering Column Shift - Place selector lever in "N" (Neutral) position, then loosen front and rear locknuts on rod at manual shift lever on transmission. Hold rod and transmission lever upward so selector lever at upper end of steering column is against neutral stop. Tighten locknut at rear until it just contacts swivel, **then tighten it two additional turns.** Tighten front locknut.
Floor Mounted Shift - Place selector lever in "N" (Neutral) position, then loosen both locknuts on manual shift rod at bellcrank and place manual shift lever in "N" (Neutral) detent. While holding selector lever against its stop, tighten front locknut finger tight against swivel, **then tighten it two additional turns.** Tighten rear locknut.

MANUAL SELECTOR LINKAGE

Neutral Safety Switch

Steering Column Shift - Located on steering column mast jacket. To adjust, loosen switch attaching screws, then with selector lever in "N" (Neutral), position switch so that a .090" drill can be inserted through hole in switch arm and into hole in switch face. Tighten attaching screws and remove pin. Check for starter operation in "P" (Park) and "N" (Neutral) positions only.
Floor Mounted Shift - Remove console, then adjust neutral switch in same manner as for "Steering Column Shift" above.

Band Adjustment

Adjust band every 26,000 miles. Remove oil pan and cleaner, then loosen adjusting screw locknut. Use an inch pound torque wrench and Tool J-8591 and tighten adjusting screw to 100 inch pounds, **then loosen adjusting screw 2¼ turns.** Tighten locknut to 30 ft. lbs.

Throttle Stopscrew

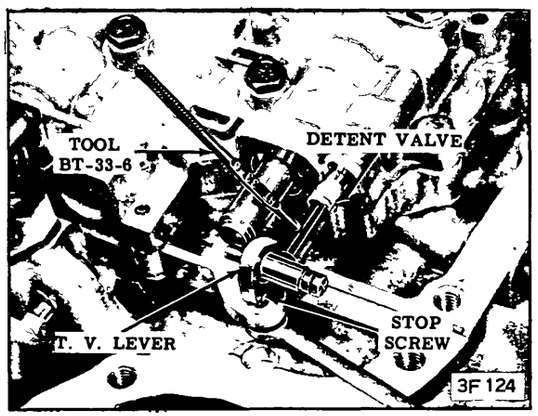
NOTE - This adjustment must be made whenever channel body and throttle body have been separated or when either has been replaced. Disconnect throttle valve rod from outer throttle valve lever on transmission, then insert Tool BT-33-6 between throttle valve plunger and throttle valve lever by pushing plunger into its bore and holding the lever forward. Adjust stopscrew against lever until throttle valve plunger bottoms in its bore, **then back stopscrew out only enough to permit removal of gauge.**

TESTING

Road Test

Operate car over a test route and note performance and shift speeds. Select a test route that will provide for all types of operation. See "Shift Speed Tables" below for correct shift speeds under different operating conditions. *CAUTION - Do not stall test transmission under any conditions.*
NOTE - This transmission is a 3-Speed (4-Stage) type. References (below) to "1st", "2nd" & "3rd" are transmission "speeds" (not Stages).

Shift Speed Tables (MPH)



Selector Lever	Throttle Position	1-2 Upshift	2-3 Upshift
"Drive"	Minimum	12-15	17-24
	Maximum	24-30	58-65
"Super"	Minimum	12-15	60-68
	Maximum	24-30	60-68
"Lo"	Minimum	Ⓒ	Ⓟ 60-68
	Maximum	Ⓒ	Ⓟ 60-68

Ⓒ - Not possible. Ⓟ - 1-3 shift.

Selector Lever	Throttle Position	3-2 Downshift	2-1 Downshift
"Drive"	Medium	35-16	12-8
	Part	35-16	None
	Detent	58-50	24-8
"Super"	Medium	58-50	12-8
	Part	58-50	None
	Detent	58-50	22-8
"Lo"	Medium	58-50	28-22
	Part	58-50	28-22
	Detent	58-50	28-22

Oil Pressure Test

Connect a 300 lbs. pressure gauge to main line passage in case (remove plug in side of case just forward of outer throttle valve lever). With transmission at normal operating temperature, engine idling at 500 RPM and parking brake applied, pressure should be 60-125 lbs. in all transmission selector ranges, with pressure not varying more than 10 lbs. between ranges. With pressure gauge connected, operate car on road. Pressures should be as indicated in following table.

THROTTLE STOPSCREW ADJUSTMENT

Operating Pressure Test

Selector Lever Position	Shift	Ⓒ Pressure
Dr., S, L, R	1st	118-185 lbs.
S (30 MPH)	2nd	98-111 lbs.
Dr. (Zero Throttle, 30 MPH)	3rd	68-78 lbs.

Ⓒ - A drop in pressure of approximately 10 lbs. as each shift is made is normal but gauge reading should stabilize after each shift is made.
OIL PRESSURE NOTE - If oil pressures are not within specifications, check the probable causes below.
Low Oil Pressure - Low oil level. Boost plug may be stuck, or wrong plug used. Pressure regulator valve or spring may be damaged or missing. Strainer and "O" ring may be leaking or missing. Manual valve may be misaligned. Foaming or cavitation may be occurring in transmission. Check for internal leakage. Pressure drop valve in valve body assembly may be stuck. Front pump slide may be stuck, causing low output. In "Lo" range only, if pressure is low, check for a malfunctioning control valve assembly or a stuck ball check valve.
High Oil Pressure - Pressure regulator valve may be stuck, damaged, or the wrong valve is used. Boost plug may be stuck, or wrong valve used. Manual valve may be misaligned with quadrant. Valve may be stuck in control valve assembly. Front pump slide may be stuck, causing high output.

TROUBLE SHOOTING & DIAGNOSIS

NOTE - This transmission is a 3-Speed (4-Stage) type. References (below) to "1st", "2nd" & "3rd" are transmission "speeds" (not "Stages").

No Drive In "D"

Check for low oil pressure. Manual linkage out of adjustment. Sticking valve in control valve assembly. Band not applying. Check for internal leakage. Check for restricted passage with air pressure. Coupling not filling.

Missing All Shifts

Sticking governor valve. Sticking valve in control valve assembly. Clutch not applying.

Drive In 2nd & 3rd Only

Check for sticking valve in control valve assembly. Clutch locked up (too many plates).

Drive In 1st Only

Check for sticking valve in control valve assembly. Front clutch not operating properly, check for leakage and for accumulator malfunction. Check for sticking valves, broken or worn rings in governor.

Drive In 1st & 2nd Only

Check for sticking governor valve or sticking valve in control valve assembly.

Drive In 3rd Only

Check for sticking valve in governor or control valve assembly

Drive in "N"

Check for engagement of internal manual control linkage Front clutch not positioned properly Reverse cone clutch not applying properly

No Reverse

Internal manual linkage not positioned properly Check for low oil pressure Reverse cone clutch not engaging or band not releasing Check for restricted passages with air pressure

Rough 1-2 Shift

Check for improperly adjusted throttle linkage Valves sticking in control valve assembly or accumulator Coupling not emptying fast enough. Check for front clutch slippage 1-2 oil passages restricted

Rough 2-3 Shift

Band not releasing Check for sticking parts in servo

Slippage In All Ranges

Check for low oil pressure

Slippage In 1-2 Shift

NOTE - This condition may be reported as 1-3 Drive only Throttle valve linkage adjusted too long Check for low oil pressure Check for restrictions or sticking parts in accumulator Sticking valves in control valve assembly Check for band slippage Front clutch not operating properly (check for number of plates in clutch) 1-2 oil passages restricted

Slippage in 2-3 Shift

Check for sticking valves in control valve assembly Coupling is not filling fast enough or front clutch may be slipping

No Engine Braking

Check for sticking valves in control valve assembly Band slipping or servo not applying

No Downshift

NOTE - No downshift with part throttle or through detent Throttle valve linkage adjusted too long Check for sticking valves in control valve assembly Accelerator travel too short Governor G-2 valve sticking

Selector Lever

Will Not Go Into Reverse - Check for mispositioned internal manual linkage Reverse blocker valve stuck open Governor G-2 valve sticking

Will N t G Int Park - Parking linkage is broken, improperly assembled, or distorted Manual linkage is not adjusted properly

Drives Forward In "R"

Check for improperly assembled or distorted internal manual linkage

Upshift Points High

Throttle valve linkage too short (adjust linkage) Check for sticking valves in control valve assembly or governor Check for bent throttle valve lever Check for high throttle valve pressure or line pressure Check for restricted governor oil passage

Upshift Points Low

Check for same points indicated in "Upshift Points High" Throttle valve linkage too long (adjust linkage)

Hanging In 2nd

NOTE - Engine stalls when car is stopped Check for sticking valve in control valve assembly or in governor Throttle valve linkage too short (adjust linkage) Check for clutch hanging up and not releasing

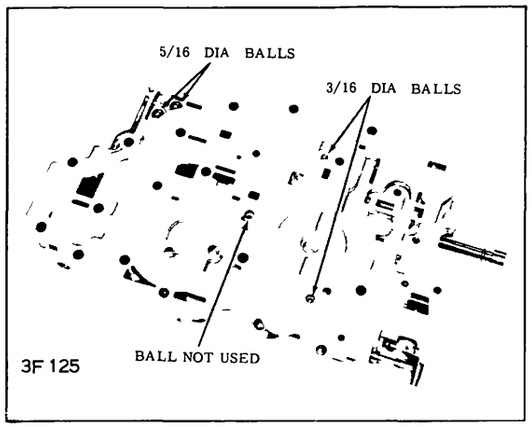
TRANSMISSION REMOVAL & INSTALLATION

Removal

Install engine support, Tool J-8974, then remove oil filler tube and breather tube Disconnect propeller shaft, shift and throttle linkage, cooler lines and speedometer cable Remove exhaust pipe and transmission rear support bar then place transmission lift in position and remove transmission to engine bolts

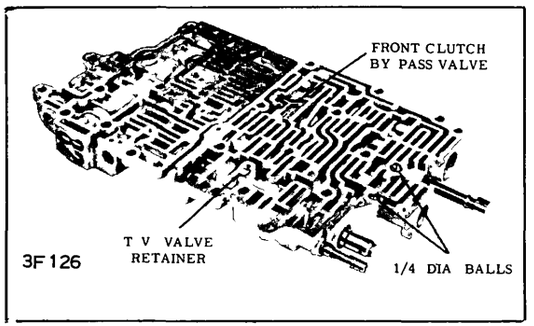
Installation

Reverse removal procedure and note the following Lubricate threads of transmission-to-engine bolts with Lubricant, Part No 980131 and tighten bolts to 30-35 ft lbs



TRANSMISSION OVERHAUL

See 1961 Final Data, Page 488, and note the following changes in procedure



Control Valve

Disassembly (Complete Control Valve) - Remove the one secondary body-to-channel plate attaching screw (on side opposite channel plate), then place control valve assembly on a clean surface so channel plate spacer is upward Remove spacer plate attaching screws (3) and spacer, then remove check balls from channel plate (see illustration) Remove channel plate-to-valve body spacer attaching screws (4) and remove spacer Remove check balls from primary valve body (see illustration)

Primary Valve Body Disassembly - 1) Remove band apply valve bushing retainer, then remove band apply valve and bushing from throttle valve bore Remove band apply valve spring, throttle valve spring, throttle valve retainer, then remove throttle valve Remove retaining pin from 2-3 valve bore while holding 2-3 throttle valve bushing, 2-3 throttle valve and spring, and the 2-3 shift valve

CHECK BALLS (CHANNEL PLATE)

CHECK BALLS (PRIMARY VALVE BODY)

2) Remove 3–4 bore plug retainer and bore plug, then remove 3–4 throttle valve bushing and 3–4 throttle valve. Remove 3–4 throttle valve from bushing. Remove 3–4 shift valve and spring.

3) Remove bore plug retainer and bore plug from other end of 3–4 shift valve bor , then remove 3–4 shift valve spring and governor valve. Remove bore plug retaining pin and bore plug from 2–3 valve bore and remove 2–3 shift valve spring. Remove 2–3 governor valve.

4) Remove bore plug retaining pin from compensator bore while holding the bor plug, then remove compensator bore plug and secondary compensator valve and spring. Remove primary compensator valv and spring. Remove compensator limit valve retainer pin by compressing limit valve spring with a brass rod, then remove compensator limit valv and spring. ***CAUTION – Do not disturb thermostatic thr ttl valv lem nt adjusting screw.*** **Remove throttle valve element clip and element.**

Primary Valve Body Reass mbly – 1) Install compensator limit valve spring and valve, then install retaining pin by compressing limit valve spring with a brass rod.

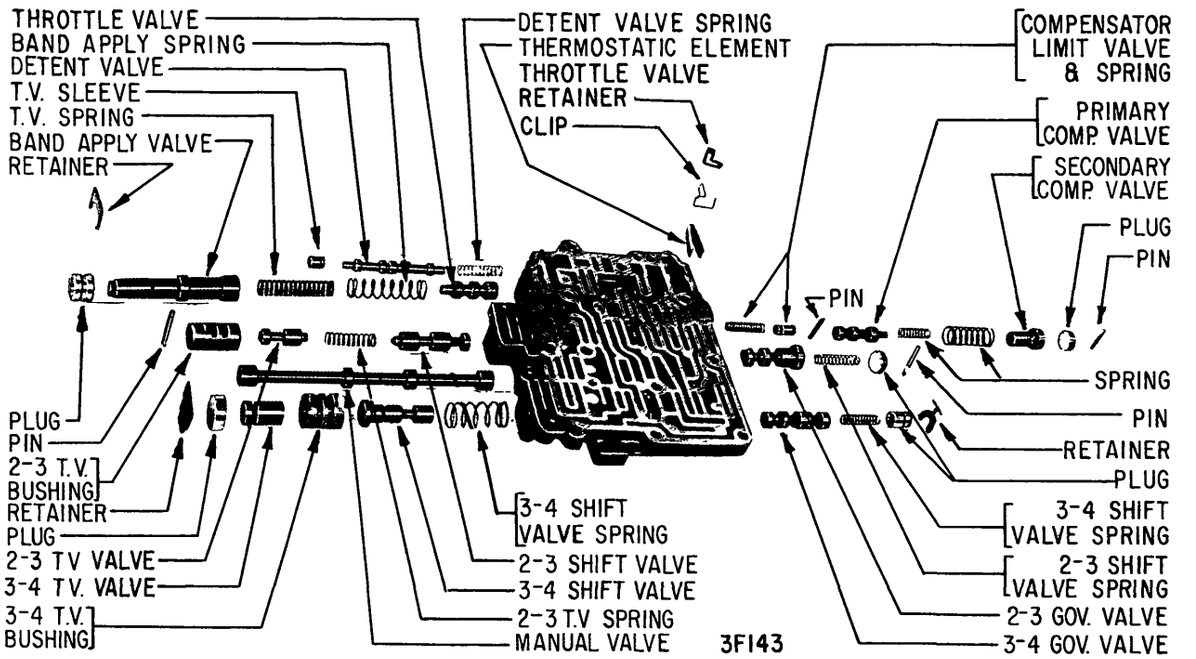
NOTE - Some transmission m d ls use a s c nd comp nsat r valv in plac f th valv spring

2) Install primary compensator valve (land end first) and spring, then install secondary compensator spring and valve (small end first). Install compensator bor plug and retaining pin.

(Continued)

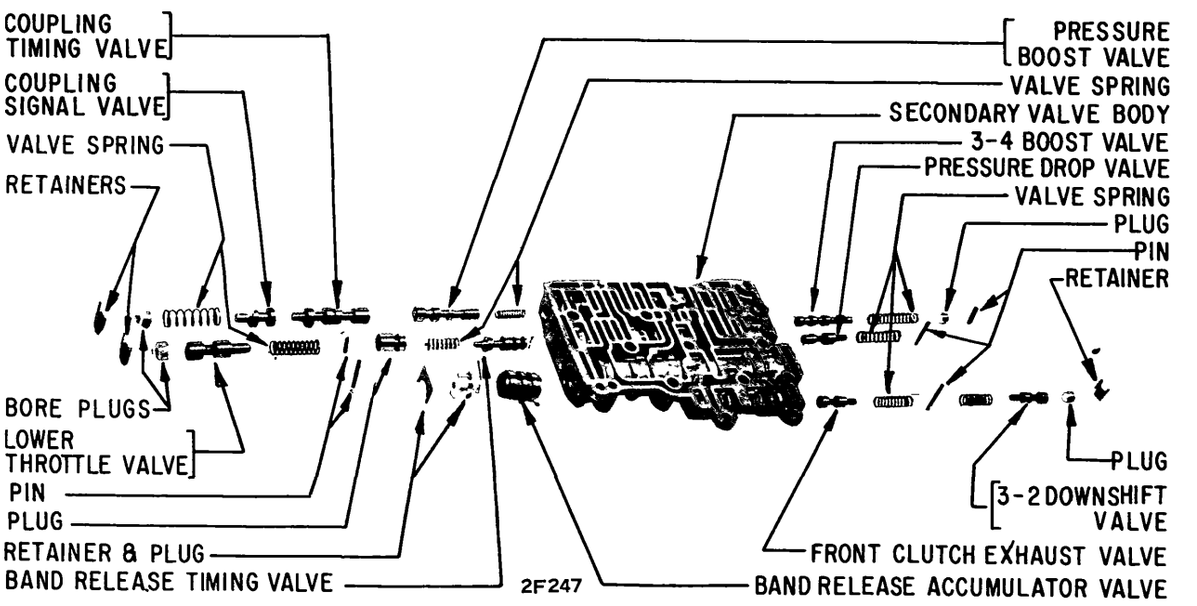
3) Install 3–4 governor valve, shift valve spring and bore plug, then install retaining pin. Install 3–4 rear shift valve spring and shift valve into other end of 3–4 shift valve bore. Install 3–4 throttle valve in the 3–4 throttle valve bushing so that it completely enters bushing, then install valve and bushing, bore plug, and retainer.

4) Install 2–3 shift valve (small end first) in 2–3 bore. Install 2–3 throttle valve spring, then install 2–3 throttle valve into 2–3 throttle valve bushing (land end first), and install 2–3 throttle valve and bushing. Install retaining pin while holding springs compressed.



5) Install throttle valve (stem end out) in throttle valve bore. Install band apply valve spring and throttle valve spring, then install band apply valve (spring pocket first). Install band apply valve bushing on band apply valve, then install band apply valve retainer while holding valve and bushing depressed (make sure retainer fits in groove in bushing). Install throttle valve retainer with long leg reaching into valve bore and the short leg resting on the step Install throttle valve element and clip. *NOTE - Do not install manual valve and detent valve train at this time.*

Secondary Valve Body Disassembly & Reassembly – Same as for previous models except that 2–3 Boost Valve parts are now referred to as 3–4 Boost Valve parts; and the 2–1 Downshift Valve and Spring is now referred to as the 3–2 Downshift Valve and Spring. See *"Secondary Valve Body Assembly" illustration.*



Control Valve: Reassembly (Complete Control Valve): Reverse disassembly procedure and note the following: Manual valve must be installed so that land with hole is outward. To align primary valve body to channel plate, insert a ¼" drill through one of the attaching holes, then tighten countersunk flathead screw.

Tightening Specifications

Location	Ft. Lbs. Torque
Channel Plate to Valve Body	2.5-3.5
Sec. Valve Body to Channel Plate	2.5-3.5
Pri. Valve Body to Channel Plate	2.5-3.5
Throttle Valve Lever to Shaft	5-6
Inner Man. & Det. Lever to Shaft	5-6
Valve Body to Case	6-8
Pump Cover to Pump Body	6-8
Throttle Valve Pressure Plug	6-7
Line Pressure Plug	6-7
Case Cover to Pump	15-18
Oil Pan to Case	12-15
Front Internal Gear to Housing	22-27
Output Shaft to Carrier	19-23
Torus Exh. Valve Cover to Torus Cover	19-23
Torus Cover to Drive Torus	17-20
Band Adj. Screw Locknut	18-20
Flange Assembly to Output Shaft	40-50
Rear Bearing Retainer to Case	20-25
Case Cover to Case	20-25
Oil Pan Drain Screw	35-45
Coupling Feed Limit Valve Plug	15-20
Pressure Regulator Plug	15-20

PRIMARY VALVE BODY ASSEMBLY

SECONDARY VALVE BODY ASSEMBLY

PONTIAC TEMPEST TRANSAXLE

P ntiac Temp st (1963)

PUSHING & TOWING (AUTOMATIC TRANSMISSION)

Pushing Car To Start Engine

The engine cannot be started by pushing (or towing) car. If necessary, a booster battery must be used.

►*BOOSTER BATTERY CAUTION:* Connect negative (-) terminal of booster battery to negative (-) terminal of car battery. Alternator will be damaged if battery is connected improperly.

Towing Car

With transmission selector lever in "N" (Neutral), car may be towed at speeds not to exceed 30 MPH. If transmission is not operating properly, raise rear wheels off ground to tow car.

DESCRIPTION

The transaxle assembly is similar to design used on previous models except as noted below.

Automatic Transmission (Tempestorque) - This unit has been redesigned to provide a solenoid operated "kickdown" and to eliminate the rear oil pump. Overhaul procedures are different than for pr evious models.

LUBRICATION

Checking Fluid Level

Check fluid level every 6,000 miles as follows:

Rear Axle & Synchro-mesh Transmission - With unit at normal operating temperature, check fluid in differential carrier first (plug is adjacent to rear axle differential joint on left side of transmission case). If level is low in differential case, also check level in transmission housing. *NOTE - With unit at operating temperature, fluid should be level with bottom of filler plug hole.*

Automatic Transmission - With transmission at normal operating temperature and transmission selector lever in "N" (Neutral) position, engine idling, check fluid level on dipstick in filler tube located under plate in right-front of luggage compartment. If level is near the "ADD" mark, add recommended fluid to bring level to "FULL" mark on dipstick. Approximately one pint of fluid is required to raise level from "ADD" to "FULL".

Draining & Refilling

Draining & Refilling is not recommended except at time of overhaul or repair.

Rear Axle & Synchro-mesh Transmission - If necessary, drain plugs in differential carrier and in transmission can be removed to drain fluid.

Automatic Transmission - Loosen filler tube attaching nut in oil pan and allow transmission to drain (converter cannot be drained). To refill, tighten filler tube nut and add 4 pints of recommended fluid, then start engine and allow to idle 3-5 minutes in "N" (Neutral). Add necessary amount of fluid to bring level to "FULL" mark on dipstick.

Recommended Fluid

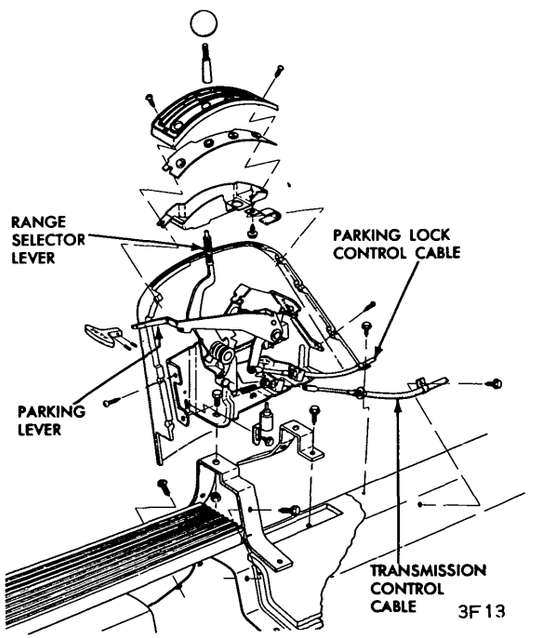
R ar Axl & Synchr -mesh Transmission - SAE 80 or SAE 90 "Multi-Purpose" gear lubricant. *CAUTION - Do not use straight mineral oil gear lubricants or lubricants containing active sulphur soaps.* Differential carrier and transmission (synchro-mesh) are connected by internal passages.

Automatic Transmission - Automatic Transmission Fluid Type "A" (Suffix "A"). Automatic transmission is sealed off from differential.

Capacity

Differential Carrier - 3.3 pts.
3-Speed Synchro-mesh Transmission - 3 pts.
4-Speed Synchro-mesh Transmission - 3.85 pts.
Automatic Transmission - 6 pts. all models (after draining). 17 pts. 4 Cyl. Eng., 19.7 pts. V8 Eng. (after overhaul with converter drained).

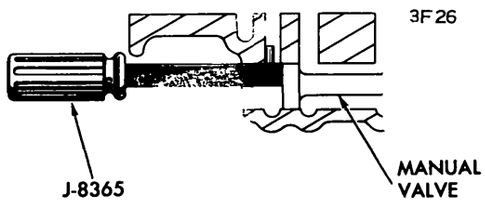
ADJUSTMENT



Throttle Linkage

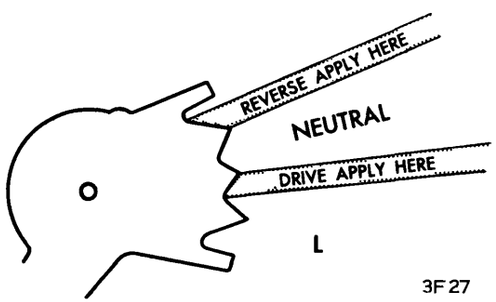
See CARBURETOR on Car Model pages.

Manual Linkage



Synchro-mesh Transmission - Manual linkage adjustment not required.

Automatic Transmission - To check manual linkage adjustment, start engine and allow 2-3 minutes for fluid to warm up, then with engine at idle speed, slowly move selector lever from "N" toward "R" and note by feel the point at which reverse clutch applies. If properly adjusted, clutch should apply within band from tooth peak to full reverse detent (see illustration).



MANUAL TRANSMISSION SHIFT LEVER ASSEMBLY

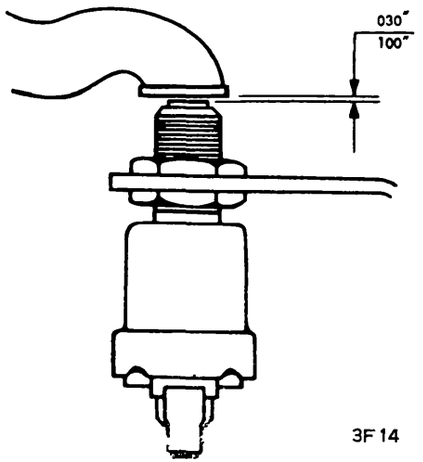
Repeat the above check while moving selector lever from "N" toward "D". Low band should apply as selector lever indicator is felt to be between tooth peak separating neutral from drive and full drive detent (see illustration). To adjust, drain transmission and remove oil pan Place selector lever in "D" (Drive) range, then insert Tool J-8365 into manual valve bore (end opposite linkage) with tab of gauge upward so it engages forward port of valve body (see illustration). With tool in place, push forward on manual valve levers. If valve is properly adjusted, tool will be held in place horizontally without being supported If adjustment is necessary, loosen lockscrew in manual valve linkage (inside transmission case) and push manual valve levers forward so tool is held in horizontal position, then tighten locknut. Recheck adjustment, install oil pan and refill transmission.

MANUAL VALVE ADJUSTMENT

CHECKING MANUAL SHIFT POINTS

Neutral Starter Switch

Located on rear of gearshift control and indicator assembly. Switch should turn on back-up lights in "R" (Reverse), starting with selector lever in any position other than "N" (Neutral). To adjust, loosen switch mounting screws and reposition as required.



Low Band

NOTE - Periodic adjustment is not recommended, however, if necessary, adjust as follows: Lower transmission to allow access to adjusting screw, then loosen locknut and tighten adjusting screw to 40 ± 5 inch pounds. **Back ff adjusting screw exactly 4 full turns** and tighten locknut, making sure that adjusting screw does not turn.

(Continued)

Downshift Switch

With throttle linkage properly adjusted and with throttle valve in wide open position adjust switch locknuts to provide a clearance of 030- 100" between switch body and lever Tighten locknuts securely

DOWNSHIFT SWITCH ADJUSTMENT

TESTING (AUTOMATIC TRANSMISSION)

TESTING NOTE - Transmission must be at normal operating temperature, fluid level at "FULL" mark on dipstick, and manual and throttle linkage adjustments must be correct

Road Test

Road test car to determine transmission shift points as indicated in table below

Transmission Shift Speeds

UPSHIFTS	①MPH 4 Cyl.	V8
Minimum Throttle	18-22	19-23
Full Throttle	②60	②70
Part Throttle (To Detent)	35-40	28-32

① - 3 09-1 axle ratio (4-Cyl), 2 91-1 axle ratio (V8) The above speeds require revision if other axle ratios are used.
② - Approximately

Pr ssure Tests

NOTE - Pressure tests can be made by running car with wheels raised off ground on jack stands

Pressure Test P int L cati ns - Three test points having hex head plugs are located on transmission case as follows

Fr nt Pump - Front of extension housing flange

Govern r - In recess near bottom of transmission case on same side as governor assembly

Modulator - In recess near bottom of transmission case on same side as modulator assembly
NOTE To aid in connecting pressure test lines to governor and modulator test points, use a pipe extension to bring line connection out beyond edge of oil pan

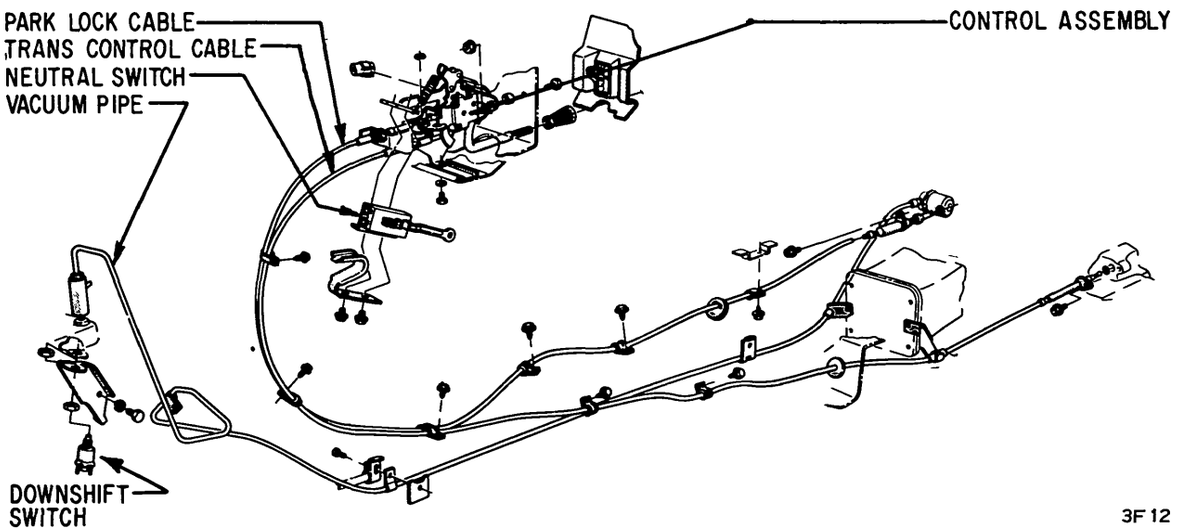
Pressure Checking - With transmission at normal operating temperature fluid at proper level, and linkage properly adjusted, place transmission in "D" position and operate car as indicated in "Pressure Check Table" *NOTE - If pump pressure is not evident, check for stuck pressure regulator valve or broken or disengaged pump drive lugs Failure of pressure to rise when disconnecting the vacuum hose (or high pressure with hose connected), indicates a stuck modulator valve, defective modulator, or collapsed hose*

PRESSURE CHECKING TABLE

Pressure Point	Eng. Type	Pressure Reading (Approx.)
Governor	4 Cyl V8	23 lbs @20 MPH-54 lbs @48 MPH 23 lbs @23 MPH-54 lbs @51 MPH
Modulator	All	110 lbs @ sea level (wide open throttle with parking brake on) to 70 lbs @ 6000 ft
Pump	All	50 lbs while coasting in high, 110 lbs @ sea level (wide open throttle with parking brake on) to 90 lbs @ 6000 ft

REMOVAL & INSTALLATION

See 1962 Final Data, Page 505, and note the following changes in procedure



Transaxle (Complete Unit)

Removal - **1)** Raise car and support at underbody side rails, then drain transmission and differential Remove rear wheels and drums, then disconnect axle shafts and pull them outward far enough to remove universal joints from carrier assembly
2) Disconnect speedometer cable On automatic transmission cars, disconnect transmission control cable, electrical connection, retainer clips, vacuum modulator line and parking lock control cable
3) Support torque tube and transaxle separately, then disconnect torque tube from transmission *CAUTION - Propeller shaft and torque tube are now held in place only by bearings in transmission extension and must be properly supported to prevent damage*
4) Disconnect axle support crossmember from insulator, then disconnect rear lower control arms from bracket on differential housing On Synchro-mesh transmissions, disconnect shift tube from transmission Disconnect exhaust system from rear tail pipe hanger, then remove axle support crossmember from transaxle assembly (lower transaxle slightly for access to bolts)
5) Separate transaxle from torque tube and propeller shaft and pull transaxle assembly straight off shaft so shaft will not bind in transmission. Lower transaxle assembly from car
Installation - Reverse removal procedures being careful not to damage seals Tighten all bolts and nuts to specifications (see "Tightening Specifications" below)

Control Cable (Auto. Trans.)

Removal - Remove bolt securing transmission control cable housing to transmission case then disconnect

(Continued)

AUTOMATIC TRANSMISSION CONTROL & PARK CABLE ASSEMBLIES

cable at selector lever assembly. Remove cable from body clips and grommets and remove cable.
Installation - Install "O" ring seal on new cable, then locate cable in approximate position in car as shown in illustrations. Seat the "O" ring and install bolt and lock washer. Complete installation, working from rear of car forward (keep slack in cable at front of car). Adjust linkage as required (see "Manual Linkage" above).

Parking Lock Cable

Removal - Disconnect control cable from cover and pawl assembly, then disconnect cable from transmission control lever assembly. Remove cable body clips and grommets and remove cable.
Installation - Reverse removal procedure, locating cable as indicated in illustrations. Work from rear toward front of car and keep slack in cable at front of car.

Automatic Transmission

Removal (From Transaxle Assembly) - With transaxle assembly removed from car, remove converter nut assembly using a strap wrench to hold converter, then pull converter with a suitable puller. Remove speedometer driven gear, governor assembly, and turbine shaft. Remove screws retaining transmission to differential carrier and separate transmission and differential carrier.
Installation - Install a new gasket to either carrier or transmission and retain in place with petrolatum, then align carrier and transmission on a flat surface and carefully guide pump shaft through differential carrier. Install governor with a new "O" ring seal, and secure transmission to carrier with retaining screws. *NOTE - Install two screws from carrier side first to prevent cocking.* Tighten screws to specifications (see "Tightening Specifications" below). Install turbine shaft being careful to avoid damaging bushings. Install converter, converter nut and seal assembly. Tighten nut until a sudden increase in resistance is felt, then complete tightening until torque is 10-20 ft. lbs. above that required for tightening to prior sudden increase in resistance. Install modulator valve and modulator assembly and secure with clamp. Install speedometer driven gear and parking pawl assembly.
NOTE - It is no longer necessary to determine thickness of Rear Selective Thrust Washer.

OVERHAUL

3-Speed Synchro-mesh Transmission - *See 1961 Final, Page 497.*
4-Speed Synchro-mesh Transmission - *See 1962 Final, Page 508.*

AUTOMATIC TRANSMISSION UNIT REMOVAL & INSTALLATION (TRANSMISSION IN CAR)

Parking Lock Cover & Pawl

Removal - Assembly can be removed after removing cable assembly, "O" ring seal and attaching screws.
Inspection - Inspect pawl for damage or wear and check to see that actuator rollers turn freely. Replace worn or damaged parts.
Installation - Reverse removal procedure.

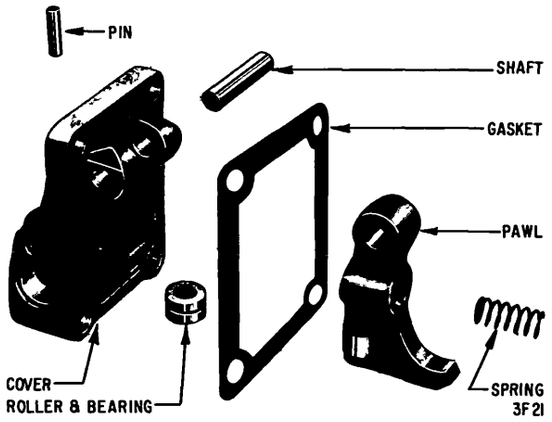
Extension Housing Oil Seal

Replacement - Remove torque tube and propeller shaft, then pry out old seal. Tap new seal into position using a suitable tool (J-21033), then install torque tube and propeller shaft.

Extension Housing using Front Bearing

Replacement - Remove torque tube, propeller shaft, and oil seal, then remove bearing retaining ring and remove bearing. Tap a new bearing into position with a suitable tool (J-21033) and install retaining ring. Install seal, propeller shaft and torque tube.

Modulator



Removal - Disconnect control arm bracket, then remove vacuum hose at modulator and remove modulator retainer plate. Remove modulator and valve from case.
Inspection - Inspect valve for nicks and burrs. If these cannot be removed with a slip stone, replace valve. Check for leakage by connecting to a vacuum source. *NOTE - A leaking modulator is indicated by oil smoky exhaust and continually low transmission oil level. Replace modulator as an assembly if it is faulty.*
Installation - Install modulator valve in transmission, then place a new "O" ring seal on modulator and install modulator. Tighten retainer plate and install vacuum hose. Connect control arm bracket.

Governor

Removal - Remove speedometer driven gear, then loosen screw securing governor tab to case and pull governor from transmission.
Inspection - Inspect driven gear for damage or wear. If necessary to replace gear, drive out roll pin with a punch and pull out old gear. Drill a new hole in governor 90° from old hole, then insert new gear and reinstall roll pin. *NOTE - No other repairs are possible.*
Installation - Install a new "O" ring seal, then insert governor into transmission with a slight twist to engage gears. Install lock bolt and speedometer driven gear.

Downshift Solenoid

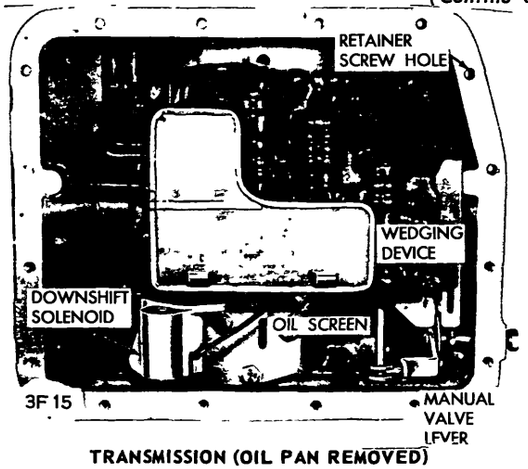
Replacement - Drain transmission and remove filler pipe, then remove oil pan and gasket. Disconnect solenoid lead from terminal, then remove solenoid attaching screws and remove solenoid from valve body. *NOTE - It may be necessary to remove one reinforcement plate screw for access to one solenoid attaching screw.* Install new solenoid by reversing removal procedure.

PARKING LOCK COVER & PAWL ASSEMBLY

Downshift Solenoid Connector

Replacement - With oil pan removed, disconnect solenoid lead from terminal and disconnect external lead from terminal. Compress connector assembly retaining fingers and push out assembly and seal. Install new connector assembly and seal into case (retaining fingers must spread out inside case to secure assembly), and connect internal and external leads. Install oil pan and fill transmission

Valve Body & Low Servo



Removal - Drain transmission and remove oil pan, then remove oil screen and "O" ring seal. Loosely install a retainer (see illustration) in pan screw hole, then remove screws attaching valve body to transmission. Tap valve body lightly with a soft hammer to loosen it from its dowels, then carefully lower valve body 1/16". Rotate retainer into place so it secures servo piston and tighten with oil pan screw (this prevents piston slipping down out of its bore and loss of low band engagement). Disconnect downshift solenoid lead from terminal, then remove valve body and gasket. If necessary to remove low servo, tighten low band adjusting screw fully and remove transfer plate and reinforcement plate. Remove retainer and pull down on low servo piston shaft with a screwdriver.
Disassembly - *See "Transmission Unit Overhaul" below.*
Installation - Reverse removal procedure and tighten all screws to specifications (see "Tightening Specifications" below).

AUTOMATIC TRANSMISSION UNIT REMOVAL (TRANSMISSION OUT OF CAR)

Automatic Transmission

Disassembly - **1)** Remove modulator, "O" ring and modulator valve, then mount transmission assembly in a suitable holding fixture.
2) Loosen low band adjusting screw locknut and fully tighten low band adjusting screw. Remove housing attaching screws and use a soft hammer to tap off extension housing and pump assembly. Turn transmission so front end is up and loosen low band adjusting

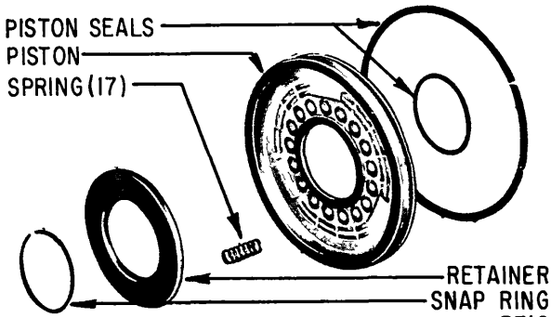
(Continued)

TRANSMISSION (OIL PAN REMOVED)

screw and remove low band, apply strut, and reaction strut.

3) Remove clutch drum assembly using care to avoid damage to machined surfaces on front face of clutch drum. Remove planet carrier assembly, fibre washer and cupped race from ring gear, then remove ring gear from engagement with reverse clutch plates.

4) Remove reverse clutch snap ring, pressure plate, drive plates (faced) and reaction plates (steel). *NOTE - V8 transmission has a spring plate under last reaction plate.*



AUTOMATIC TRANSMISSION UNIT OVERHAUL (AUTOMATIC TRANSMISSION)

Reverse Piston

Removal - Compress spring retainer with a suitable tool (J-9542) until springs bottom, then remove snap ring. Carefully release pressure and remove spring retainer and return springs. To remove reverse piston, apply air pressure at reverse piston apply pressure port. Remove piston inner and outer seals.

Inspection - Wash all parts in clean solvent and blow dry with air. Check for broken return springs and make a comparative test of spring heights by standing all of springs in a row. If an appreciable difference in spring height is noted, replace springs.

Installation - Install inner and outer seal in reverse piston, then install piston in case. Position the 17 return springs in their seats on piston and install spring retainer. Compress springs with same tool used at removal, then install snap ring and remove tool

REVERSE PISTON ASSEMBLY

Clutch Drum

Disass mbly - Remove snap ring securing low sun gear and clutch flange assembly to drum, then remove low sun gear clutch flange and hub-to-flange thrust washer. Remove clutch hub, then remove nested drive and reaction plates and hub thrust washer. To remove spring retainer, compress springs with a suitable tool (J-9542) and remove snap ring, then carefully release pressure on tool and remove spring retainer and return springs. To remove clutch piston, pull upward with a twisting motion on center. Remove seal on piston and piston inner seal from hub of clutch drum.

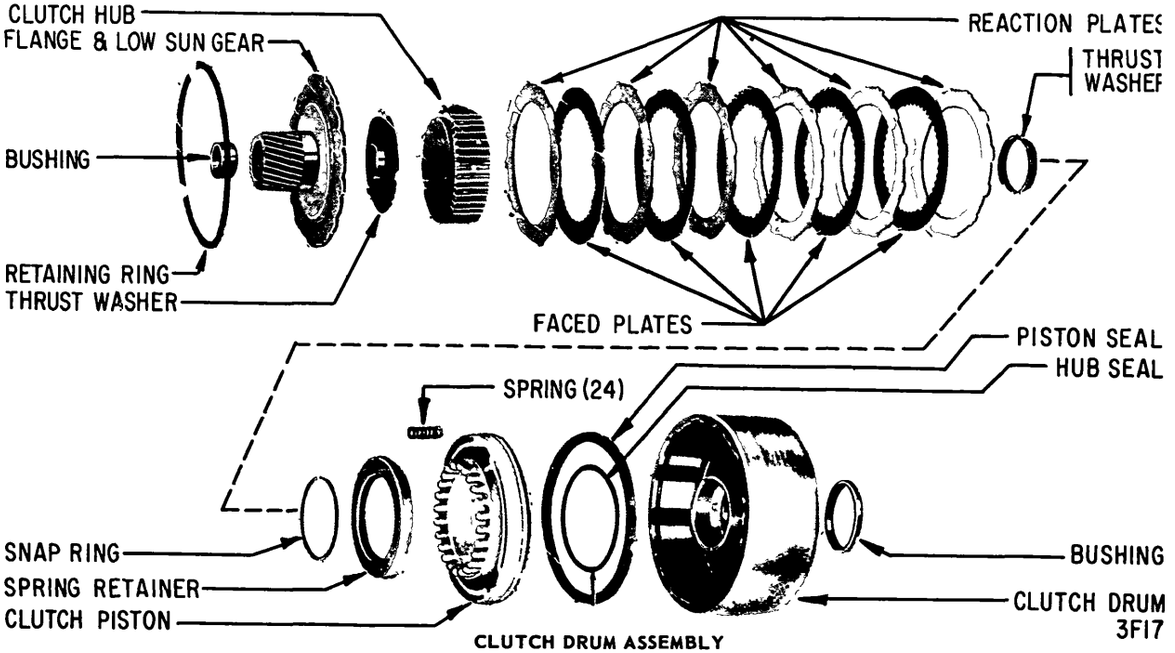
Insp ction - Wash all parts in solvent and blow dry with air. Inspect drum brake band surface for excessive scoring or burning. Check drum bushing for scoring or damage. Check steel ball in clutch drum that acts as relief valve and make sure it is free to move in hole and that orifice leading to front of drum is open. *NOTE - If ball is loose enough to come out or not loose enough to rattle, replace clutch drum as an assembly. DO NOT attempt to restake ball.* Check fit of clutch flange in drum slots (there should be no appreciable radial play between these two parts). Check low sun gear for nicks or burrs and bushing for wear. Check clutch plates for burning, pitting or metal pick up. Check to see that faced plates are a free fit over hub and that steel plates are a free fit in clutch drum slots. Check for excessive wear on friction facing of drive plate teeth. Check condition of clutch hub splines and mating splines on faced plates.

Clutch Drum Bushing Replacement - Remove old bushing with a suitable chisel (J-8400-1), being careful not to damage bushing bore. Install bushing with a suitable tool (J-9546).

Low Sun Gear Bushing Replacement - Remove old bushing with a suitable chisel (J-8400-1),. being careful not to damage bushing bore. Install new bushing with a suitable tool (J-21094).

Reassembly - Install piston inner seal in clutch drum hub, making sure that lips are downward toward front of transmission. Install a new piston seal in clutch piston so lips of seal are toward front of transmission (clutch drum) when installed. Lubricate both seals, then install piston in clutch drum with a twisting motion. Place 24 return springs in position on clutch piston and install spring retainer. Compress springs with same tool used at disassembly and install snap ring in groove. Remove tool and install hub front thrust washer with its lip toward clutch drum. Align two dimples with notches in hub and install clutch hub. Install steel reaction plates and faced drive plates alternately, starting with a steel plate. *NOTE - V8 engine transmissions have 6 steel and 5 faced plates. 4 Cyl. engine has 4 steel and 3 faced plates.* Install hub rear thrust washer with its flange toward low sun gear, then install low sun gear and clutch flange assembly and secure with snap ring. *NOTE - Openings of retainer ring should be lined up with a clutch drum slot.* Check assembly by turning clutch hub to insure it is free to rotate.

Valve Body & Low Servo



Disassembly - Remove manual valve and downshift solenoid, then remove detent valve, modulator pressure control valve and spring. Remove shift valve retaining ring, sleeve, shift control valve, spring seat, spring, and shift valve. Remove retaining ring, then remove modulator valve sleeve and valve, spring, and pressure regulator valve Remove roll pin, spring, and high speed downshift timing valve. To disassemble low servo piston, remove hairpin retainer securing piston to piston rod and remove all components.

Inspection - Valve Body - Clean all parts in solvent, then inspect all valves and their bores in valve body for burrs or other deformities that could result in valve hang-up.

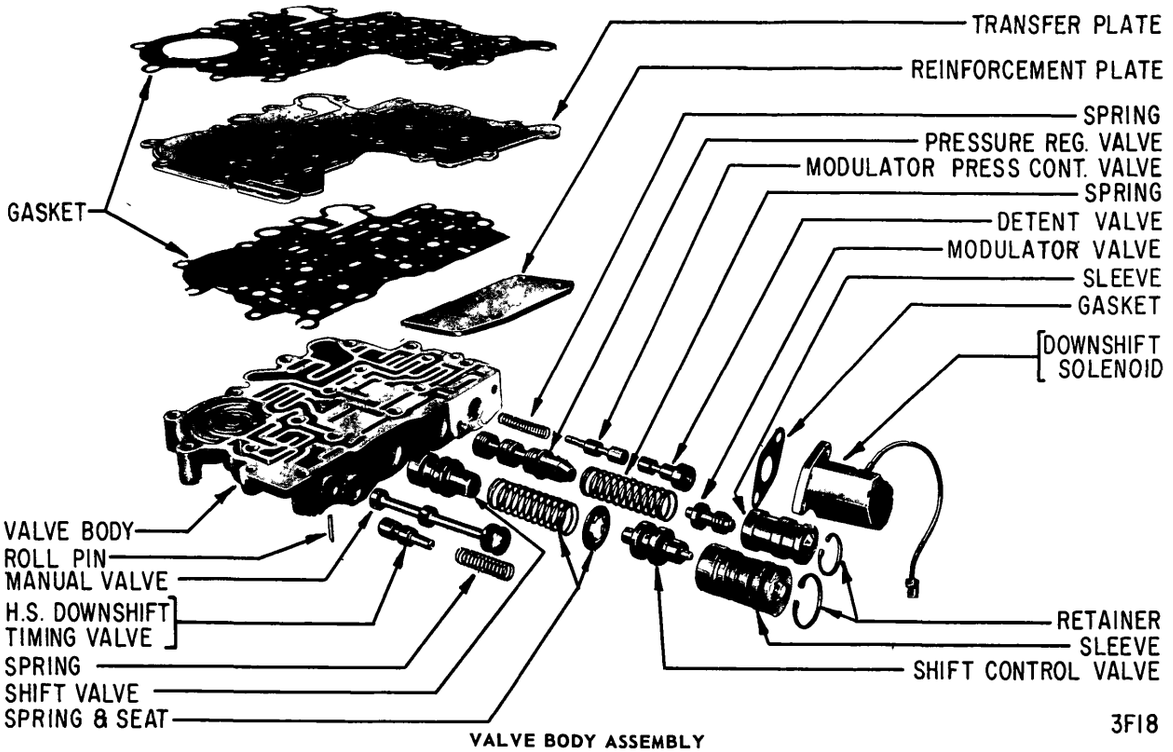
Low Servo - Remove piston ring from piston and install it in low servo bore and measure ring gap which should be .002-.012". Assemble ring to piston and measure clearance between ring and one side of piston groove. Clearance should be .0005-.005".

Reassembly - Install high speed downshift timing valve into its bore (stem out) and install spring and roll pin. Install pressure regulator valve (stem out) and install spring, then assemble modulator valve (stem out) and sleeve, and install assembly into bore and secure with

(Continued)

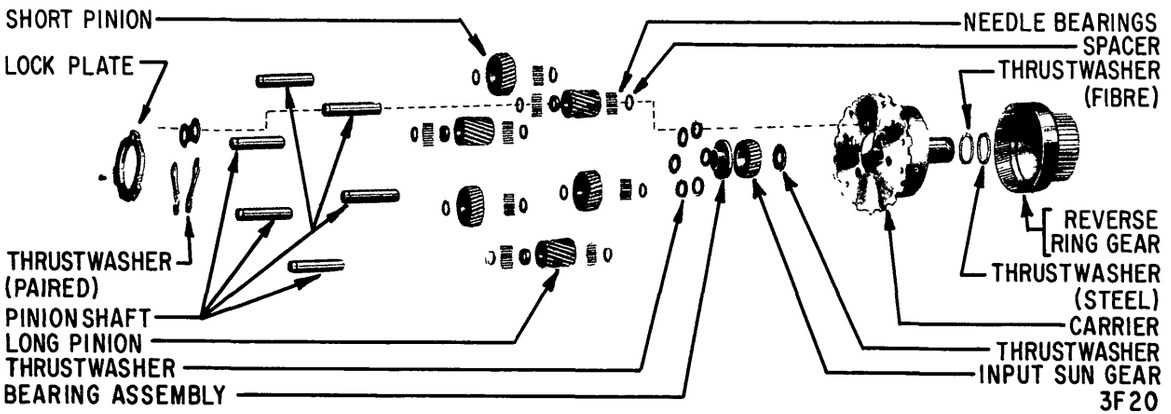
CLUTCH DRUM ASSEMBLY

retaining ring. Install shift valve (stem out) and install spring and spring seat with raised portion of spring seat toward spring. Assemble shift control valve and sleeve with large diameter stem out, then install assembly and secure with retaining ring. Assemble modulator pressure control valve spring on stem of valve and install assembly, spring first, in valve bore. Install detent valve with beveled stem out. Use a new gasket and assemble downshift solenoid to valve body and secure with two screws, then install manual valve.



Pump & Extension Housing

Disassembly - Remove two hook-type oil sealing rings, thrust washer and shims (if present) from pump hub. *NOTE - V8 engine transmission has thrust bearing assembly instead of a thrust washer.* Remove screws and separate pump body and housing being careful not to drop gears from pump body, then remove pump shaft. Mark, but do not scar, pump gear faces to insure reassembly with same face upward, then remove gears. Remove pump shaft thrust washer and drive out pump priming valve retaining pin, then remove valve spring and valve. **Remove coast downshift timing valve from extension housing only if it is known to be defective.** Remove housing outer seal and pry out oil seal. Remove front bearing retainer ring and remove front bearing with a suitable tool (J-6292). Remove rear bearing and thrust washer by inserting a suitable tool through front of extension and driving bearing out the back.



Inspection - Wash all parts in solvent and blow out all oil passages. Inspect all parts for nicks, scoring, or damage. Check oil control rings removed from pump body (install rings in operating position in bore of clutch assembly to make sure they have end clearance). If bushing in pump body is damaged, replace bushing (see below). With parts clean and dry, install pump gears and check clearances with a feeler gauge. Clearance between outer diameter of driven gear and body should be .0025-.005". Clearance between driven gear and crescent should be .0025-.005". With a scale and feeler gauge check gear end clearance which should be .0005-.0015". Inspect front and rear bearings for roughness, wear, or damage.

Pump Body Bushing Replacement - Remove old bushing with a suitable chisel (J-8400-1). Install new bushing with a suitable tool (J-21098).

Reassembly - Install pump shaft thrust washer in extension housing with grooves upward, then install caged needle bearing in extension housing with identification on outer race facing upward, using a suitable tool (J-21249) to drive bearing into position. Install front bearing with a suitable tool (J-21033), then install retaining ring. Use a soft hammer and tap new drive line seal into position. Use a suitable tool (J-21237) to install coast downshift timing valve into place so that distance from housing face to top edge of valve is 3/8". *CAUTION - Do not install valve by tapping on spring retaining fingers or the calibration will be affected.* Install pump priming valve into pump body, stem first, then install valve spring and secure with retaining pin. Install pump gears (previously marked faces upward), thrust washer and pump shaft assembly. Assemble extension housing and pump body and install 7 outer screws for preliminary alignment. Align

VALVE BODY ASSEMBLY

EXTENSION HOUSING & PUMP ASSEMBLY

housing and pump body using alignment band, Tool J-21034. then secure assembly with 5 screws and remove alignment band. Turn shaft and check for binding. Install shims as required on pump body hub, then install thrust washer or bearing assembly, engaging tang of washer in pump body notch. Install two hook type oil seal rings. *NOTE - Number of shims required on pump body is determined during transmission rear assembly (see below).* Install new outer seal ring in groove on outer diameter of extension housing.

Planet Carrier

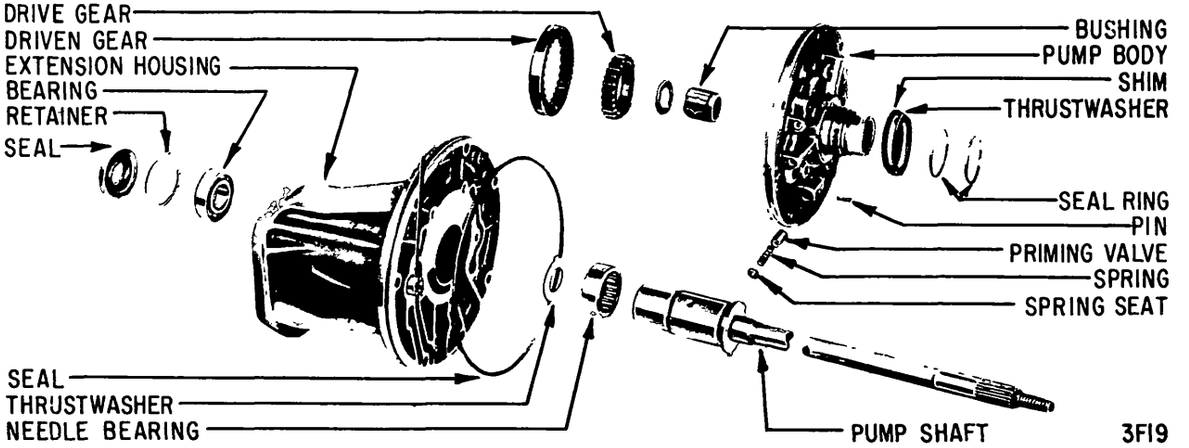
NOTE - Before disassembling planet carrier, inspect as follows: Wash assembly in solvent and blow out all oil passages. Inspect planet pinions for nicks and toth damage, then check end play of pinions. Clearance should be .006-.030". Check input sun gear and thrust washer for damage. Inspect output shaft bearing surface and splines for damage. If wear or damage is evident, disassemble and replace parts as necessary.

(Continued)

Disassembly - Place carrier assembly in a vise with front end facing upward, then use a prick punch to mark each pinion and planet carrier for reassembly in in original position. Remove pinion shaft lock plate screws and rotate lock plate clockwise enough to remove it. Start with a short pinion and drive on front end of pinion shaft, using a soft steel drift, until shaft is beyond press fit area of front flange. Insert a "dummy" shaft (J-9538) into short planet pinion, pushing pinion shaft ahead of it until "dummy" shaft is centered in pinion and pinion shaft is removed. Remove short pinion and pinion rear thrust washer, then remove "dummy" shaft, needle bearings, and needle bearing spacers from pinion. *CAUTION - Be careful not to lose pinion needle bearings (20 in each pinion with a spacer at each end).* Remove remaining short pinions in same manner, then remove input sun gear thrust bearing race, thrust bearing, input sun gear, and rear thrust washer. Using the same procedure as for removal of short pinions, remove long pinions and 3 front (paired) thrust washers. *CAUTION - Be careful not to lose pinion needle bearings (20 in each end of each pinion, separated by a wide spacer and with a spacer at each end).*

Inspection - Wash all parts in solvent and blow dry with air, then recheck all parts for wear or damage. If needle bearings show excessive wear, replace all bearings.

Reassembly - Use "dummy" shaft and assemble needle bearing spacers and needle bearings in one of the long pinions (20 bearings at each end with wide spacer in between and a thin spacer at each end). Hold needle bearings in position with petrolatum. Position long pinion with "dummy" shaft centered in pinion and with thrust washers at each end, in planet carrier. Use a "paired" thrust washer at front and a single washer at rear, with oil grooves in both washers facing pinion. Select proper pinion shaft, as marked at disassembly, lubricate shaft and install it from front end, pushing "dummy" shaft ahead of it. Make sure that thrust washer at rear is picked up and that shaft lock plate slot is properly aligned. Use a brass drift and drive pinion shaft in until lock plate slot is flush with assembly surface. Install remaining long pinions in same manner, then install input sun gear rear thrust washer, input sun gear, front thrust bearing, and bearing race with inner diameter flange up. Install short pinions in same manner as for long pinions. *NOTE - Front (paired) thrust washer already installed with long pinion is used with adjacent short pinion.* Check end clearance of pinions which should be .006-.030". Install pinion shaft lock plate so that tangs engage slots in shaft and the three screw holes are accessible. Install pinion shaft lock plate attaching screws and tighten to 2½-3 ft. lbs.



Turbine Shaft

Inspection - Inspect splined areas for wear or damage, check lubrication holes to be sure they are open. Inspect bushing for wear or damage and make sure hook type oil seal is free to rotate.

Bushing Replacement - Cut bushing out with a suitable chisel being careful not to damage bore. Install new bushing with a suitable tool (J-21095).

Converter

NOTE - Internal repairs cannot be made. Converter is welded unit.

PLANET CARRIER ASSEMBLY

Inspection - Check seams for stress or breaks and either replace converter or repair welds as required. *NOTE - If welds are repaired, keep added material to a minimum by chipping off scale and filing away excess weld to retain converter balance.* Inspect converter hub bushing for wear or damage.

Bushing Replacement - Remove old bushing with a suitable chisel being careful not to damage converter bore. Install new bushing with a suitable tool (J-21096).

AUTOMATIC TRANSMISSION UNIT INSTALLATION (TRANSMISSION OUT OF CAR)

Automatic Transmission

Reassembly - **1)** Install transmission in holding fixture with rear of case downward, then install reverse clutch spring plate (spring plate on V8 transmission only), and reaction plates (see illustration). *NOTE - Notched lug in each steel reaction plate must be installed so it is at top of groove in 4 o'clock position in case.*

2) Install pressure plate so that lug with rectangular "dimple" engages 4 o'clock case groove, then install plate snap ring. Check for correct selective reaction spacer plate running clearance as follows: Place transmission horizontally, then use feeler gauges and measure clearance between pressure plate and first faced plate. Clearance should be .025-.060". If clearance is not within limits, remove reverse clutch pack and install a thicker or thinner selective plate next to piston. *NOTE - Selective plates are available in thicknesses of .070", .102" and .134".* On V8 engine transmission, install selective plate on top of spring plate.

3) Align internal lands of reverse clutch drive plates and center them in case. Engage reverse ring gear with reverse drive plates. *NOTE - Engagement must be made by "feel" while moving drive plates laterally.* Install metal thrust washer on reverse piston hub, engaging washer "dimples" in hub notches, then install fibre washer on top of it.

4) Install planet carrier with a slight twist to engage planet pinions with reverse ring gear, then install clutch drum assembly, using a slight twist to engage low sun gear with pinions in planet carrier.

5) Install shim selector gauge, Tool J-21093 and check end clearance (see illustration). *NOTE - The measurement made with feeler gauge determines number of shims to be used on pump body hub (see "Pump & Extension Housing" under "Transmission Unit Overhaul" above).* If pin of gauge, Tool J-21093, does not rest on face of clutch drum, there is excessive end play which may be due to worn parts. If feeler gauge thickness exceeds .0485", incorrect assembly of parts is indicated and the transmission assembly should be rechecked.

Shim Specifications

Gauge Thickness	Shims Required
Flush to .0015"	3
.0015-.0175"	2
.0175-.0335"	1
.0335-.0485"	0

6) Install low band, apply strut and reaction strut, then tighten low band adjusting screw enough to prevent strut from falling out of place. Shake clutch drum slightly to center low band and linkage. Install a new pump gasket, then index and install pump and extension housing assembly. Use care to avoid breaking cast iron rings on pump body hub as they enter clutch drum bore. Tighten extension housing attaching screws (see "Tightening Specifications" below). Adjust low band (see "Adjustment" above).

Tightening Specifications

Location	Torque
Case to carrier bolts	55-75 ft. lbs.
Valve body to case bolts	100-140 in. lbs.
Pump body to extension housing	14-22 ft. lbs.
Extension housing to case	14-22 ft. lbs.
Oil pan to case bolts	35-45 in. lbs.
Modulator clamp bolt	100-132 in. lbs.
Low band locknut	20-25 ft. lbs.
Converter nut	Ⓒ 10-20 ft. lbs.

Ⓒ - Above torque required to tighten nut until sudden resistance is felt (see "Removal & Installation" above).

RAMBLER SIX AUTOMATIC TRANSMISSION

Rambler American (1963)
Rambler Classic Six (1963)

PUSHING (TO START) & TOWING

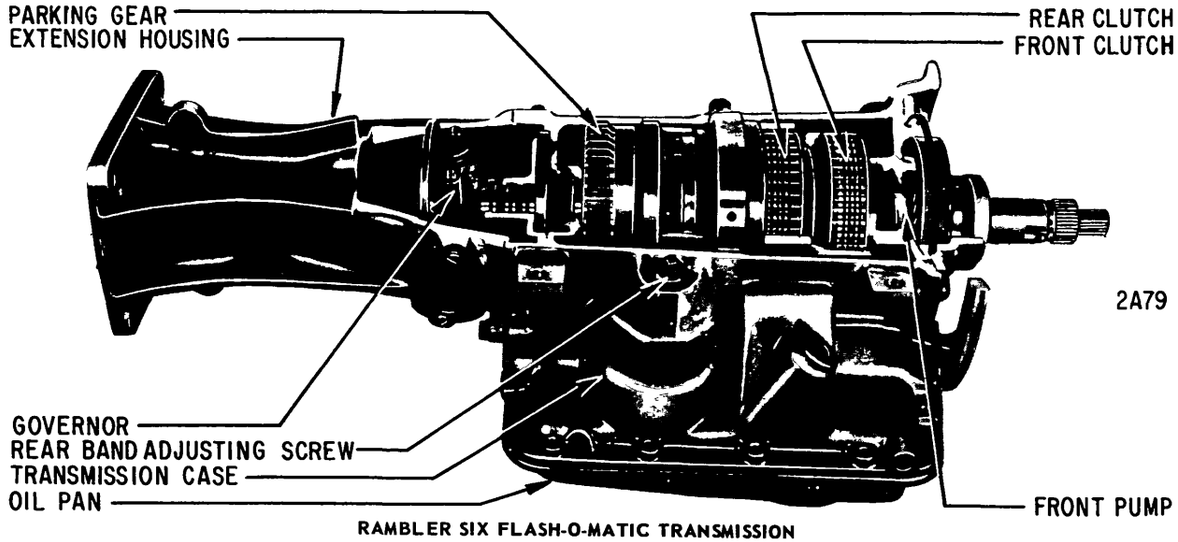
Pushing Car To Start Engine

With selector lever in "N" (Neutral), push car until it reaches a speed of approximately 15-20 MPH, then turn ignition switch on and place selector lever in "L" (Low) until engine starts.

Towing Car

If transmission is operating properly, car may be towed for short distances with transmission selector lever in "N" (Neutral). If transmission is inoperative or if car is to be towed a long distance, raise rear wheels off ground or disconnect propeller shaft.

►CHANGES, CAUTIONS, CORRECTIONS



► *1962-63 RAMBLER AMERICAN & CLASSIC SIX LOSS OF DRIVE WHILE IN GEAR CORRECTION:* This condition may be due to an internal oil leak occurring at front pump suction tube and "O" ring. Correct as follows: Remove transmission oil pan, control valve assembly and oil tubes, then remove front pump suction tube and "O" ring. Install a new suction tube and "O" ring assembly, using care not to damage tubes during replacement. *NOTE - Early 1962 models used a steel tube having the "O" ring seal in groove on tube. Later models use an aluminum tube and "O" ring assembly.*

► *1962-63 TRANSMISSION OIL SCREEN INSTALLATION & PRODUCTION CHANGE:* Some late 1962 and all late 1963 transmissions were equipped with oil screen in production. To install the new screens on models not so equipped, replace original fillister head screws with pan head screws. The new screens are available under Part No. 3170355 (Rear Screen); Part No. 3170356 (Front Screen).

► *1962-63 OIL LOSS THROUGH TRANSMISSION CASE BREATHER CORRECTION:* A new breather baffle, Part No. 3170944 is being used in late 1963 production and can be used on earlier transmissions to correct oil loss. Drain two quarts of oil from transmission, then remove transmission extension housing. *NOTE - On 1963 Classic models, support transmission and engine assembly when removing extension housing and rear crossmember.* Remove speedometer drive gear and governor assembly from output shaft, then place flat side of baffle over rear pump. Cutaway portion of circumference must be located toward bottom. Equally spaced lugs on baffle will retain it in case. Reverse disassembly procedure and fill transmission with fluid.

DESCRIPTION

Three speed hydraulically controlled automatic planetary transmission of same design used on previous models. A steering column mounted range selector lever is used on all models (pushbutton type control is not used).

RAMBLER SIX FLASH-O-MATIC TRANSMISSION

LUBRICATION

Checking Fluid Level

Check fluid level every 4,000 miles. With transmission at normal operating temperature, engine at idle speed, move selector lever through all ranges momentarily and return to "N" (Neutral) position. Check fluid level on dipstick and add recommended fluid as necessary to bring level up to "F" mark on dipstick. *NOTE - Approximately 1½ pts. of fluid required to raise level from "L" mark to "F" mark on dipstick. Do not overfill.*

Draining & Refilling

NOTE - Draining & refilling is not recommended except at time of transmission overhaul. With transmission at normal operating temperature, remove oil filler tube from side of transmission oil pan and allow transmission to drain. To drain converter, remove transmission oil pan and loosen control valve body. *NOTE - Loosening control valve body provides a "bleed", allowing converter to drain.* To refill transmission and converter, install oil pan and filler tube (after tightening control valve body assembly), and pour 5 qts. of recommended fluid into filler tube. Start engine and run it with selector lever in "N" (Neutral), then pour in 4 qts. of fluid and move selector lever through all ranges, returning to "N" position. Recheck fluid level and adjust to "F" mark on dipstick.

Recommended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity

9 qts. with transmission and converter dry.

ADJUSTMENT

Throttle Linkage

See CARBURETOR n Car Mod l pag s.

Manual Linkage

Place selector lever in "L" (Low), then disconnect gearshift rod trunnion from manual lever on transmission. *NOTE - Make sure manual lever on transmission is in extreme rear position.* Adjust trunnion on manual shift rod to enter freely into hole in bushing in transmission lever. Replace washer and secure with cotter pin. Check selector lever in all positions.

Neutral Safety Switch

Located on steering jacket tube under instrument panel. To adjust, loosen capscrews securing switch to jacket tube, then place transmission selector lever in "N" (Neutral). Use a 3/32" pin for alignment and insert pin in hole on face of switch, then rotate switch until pin freely enters hole in switch toggle. Tighten attaching screws and remove alignment pin. *NOTE - Tang of switch must ent r chann l on op rating shaft before securing switch to jacket.* Check to make sure engine starts in "N" or "P" only.

Front Band

With oil pan removed, loosen locknut on adjusting screw and insert a .250" gauge block (part of Tool J-5880-01) between end of adjusting screw and servo rod. Use Adapter J-9639 and an inch pound torque wrench and tighten adjusting screw to 9 inch pounds *(see "Torque Wrench Not " b low).* Tighten locknut securely and remove gauge.

Rear Band

Loosen locknut on right hand side of transmission case and install Adapter J-21111 on adjusting screw. Tighten adjusting screw to 10 ft. lbs. *(NOTE - This supers d s previous specification of 7 ft. lbs.).* Back off screw ¾ turn and tighten locknut to 30 ft. lbs. *NOTE - S "Torqu Wr nch Not " b low.*

TORQUE WRENCH NOTE (Fr nt & R ar Band Ad-

(Continu d)

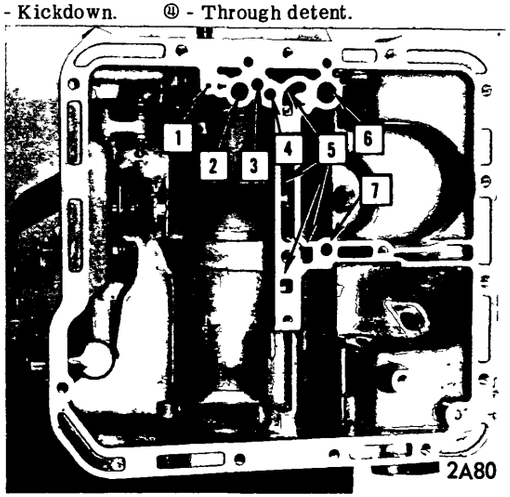
justment) - The adjusting screw tightening specifications given above are for tightening torque at the adjusting screw. If the indicated adapters are used (lengthening the torque wrench), determine the proper torque wrench reading as follows: Multiply torque required at adjusting screw by length of torque wrench (center of handle to center of drive); then divide the product by length of torque wrench plus length of adapter (center of drive socket to center of driven socket) The result will be the reading required on torque wrench to obtain proper torque at adjusting screw.

TESTING

Stall Test

With engine at normal operating temperature, place transmission in "D1" position. Apply parking brake and foot brake and accelerate engine with wide open throttle to 1400 RPM. *CAUTION - Do not hold throttle open for more than 15 seconds.* If engine speed will not reach 1400 RPM, poor engine performance is indicated. An engine speed over 1400 RPM indicates transmission or converter slippage.

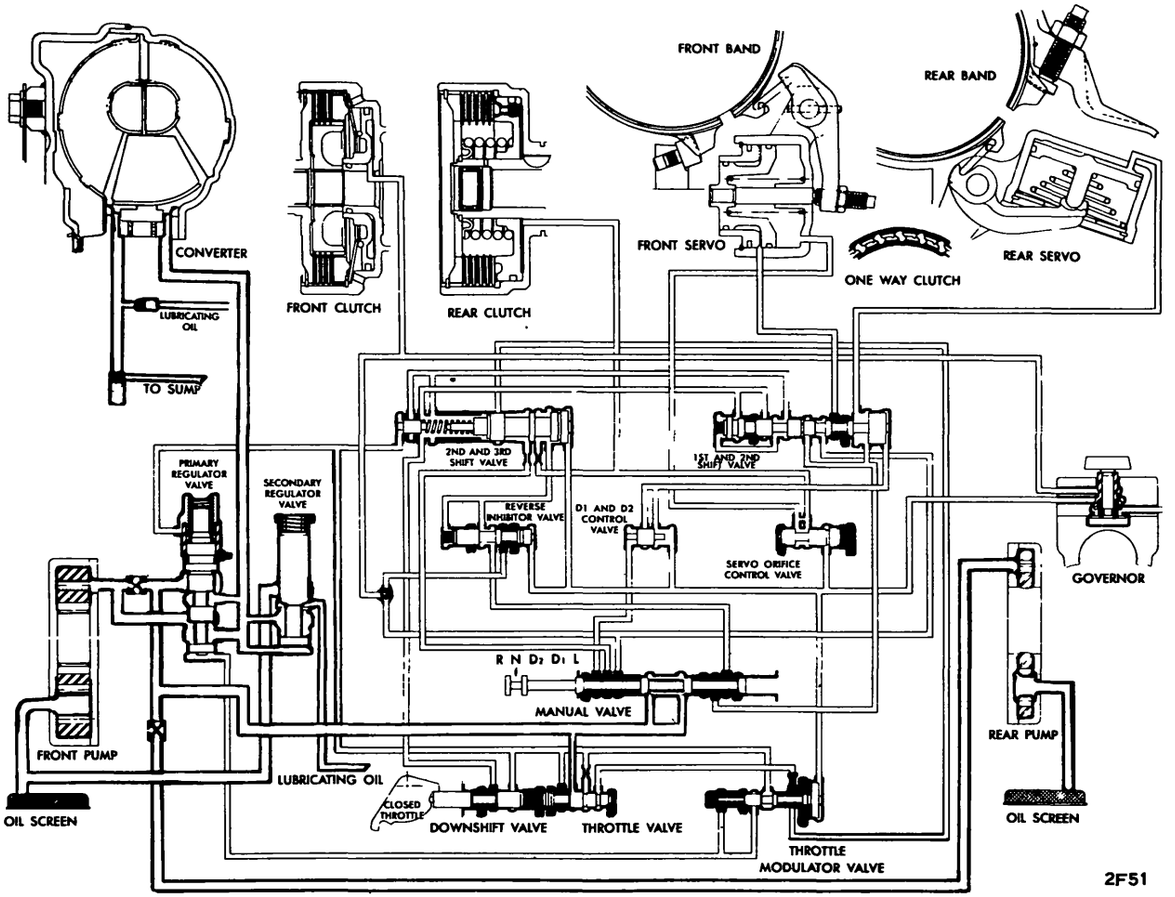
Road Test



Drive car and check for upshifts and downshifts as indicated in following table.

SHIFT SPEEDS

(American)



Upshift①	Light Thr ttl	Full Throttle②	Kickdown④
1-2	6-10 MPH	24-28 MPH	37-41 MPH
2-3	12-16 MPH	45-49 MPH	66-70 MPH
D wnshift	**Cl s d Thr ttle**	**Part Throttle③**	**Kickdown④**
3-1	5-9 MPH		25-29 MPH
3-2		21-25 MPH	58-62 MPH

① - Selector lever in "D1". ② - To detent.
③ - Kickdown. ④ - Through detent.

1. Control Pressure
2. Rear Pump Pressure
3. Front Clutch and Governor Feed
4. Governor
5. Lubrication
6. Rear Pump Suction
7. Rear Clutch Apply

TRANSMISSION CASE OIL PASSAGES

RAMBLER SIX AUTOMATIC TRANSMISSION HYDRAULIC CIRCUITS

(Rambler Classic)

Upshift①	Light Throttle	Full Throttle②	Kickdown④
1-2	6-10 MPH	25-29 MPH	35-39 MPH
2-3	12-16 MPH	41-45 MPH	59-63 MPH
Downshift	**Closed Throttle**	**Part Throttle③**	**Kickdown④**
3-1	5-9 MPH		23-27 MPH
3-2		23-28 MPH	55-59 MPH

① - Selector lever in "D1". ② - To detent.
③ - Kickdown. ④ - Through detent.

Air Pressure Test

Front Servo - Remove front servo apply tube and apply pressure where tube enters servo body. Watch for servo operation.

Rear Servo - Remove rear servo apply tube and apply pressure where tube enters servo body. Watch for servo operation.

R ar Clutch - Remove rear clutch tube and apply pressure where tube enters hole in case. A dull thud should be heard.

Governor - To check governor, remove valve body and apply pressure to governor oil passage in case (see illustration).

Front Clutch - Remove valve body and apply pressure to front clutch and governor feed oil passage in case (see illustration). A dull thud should be heard.

Oil Pressure Test

CAUTION - Make this test only if transmission is not shifting properly after checking throttle linkage for proper adjustment. Connect a suitable pressure gauge to control pressure test point on rear of transmission case (above oil pan flange toward left side of case). With transmission fluid at 190°F, pressure should be 100 lbs. ± 10 lbs. at 1000 RPM. At idle speed of 475 RPM, pressure should be 50-62 lbs.

TROUBLE SHOOTING & DIAGNOSIS

NOTE - Before making any corrections to transmission, check and adjust fluid lev l, manual linkage and throttle linkage, then rech ck operation of transmission to determine if trouble has been improved or corrected.

Harsh Drive Engagement

Control valve assembly not tightened properly. Throttle valve sticking. Primary or secondary regulator valve sticking. Front clutch frozen or warped.

Delayed Drive Engagement

Improper idle speed. Oil tube missing or not installed properly. Seal rings missing or broken. Control valve assembly not tightened properly. Primary regulator valve sticking. Front clutch ball check missing or sticking. Failure in front or rear clutch. Converter slipping.

No "D-2" Range

Front band not adjusted properly. Oil tube missing or not installed properly. Sealing rings missing or broken. Control valve not properly tightened. Primary regulator valve sticking. Front clutch ball check missing or sticking. Front clutch failure. Front band failure or faulty servo. Input shaft broken. Front pump drive tangs broken or converter broken. Worn front pump or converter failure.

No "D-1" or "L" Range

Oil tubes missing or improperly installed. Sealing rings missing or broken. Control valve not properly tightened. Secondary regulator valve sticking. Failure in front clutch or front clutch check ball missing or sticking. Sprag clutch slipping or improperly installed. Input shaft broken. Front pump or converter failure.

No "R" Range

Oil tubes missing or improperly installed. Seal rings missing or broken. Control valve not properly tightened. Primary regulator valve sticking. Governor valve sticking or improperly installed. Reverse inhibitor valve sticking. 1-2 shift valve sticking. 2-3 shift valve sticking. Front clutch frozen or warped. Rear clutch failure, faulty piston, broken return spring or worn plates. Rear band failure or faulty servo. Input shaft or converter broken. Front pump failure.

Lock-Up Forward & Reverse

Front or rear clutch frozen or warped. Sprag clutch frozen.

No Neutral

Front clutch frozen or warped.

No 1-2 Upshift

Bands not adjusted properly. Governor valve, modulator valve or throttle valve sticking. Oil tubes missing or not properly installed. Control valve not properly tightened. 1-2 shift valve sticking. Front band slipping or servo faulty.

No 2-3 Upshift

Oil tubes missing or not properly installed. Sealing rings missing or broken. Control valve not properly tightened. Throttle valve sticking. Governor valve sticking or not properly installed. 2-3 shift valve sticking or plug missing. Failure in rear clutch. Annular piston not seating.

Low 1-2 & 2-3 Upshift

Oil tubes missing or not properly installed. Seal rings missing or broken. Control valve not tightened properly. Throttle valve sticking or not properly installed. Governor valve sticking. 2-3 shift valve plug sticking.

High 1-2 & 2-3 Upshift

In addition to corrections for "Low 1-2 & 2-3 Upshift", check for sticking modulator valve. 1-2 or 2-3 shift valve sticking, or 2-3 shift valve plug sticking.

Slipping 1-2 & 2-3 Shift

Front band not properly adjusted. Oil tubes missing or improperly installed. Sealing rings missing or broken. Control valve assembly not tightened properly. Primary regulator valve or throttle valve sticking. Governor valve sticking or improperly installed. If 1-2 shift is slipping, check for front clutch check ball sticking or missing, or faulty front servo. If 2-3 shift is slipping, check for worn or slipping rear clutch plates.

Harsh 1-2 & 2-3 Shift

Front band not properly adjusted. Control valve assembly not properly tightened. Primary regulator, throttle valve, or modulator valve sticking. Governor valve sticking or not properly installed. If 1-2 shift is harsh, check for front clutch slippage or for frozen sprag clutch. If 2-3 shift is harsh, check for warped or frozen rear clutch.

Faulty 1-2 Shift

Improper rear band adjustment. Rear clutch frozen. Sprag clutch frozen.

Faulty 2-3 Shift

Improper front band adjustment. Oil tubes missing or not properly installed. Control valve assembly bolts missing or not properly tightened.

No 2-1 Downshift

Control valve assembly not properly tightened. Throttle valve sticking. Governor valve sticking, leaking or not properly installed. D-1 & D-2 control valve sticking. 1-2 shift valve sticking.

No 3-2 Downshift

Control valve assembly not properly tightened. Throttle valve or governor valve sticking. 2-3 shift valve or plug sticking.

High 2-1 & 3-2 Downshift

Sealing rings missing or broken. Control valve assembly not properly tightened. Throttle valve, modulator valve or governor valve sticking. 2-3 shift valve or plug sticking.

Slipping 2-1 Downshift

Sprag clutch slipping or not properly installed.

Slipping 3-2 Downshift

Improper front band adjustment. Oil delivery tubes missing or not properly installed. Seal rings missing. Control valve assembly not tightened properly. Primary regulator valve, throttle valve, or governor valve sticking. Rear clutch failure. Front band slipping or faulty servo.

Harsh 3-2 Downshift

Front band not properly adjusted. Control valve assembly not tightened properly. Throttle valve sticking. Rear clutch frozen or warped.

TRANSMISSION REMOVAL & INSTALLATION

Removal

Disconnect throttle cable from carburetor throttle shaft and from cable bracket, then disconnect battery cable. Raise car and place jack stands under rear of car at body sills. Disconnect manual shift rod from transmission lever, brake tube from under floor pan, rear shocks from rear axle, and speedometer cable from transmission. Drain transmission, then proceed as follows:

Rambler American (Exc. Convertibl) - Disconnect parking brake cable, then disconnect rear spring front brackets from floor pan studs. Slide axle to rear, disconnecting front universal joint from transmission output shaft. Place a suitable lift under transmission, then remove transmission case-to-converter bolts. Make sure transmission is in alignment with converter housing, then pull transmission to rear until clear of converter, and remove from car.

Rambler American (Convertibl) - Disconnect parking brake cable, then lower rear axle to relieve spring tension and remove rear spring to axle "U" bolts. Raise rear axle enough to relieve weight of rear axle on springs and to clear spring center bolts. Slide rear axle on springs to remove universal joint from transmission output shaft. Use a suitable lift under transmission, then remove transmission case-to-converter housing bolts. Move transmission to rear to clear input shaft and converter housing, then tilt transmission front end to right side. Keep lowering front end and tilting to right side until transmission input shaft clears converter housing and rear of case clears slot in crossmember. Remove transmission from car.

Rambler Classic - Disconnect stabilizer bar from left side of rear axle, then disconnect torque tube and parking brake cable. Lower rear axle and move toward rear to separate torque tube and propeller shaft from transmission. Use a suitable lift under transmission, then support rear of engine and remove transmission case-to-converter housing bolts. Remove the two rear crossmember bolts from engine rear support to transmission insulator and disconnect crossmember from side sills. With transmission and converter housing in alignment, pull transmission assembly to rear and remove from car.

Installation

Reverse removal procedure and note the following: Position front pump drive tangs in a horizontal position, then use a thin screwdriver to position front pump external tooth drive gear lugs in a vertical position. Carefully slide transmission assembly into converter and converter housing. Do not use force. Tighten all screws, bolts, and nuts to specifications *(see "Tightening Specifications" below).*

TRANSMISSION UNIT REPLACEMENT (TRANSMISSION IN CAR)

See 1962 Final Data, Page 512, and note the following:

Parking Brake Control

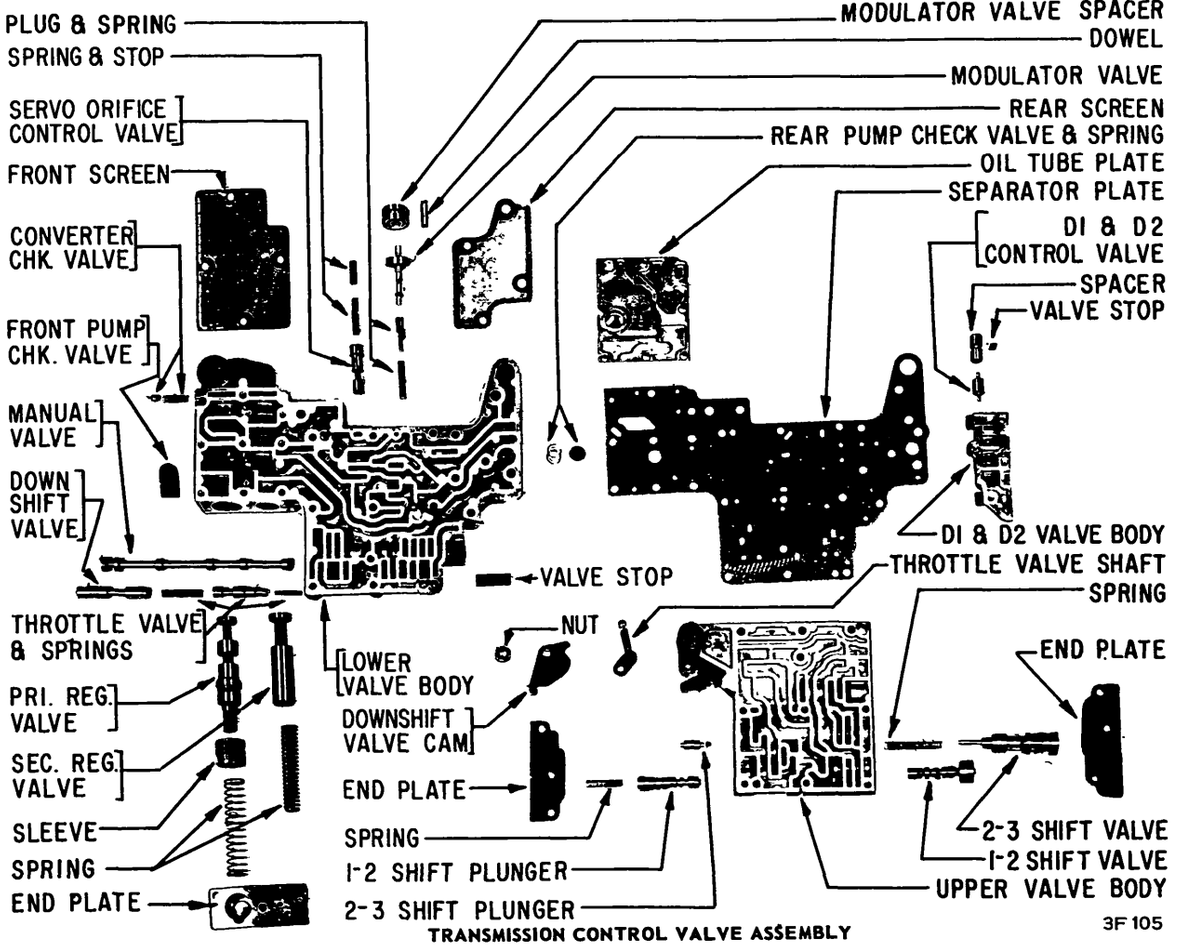
All M dels (R moval) - Remove oil pan and throttle control cable from transmission case, then remove control valve assembly. Remove park lever assembly by removing retaining spring and washer on inner end of toggle hub and remove toggle lift assembly from shaft. Remove tapered pin from case with Tool J-9644 and remove parking brake control toggle hub shaft from case.

Installati n - Install "O" ring seal on parking brake toggle hub shaft, then install shaft in case and tap tapered pin into place. Install parking pawl lift assembly on shaft, aligning teeth with shift control inner lever, and install washer and retaining pin. Install control valve assembly, oil pan and gasket.

TRANSMISSION & CONVERTER ASSEMBLY REMOVAL & INSTALLATION

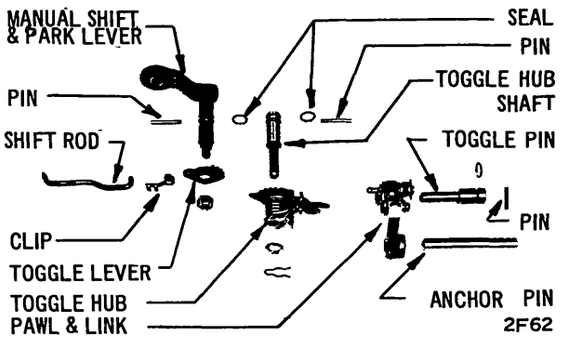
Removal

NOTE - On Rambler American Convertible, the transmission and converter must be removed and replaced separately.



Proceed as for "Transmission Removal" (see above) to the point where transmission case-to-converter housing bolts are to be removed and note the following additional instructions:

Rambler American (Exc. Convertible) - Remove converter housing lower mud pan, then remove capscrews retaining converter to drive plate. Remove crossmember side sill bolts and lower engine and transmission assembly. *NOTE - When lowering the assembly, place a wooden board ¾" x 6" x 16" between engine oil pan and front suspension crossmember so that engine will rest on board between oil pan and crossmember.* Remove engine-to-converter housing attaching bolts, then with all parts in alignment, pull transmission and converter assembly to rear until housing and converter are clear of engine and remove from car.



Rambler Classic - Support engine at rear, then remove starter motor. Disconnect crossmember from engine rear support transmission insulator and from side sills, then remove converter housing mud pan. Lower transmission and engine enough to clear floor pan and remove converter housing to engine bolts. Remove capscrews attaching torque converter to flex plate, then remove lower bellcrank and exhaust pipe bracket. Pull transmission and converter assembly to rear and remove from car.

Installation

Reverse removal procedure and use the two lower engine-to-converter housing bolts as dowels to guide housing into place. Tighten all bolts and nuts to specifications *(see "Tightening Specifications" below).*

TRANSMISSION CONTROL VALVE ASSEMBLY

MANUAL & PARK LINKAGE (ALL MODELS)

TRANSMISSION OVERHAUL

See 1962 Final Data, Page 513 and note the following:

Rambler Classic - Procedures outlined in 1962 Final Data, except for parking brake controls (see above), apply to 1963 models.

Tightening Specifications

Location	Torqu
Rear Extension to Case	100-120 In. Lbs.
Oil Pan to Case	100-120 In. Lbs.
Front Servo to Case	100-120 In. Lbs.
Rear Servo to Case	120-154 In. Lbs.
Frt. Pump Adapter to Housing ①	25-35 In. Lbs.
Frt. Pump Adapter to Housing ②	17-22 Ft. Lbs.
Frt. Pump Adapter to Case	120-200 In. Lbs.
Rear Pump to Case ②	55-66 In. Lbs.
Rear Pump to Case ①	20-30 In. Lbs.
Center Support to Case	120-154 In. Lbs.
Throttle Shaft Locknut	20-25 Ft. Lbs.

Rear Oil Screen	55-66 In. Lbs.
Gov. Valve Body to Weight	50-60 In. Lbs.
Gov. Valve Body Cover	20-30 In. Lbs.
Line Pressure Plug	4-6 Ft. Lbs.

① - 10-24 screws. ② - Exc. 10-24 screws.

RAMBLER EIGHT & CHECKER AUTOMATIC TRANSMISSION

DRIV-ER-MATIC & DUAL RANGE
Checker (1963)
FLASH-O-MATIC
Rambler Classic V8 (1963)
Rambler Ambassador V8 (1963)

PUSHING (TO START) & TOWING

Pushing Car To Start Engine

With selector lever in "N" (Neutral), push car until it reaches a speed of approximately 15-20 MPH, then turn ignition switch on and place selector lever in "L" (Low) until engine starts.

Towing Car

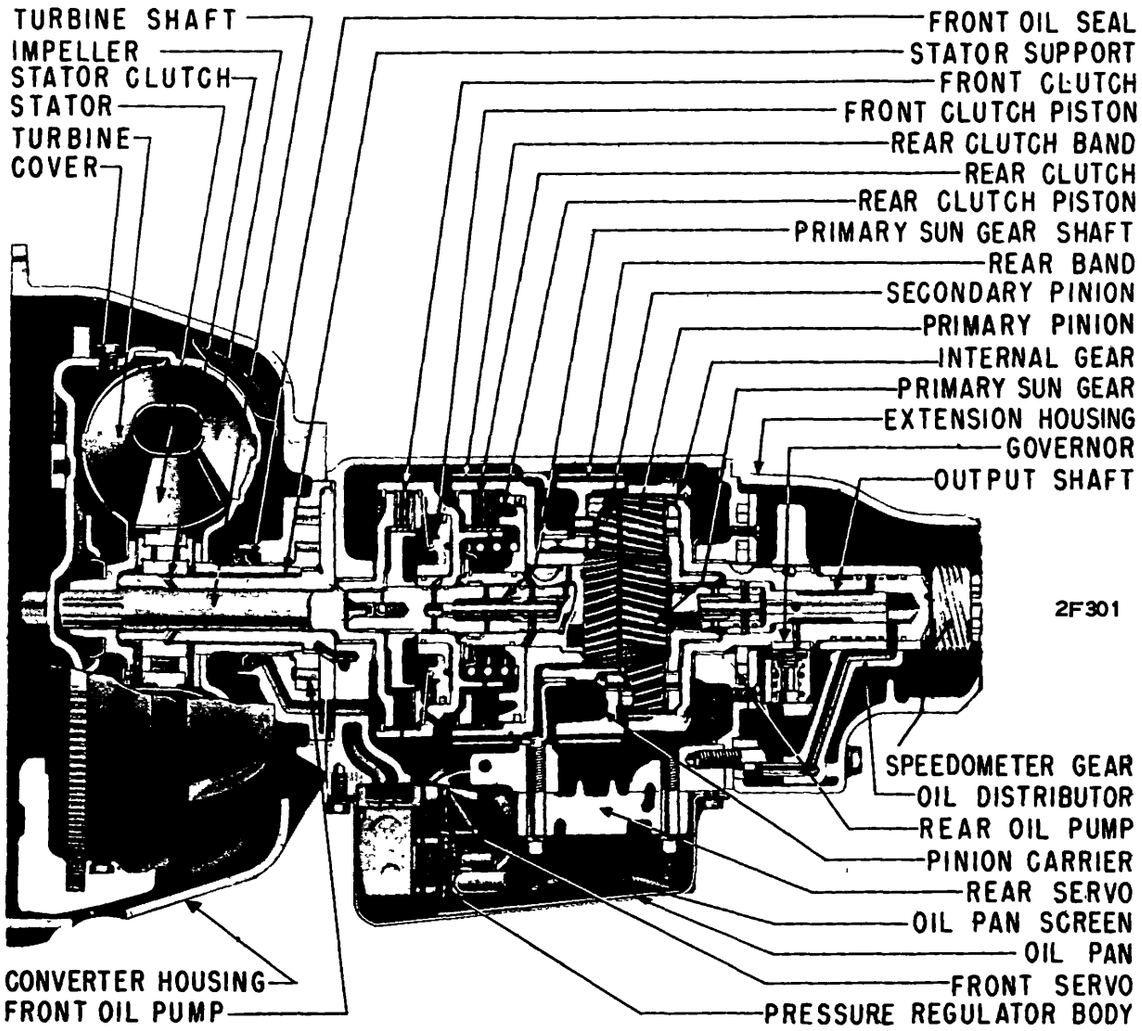
If transmission is operating properly, car may be towed for short distances with transmission selector lever in "N" (Neutral). If transmission is inoperative or if car is to be towed a long distance, raise rear wheels off ground or disconnect propeller shaft.

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 RAMBLER AMBASSADOR TRANSMISSION OIL SCREEN PRODUCTION CHANGE:* A new oil screen assembly, Part No. 3169500, is being used in production on later cars and may be used for service replacement on all 5880 through 6380 Series cars.

DESCRIPTION

Three speed hydraulically controlled automatic planetary transmission of same design used on previous models. A steering column mounted range selector lever is used on all models (pushbutton type selector not used on Rambler models).



LUBRICATION

Checking Fluid Level

Check fluid level every 1,000 miles (Checker); every 4,000 miles (Rambler). With transmission at normal operating temperature, engine at idle speed, move selector lever through all ranges momentarily and return to "N" (Rambler); "D2" (Checker). Check fluid level on dipstick and add recommended fluid as necessary to bring level up to "F" mark on dipstick. *NOTE - Approximately 2 pts. of fluid are required to raise level from "L" mark on dipstick to "F" mark on dipstick. Do not overfill.*

Draining & Refilling

RAMBLER NOTE - Draining and refilling is not recommended except at time of overhaul. With transmission at normal operating temperature, remove oil filler tube from side of transmission oil pan and allow transmission to drain. To drain converter on Rambler models, remove transmission oil pan and loosen control valve body to provide a "bleed", allowing converter to drain. On Checker models, remove two drain plugs from converter (180° apart) through opening in converter housing. To refill transmission and converter, install converter drain plugs (tighten control valve body and replace oil pan), then pour 5 qts. of recommended fluid into filler tube. Start engine and run it with selector lever in "N" (Neutral), then pour in 4 qts. of fluid and move selector lever through all ranges, returning to "N". Recheck fluid level and adjust to "F" mark on dipstick. Do not overfill.

RAMBLER V8 FLASH-O-MATIC TRANSMISSION

R c mmended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity

11 qts. (Rambler); 10 qts. (Checker).

ADJUSTMENT

Throttle Linkage

See CARBURETOR on Car Model pages.

Manual Linkage

Rambler - Place selector lever in "L" (Low) position, then disconnect gearshift rod trunnion from lever on transmission (make sure transmission lever is in extreme rear position). Adjust trunnion on gearshift rod for free entry into hole in bushing in transmission lever, then install washer and cotter pin. Check selector lever in all transmission positions. *(Continued)*

Checker - Disconnect manual shift rod from selector lever on steering column and lever on transmission Position transmission selector lever so indicator is down against stop in "D" (Drive) position then place manual lever on transmission in 'D" (Drive) detent (second from top of transmission) Adjust length of manual shift rod so it fits into ball joint on steering column and into shift lever on transmission without changing position of selector lever or manual lever on transmission Tighten ball joint nut at steering column and install washer and cotter pin at transmission lever Move selector lever through all ranges and check operation

N utral Safety Switch

Rambler - Located on steering jacket tube under instrument panel To adjust, loosen capscrews securing switch to jacket tube, then place transmission selector lever in "N" (Neutral) Use a 3/32" pin for alignment and insert pin in hole on face of switch then rotate switch until pin freely enters hole in switch toggle Tighten attaching screws and remove alignment pin *NOTE - Tang of switch must enter channel on operating shaft before securing switch to jacket* Check to make sure engine starts in "N" or "P" only

Checker - Starter circuit must be open in all positions except "N '(Neutral) To adjust loosen neutral switch-to steering column screws and position switch so starter circuit is closed when selector lever is in "N" (Neutral)

Kickdown Switch

Rambl r - Switch is located on engine side of firewall and is actuated by carburetor throttle linkage To adjust, hold accelerator pedal fully depressed, then adjust switch in bracket so plunger is depressed and switch is closed

Ch ck r - Loosen two nuts on kickdown switch (one above toeboard and the other below toeboard) and rotate upper nut to obtain a clearance of ¼" between switch and accelerator pedal when carburetor throttle valves are in wide open position

Vacuum Solenoid Unit

Rambl r - Remove pressure test plug at left front side of transmission and install the 1/8" pipe plug ex tension provided with Tool J-8773 (Vacuum Solenoid Control Adjusting Kit), then connect an oil pressure gauge to the extension Disconnect vacuum line at the vacuum solenoid unit and attach the vacuum gauge to the 'T" fitting on test line Start engine and bring to normal operating temperature with transmission in neutral At engine speed of 475 RPM transmission in neutral, turn needle valve on test line to lower vacuum reading on gauge to obtain a vacuum reading of 13 8" Hg With correct vacuum reading, oil pressure reading should be 85 lbs ± 3 lbs If oil pressure reading is not correct, loosen vacuum solenoid unit locknut and turn unit in toward case if pressure is too low, away from case if pressure is too high After making correct adjustment, cover the bleed hole provided in needle valve to stop atmospheric pressure entering the line This will bring vacuum reading on test gauge to optimum engine vacuum and the oil pressure gauge should then read 55-65 lbs With rear wheels raised off floor, place transmission in "D2" position, then cover bleed hole in needle valve Accelerate engine until transmission shifts into direct drive Pressure gauge should read 25-35 lbs *NOTE - If vacuum solenoid unit was removed for replacement or for transmission repairs, initially install unit so the measurement between back face of transmission case and front edge of vacuum solenoid unit is 23/64" Make final adjustment as indicated above*

Checker - After unit is installed on transmission case, it should be initially adjusted in or out so distance between front edge of unit and transmission case is 3/8" Remove 1/8" pipe plug from lower left corner of transmission case and install a 300 lb pressure gauge Remove fitting at rear of vacuum solenoid unit and install a vacuum gauge using a "T" fitting Install vacuum line so unit will operate and gauge will register Connect a tachometer to engine then start engine and run several minutes to bring to normal operating temperature Place selector lever in "D1" and apply parking brake and service brakes Accelerate engine until a reading of 10 5" Hg is obtained on vacuum gauge Reading on pressure gauge should be 90-105 lbs If pressure is below specifications, turn vacuum solenoid unit inward to increase pressure If above specifications, turn unit outward When correct pressure has been obtained, tighten locknut *NOTE - It is recommended that vacuum solenoid unit not be turned more than ½ turn either way from initial setting of 3/8" When making the above tests, do not operate engine more than 10 seconds at any one interval*

Front Band

With transmission oil pan and screen removed, use Tool J-5880-01 (Rambler), Tool No 7195 (Checker) and loosen adjusting screw, then insert gauge block (part of tool) between end of adjusting screw and servo piston rod Turn screw in until it overruns and remove gauge block *NOTE - It may be necessary to back adjusting screw off slightly to remove gauge block If so, be sure to tighten screw the same amount after block is removed* Tighten locknut to 20-25 ft lbs and install screen, gasket, and transmission oil pan Refill transmission *See "Torque Wrench Note" below*

Rear Band

Rambler - Loosen locknut on right hand side of transmission case and install Adapter J-21111 on adjusting screw Tighten adjusting screw to 10 ft lbs *(NOTE - This supersedes previous tightening specification of 9 ft lbs)* Back off adjusting screw 1½ turns and tighten locknut to 30 ft lbs *See "Torque Wrench Note" below*

Checker - Remove cover plate from floor pan and position Tool No 7225 on adjusting screw and loosen locknut Using "T" handle of tool, tighten adjusting screw until wrench overruns (10 ft lbs), **then back off adjusting screw 1½ turns.** Hold adjusting screw stationary and tighten locknut to 35-40 ft lbs

TORQUE WRENCH NOTE (Front & Rear Band Adjustment) - The adjusting screw tightening specifications given above are for tightening torque at the adjusting screw If the indicated adapters are used (lengthening the torque wrench), determine the proper torque wrench reading as follows Multiply torque required at adjusting screw by length of torque wrench (center of handle to center of drive), then divide the product by length of torque wrench plus length of adapter (center of drive socket to center of driven socket) The result will be the reading required on torque wrench to obtain proper torque at adjusting screw

TESTING

Stall Test

With engine at normal operating temperature, place transmission in "D1" position Apply parking brake and foot brake and accelerate engine with wide open throttle to 1600 RPM *CAUTION - Do not hold throttl open for more than 15 seconds* If engine speed will not reach 1600 RPM, poor engine performance is indicated An engine speed over 1600 RPM indicates transmission or converter slippage

Road Test

Drive car and check for upshifts and downshifts as indicated in following table

SHIFT SPEEDS

(Rambler Ambassador)
(Series 80)

Upshift	Light Throttle	Full Throttle	Kickd wn
1-2	10-14 MPH	26-30 MPH	37-41MPH
2-3	21-25 MPH	46-50 MPH	64-68 MPH
Downshift	**Closed Throttle**	**Full Throttle**	**Kickdown**
3-2	16-20 MPH	28-32 MPH	58-62 MPH
2-1	6-10 MPH		25-29 MPH

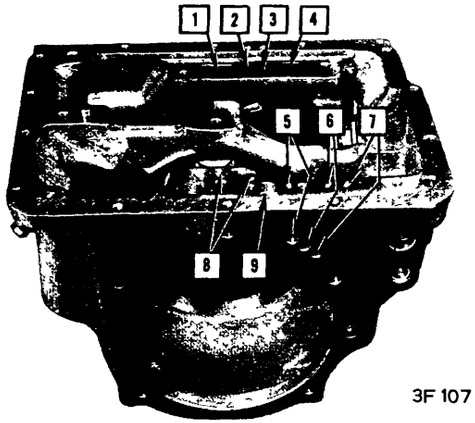
(Checker Superba)

Upshift	Light Throttle	Full Throttle	Kickdown
1-2	5-8 MPH	22-30 MPH	
2-3	10-13 MPH	41-50 MPH	
Downshift	**Closed Throttle**	**Full Throttle**	**Kickdown**
3-2	7-11 MPH		35-49 MPH
2-1	3-7 MPH		

Air Pressure Test

With transmission in car, remove oil pan and control valve assembly (leave front servo tubes in front servo and make sure servo attaching screw tight) *NOTE - When making air pressure tests, hold a clean towel over transmission opening to prevent excessive oil spray*

Front Clutch - Apply air pressure to front clutch passage (on transmission case rear flange) Listen for a dull thud indicating clutch is operating Retain air pressure in this passage for several seconds to check for leaks in this circuit



Governor Valve - Remove governor inspection hole cover and apply air pressure to front clutch passage (see above) Listen for a click and watch valve snap inward Replace inspection hole cover

Rear Clutch - Apply air pressure to rear clutch passage (on transmission case rear flange) Listen for a dull thud indicating clutch is operating Retain air pressure in this passage for several seconds to check for leaks in this circuit

(Continu d)

Front Band & Servo - Apply air pressure to front servo apply tube (rear tube) and note band application. **Rear Band & Servo** - Apply air pressure to rear clutch oil passage (on transmission case rear flange) and note band application.

TESTING NOTE; If servos, bands, clutches, and governor operate with air pressure, then the no-drive problems, erratic shift, or no-shift conditions indicate that the control valve assembly and pressure regulator assembly is the cause of the trouble. *See "Control Valve" and "Pressure Regulator Valve" below.*

3F 107

1. Front Pump Intake
2. To Converter
3. From Converter
4. Front Pump Discharge

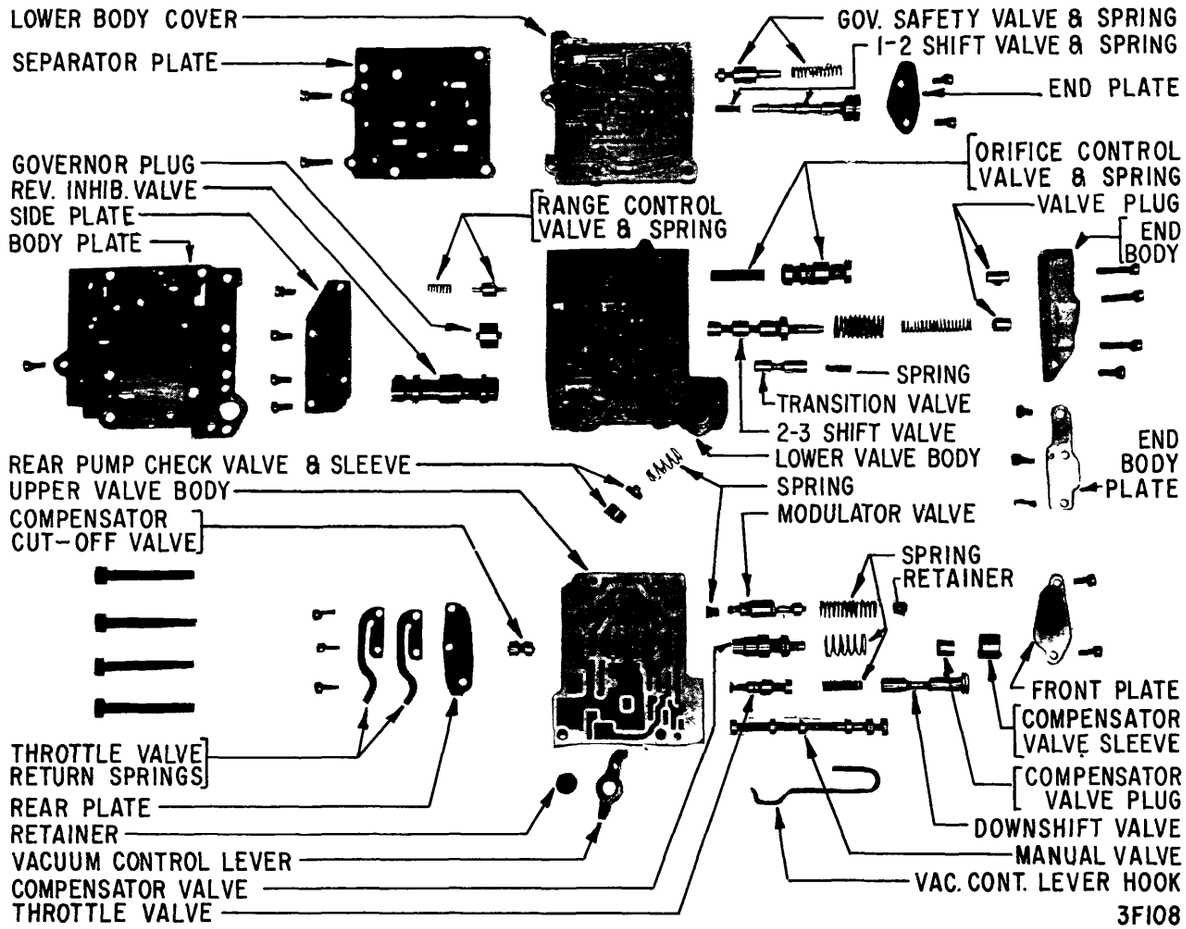
6. Front Clutch
7. Governor Output
8. Rear Servo

AIR PRESSURE TEST POINTS

TROUBLE SHOOTING & DIAGNOSIS

NOTE - Before making any corrections to transmission, check and adjust fluid level, manual linkage and throttle linkage, then recheck operation of transmission to determine if trouble has been improved or corrected.

Initial Engagement Rough



Idle speed may be too high. Control pressure may be too high caused by improper adjustment of throttle control vacuum unit. Control valve assembly or pressure regulator valve assembly may be dirty.

Initial Engagement Delayed

Fluid level may be low. Control pressure may be too low at idle speed, caused by low engine idle speed, dirty control valve or pressure regulator valve assemblies. Front pump may be worn. Fluid circuits may be leaking.

Inop rative in All Ranges

Fluid level may be low. Manual linkage may be disconnected. No control pressure, caused by inoperative front pump (check front pump and front pump drive tangs on converter). Rear band and (or) servo not operating. Converter may be slipping. *NOTE - If there is no drive in "D1" position only, check sprag clutch.*

RAMBLER V8 CONTROL VALVE ASSEMBLY

No Drive in "D" or "L" Position

Fluid level may be low. Manual linkage may be improperly adjusted. Control pressure may be low, caused by improper adjustment of vacuum control unit, or dirty control and pressure regulator assemblies. Front clutch or rear band not applying. Transition valve in control valve assembly may be sticking.

No Drive in "R" Position

Fluid level may be low. Manual linkage may be improperly adjusted. Control pressure may be low, caused by improper adjustment of vacuum control unit, or dirty control and pressure regulator assemblies. Rear clutch or rear band not applying. Transition valve in control valve assembly may be sticking. *NOTE - If there is no drive in "R" position at times from "D2" position, range control valve may be stuck. If necessary, remov and chamfer both ends of valve.*

Locks Up in "D" Position (1st Gear)

Rear clutch is applied, caused by faulty control valve assembly, dirty governor valve, or mechanical failure in rear clutch.

Locks Up in "D" Position (2nd G ar)

Rear band or sprag applied. Rear clutch may be applied.

L cks Up in "D" Position (3rd G ar)

Rear band or sprag clutch applied, caused by dirty control valve assembly or by mechanical failure. Front band .may be applied because of mechanical failure.

(Continued)

Locks Up in "R" Position

Front clutch applied, check for mechanical failure Front band applied, check for mechanical failure or for a dirty control valve assembly.

Slips in "L" Position

Fluid level may be low. Vacuum and solenoid unit may not be properly adjusted. Control pressure low, caused by a dirty control valve and pressure regulator valve assembly. Rear servo travel is limited or front clutch slips. Check for mechanical failure. Rear pump check valve stuck open.

Slips in "D" (1st Gear)

Fluid level may be low. Vacuum solenoid unit may not be properly adjusted. Control pressure low, caused by a dirty control valve and pressure regulator valve assembly. Check sprag clutch for slippage. Front clutch slipping. Rear pump check valve stuck open.

Slips in "R" Position

Fluid level may be low. Control pressure low, caused by a dirty control valve and pressure regulator valve assembly. Vacuum solenoid may not be properly adjusted. Rear servo travel limited. Rear clutch slipping. Rear pump check valve stuck open.

1-2 Upshift Rough

Vacuum solenoid unit may not be properly adjusted. Front band out of adjustment. Governor valve stuck.

1-2 Upshift Slips

Vacuum solenoid may not be properly adjusted. Front band not properly adjusted or servo piston travel is limited. Front band glazed. Governor valve stuck.

N 1-2 Upshift

Governor valve or 1-2 shift valve stuck.

1-2 Upshift Lat

Governor valve stuck or a leak in governor circuit. Control pressure too high, caused by an improperly adjusted vacuum solenoid unit or by a dirty control valve assembly. *NOTE - If 1-2 Upshift is early, check for a stuck governor valve.*

2-3 Upshift Rough

2-3 Upshift Rough

Control pressure too high, caused by an improperly adjusted vacuum solenoid unit Front band not adjusted properly. Governor valve stuck.

2-3 Upshift Slips

Control pressure too low, caused by an improperly adjusted vacuum solenoid unit. Front band not adjusted properly. Governor valve stuck. Internal leakage in transmission.

No Direct Drive or 2-3 Upshift

Governor valve stuck. 2-3 shift valve stuck. Bushing in output shaft misaligned.

2-3 Upshift Late

Governor valve stuck or leak in governor circuit Vacuum solenoid not properly adjusted. *NOTE - If 2-3 Upshift early, check for stuck governor valve.*

3-2 Downshift Rough (Clo

3-2 Downshift Rough (Closed Throttle)

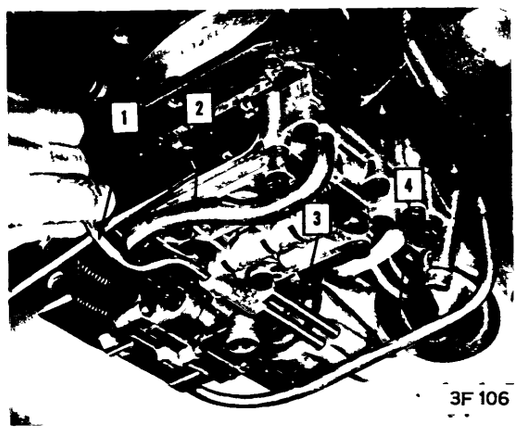
Vacuum solenoid not properly adjusted. Orifice control valve stuck.

3-2 Kickdown Early

Vacuum solenoid not properly adjusted. Kickdown switch not properly adjusted. *NOTE - If there is no kickdown, check for loss of current through kickdown switch.*

No Push Start

Rear pump inoperative. Pressure regulator valve stuck.



No Park Position

Manual linkage out of adjustment. Damaged internal linkage or parking pawl.

REMOVAL & INSTALLATION

See 1962 Final Data, Page 520 and note the following changes in procedure.

Rambler - A manual control rod replaces the shift cable used on previous models. Disconnect manual rod at transmission manual shift lever.

1. Compensator Tube
2. Control Pressure Tube
3. Front Servo Tubes
4. Lubrication Tube

CONTROL VALVE BODY TUBE LOCATION

TRANSMISSION OVERHAUL

CONVERTER OVERHAUL NOTE - Torque converter is a sealed assembly (case is welded together during manufacture) and cannot be disassembled for service.

Transmission Overhaul

See "Warner Automatic Transmission" in 1960 Final Data, Page 506, or later Manual edition and note th following:

Manual Linkage & Parking Pawl - Removal - To remove detent ball and spring, hold detent ball down, then move manual shaft lever toward rear of case Remove manual shaft lever nut and remove shaft from case, then remove oil seal from case. Remove torsion lever assembly by removing retaining clips from detent and torsion rod and remove rod. Remove torsion lever shaft by tapping it out of case. Tilt case or use a magnet to remove parking pawl shaft. Partially remove toggle lever shaft plug by tapping on toggle lever from inside, case, then complete removal with snap ring pliers, and remove toggle lever shaft and assembly.

Installation - Reverse removal procedure, installing a new toggle lever shaft plug and a new manual lever shaft oil seal.

Tightening Specifications

Location	Torqu
Converter to Drive Plate	23-28 Ft. Lbs.
Front Pump to Case	17-22 Ft. Lbs.
Front Servo to Case	30-35 Ft. Lbs.
Rear Servo to Case	40-45 Ft. Lbs.
Planetary Support to Case	20-25 Ft. Lbs.
Oil Distributor to Sleeve	8-10 Ft. Lbs.
Upper Valve Body to Lower Body	4-6 Ft. Lbs.
Valve Body to Case	8-10 Ft. Lbs.
Pressure Regulator to Case	17-22 Ft. Lbs.
Extension Housing to Case	28-33 Ft. Lbs.
Oil Pan to Case	10-13 Ft. Lbs.
Pressure Gauge Hole Plug	7-15 Ft. Lbs.
Oil Pan Drain Plug	20-25 Ft. Lbs.
Rear Band Adj. Screw Locknut	35-40 Ft. Lbs.
Front Band Adj. Screw Locknut	20-25 Ft. Lbs.
Detent Lever Attaching Nut	35-40 Ft. Lbs.
Front Pump Cover	25-35 In. Lbs.
Rear Pump Cover (¼")	50-60 In. Lbs.
Rear Pump Cover (10-24)	20-30 In. Lbs.
Governor Insp. Cover	50-60 In. Lbs.
Gov. Valve Body to Counterweight	50-60 In. Lbs.
Governor Valve Body Cover	20-30 In. Lbs.
Pressure Regulator Cover	20-30 In. Lbs.
Control Valve Body Screws	20-30 In. Lbs.

Control Valve Lower Body Plug	7-15 Ft. Lbs.
Transmission Vent Assembly	7-10 Ft. Lbs.

STUDEBAKER SIX M-35 AUTOMATIC TRANSMISSION

Studebaker Lark Six (Exc. Police & Taxi) (1963)

PUSHING (TO START) & TOWING

Pushing Car To Start Engine

Move selector lever to "N" (Neutral) position. When car speed reaches 15-25 MPH, turn ignition switch on and move selector lever to "L" (Low) position.

Towing Or Pushing Car

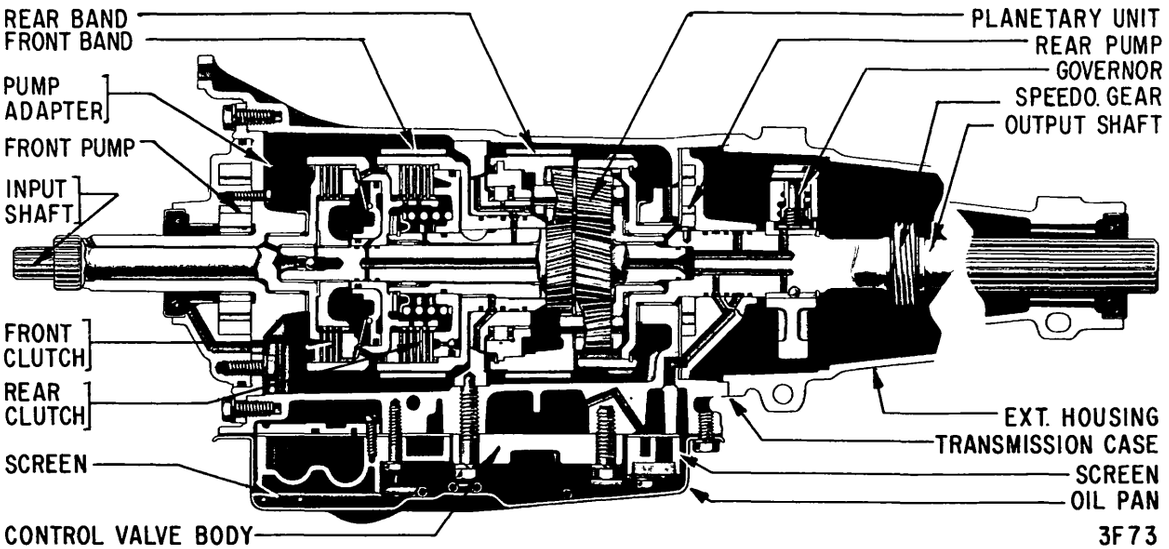
If transmission is operating properly, car may be towed for short distances by placing selector lever in "N" (Neutral) position. If transmission is inoperative or if car is to be towed for a prolonged period, disconnect propeller shaft or tow with rear wheels off ground.

►CHANGES, CAUTIONS, CORRECTIONS

►*THROTTLE LINKAGE BINDING ON THROTTLE CONTROL LEVER ON TRANSMISSION CORRECTION (EARLY CARS):* Replace Outer Throttle Control Lever. In addition, the wave washer should be placed on top of throttle control lever on transmission to prevent rod from interfering with transmission case.

DESCRIPTION

Three speed hydraulically controlled planetary transmission with sealed torque converter assembly. Transmission case and torque converter housing are aluminum castings. The starter ring gear is welded to converter impeller housing and is not serviced separately.



LUBRICATION

Checking Fluid Level

Check fluid level every 1,000 miles. With transmission at normal operating temperature, place selector lever in "N" or "P" position, then apply parking and foot brake and move selector lever from "P" or "N" to the "L" position and then back to "P" or "N". Check fluid level on dipstick and add necessary recommended fluid to bring fluid to "F" mark on dipstick. *NOTE - Approximately 1½ pts. of fluid is required to raise level from "L" mark on dipstick to "F" mark.*

Draining & Refilling

NOTE - Change fluid only as required. If transmission pan is removed, the drained quantity of fluid should not be reused. Replace all fluid whenever torque converter or transmission is replaced or disassembled. With transmission at normal operating temperature; remove filler tube from transmission oil pan and allow to drain. Rotate converter until drain plug is visible through hole in housing, then remove plug. Remove transmission oil pan and clean screens. Replace screens and oil pan, using a new gasket, then install filler tube. Install three quarts of recommended fluid, then start engine and place transmission selector lever in "N" (Neutral). Slowly pour in four quarts of fluid and then move selector lever through all ranges. Check fluid level and add sufficient fluid to bring level to midway between "L" and "F" marks on dipstick. Bring transmission to normal operating temperature and fill transmission to "F" mark. DO NOT OVERFILL.

STUDEBAKER SIX M-35 AUTOMATIC TRANSMISSION

Recommended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A").

Capacity

7½ qts. (Approximate), after draining transmission and converter.

ADJUSTMENT

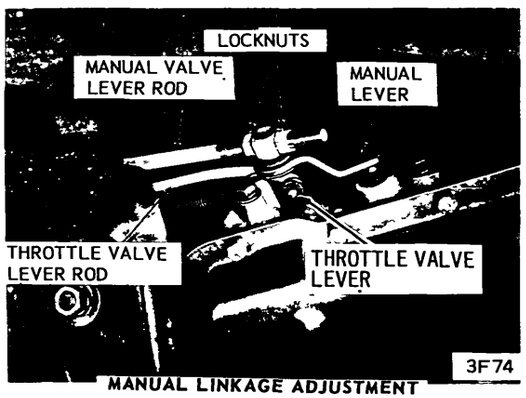
Throttle Linkage

See CARBURETOR on Car Model pages.

Manual Shift Linkage

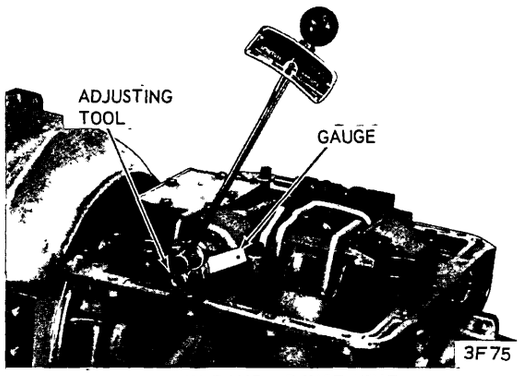
Disconnect shift lever-to-transmission manual valve lever rod (see "Manual Linkage Adjustment" illustration) at transmission lever by removing swivel assembly, then place selector lever in "R" position and place manual lever on transmission in "R" position (end of manual lever travel). Loosen locknuts and adjust shift lever-to-manual lever rod until swivel pin will slip freely into hole in manual lever. Tighten both locknuts and reinstall swivel on manual lever. Check quadrant positions against transmission detents and readjust if necessary.

Neutral Safety Switch



Place transmission selector lever in "N" (Neutral), then loosen switch bracket on steering column jacket. Align pin hole in switch lever with corresponding hole in switch body and install pin to maintain alignment. Tighten bracket attaching screws, then test operation of switch. Engine should start only with selector lever in "P" (Park) or "N" (Neutral) positions.

Front Band



Remove transmission oil pan, then loosen front servo adjusting screw locknut two full turns. Insert a .250" gauge block between servo piston rod and adjusting screw (see "Front Band Adjustment" illustration). Place adjusting tool, J-9636, on adjusting screw and tighten to 10 inch pounds with an accurate torque wrench. Tighten locknut to 20-25 ft. lbs. and remove gauge block. Replace oil pan, using a new gasket and refill transmission.

Rear Band

Fold back floor covering on right side, then remove inspection cover and loosen rear band adjusting screw locknut. Use rear band adjusting tool, J-5883, and tighten screw until tool overruns, **th n back ff adjusting screw ¾ turn** and tighten locknut to 20-25 ft. lbs. *CAUTION - Adjusting screw must be backed off EXACTLY ¾ turn.*

MANUAL LINKAGE ADJUSTMENT

FRONT BAND ADJUSTMENT

TESTING

Road Test

NOTE - Check and adjust transmission fluid level before road testing car. Check application of bands and clutches in all driving ranges by stopping car and moving selector lever to all various positions.

1) If car does not move forward in "D" (Drive), but reverses normally, place selector lever in "L" (Low). If car now moves forward, the one-way clutch is slipping. If car does not move forward or slippage exists, front clutch is slipping.

2) If car does not move rearward in "R" (Reverse), but drives forward (in forward ranges), the rear band or rear clutch is slipping. To determine whether rear band or rear clutch is slipping, tighten rear band adjusting screw until band holds the drum mechanically. If car moves rearward, rear band was slipping. If, after tightening rear band onto drum, transmission still slips in reverse, the rear clutch is slipping.

3) If only one upshift occurs, and that shift is from first to direct, front band slippage is indicated.

4) If no upshift occurs in "D" (Drive), sticking governor or incorrect control pressure is indicated.

5) While going downhill, place selector lever in "L" (Low) at 20 MPH and close the throttle. An automatic downshift to first should occur between 9-13 MPH, and engine braking should be noticed. If car freewheels after downshifting from second, the rear band is slipping.

6) If all upshifts are high and tend to be harsh, excessively high control pressure is indicated.

7) If slippage is noted during second-to-direct upshift, or during a direct-to-second downshift, and shift speeds tend to be slow, excessively low control pressure is indicated. *NOTE - With a cold transmission, some slippag may b noted during the first or second 2-3 upshift. This is a normal condition.*

8) If kickdown position upshift speeds are low, or if kickdown downshifts are difficult to obtain, check for detent feel near wide open throttle position. If detent cannot be felt, adjust position of accelerator pedal.

9) Place selector lever in "D" (Drive) and check shift speeds. S *"Shift Sp d Tabl " below.*

Shift Sp eds

UPSHIFTS	Thr ttl	℄ Speed (MPH)
1-2	Minimum	5-8
2-3	Minimum	11-15
1-2	At Detent	24-29
2-3	At Detent	42-48
1-2	Thru Detent	34-40
2-3	Thru Detent	57-63
DOWNSHIFTS	**Throttle**	**℄ Speed (MPH)**
3-2	Thru Detent	52-59
2-1	Thru Detent	19-23
2-1	Inhibited	9-13
3-1	Closed	3-5

℄ - With 3.73-1 axle ratio.

Stall Test

Connect a tachometer to engine, then start engine and place selector lever in "D" (Drive). Apply brakes and run engine at full throttle, noting the tachometer reading. Repeat this procedure with transmission in "L" (Low) and "R" (Reverse). Stall speed should be 1450-1500 RPM. *NOTE* - A stall speed of 800-1000 RPM (engine in good operating condition), is caused by slippage in transmission. A stall speed of 1000-1450 RPM usually indicates engine problems rather than converter problems. *CAUTION - DO NOT hold stall condition for more than 10 seconds at one time, or for a total period exceeding ½ minute in any one half hour period.*

Free Running Test

With selector lever in "N" (Neutral), slowly accelerate engine. If tachometer reading readily reaches 4000 RPM before wide open throttle is obtained, release accelerator immediately. *CAUTION - Do not run engine over 4000 RPM with no load.* The result of this test indicates that converter stator is NOT stuck (it is freewheeling). If at wide open throttle, engine speed is 3900 RPM or less, a stuck stator is indicated.

Fluid Pressure Tests

NOTE - Remove 1/8" pipe plug located near flange of case at rear, below extension housing, then proceed as follows:

Idle Pressure - With engine at normal operating temperature and at idle speed, move selector lever to "D" (Drive), "L" (Low) and "R" (Reverse). Pressure should be 50-62 lbs. in all ranges. *NOTE* - If pressure is low in any one range, a fluid leak is indicated in that circuit and requires correction. If pressure is high, check and adjust throttle linkage.

Pressure Build-Up Check - Place selector lever in "D" (Drive) and apply brakes. Run engine at 1000 RPM and check pressure on gauge which should be 85-95 lbs. *NOTE - If pressure is less than specified limits, throttle valve linkage is too long. If more than specified limits, throttle valve linkage is too short.*

Stall Pressure - Apply brakes and move selector lever to "D" (Drive). Run engine at full kickdown position and check pressure gauge. Reading should be 170-200 lbs. in "D", "L" and "R".

PRESSURE TESTING NOTE - Pressur variati ns in xc ss of 10 lbs. for any giv n t st must b inv stigated further, particularly f r malfunctioning in thr ttle valv , modulator valv , or primary r sec ndary regulat r valv .

TROUBLE SHOOTING & DIAGNOSIS

Rough Initial Engagement

Idle speed is too high. Control pressure is too high.

Delayed Initial Engagement

Fluid level low. Control pressure too low at idle speed.

Inoperative In All Ranges

Fluid level low. Manual linkage disconnected. No control pressure. Rear band or servo inoperative. Converter failure. *NOTE - Check sprag clutch if there is no drive in "D1" position only.*

No Drive In "D" or "L"

Fluid level low. Manual linkage not properly adjusted. Control pressure low. Front clutch not applying. Rear band not applying. Transition valve stuck.

No Drive In Reverse

Fluid level low. Manual linkage not adjusted properly. Control pressure low. Rear clutch not applying. Rear band not applying. Transition valve stuck.

Locks Up In "D"

First Gear - Rear clutch applied.
Second Gear - Rear band or sprag clutch applied. Rear clutch applied.
Third Gear - Rear band or sprag clutch applied. Front band applied.

Locks Up In "R"

Front clutch or front band applied.

Slippage

Reverse - Fluid level low. Control pressure low. Rear servo travel limited. Rear clutch slips. Rear pump check valve stuck open.
Low - Fluid level low. Control pressure low. Rear servo travel limited. Front clutch slips. Rear pump check valve stuck open.
Drive (1st Gear) - Fluid level low.
Sprag Clutch - Front pump slips. Rear pump check valve stuck open.
1-2 Upshift - Control pressure low. Incorrect band adjustment. Governor valve stuck. Front servo piston travel limited. Front band glazed.
2-3 Upshift - Control pressure low. Front band improperly adjusted. Governor valve stuck. Internal leakage.

Rough Upshift

1-2 Shift - Control pressure too high. Bands not adjusted properly. Governor valve stuck.
2-3 Shift - Control pressure too high. Bands not adjusted properly. Governor valve stuck.

Rough Downshift

Cl s d Thr ttl - Throttle linkage not adjusted properly. Orifice control valve stuck. Engine idle speed too high.

(Continued)

No Upshift

1-2 Shift - Governor valve stuck. 1-2 shift valve stuck. **2-3 or No Direct Drive** - Governor valve stuck. 2-3 shift valve stuck. Bushing in output shaft misaligned.

Early Upshift

1-2 & 2-3 Shifts - Governor valve stuck. Control pressure low.

Late Upshift

1-2 & 2-3 Shifts - Governor valve stuck. Leak in governor circuit. Control pressure too high.

Early 3-2 Kickdown

Throttle linkage not adjusted properly.

No Kickdown

Throttle linkage not adjusted properly. Control valves sticking.

No Push Start

Rear pump inoperative. Pressure regulator valve stuck.

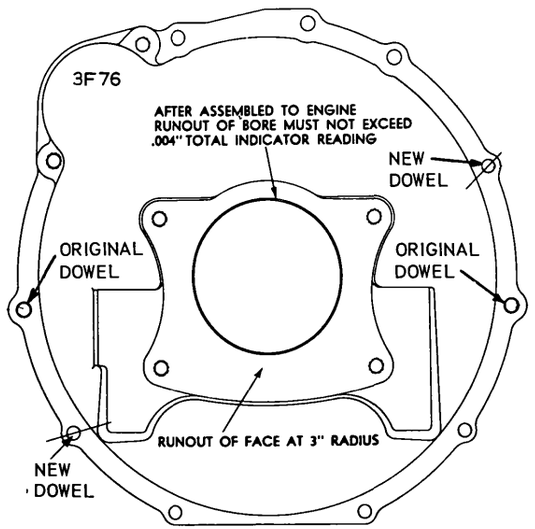
No Park Position

Improper manual linkage adjustment. Damaged internal linkage. Damaged park pawl.

REMOVAL & INSTALLATION

Transmission

Removal - Drain transmission and converter, then remove propeller shaft assembly. Disconnect rods from levers at transmission, then remove speedometer cable and pinion. Place a transmission cradle under transmission oil pan flange and remove transmission-to-converter bell housing capscrews. Install transmission-to-converter housing guide pins, Tool J-21254, into upper capscrew holes, then slide transmission rearward until front of transmission clears converter housing and remove transmission. *NOTE - On Station Wagons and Convertibles, position rear of transmission assembly over "X" member of frame and move assembly toward rear until front of transmission is clear of converter housing (in some cases it may be necessary to remove crossmember and lower engine for clearance).*



Installation - Reverse removal procedure and tighten all bolts and nuts to specifications (see "Tightening Specifications" below).

Torque Converter

Removal - Remove transmission assembly (see above); then remove starter motor. Disconnect tailpipe supports at converter housing and remove engine rear insulator stud nuts and jack up rear of engine enough to separate insulator from crossmember. Remove engine rear support crossmember. Remove converter bell housing and splash shield, being careful not to damage bell housing dowels or distort converter blower. Lower rear of engine (do not pull water outlet hose off), then remove converter drive plate-to-converter screws and remove converter.

Installation - Reverse removal procedure, using converter aligning tool, J-21257, in bore of converter housing and over pump drive fingers on converter assembly. Tighten all bolts and nuts to specifications (see "Tightening Specifications" below).

Alignment (New Converter Housing) - Install housing (converter removed) on dowels and tighten capscrews and bolts, then install clutch aligning gauge, Tool J-2045, in end of crankshaft, making sure gauge is centered and locked securely. Install dial indicator on gauge and set indicator on face of housing at a 3" radius. Turn crankshaft and check total indicator reading. If face runout exceeds .006", replace housing. Place dial indicator in the bore and turn crankshaft slowly. If bore runout exceeds .004" total reading, reposition housing and relocate dowels. To reposition dowels, enlarge the two holes to be used as new dowel positions, then ream holes to .3900-.3905" and insert original dowel bolts in the new holes (see "Housing Alignment" illustration).

CONVERTER HOUSING ALIGNMENT

TRANSMISSION UNIT REPLACEMENT (TRANSMISSION IN CAR)

Using the same procedure as for "Transmission Out of Car" (see below), the following sub-assemblies can be removed and replaced with transmission in car. Oil Pan Gasket & Screen; Control Valve Body & Pressure Regulator; Front & Rear Servos; Control Shift Inner Levers; Manual Control Shaft Seals; Parking Brake Control Shaft; Parking Pawl Assembly; Extension Housing (Exc. Sta. Wgn. & Conv.); Extension Housing Oil Seal & Bushing; Speedometer Drive Gear (Exc. Sta. Wgn. & Conv.); Governor Valve Body; Rear Pump (Exc. Sta. Wgn. & Conv.).

TRANSMISSION UNIT REMOVAL (TRANSMISSION OUT OF CAR)

Valve Body

Remove oil pan and screen, then remove rear servo apply tube, rear clutch tube and front servo apply and release tubes. Remove shift rod retaining clip and disengage rod from inside detent lever. Remove throttle valve shaft lever and washer, then remove valve-to-case retaining cap screws and remove valve body. Remove front pump oil pressure tube, suction tube and "O" ring, and converter "in" and "out" tubes from front pump.

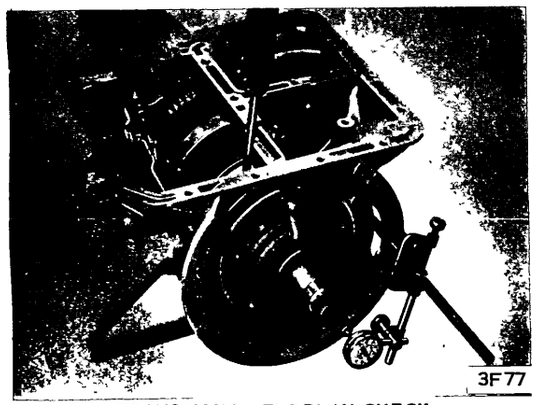
Front & Rear Servos

Remove two capscrews at each servo and remove servos and struts from case.

Transmission Endplay

NOTE - Check and record transmission endplay befor proceeding with disassembly. Th endplay measurement will be required during reassembly.

Remove one front pump attaching screw and screw dial dial indicator support rod J-5864 in hole, then mount a dial indicator on support with contact on end of input shaft (see "Endplay Check" illustration). Insert a screwdriver between front clutch cylinder and case and pry cylinder to rear of transmission. Set dial indicator at zero, then insert screwdriver between large internal gear and case and pry units toward front of transmission. Record the reading obtained. Endplay should be .009-.032".



Front Pump

Remove pump attaching screws and remove pump assembly, gasket and selective washer.

Clutches & Sun Gear

Remove front and rear clutches and forward sun gear assembly out through front of case (start units out of case by inserting a screwdriver between rear clutch drum and center support). *CAUTION - Do not allow units to separate during removal.*

(Continued)

TRANSMISSION ENDPLAY CHECK

Front Band

Remove front band through front of case. *NOTE - Front and rear bands are interchangeable.*

Pinion Carrier

Remove two center support screws from outside of case, then remove center support and planet carrier assemblies through front of case. The sprag clutch is located between center support and planet carrier assemblies.

Rear Band

Remove rear band through front of case. *NOTE - Front and rear bands are interchangeable.*

Extension Housing

If rear oil seal is to be replaced, remove seal with Tools J-2619 and J-4830-02. Remove capscrews, then remove extension housing and gasket from output shaft.

Speedometer Gear

Remove speedometer gear outer snap ring, speedometer gear, ball drive and inner snap ring from output shaft.

Governor

Remove governor snap ring and slip governor assembly off shaft, then remove drive ball from recess in output shaft.

Rear Pump

Remove attaching screws and remove rear pump body, driven and drive gears from output shaft. Remove three oil rings and pump drive key from output shaft, then remove pump plate.

Output Shaft

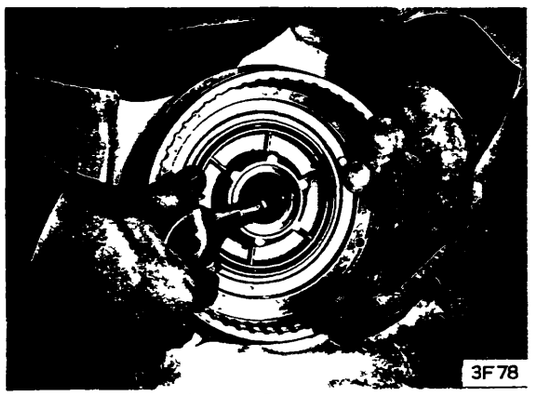
Remove output shaft and rear thrust washer through front of case.

Internal Linkage

Position Tool J-9644 with projection of tool in top end of hole (top end of tapered pin retaining manual valve lever shaft), then tighten tool screw and force pin out of hole. Remove nut on inner end of shaft and remove manual valve lever shaft from case. Remove tapered pin holding park lever toggle shaft with Tool J-9644. Remove park lever retainer clip and washer from end of toggle shaft and remove toggle lift lever assembly and shaft. Remove parking toggle roll pin and parking toggle pin from case, then remove parking brake anchor pin. *NOTE - A magnet can be used to draw pin from case.* Remove parking brake toggle link and pawl assembly.

TRANSMISSION UNIT OVERHAUL

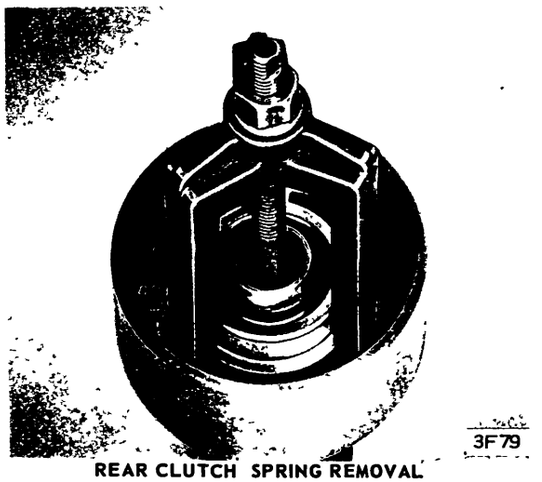
Front Clutch



Disassembly - Separate front clutch and input shaft assembly off rear clutch and remove input shaft snap ring and input shaft. Remove fibre thrust washer, then lift out clutch hub, four lined and four steel plates from drum. Remove front clutch return spring snap ring and remove spring. Apply air pressure to inside diameter of hub at oil hole and blow piston out of bore (see illustration). Remove rubber piston seal and piston steel wear ring from piston, then remove "O" ring seal from clutch hub.

Inspection - Inspect all parts for overheating, metal pick-up, cracks or burrs on thrust surfaces, splines and serrations. Inspect clutch plates for burrs, distortion, wear and flatness. *NOTE - Lined plates must be replaced when grooves of lining are no longer visible or if plates are warped.* Inspect steel plates for burrs on serrations, distortion, and tooth wear.

Reassembly - Lubricate all parts with transmission fluid, then install "O" ring seal on clutch drum hub and a new seal on clutch piston. Install piston in clutch drum bore, pressing it down until it bottoms in bore (be careful not to damage outer piston seal). Install metal wear ring and return spring on piston (concave side of spring upward), then install return spring snap ring.



Rear Clutch & Sun Gear

Disassembly - **1)** Remove bronze and steel thrust washers from rear clutch drum, then remove two oil seal rings from sun gear shaft and lift clutch assembly upward off shaft. Remove sun gear from planet carrier. **2)** Remove locking type oil ring from rear of sun gear shaft and remove needle thrust bearings from each side of sun gear. **3)** Remove pressure plate retaining snap ring, clutch pressure plate, lined plates, and steel plates from clutch drum. Position spring compressor, Tool J-5886 and adaptor, Tool J-5886-5 over clutch spring retainer and compress spring, then remove snap ring, (see illustration). **4)** Remove compressor tool adapter, spring retainer, and spring. Apply air pressure to hole in outer diameter of clutch cylinder hub and blow out piston. Remove clutch piston seal and "O" ring seal from clutch drum hub. *NOTE* - When handling rear clutch drum, use care as needle bearings will fall out when assembly is removed from sun gear. There are thirty rollers in bearing assembly, and it is recommended that a heavy grease be used when installing roller into bearing cage.

FRONT CLUTCH PISTON REMOVAL

Inspection - Inspect all parts for burrs, scratches, worn ring grooves and broken teeth. Use an awl to check front clutch lubrication ball check valve in front end of sun gear shaft for freedom of movement. Check clutch drum for scores on band surfaces and in piston bore. Inspect ball check in piston and make sure it is free to float. Apply clean compressed air to see that ball seats tightly. Inspect lined plates for overheating, metal pick-up, and excessive wear. If grooves in plates are no longer visible, replace plate. Check steel plates for scratches, burrs and for proper coning. *NOTE - Each steel plate is coned .010-.020" (clearance at inner diameter of plate). Replace all plates that do not have proper coning. If one plate, lined or steel, requires replacement, the entire clutch pack should be replaced.* Inspect front clutch release spring for distortion.

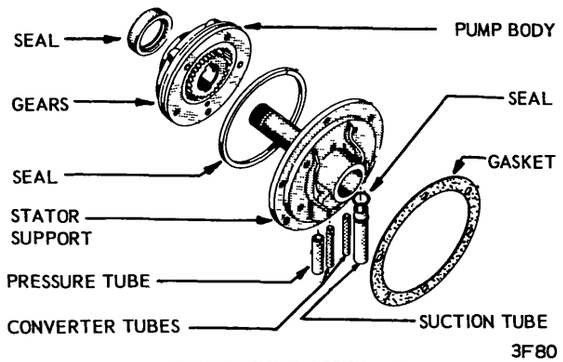
REAR CLUTCH SPRING REMOVAL

Reassembly - **1)** Lubricate all parts with transmission fluid, then install a new clutch piston inner "O" ring seal on clutch drum hub and a new outer seal on clutch piston. Place piston in installer, Tool J-9621, and with tool on bench, tap piston down in bore of tool. Place tool in bore of clutch cylinder and using a suitable tool, tap piston into place in rear clutch drum. **2)** Install return spring, retainer and snap ring in rear drum and compress spring with Tool J-5886 and J-5886-5, then install snap ring and remove compressor tools. **3)** Starting with a steel plate, install lined and steel plates alternately, being sure to align serrations of plates with serrations in clutch drum. *NOTE - Steel plates are installed with concave side in the upward direction.* Install clutch pressure plate with smooth side downward and install retaining snap ring. **4)** Place sun gear in planet carrier with one needle thrust bearing on top side of gear and install rear clutch assembly on the shaft. *CAUTION - Be sure all needle bearings are in place in rear clutch drum.* Install two oil seal rings on forward sun gear shaft, then install steel and bronze washers on shaft. Install

(Continued)

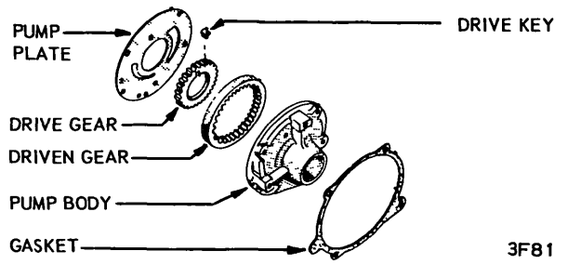
front clutch hub on sun gear shaft, then install clutch pressure plate with smooth side upward and clutch hub with thrust face upward in clutch drum bore. 5) Starting with a lined plate, install lined and steel plates alternately, being sure to align serrations of plates with serrations in hub and drum. Coat clutch fibre washer with heavy grease and position it on clutch hub. Align serrations of clutch cover and turbine shaft with serrations in clutch drum and install cover and snap ring. Remove front and rear clutch assemblies from planet carrier, being careful not to separate the two clutch units.

Center Support



NOTE - Center support is serviced as a complete assembly. Inspect support race and bushing for scoring and excessive wear and check feed hole for obstructions.

Pinion Carrier & One-Way Clutch



Disassembly - Slip the one-way clutch out of outer race. *NOTE - Do not remove outer race unless replacement is necessary. If required, remove snap ring in carrier and remove race.* Planetary pinions are serviced as part of pinion carrier and no further disassembly is required.

Inspection - Inspect drum surface and inner and outer bushings for scores. Rotate pinions on their shafts and check for freedom of movement and for worn or broken teeth. Pinion endplay should be .010-.020". Inspect shafts for tightness in pinion carrier.

Reassembly - Install one-way clutch with lip side of clutch case down into outer race of planet carrier assembly and brass drag strips away from pinion carrier.

FRONT PUMP ASSEMBLY

REAR PUMP ASSEMBLY

Front Pump

Disass mbly - Remove capscrews and separate front pump from pump adapter and converter support. Mark top of drive and driven gears with a crayon or pencil so they may be reinstalled in original position, then remove pump gears and "O" ring seal from body. If front pump seal is to be replaced, use a small punch and drive seal from pump body. Remove suction tube "O" ring from pump and converter adapter.

Inspection - Inspect pump body, gears, and converter support for scores and excessive wear. Check bushings and journal for scoring, wear or damage.

Reassembly - Lubricate all parts with automatic transmission fluid, then install seal (if removed) in pump with Tool J-9615. Install a new pump body-to-adapter seal on pump body, then install pump gears on body, aligning marks made at disassembly. Assemble pump body to adapter and tighten the five large screws evenly to 17-22 ft. lbs., and the small screw to 25-35 inch pounds. Check pump gears for free movement.

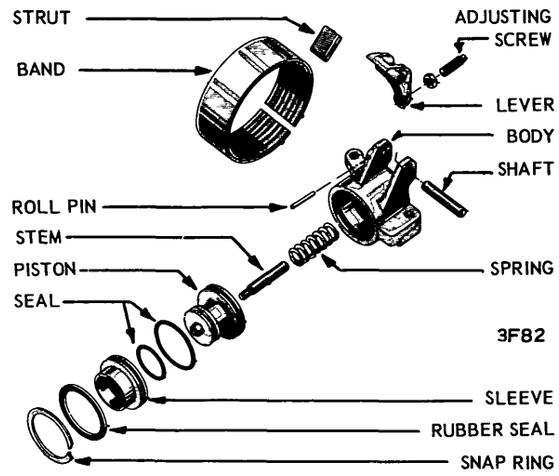
Rear Pump

Inspect pump body plate for excessive wear and replace plate if necessary. Inspect pump body, pump bushing, and gears for wear or scoring.

Front Servo

Disassembly - Hold pressure against servo piston and remove snap ring, then release pressure and remove servo piston, sleeve, and spring. Separate piston and sleeve and remove rubber seal from sleeve. Remove large and small rubber seal rings from piston. Drive actuating lever roll pin from servo body, then push out actuating lever shaft and remove lever.

Inspection - Inspect servo body for cracks, burrs, and obstructed fluid passages. Inspect piston bore and stem for scores. Inspect actuating lever and shaft for wear and freeness.



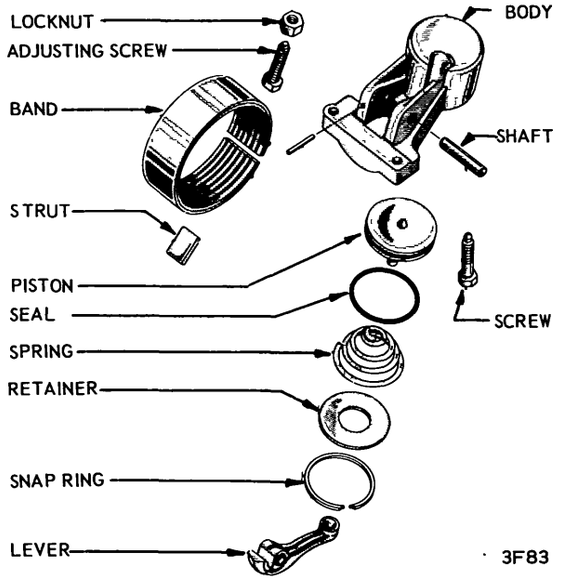
Reassembly - Lubricate all parts in transmission fluid, then install new piston and sleeve seals and assemble piston and piston sleeve together. Install servo spring in body and install servo piston and sleeve. Press sleeve into body and install snap ring, then install actuating lever, shaft, and roll pin. Apply air pressure to bore in servo and check servo for freeness of movement.

Rear Servo

Disassembly - Pull actuating lever roll pin out of body and remove actuating lever shaft and lever. Exert pressure to compress servo spring and remove snap ring, then release pressure and remove spring retainer and spring. Force air into servo pressure hole and blow out piston, then remove "O" ring seal from piston.

Inspection - Same as for front servo (above).

Reassembly - Lubricate all parts with transmission fluid, then install new "O" ring seal on piston and install piston in servo body. Install servo return spring with small end of spring against servo piston. Position spring retainer on spring, compress spring and install snap ring. Install actuating lever, shaft, and roll pin. Apply air pressure to hole and check for freeness of movement.



FRONT SERVO ASSEMBLY

Governor

Disassembly - Remove counterweight screws and separate valve assembly and counterweight, then remove valve body cover. Remove governor valve retainer, spring, governor valve and flyweight. *NOTE - Be careful not to lose spring wh n r moving valve retainer.*

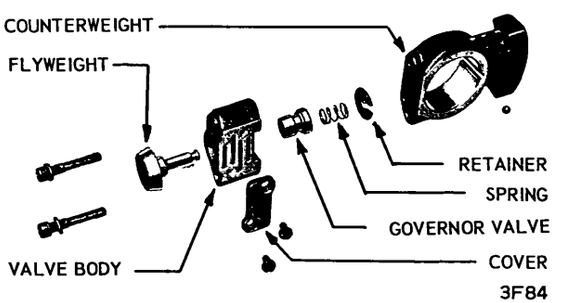
Inspecti n - Inspect mating surfaces of governor valve assembly and counterweight for burrs and distortion.

(Continu d)

REAR SERVO ASSEMBLY

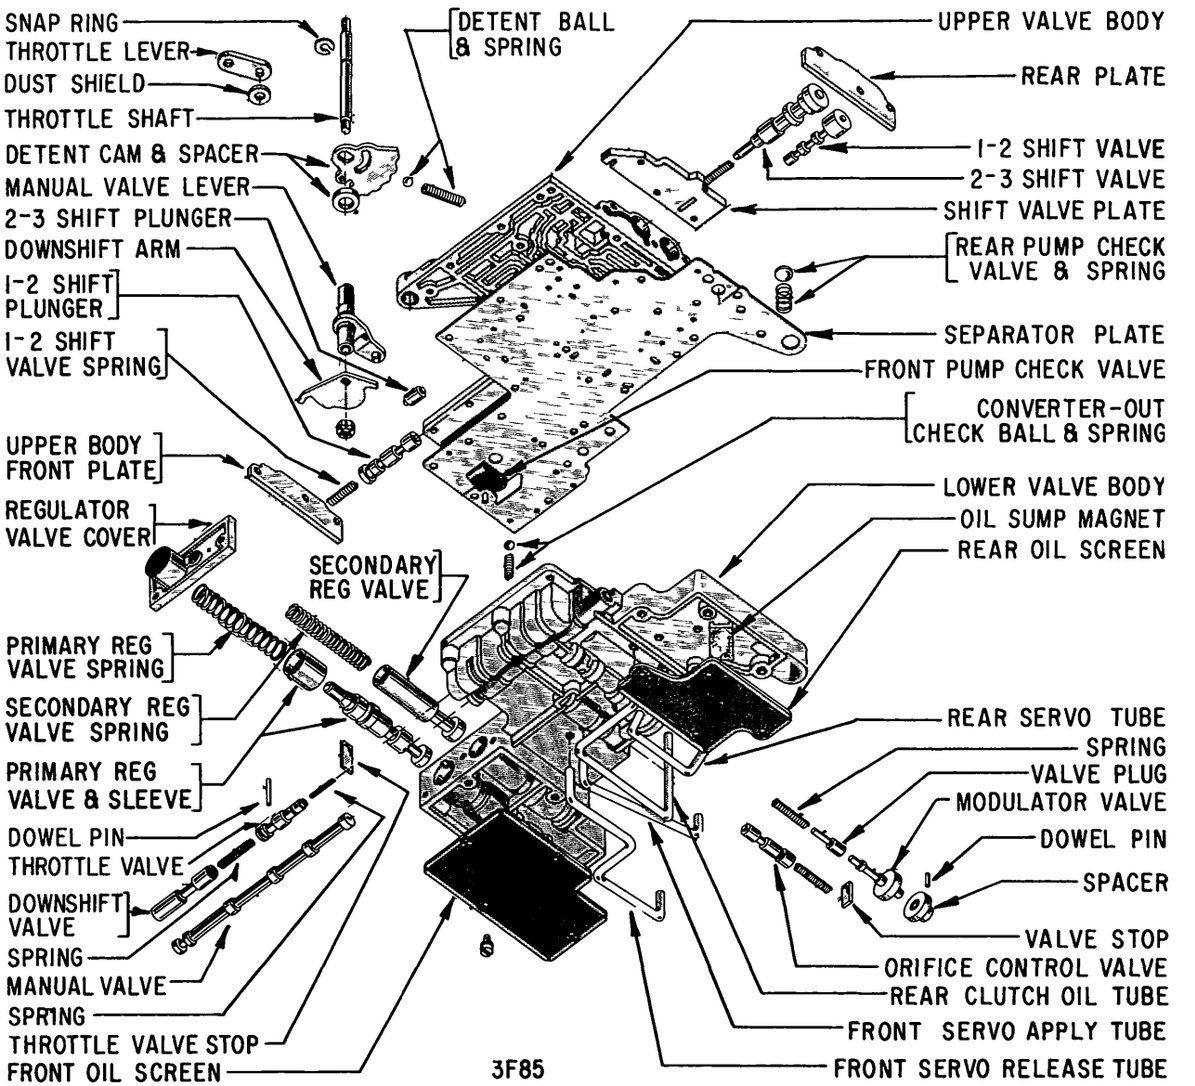
Make sure these surfaces are flat Inspect fluid passages for obstructions and governor valve for freeness of movement in valve body

Reassembly - Install flyweight governor valve and spring in governor body and install retainer Install cover on valve body and tighten screws to 20-30 inch pounds Assemble governor valve and counterweight aligning fluid passages then tighten screws to 50-60 inch pounds



Control Valve & R gulator

NOTE - It is recommended that each valve body of the assembly be disassembled, cleaned, inspected, and reassembled one at a time to prevent possibility of accidentally interchanging springs



Disass mbly (Upper Valv Body) - Remove eight lower valve body-to upper valve body attaching screws (note the one longer 1 3/8' screw) Invert valve body and remove cover plate and the four 7/8" long upper valve body-to-lower valve body attaching screws then separate upper valve body and lower valve body Remove front and rear end plates *NOTE - When removing rear plate, hold pressure on plate as it is under spring pressure* Remove valves and springs (see "Valve Body Assembly" illustration) If manual valve detent lever cam, detent ball, and downshift lever are to be removed remove locknut on shaft and remove downshift cam, spacer washer and operating lever from valve body *NOTE - Be careful not to lose detent ball when removing cam (ball is under spring pressure)*

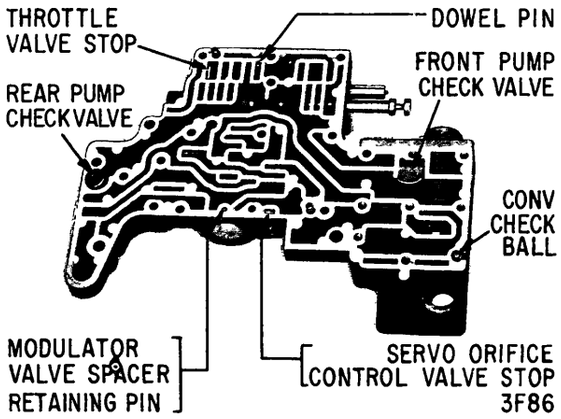
R ass mbly (Upp r Valv Body) - *NOTE - Inspect all parts before reassembly See "Valve Body Assembly Inspection" below* Reverse disassembly procedure and refer to "Valve Body Assembly' illustration for parts installation Tighten end plate attaching screws to 20-30 inch pounds

Disass mbly (L w r Valve Body) - Remove eight oil tube plate-to-lower valve body screws (note the two longer 1" screws) Remove separator plate, then remove front and rear pump check valves, converter check ball, and ball spring Remove servo orifice control valve stop, dowel pin (retaining modulator valve spacer) throttle valve stop, and throttle valve dowel pin *NOTE - Use an Alnico magnet to remove parts if necessary* Remove other valves and springs

GOVERNOR ASSEMBLY

CONTROL VALVE ASSEMBLY

in valve body Remove three screws from pressure regulator valve cover on lower valve body, then apply pressure to plate and remove plate, valves, springs and sleeve



Reassembly (Lower Valve Body) - *NOTE - Inspect all parts before reassembly See "Valve Body Assembly Inspection" below* Reverse disassembly procedure, referring to "Valve Body Assembly" illustration, and note the following Check front and rear check valves for free movement after separator plate is installed on valve body Tighten all screws to 20-30 inch pounds, making sure that the two 1" long screws are installed in proper locations

Valve Body Assembly Inspection - Clean all parts in solvent and blow dry with air, then inspect all valves and bores for scores and burrs Check all fluid passages for obstructions and all mating surfaces for burrs and distortion Carefully inspect springs for distortion. *NOTE - Crocus cloth may be used to polish valves and plugs Be careful to avoid rounding sharp edges of valves or plugs* Check all valves for freedom of movement in their respective bores (valves and plugs, when dry, should fall from their own weight in their respective bores)

(Continued)

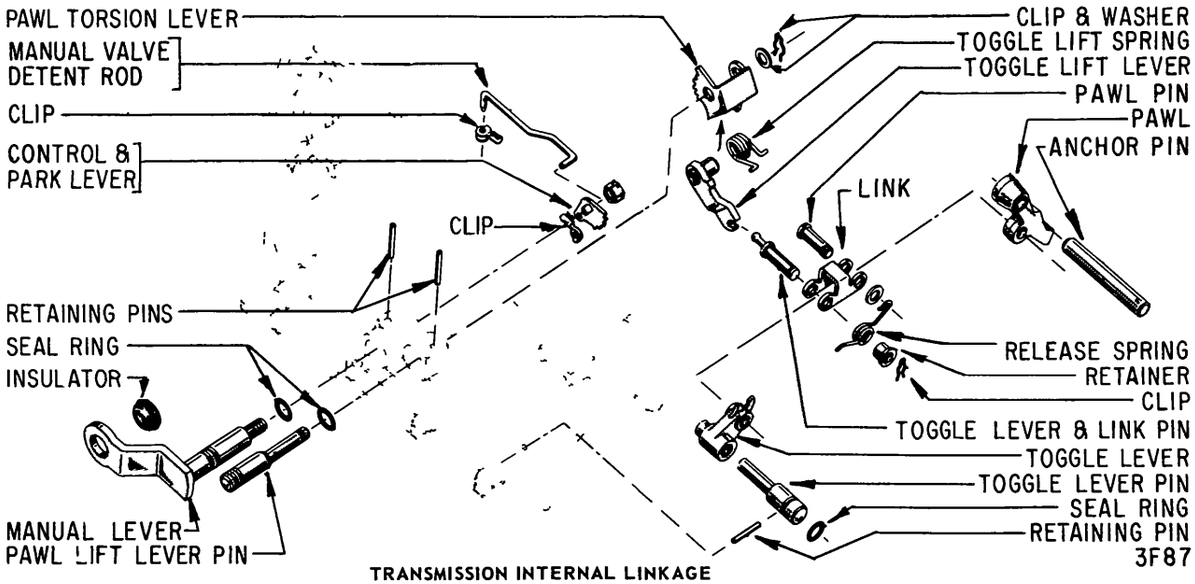
Transmission Case

Inspection - Clean case thoroughly and blow out all fluid passages then inspect for stripped threads obstructed fluid passages and cracks Inspect mating surfaces for burrs and case bushings for scores and excessive wear *NOTE - Minor burrs and scratches can be removed with crocus cloth Parts having large burrs, scratches, excessive wear, distortion, or stripped threads should be replaced*

LOWER VALVE BODY PARTS LOCATION

TRANSMISSION UNIT INSTALLATION (TRANSMISSION IN CAR)

Internal Linkage



Install parking brake toggle link and pawl assembly in case and install anchor pin Install a new "O" ring oil seal on toggle pin and install pin in case and secure with a roll pin Install a new "O" ring seal on park lever shaft and install shaft in case, then secure with tapered retaining pin Install toggle lift lever assembly on park lever and secure in place with washer and retaining spring Install a new "O" ring seal on manual control lever, and using a tapered retaining pin as a stop guide to keep shaft from going past pin groove in case, install shaft in case and secure with tapered pin *NOTE - If manual control lever shaft is pushed past pin groove, the "O" ring will be damaged and require replacement* Install toggle lift lever cam and manual rod assembly on manual valve shaft and secure with nut

Output Shaft

Install output shaft end rear thrust washer in case, making sure thrust washer seats against case

Rear Pump

Install pump plate, drive pin and drive gear on output shaft, then install three oil seal rings on shaft and lubricate them with transmission fluid Install pump body and driven gear, then install screws and tighten to 55-66 inch lbs (large screws), 20-30 inch pounds (small screw)

TRANSMISSION INTERNAL LINKAGE

Governor

Install drive ball governor assembly and snap ring on output shaft *NOTE - Plate on governor valve goes toward rear*

Speedometer Gear

Install snap ring, drive ball, speedometer gear, and rear snap ring On output shaft

Extension Housing

Install housing and new gasket and tighten attaching bolts to 14-18 ft lbs (5/16" screws), 30-40 ft lbs (7/16" screws)

Rear Band

Install rear band in case with band anchor end toward rear band adjusting screw

Pinion Carrier

Reassemble planet carrier, sprag clutch, and center support, then place planetary thrust bearing race in carrier with flange of race seated in shaft hole Install planetary thrust bearing race with flat side against carrier and place bearing on race Align oil holes in center support with holes in case and install two center support screws (on outside of case) and tighten to 120-154 inch pounds

Front Band

Install band in case with band anchor toward center rib of case, then install oil seal lock ring in oil grooves on rear clutch hub and sun gear shaft assembly Install needle bearing on sun gear shaft against sun gear

Front & Rear Clutches & Sun Gear

Install front and rear clutch and sun gear assembly in case, being careful not to separate clutch assemblies or break oil seal rings

Front Pump

Install pump assembly and selective thrust washer and tighten attaching screws to 100 120 inch pounds *NOTE - After installation of front pump, recheck endplay If not within limits of 009-032", install a new thrust washer of suitable thickness to obtain proper endplay* Install oil pressure tube converter in and out tubes and oil suction tube in front pump assembly

Front & Rear Servos

Install rear servo in case and insert actuating strut in band end, then tighten servo capscrew to 120-154 inch pounds Install front servo in case and insert actuating strut in band end, then tighten servo capscrew to 100-120 inch pounds

Valve Body

Install valve body and tighten capscrews to 55-65 inch pounds, then install shift rod linkage on valve body Install rear servo apply tube, rear clutch tube, front servo apply and release tubes, being careful not to distort tubes *NOTE - Long end of front servo release tube (steel) goes into servo body Install front end of servo apply tube (aluminum) in servo (short end of tube in servo)* Adjust front and rear bands (see "Adjustment" above)

AIR PRESSURE CHECKS

NOTE - Before installing transmission in car, make the following checks to determine if clutches, bands, and servos are operating properly Use air nozzle assembly, Tool J-8124 for testing When making tests, hold a clean towel over transmission opening to prevent excessive oil spray

(Continued)

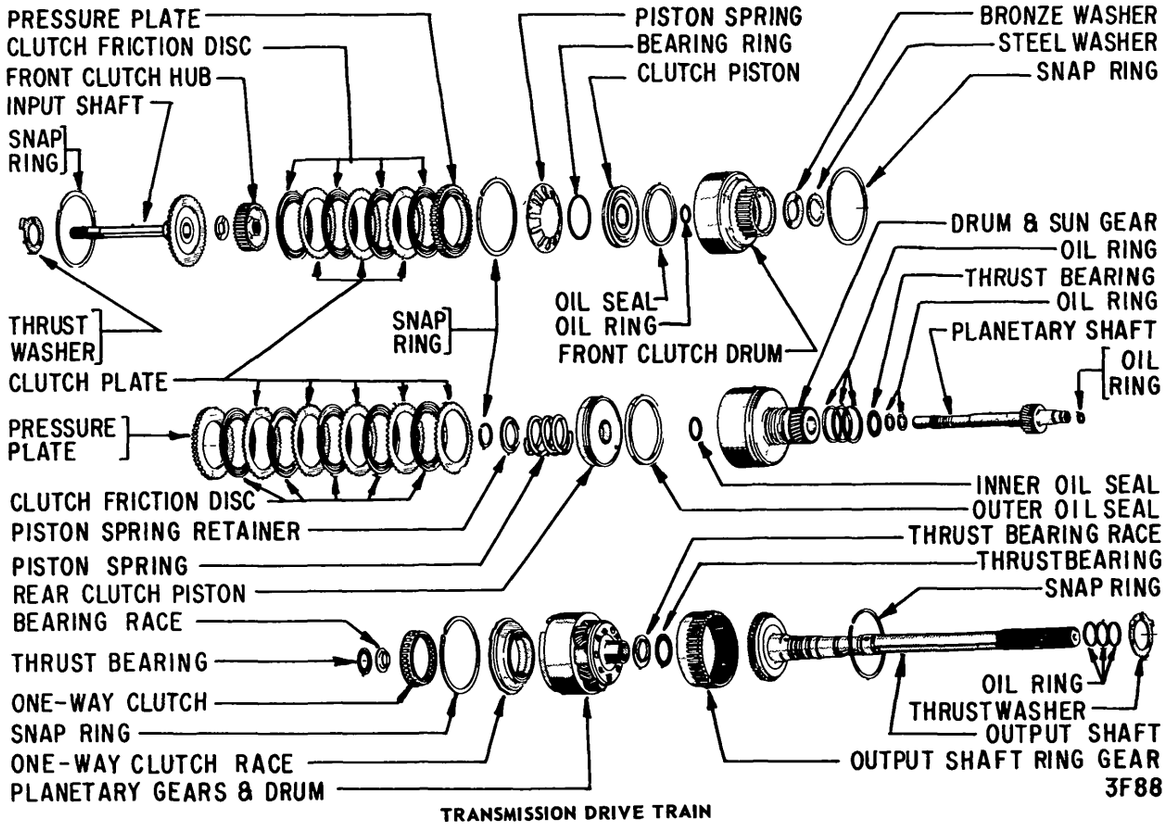
Fr nt Servo

Remove front servo apply tube and apply air pressure where tube enters body.

Rear Servo

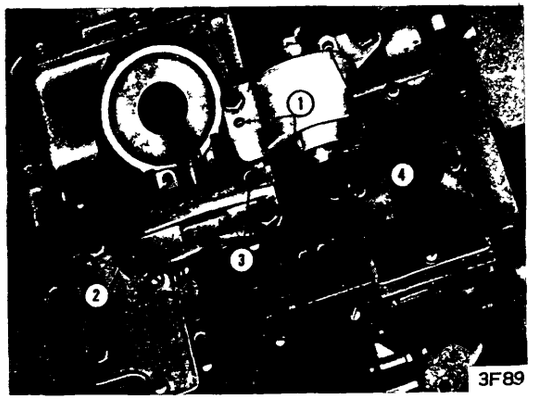
Remove rear servo apply tube and apply air pressure where tube enters body.

Rear Clutch



Remove rear clutch tube and apply air pressure where tube enters hole in case. A dull thud should be heard when pressure is applied.

Governor



To check governor, remove valve body and apply air pressure to governor hole in case.

Front Clutch

Remove valve body and apply air pressure to front clutch and governor feed hole in case. A dull thud should be heard.

TRANSMISSION DRIVE TRAIN

1. Front servo apply tube holes
2. Rear servo apply tube holes
3. Rear clutch tube holes
4. Front servo release holes

AIR PRESSURE CHECK POINTS

Tightening Specifications

Location	Torqu
Front Band Adj. Screw Locknut	20-25 Ft. Lbs.
Rear Band Adj. Screw Locknut	25-30 Ft. Lbs.
Transmission to Converter Housing	17-22 Ft. Lbs.
Converter Housing to Engine	23-28 Ft. Lbs.
Converter to Drive Plate	23-28 Ft. Lbs.

Oil Pan to Case	100-120 In. Lbs.

STUDEBAKER FLIGHTOMATIC & POWER-SHIFT TRANSMISSION

Studebaker Lark & Hawk V8 (1963)
Studebaker Avanti (1963)
Studebaker Six (Police & Taxi) (1963)

PUSHING (TO START) & TOWING

Pushing Car To Start Engine

Move selector lever to "N" (Neutral) position. When car speed reaches 20 MPH, turn ignition switch on and move transmission selector lever to "L" (Low) position.

Towing Or Pushing Car

Car can be towed for very short distances with selector lever in "N" (Neutral). If transmission is inoperative or if car is to be towed for a prolonged period, disconnect propeller shaft or tow with rear wheels off ground.

DESCRIPTION

Transmissions used on these models are similar to transmissions used on corresponding previous (1961-62) models. Power-Shift transmissions (floor mounted gear-shift) and Flightomatic transmissions (Police & Taxi) are water cooled by circulating transmission fluid through an oil cooler located in car radiator. The transmissions used on 170" Six Cyl. Police & Taxi models, and on Power-Shift transmissions are similar to other transmissions except that a one-way sprag clutch is used in the planetary gear train to eliminate application of rear band when transmission is operating in "D" (Drive) range. The control valve assemblies on Flightomatic (V8); Flightomatic 170" Six Cyl. Eng.; and Power-Shift transmissions are different.

TRANSMISSION IDENTIFICATION

IDENTIFICATION NOTE - Transmission model number and serial number is stamped on a plate attached to left side of transmission case at rear of throttle valve lever.

Transmission Model Application

Car Model	Transmission Model
Lark & Hawk V8 (Exc. Jet Thrust Eng.)	AS-10-5P
Lark & Hawk V8 (Jet Thrust & Super Jet Thrust)	AS-14-7A
Taxi, Police, & Hvy. Duty V8	AS-12-7A
Police & Hvy Duty 6 Cyl.	AS-24-8
Taxicab 6 Cyl.	AS-26-8
Avanti (Jet Thrust & Super Jet Thrust)	AS-2-10

OPERATION

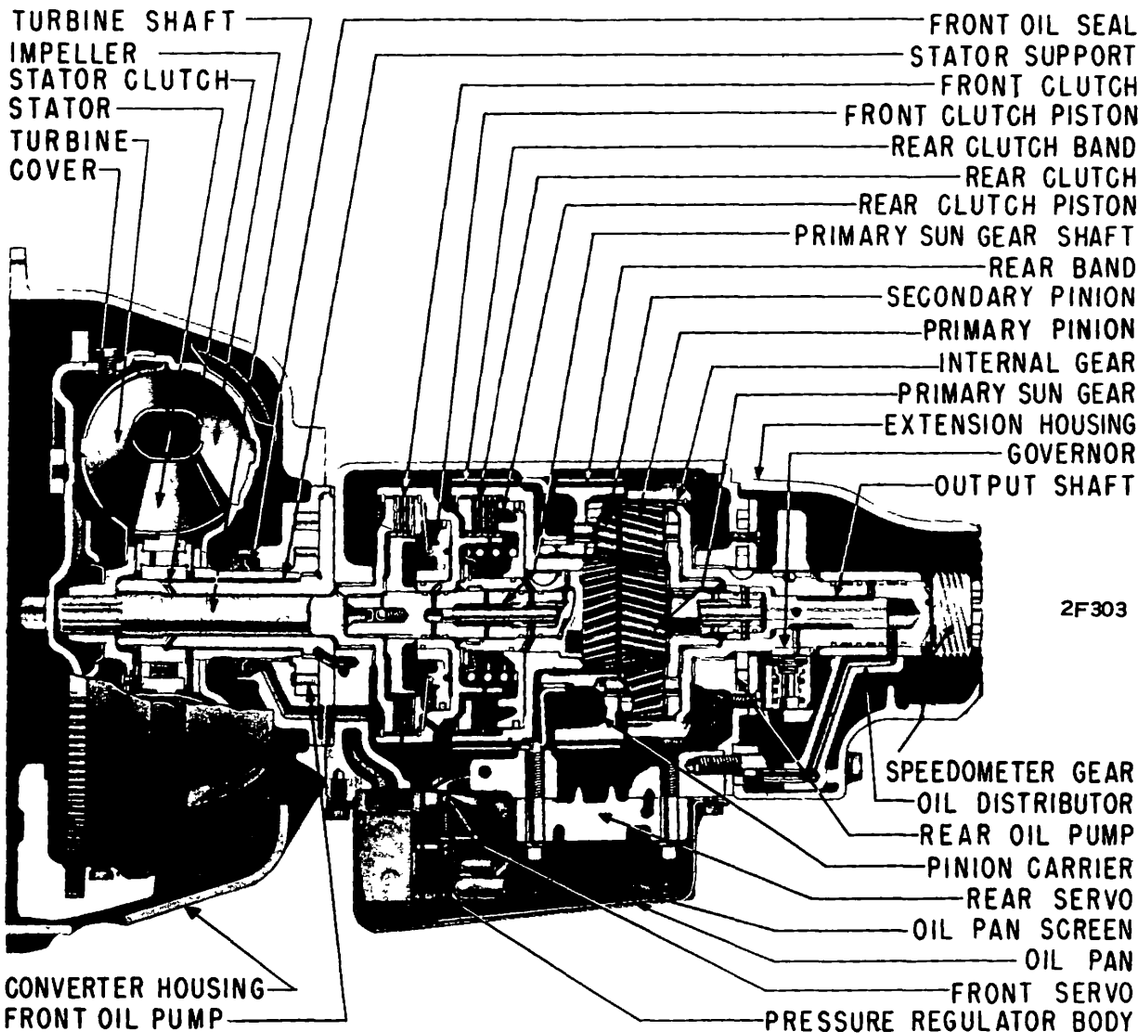
Low Range

Selector Lever in "L" or "1" - Front clutch and rear band are applied. Power is transmitted from input shaft to primary sun gear through the locked front clutch. Primary sun gear drives primary pinion which in turn, drive secondary pinions. Secondary pinions drive the internal gear and transmission output shaft in direction of sun gear rotation (engine rotation).

Selector Lever in "D" (Flightomatic V8 & Power-Shift Transmissions) - *These transmissions do not start in Low Range (Selector Lever in "D"), however, Flightomatic V8 transmission can be "kicked down" from Intermediate Range to Low Range at low car speed (12-18 MPH maximum speed).* On Flightomatic V8, front clutch and rear band are applied and power transmission is the same as for "Selector Lever in L" above.

Selector Lever in "D" (Flightomatic 170" Six Cyl. Eng. Transmission) - Front clutch and one-way sprag clutch are applied and power transmission is the same as for Selector Lever in "L" above.

Intermediate Range



Selector Lever in "D" (All Models) - Front clutch and front band are applied. Power is transmitted to primary sun gear through locked front clutch to drive primary pinions and secondary pinion, forcing secondary pinions to "walk" around stationary secondary sun gear. The internal gear and output shaft rotate in direction of engine rotation.

Selector Lever in "2" (Power-Shift Transmission) - Front clutch and front band are applied and power transmission is the same as for "Selector Lever in D" above.

High Range

Selector Lever in "D" (All Models) - Front and rear clutches are applied, locking primary sun gear to transmission input shaft and secondary sun gear to primary

(Continued)

FLIGHTOMATIC & POWER-SHIFT TRANSMISSION

sun gear Power is transmitted through transmission unchanged in direction or ratio

Reverse Range

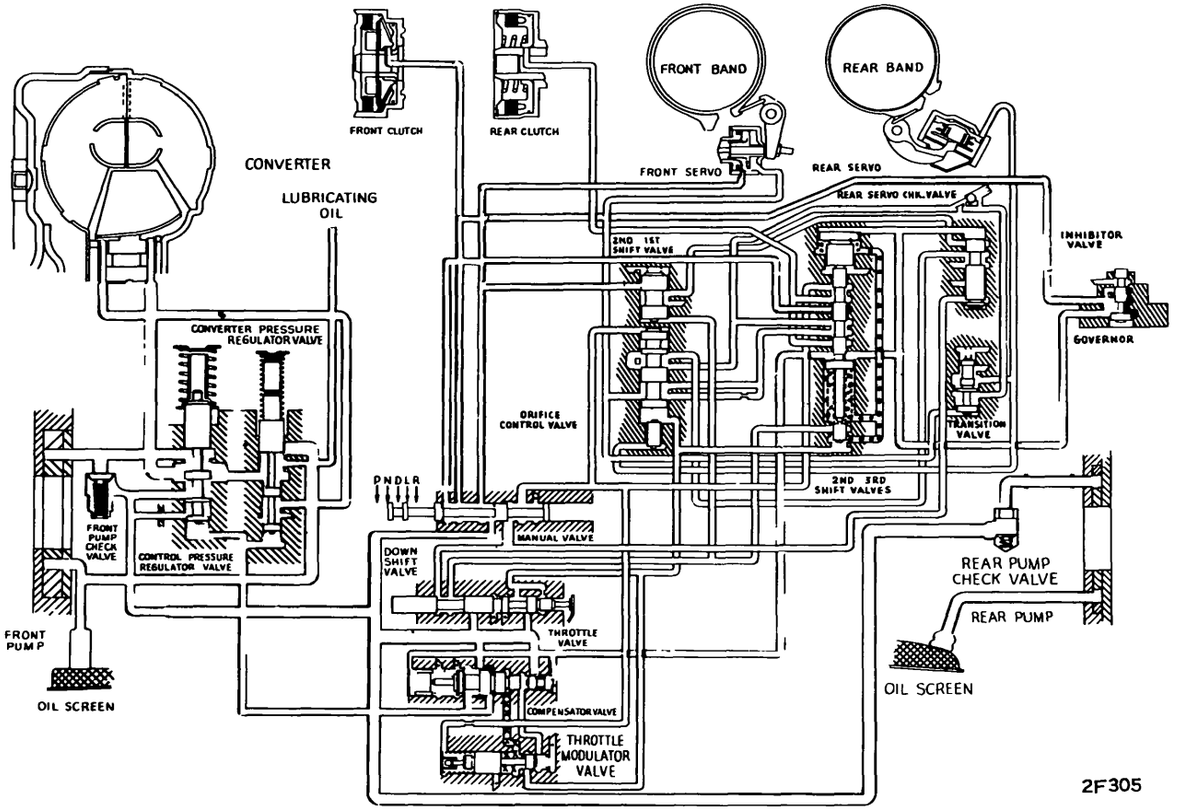
Selector Lever in "R" (All Models) - Rear clutch and rear band are applied Power is transmitted from input shaft to secondary sun gear through locked rear clutch, causing secondary sun gear to drive secondary pinions which turn internal gear and transmission output shaft in reverse direction (opposite engine rotation)

Park

Selector Lever in "P" (All Models) - Rear clutch is applied and no power is transmitted Internal linkage engages parking pawl with gear on internal outside of internal gear assembly

POWER-SHIFT AUTOMATIC TRANSMISSION OPERATING NOTE - This transmission provides six manually selected lever positions (five on other transmissions) The floor mounted selector lever moves easily between "N", "D", "2" and "1" positions and for safety, the pushbutton in top of lever must be partially depressed for entry into "R" position The lever may be moved from "R" to any other position (except "P") without depressing lever pushbutton Pushbutton must be fully depressed for entry into "P" position Forward drive ranges operate as follows

"D" (Drive) - Car starts in second gear at all times, with an automatic upshift to high and an automatic downshift to second gear at variable car speeds dependent on load and throttle position When in high gear, transmission can be downshifted to second gear by depressing accelerator to floor (when car speed is below 62-75 MPH)



"2" (Second) - Car starts and drives in second gear with no automatic upshift or downshift If selector lever is moved from "D" to "2" at speeds above 47-57 MPH with a closed throttle, transmission will remain in high until speed drops to 47-57 MPH For extra performance, transmission can be downshifted to second gear by moving lever from "D" to "2" and depressing accelerator (when car speed is below 62-75 MPH)

"1" (First) - Car starts in first gear with no automatic upshift or downshift If lever is moved from "2" to "1" at speeds above 20-25 MPH with throttle closed, transmission will remain in second until speed drops to 20-25 MPH, then downshift into first gear If lever is moved from "D" to "1" at speeds above 25 MPH with throttle closed transmission will downshift to second, then to first at the above indicated shift points With transmission in either second or high gear, low gear may be used for extra performance by moving selector lever to "1", and depressing accelerator (when car speed is below 37-47 MPH) For maximum performance, start in "1" and manually upshift to "2", then to "D" while holding accelerator in desired performance position (it is not necessary or desirable to close throttle while upshifting) *NOTE - Do not exceed engine speed of 5,000 RPM Do not place selector lever in "R" or "P" ranges while car is moving*

LUBRICATION

Checking Fluid Level

Check fluid level every 1,000 miles With transmission at normal operating temperature, move selector lever through all ranges, then place in "D" (Drive) Check fluid level on dipstick (located under hood) and add recommended fluid as required to bring level to "F" mark on dipstick *NOTE - Approximately 1½ pts of fluid required to raise level from "L" to "F" mark on dipstick*

HYDRAULIC CIRCUIT DIAGRAM (V8 MODEL EXC. POWER-SHIFT)

Draining & Refilling

Drain and refill every 15,000 miles With transmission at normal operating temperature, remove transmission filler pipe, then rotate converter until drain plug is visible through hole in housing and remove converter drain plug *NOTE - If converter is not equipped with two drain plugs 180° apart, it will be necessary to remove oil pan and take out the converter regulator valve spring and pull out converter valve to provide a bleed for the converter After draining, replace valve and spring* If second drain plug is provided in converter, remove plug and drain Replace drain plugs and filler pipe, then pour in 3 qts of recommended fluid Start engine, transmission in "N" (Neutral) and slowly pour in 4 qts additional Move selector lever through all ranges, then recheck fluid level Add sufficient fluid to bring level to "F' mark on dipstick

Recommended Fluid

Automatic Transmission Fluid Type "A" (Suffix "A")

Capacity

9 qts (Exc Super Jet Thrust Eng , Jet Thrust Eng & Taxicab), 9½ qts (Super Jet Thrust Eng , Jet Thrust Eng , & Taxicab)

ADJUSTMENT

Throttle Linkage

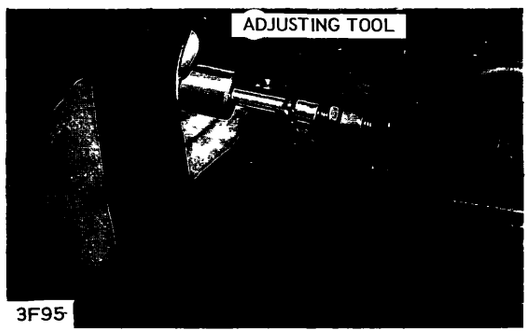
See CARBURETOR on Car Model pages

Manual Linkage

On all models, disconnect selector shift lever-to-transmission manual lever rod at transmission by removing swivel assembly Place selector lever in "D" (Exc Power-Shift Transmission), in "P" (Power-Shift Transmission) then place manual lever on transmission in corresponding detent position Loosen locknut at swivel and adjust shift lever rod length until swivel pin slips freely through hole in lever Tighten locknuts against swivel and reinstall swivel assembly to lever Check operation in all positions

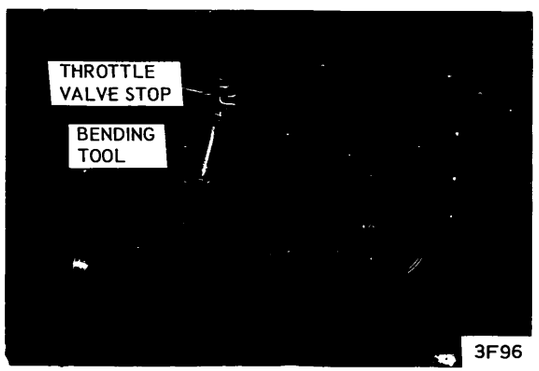
(Continued)

N utral Saf ty Switch



Neutral safety switch is located on steering column (Exc. Power-Shift Trans.); on bracket attached to retainer plate at side of transmission (Power-Shift Trans.) Place selector lever in "N" (Neutral), then loosen switch mounting bracket attaching screws. Align pin in switch lever with hole in switch body (Exc. Power-Shift Trans.); align pin hole in switch lever with hole in mounting bracket (Power-Shift Trans.). Hold switch in position or use a pin to maintain alignment and tighten mounting screws. Check operation. Starter should operate only with selector lever in "N" (Neutral) or "P" (Park).

Front Band



Remove transmission oil pan, gasket and screen, then loosen front servo adjusting screw two full turns. Install adjusting gauge block, Tool J-5880 (see "Front Band Adjustment" illustration), then install adjusting tool (Part of J-5880) on adjusting screw and tighten until tool overruns. **Back off adjusting screw one complete turn** and tighten locknut to 20-25 ft. lbs. Replace oil pan, gasket and screen and refill transmission to proper level.

Rear Band

Remove inspection cover in front compartment floor, then loosen adjusting screw locknut. Place rear band adjusting tool, J-5883 on adjusting screw and tighten screw until tool overruns. Back off adjusting screw EXACTLY 1½ turns and tighten locknut to 35-40 ft. lbs. *NOTE - It is very important that adjusting screw be backed off 1½ turns.*

FRONT BAND ADJUSTMENT

THROTTLE VALVE STOP ADJUSTMENT

Throttle Valve Stop

Remove oil pan and screen, then remove compensator pressure tube (see "Control Valve Tubes" illustration). Remove bellcrank-to-throttle valve lever rod from throttle valve lever. Hold throttle valve lever against throttle valve stop and measure distance from center of hole in lever to machined surface on rear of transmission case. This distance should be 4 7/32-4 5/8" . If not within specifications, bend throttle valve stop as necessary, using a suitable tool such as J-5887 (see "Throttle Valve Stop Adjustment" illustration).

TESTING

Stall Test

NOTE - Do not operate engine at high speed with selector lever in one of the drive ranges (with rear wheels held stationary) for more than 10 seconds at a time, or for a total time greater than one minute in any half hour period.

Connect tachometer to engine and place it where it can be easily read from drivers seat, then set hand brake and start engine. Place selector lever in "D" position, apply service brakes and operate engine at full throttle. Note tachometer reading. Repeat this procedure with selector lever in "L" (or "1") and "R" positions. Normal stall speeds are 1450-1550 RPM (6 Cyl. Eng.); 1550-1650 RPM (259" Eng.); 1750-1850 RPM (289" Eng. Exc. Jet Thrust & Super Jet Thrust); 2100 RPM, minimum (289" Jet Thrust & Super Jet Thrust Engs.). If stall speed is between 800-1000 RPM (if engine is normal), slippage is indicated in torque converter free wheel unit. If stall speed is greater than normal, slippage in transmission is indicated.

Free Running

With selector lever in "N", slowly accelerate engine. If tachometer reading reaches 4000 RPM before wide-open throttle is obtained, release accelerator immediately (do not run engine under no load at a speed exceeding 4000 RPM). If speed is 4000 with less than wide open throttle, converter stator is not stuck. If speed is 4000 or less with wide open throttle, it would indicate that stator is stuck.

Road Test

A thorough test should be made to determine shift speeds and performance of transmission. Initial application of bands and clutches should be checked in all driving ranges. A driving test should be made in "D" range to check shift speed chart (see "Transmission Shift Speeds" below).

NOTE - Shift points in table encompass rear axle ratios used in production. The low ratio shift speeds will be toward upper limit of each range. Higher ratios will be toward lower limit.

TRANSMISSION SHIFT SPEEDS

Minimum Throttl Upshifts (MPH)

Trans. Model No.	1-2	2-3
AS-10-5P & AS-12-7A		12-18
AS-14-7A		6-11
AS-24-8		16-19
AS-26-8		6-8
AS-2-10		15-20

Maximum Throttl Upshifts (MPH)

Trans. Model No.	1-2	2-3
AS-10-5P & AS-12-7A	34-42	63-73
AS-14-7A	38-52	78-105
AS-24-8	35-38	59-64
AS-26-8	28-32	41-46
AS-2-10		68-84

Maximum Kickd wn (MPH)

Trans. Model No.	3-2	2-1	3-1
AS-10-5P & AS-12-7A	60-70	20-26	12-18
AS-14-7A	74-98	9-20	6-13
AS-24-8	50-55	10-14	15-19
AS-26-8	34-39	6-10	10-14
AS-2-10	62-75	36-48	36-48

Inhibited & Closed Thr ttle Downshift (MPH)

Trans. Model No.	2-1 (Inhibited)	3-2 (Cl s d)
AS-10-5P & AS-12-7A	15-21	3-8
AS-14-7A	8-16	2-6
AS-24-8	15-22	7-11
AS-26-8	14-18	6-10
AS-2-10	ℂ	6-11

ℂ - 47-57 MPH (3-2 Inhibited Downshift with selector lever in "1" or "2"). 20-25 MPH (2-1 Inhibited Downshift with selector lever in "1").

Fluid Pressure

NOTE - Fluid pressure tests should be made to determine whether or not pressure regulator system is operating properly and to determine if there is fluid leakage in clutch circuits. Remove 1/8" pipe plug located near front of transmission on throttle lever side of transmission case and install a suitable pressure gauge. Make the following te sts:

Idle Pressure - With engine at idle speed and at normal operating temperature, move selector lever to all drive positions and note pressure reading on gauge. Pressures should be as indicated in table below. If pressure is below limits in one range, a fluid leak in that circuit is indicated. If pressure is high, throttle linkage should be checked and adjusted.

Pressure Regulator - Move selector lever to "D" position and apply brakes. Run engine at 1000 RPM (Exc. Jet Thrust & Super Jet Thrust Engines); 1400 RPM (Jet Thrust & Super Jet Thrust Engines). Pressures should be as indicated in table below. If pressure is less than minimum specification, valve linkage is too long. If pressure is greater, linkage is too short.

Stall Pressure - Apply all brakes and operate engine at full throttle kickdown position. Move selector lever to all drive positions. Pressures should be as indicated in table below . If pressure is not within limits, control valve assembly and pressure regulator valve assembly must be removed and cleaned.

(Continued)

Transmission Fluid Pressures (Pounds Pressure on Gauge)

Trans. Model No.	Idle Press.	Regulator Press.	Stall Pressure ℄ D,L,1,2	Stall Pressure ℄ R
AS-10-5P	50-80	80-85	130-175	170-190

AS-2-10	50-75	80-85	130-175	170 Min.

℄ - Selector lever in indicated range.

Air Pressure (Trans. in Car)

NOTE - With transmission oil pan and control valve assembly removed, proceed as follows:

TROUBLE SHOOTING

FLIGHTOMATIC TRANSMISSION

Roughness

Initial Engagement - Idle speed too high. Control pressure too high caused by improper throttle valve linkage adjustment or dirt in control valve assembly or regulator valve assembly.
1-2 Upshift Rough - Check and adjust throttle control linkage as control pressure may be too high. Clean and adjust bands. Governor valve may be stuck .
2-3 Upshift Rough - Check and adjust throttle control linkage as control pressure may be too high. Clean throttle control valve assembly. Adjust front band. Check for stuck governor valve.
3-2 Downshift Rough (Closed Throttle) - Adjust throttle control linkage. Orifice control valve stuck.
2-1 Downshift Rough (Closed Throttle) - Adjust throttle control linkage. Rear servo check valve may be stuck.

No Drive

No Drive in All Ranges - Check fluid level. Manual linkage may be disconnected. No control pressure which may be caused by trouble at front pump. Check rear band adjustment. Check rear servo action with air pressure. Check rear band adjustment. Inspect and clean control valve assembly. Check engine stall speed, as converter may not be operating properly.
No Drive in "D" or "L" Position - Check fluid level. Manual linkage may be disconnected. Control pressure may be low. Adjust throttle valve linkage. Clean control valve and pressure regulator valve assemblies. Check front clutch action with air pressure. Check rear servo and band with air pressure. Check transition valve in control valve assembly.
No 2-3 Upshift - Governor valve or 2-3 shift valve may be stuck.
No Kickdown - Adjust throttle control linkage.

Locking Up

Locks in "D" - Rear clutch or front band may be applied. Clean control valve assemblies and governor valve assemblies. Check rear clutch and front band and servo for mechanical failures.
Locks in "D" (2nd Gear) - Check rear band and servo, and rear clutch for mechanical failure.
Locks in "D" (3rd Gear) - Front or rear band may be applied. Check bands and servo for mechanical failure. Clean control valve assembly.
Locks Up in "R" - Check front clutch and front band servo for mechanical failure. Clean control valve assembly.

Slippage

Slips in "D" or "L" - Check fluid level. Control pressure may be low. Check throttle valve linkage. Clean control valve and pressure regulator valve assemblies. Rear servo travel may be limited; check for mechanical failure of band or servo. Check front clutch for mechanical failure. Rear pump check valve may be stuck open.
Slips in "R" - Check fluid level. Check and adjust throttle control linkage. Clean control valve and regulator valve assemblies. Check rear servo for limited travel. Check front clutch for mechanical failure as it may be slipping. Rear pump check valve may be stuck open.
1-2 Upshift Slipping - Check and adjust throttle control linkage as control pressure may be too high. Adjust bands. Check for stuck governor valve. Check front servo piston for limited travel with air pressure. Check for fluid leakage.
2-3 Upshift Slipping - Control pressure may be too low; adjust throttle control linkage and clean control valve assembly. Adjust front band. Check for internal leaks and for stuck governor valve.

Early-Late Shifting

1-2 & 2-3 Upshift Early - Check for stuck governor valve.
1-2 & 2-3 Upshift Late - Check for stuck governor valve or leak in governor circuit. Check and adjust throttle control linkage and clean control valve assembly.
3-2 Kickdown Early - Adjust throttle control linkage.

Cannot Push Start

Rear pump not operating. Pressure regulator valve may be stuck.

No Park Position

Adjust manual linkage. Check for damaged internal linkage or pawl.

POWER-SHIFT TRANSMISSION

Roughness

Initial Engagement - Idle speed too high. Control pressure too high caused by improper throttle valve linkage adjustment or dirt in control valve assembly or regulator valve assembly.
2-3 Upshift Rough - "D" Range - Control pressure too high caused by improper throttle valve linkage adjustment. Valves in control valve assembly sticking. Adjust front band. Governor valve sticking.
3-2 Downshift Rough (Closed Throttle) - "D" Range - Check and adjust throttle valve linkage. Valves in control valve assembly sticking. Idle speed too high.
Manual 1-2 Upshift Rough - Control pressure too high. Check and adjust throttle valve linkage. Clean and inspect pressure regulator and valve body assembly. Governor valve sticking.
Manual or Automatic 2-3 Upshift Rough - Control pressure too high. Check and adjust throttle valve linkage. Clean pressure regulator and control valve assemblies.

No Drive or Slippage

No Drive in All Ranges - Fluid level low. Manual linkage loose or disconnected. Check front pump and front pump drive tangs on converter (may be cause of no control pressure). Check engine stall speeds for possible converter failure.
No Drive or Slippage in "1", "2" & "D" - Fluid level low. Manual linkage loose. Adjust throttle valve linkage. Clean control valve and pressure regulator valve assemblies. Front clutch will not apply properly.
No Kickdown - "D" Range - Adjust throttle control linkage.
No Drive or Slippage in "R" - Manual linkage loose. Rear band does not apply. Rear clutch inoperative. Check for stuck 1-2 shift valve.
Starts in 1st Gear in "2" Range and (or) "D" Rang and (or) Slips in "2" and 2nd Gear in "D" - Front band not applying properly. Check band adjustment. Check for mechanical failure of band or servo. Check for fluid leaks in servo circuit. Clean and inspect valve body assembly.
Manual 1-2 Upshift Slippage - Control pressure low. Check throttle valve linkage. Clean and inspect pressure regulator assembly and control valve assembly. Front band not applying properly. One-way clutch slipping.
Manual or Automatic 2-3 Upshift Slippage - Adjust throttle valve linkage. Clean and inspect pressure regulator assembly and control valve assembly. Adjust front band. Governor valve sticking. Check for internal leakage. Rear clutch slipping.
No 2-3 Upshift - "D" Range - Governor valve or 2-3 shift valve may be stuck.

Locking Up

Locks in "R" and (Or) "1" - Manual linkage loose. Rear band not properly adjusted. Check rear servo operation. Rear clutch not operating properly. Transition or 1-2 shift valve stuck.
Drives in Neutral, Locks Up in Reverse, and Engin Does Not Run Free in Park - Front clutch applied. Check clutch for mechanical failure.
Locks Up in "R" and (Or) "1" - Front band applied. Check band and servo. Clean control valve assembly.
Locks Up in "2" and "D" - One-way clutch stuck. Rear band applied. Clean and inspect control valve assembly.
Locks Up in "1", "2" and "3" - Rear clutch applied. *NOTE - Car cannot be pushed backwards in neutral if rear clutch seizes.* Clean and inspect control valve assembly.
Locks Up in "1" Only - Rear clutch or front band applied. Clean and inspect control valve assembly.
Locks Up in "2" Only or "D" Only - Rear band or rear clutch applied. Clean and inspect control valve assembly.

Early-Late Shifting

2-3 Upshift Early - Adjust throttle valve linkage. Clean and adjust pressure regulator and control valve

(Continued)

assemblies. Governor valve sticking.
2-3 Upshift Lat - Adjust throttle valve linkage. Clean and adjust pressure regulator and control valve assemblies. Governor valve sticking. Leakage in governor circuit.
3-2 Kickdown Early - "D" Range - Check and adjust throttle valve linkage.

Downshifts

Downshifts to First Gear in "2", "D" or "D" Kickdown - Check and adjust front band. Check for mechanical failure or front band or servo. Check for fluid leaks in front servo circuit. Clean and inspect control valve assembly.

Cannot Push Start

Rear pump not operative. Pressure regulator valve may be stuck.

No Park Position

Adjust manual control linkage. Check for damaged internal linkage or pawl.

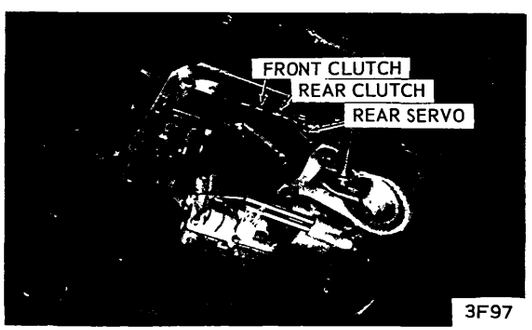
AIR PRESSURE CHECKS

Make the following air pressure checks with transmission in car to determine normal operation of components. See "Air Pressure Check" illustration for location of check points. Remove transmission oil pan, screen, and control valve assembly. *NOTE - Front servo tubes should remain in front servo, and servo attaching screws must be tight.*

Front Clutch

Apply pressure to front clutch passage and listen for a dull thud, indicating clutch is operating.

Front Band & Servo

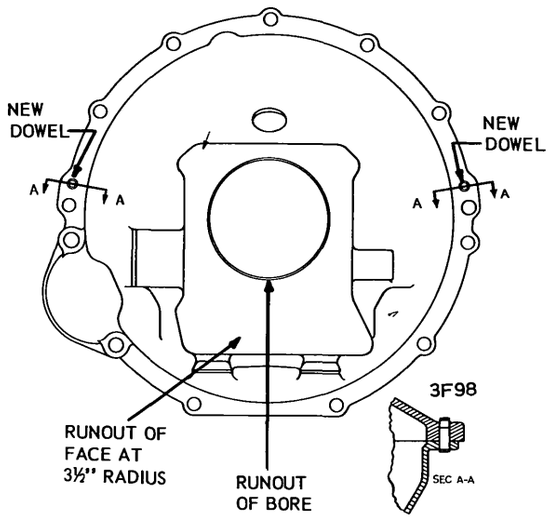


Apply air pressure to front servo apply tube and note band operation.

Rear Band & Servo

Apply air pressure to rear servo and note band application.

Governor Valve



Remove governor valve inspection cover and apply air pressure to front clutch passage. Listen for a click and watch valve snap inward. If a click is not heard, the valve may be stuck.

AIR PRESSURE TEST POINTS

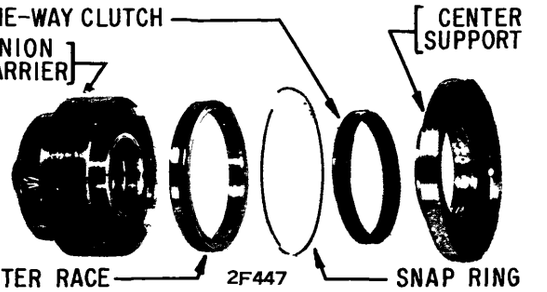
Rear Clutch

Apply air pressure to rear clutch passage and listen for a dull thud indicating clutch is operating. Keep air pressure in passage for several seconds to check for leaks in this circuit.

CONVERTER HOUSING ALIGNMENT

TRANSMISSION & CONVERTER (REMOVAL & INSTALLATION)

See 1961 Final, Page 515 and note the following:

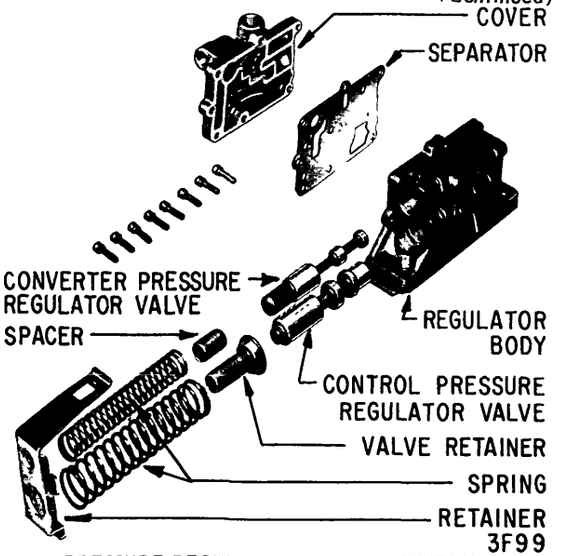


Power-Shift Transmission

Removal - Drain transmission and converter, then remove propeller shaft assembly. Disconnect shift and throttle linkage from transmission levers and remove shift lever assembly from inside the car. Remove center console left side cover and remove parking brake cable-to-body retaining clip nut, then remove clip from floor pan under car. Disconnect oil cooler lines and speedometer cable at transmission. Remove exhaust pipe from manifold, then remove rear section of exhaust pipe from front section and muffler, and remove pipe. Install a suitable transmission lift, then remove four transmission-to-converter bellhousing screws and install a guide pin, Tool J-4285 in each of the upper capscrew holes. Tilt rear of transmission upward and move assembly toward rear until converter housing is cleared, then remove from car.

Installation - Reverse removal procedure and tighten all bolts and nuts to specifications. *See "Tightening Specifications" below.*

Torqu Converter



Rem val - Remove transmission, then remove rear engine insulator nuts and jack engine up enough to separate insulator from crossmember. Remove rear engine support crossmember, then remove starter motor. Remove converter housing-to-engine capscrews and remove converter housing, being careful not to damage housing or dowels or distort converter blower. If necessary, lower engine slightly to aid in removal. Remove crankshaft-to-converter drive plate screws and remove converter assembly.

ONE-WAY (SPRAG) CLUTCH (POWER-SHIFT & 6 CYL. ENG. AUTO. TRANS.)

Installation - Reverse removal procedure, using Converter Aligning Tool J-6310, and tighten all bolts and nuts to specifications. *See "Tightening Specifications" below.*
Alignment (New Converter Housing) - With torque converter removed, install housing on dowels and tighten capscrews and bolts, then install clutch aligning gauge, Tool J-2045 in end of crankshaft, making sure gauge is centered and locked securely. Install a dial indicator on gauge and set indicator on face of housing at a 3½" radius. Turn crankshaft and check total indicator reading. If face runout exceeds .006", replace housing. Place dial indicator in the bore and turn crankshaft slowly. If bore runout exceeds .004" total indicator

(Continued)

PRESSURE REGULATOR VALVE ASSEMBLY

reading, reposition housing and relocate dowels. To reposition dowels, remove housing and drive out old dowels. Assemble housing on engine and tighten capscrews only enough to hold housing in place against block. Again check runout. If not within limits, use a lead hammer and shift housing until bore runout is within limits, then tighten capscrews and recheck runout. To maintain alignment, use a 11/32" drill and drill two new dowel holes in approximate location shown in illustration. Ream holes to .376-.377", then install dowels in new holes.

OVERHAUL

Convert r

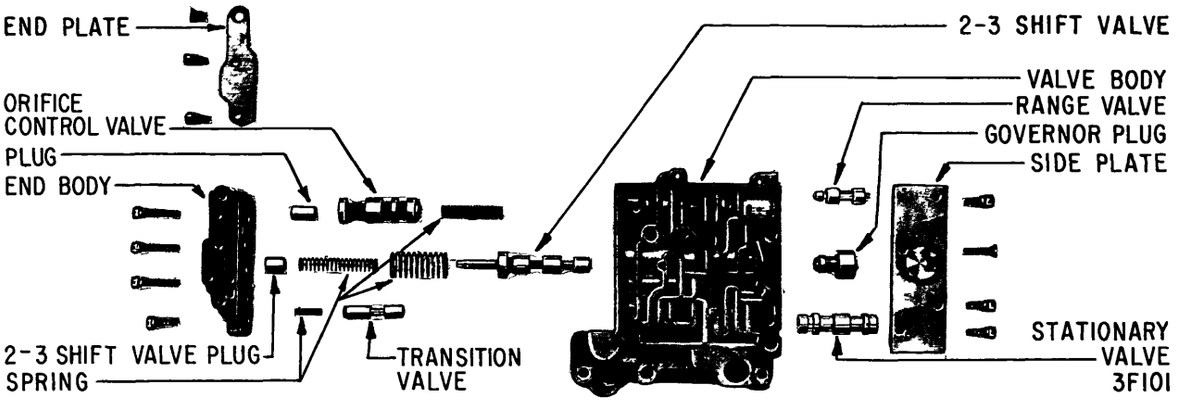
Converter assembly is welded and cannot be disassembled for servicing or overhaul.

Transmission

See "Warner Automatic Transmission" in 1960 Final Data, Page 506, or later Manual edition and note the following:

C ntrol Valve Assembly (6 Cyl. Models): Lower Valve B dy Cover - Rear Servo Check Valve and Spring not used. The only valve at this location is the 1-2 shift valve and spring.

Pinion Carrier - Pinion carrier is serviced only as an assembly and cannot be overhauled. On models with one-way sprag clutch, the sprag clutch may be removed by slipping it out of outer race, then outer race can be removed by removing snap ring. *NOTE - Do not remove outer race unless replacement is necessary.* To reassemble one-way clutch and outer race, install outer race and secure in place with snap ring. Install one-way clutch into pinion carrier and outer race assembly with flanged end of one-way clutch towards pinion carrier. Properly assembled, the brass drag strips attached to inner cage of one-way clutch will be located away from pinion carrier.



POWERSHIFT TRANSMISSION

Pressure Regulator

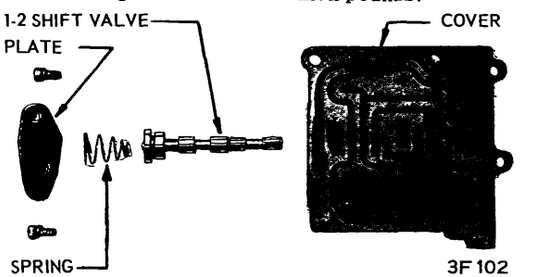
Disassembly - Remove valves from regulator body (see "Pressure Regulator" illustration), then remove regulator cover and separator plate.

Inspection - Clean all parts and inspect all mating surfaces, valves and valve bores for scoring, burrs and damage. Check fluid passages for obstructions and valve springs for distortion.

Reassembly - Position separator plate on cover and install cover and plate on regulator body and tighten screws to specifications (see "Tightening Specifications" below). Install valves in valve body.

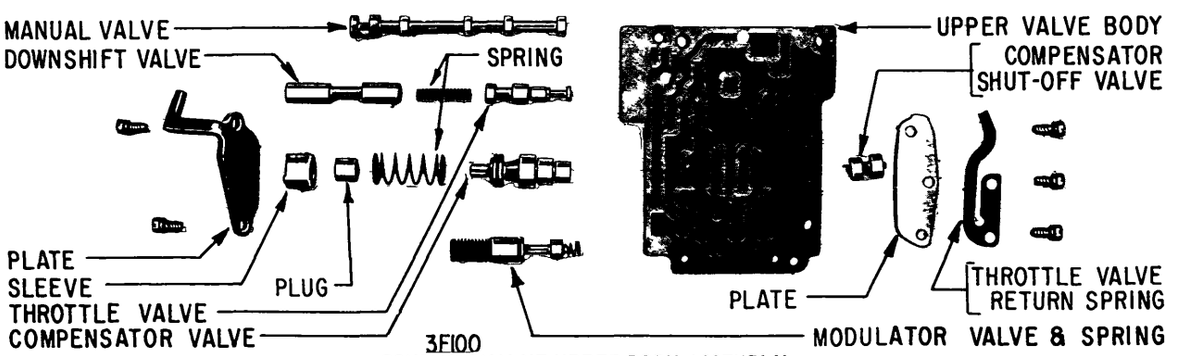
CONTROL VALVE LOWER BODY ASSEMBLY

Control Valve



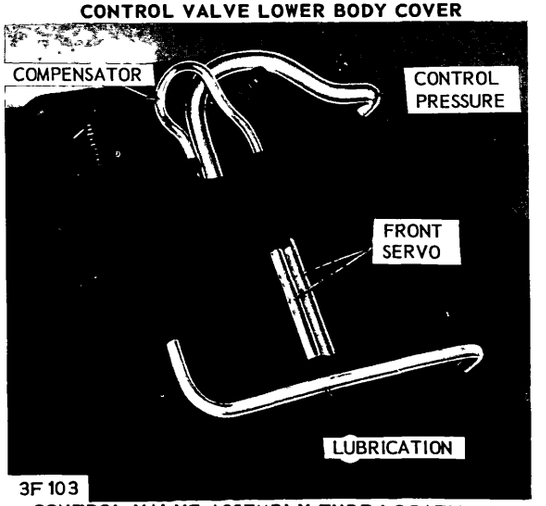
Disassembly - Upper Valve Body - Remove four lower body-to-control valve assembly attaching capscrews and lockwashers, then invert assembly and remove separator plate-to-lower valve body attaching screws. Remove upper valve body and separator plate, then remove two separator plate attaching screws and remove separator plate. Remove valves and springs (see "Upper Valve Body" illustration).

Lower Valve Body - Remove screws and washers attaching cover to lower valve body, then remove cover and separator plate. Remove valves and spring (see "Lower Valve Body" illustration).



Lower Valve Body Cover - Remove valves and spring (see "Lower Valve Body Cover" illustration).

Reassembly - Upper Valve Body - Reinstall valves and springs in their respective bores (see "Upper Valve Body" illustration) and tighten front plate attaching screws to 20-30 inch pounds. *NOTE - When installing rear plate, the throttle valve must protrude from valve body to provide clearance for the stop on rear plate.* Tighten rear plate screws to 20-30 inch pounds. Position separator plate on upper valve body and tighten screws to 20-30 inch pounds.



Lower Valve Body - Reinstall valves and springs in their respective bores, then tighten end body plate retaining screws, end body retaining screws, and side plate retaining screws to 20-30 inch pounds.

CONTROL VALVE LOWER BODY COVER

CONTROL VALVE UPPER BODY ASSEMBLY

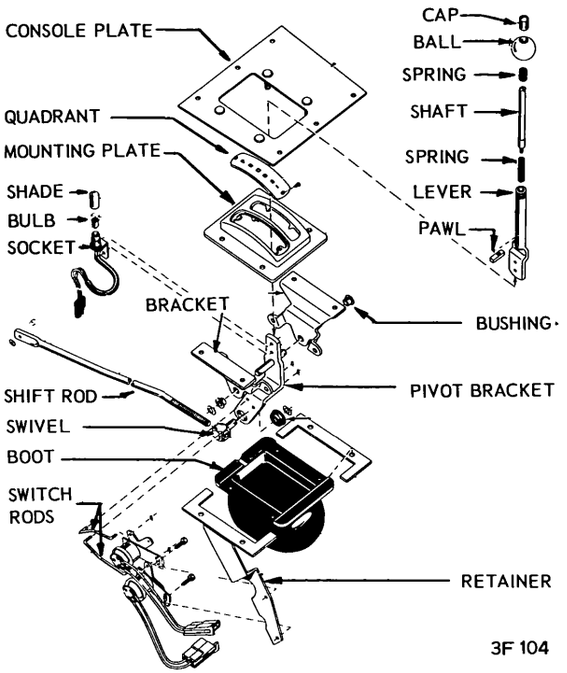
CONTROL VALVE ASSEMBLY TUBE LOCATIONS

Lower Valve Body C ver - Install valve and spring in bore of cover (see "Lower Valve Body Cover" illustration), making sure that spring is not caught between body and plate, then tighten end plate retaining screws to 20-30 inch pounds.

Control Valve - Position upper valve body and separator plate on lower valve body and install retaining screw and lockwasher (do not tighten screw). Position separator plate and lower valve body cover on lower valve body and install retaining screws and lockwashers (do not tighten screws). Install four capscrews and lockwashers attaching lower valve cover to control valve assembly and tighten to 4-6 ft. lbs. Tighten all retaining screws to 20-30 inch pounds.

GEARSHIFT LINKAGE
(Power-Shift Transmission)

Removal



Disconnect manual valve rod from selector lever, then remove ashtray and console shift cover pad from around selector lever. Remove shift lever mechanism-to-center console retaining screws and lift shift mechanism from console. Disconnect back-up light, starter cutout switch and indicator light wires from connectors.

Disassembly

Unscrew selector lever shaft ball, then remove cap and secondary spring. Remove retainer plate nuts and the back-up and neutral switch operating rods from manual shift lever. Remove retainer plates, rubber boot, console mounting plate and selector indicator housing from mounting bracket and pivot lever assembly. Remove pivot bracket assembly bolts from bracket. Remove cotter pin, spring washer, washers and bushings and remove brackets from pivot pin in manual selector lever. Unscrew plunger shaft from pawl and remove pawl, plunger shaft and primary spring. Remove two switch operating rods from switch and remove switches from retainer plate.

Reassembly

Install back-up and neutral switch on retainer plate, then install primary spring in selector lever shaft.

GEARSHIFT LINKAGE (POWER-SHIFT TRANSMISSION)

Compress spring and insert pawl in bottom slot of selector lever with chamfer in pawl toward top. Install plunger shaft in selector lever and screw plunger shaft securely to the pawl. Install pivot bracket assembly, bushings, washers, spring washer and cotter pins. *NOTE - Spring washer is installed on left side of bracket as mounted in car.* Install console mounting plate, indicator housing, rubber boot, and retainer plate. Install switch operating rods, then install secondary spring, cap, and selector lever ball.

Installation

Connect back-up light, neutral switch and indicator wires at connectors, then install shift mechanism assembly in center console and install retaining screws. Install console shift cover pad, then connect manual shift valve-to-selector lever rod to selector lever.

Tightening Specifications

Location	Torque
Transmission to Converter Housing	40-45 Ft. Lbs.
Converter Housing to Engine	23-28 Ft. Lbs.
Converter to Drive Plate	23-28 Ft. Lbs.
Oil Pan Screws	10-13 Ft. Lbs.
Pressure Regulator to Case	17-22 Ft. Lbs.
Control Valve to Case	8-10 Ft. Lbs.
Front Servo Attaching Bolt	30-35 Ft. Lbs.
Rear Servo Attaching Bolt	40-45 Ft. Lbs.
Governor Screws	50-60 In. Lbs.
Manual Lever Shaft Nut	35-40 Ft. Lbs.
Throttle Lever Shaft Nut	17-20 Ft. Lbs.
Stator Support Attaching Screws	25-35 In. Lbs.
Rear Pump Cover Screws	50-60 In. Lbs.
Extension Housing to Case	28-30 Ft. Lbs.

AIR CONDITIONING SERVICE CAUTIONS

HANDLING FREON: Though considered the safest and best refrigerant for use in Air Conditioning systems, the following precautions must be observed to avoid serious accidents or damage to the system.

Drum: 1) Do not leave drum uncapped (metal cap furnished with drum is for protection of valve and safety plug). It should be replaced after each use of drum.
2) Do not carry drum in passenger compartment of car. Place drum in luggage compartment or, if in an open truck, cover drum to protect it from radiant sun heat. If precaution not taken, resultant increase in pressure may cause safety plug to release or drum to burst.
3) When charging system, do not subject drum to high heat. Use water no warmer than 125°F (Hot rags will suffice). *Never place drum on radiator, stove, or use torches for heating during charging.* Keep drums upright.
4) Never permit a drum to be dropped or strike another drum violently.
5) Do not fill drum completely (when filling one drum from another). Leave space above liquid for expansion.

Personal: 1) Do not discharge Freon into room with exposed flame because concentrations of this gas in contact with open flame will produce a toxic gas.
2) Do not expose eyes to liquid, *USE GLASSES OR GOGGLES. Liquid Freon will freeze anything with which it comes in contact.* If Freon should strike eyeballs, splash water to area of eye to gradually get temperature above freezing point, apply a few drops of sterile mineral oil to eyes as an irrigator. If irritation continues, wash eyes with a weak solution of boric acid. *DO NOT RUB EYES. See an eye specialist at once.*
3) Do not inhale large quantities of Freon vapor as it will act an an anesthetic.
4) If Freon comes in contact with skin, injury should be treated for frostbite.

HANDLING REFRIGERANT LINES: 1) Keep refrigerant lines dry and clean. Whenever a connection or joint is broken, clean all dirt from joint or connection.
2) Parts from stock are capped and dehydrated. Caps should only be removed just prior to installation. Lines removed from system to be used again, should be capped immediately, to prevent dirt and moisture from entering lines.
3) Lines should be free of kinks, and should be carefully stored to avoid crushing or bending.
4) Proper size wrenches should be used when tightening fittings. Always use two wrenches to prevent twisting copper tubing.
5) Tubing that is left free to vibrate will harden and crystallize the area of the tubing at flare sections so that it may become brittle and break.
6) When using paint drying lamps, ovens, steam cleaners, or other heat producing devices, avoid heating any part of system. If sufficient heat applied, pressure will increase to a point where some part of system will rupture.
7) When undercoating, use care to see that undercoating does not plug evaporator drain. Do not coat air conditioning joints and connections.
8) Keep gauge set and lines free of moisture.
9) Compressor lubricant container must not be left open longer than necessary as the special oil is moisture free and will absorb moisture from air if left uncapped.

AIR CONDITIONING LEAK TESTS

LEAK TESTING CONFINED AREAS: For leak testing confined areas, such as sections of evaporator and condenser, a torch or flame type detector must be used. Two types are available. One type uses anhydrous methyl alcohol, under pressure, for producing the testing flame. The cylinder is refillable, and must be preheated to pressurize cylinder. The other type uses propane gas, under pressure, to produce the testing flame. The cylinder is replaceable and comes already pressurized, making it unnecessary to pre-heat cylinder in order to produce testing flame. Instructions for use of the detectors are furnished with the detector.

Leak Testing: With flame adjusted, explore for leaks by moving end of hose or sampling tube around all points where a leak may be. Especially check around bottom of connections, since Freon is heavier than air and will be more apparent at bottom of fitting. Color of flame will turn to a yellow-green when a small leak is detected. Large leaks will be indicated by a change in color to bright or brilliant blue or purple. When hose or tube is moved away from leak, flame will clear to an almost colorless pale-blue or green. *CAUTION*—Do not use lighted detector in any place where combustible or explosive gases, dust or vapors may be present. Do not breathe fumes and black smoke that are produced if leak is a big one. Before leak testing, be sure car is thoroughly aired (particularly if Freon tank used or if system opened for any reason) and moved to a Freon-free area in order that false readings may be prevented.

PIN-POINTING LEAKS: There are a number of fittings and places throughout the air conditioning unit where a leak detector solution or detergent may be used to pin-point leaks. Apply solution to suspected area with swab that is attached to bottle cap. Bubbles will form, within seconds, if there is a leak.

AIR CONDITIONING TROUBLE SHOOTING

►*CAUTION: Do not disconnect refrigerant lines, replace parts, or attempt adjustments without complete instructions. See "Air Conditioning Service Cautions".*

POOR COOLING: 1) Blowers Not Operating—Fuse blown or faulty circuit breaker; switch in "Off" position; defective switch; switch resistors or blower rheostats inoperative; broken wire or loose connections; blower motor defective; blower fans or motor improperly installed.
2) Restricted Air Flow—Filters clogged; dirt or other obstructions in air ducts; evaporator fins or coils clogged or restricted with frost or ice.
3) Refrigerant Flow to Cooling Coils or Fins Incorrect—Expansion valve improperly adjusted or defective; power element or temperature bulb does not contact pressure line properly; restriction in liquid line between receiver and cooling coils or fins; power element or temperature bulb discharged; insufficient refrigerant; by-pass valve, thermostatic switch or solenoid (if so equipped) not properly set or inoperative; modulator valve (if so equipped) defective; break in any part of closed refrigeration system.
4) Refrigerant Not Condensing Properly—Air flow through condenser, restricted, high engine operating temperatures; air or excess refrigerant in system; restriction in high pressure side of compressor and condenser.
5) Clutch (If So Equipped) Does Not Engage—Defective coil or relay; clutch plate lining worn or saturated with oil causing slippage; air conditioning "On" switch defective; thermostat inoperative; clutch adjustment incorrect.
6) Compressor—Belts not adjusted properly, worn, or broken; operating above normal pressures; disconnect pulley bolts not in place; valves faulty; service valves not fully open.
7) Electrical—Loose connections or broken wires between electrical units, blown fuses or faulty circuit breakers.

TOO COLD: 1) Clutch (If So Equipped) Does Not Disengage—Thermostat inoperative; relay stuck closed; air conditioning "On" switch inoperative.
2) Blower Speed Cannot be Reduced—Defective blower switch.

VIBRATION—NOISE: 1) Blowers—Loose on shaft; striking housing; foreign material; motor bearings or mounts loose or worn.
2) Compressor—Mounting brackets loose; loose internal parts; insufficient oil; too much refrigerant.
3) Air Flow—Foreign material in air system; small slits or openings in ducts.

INCORRECT OPERATING PRESSURE: 1) Excessive Pressure on High Pressure Side—Air or excess refrigerant in system; air flow through condenser core restricted; kinks or restrictions in line on high pressure side; high engine temperature; shut-off valve on high pressure side of compressor not fully open; insufficient air flow through cooling coil; defective expansion valve or incorrect adjustment.
2) Insufficient Pressure on High Pressure Side—Shortage of refrigerant; defective expansion valve or incorrect adjustment; leaky or broken compressor valves.
3) Excessive Pressure on Low Pressure Side—Power element or temperature bulb not making correct contact with pressure line; expansion valve needle stuck open or leaking.
4) Insufficient Pressure on Low Pressure Side—Restriction in lines, shortage of refrigerant; expansion valve needle stuck shut; expansion valve not open far enough, plugged, or defective; dehydrator-filter (strainer-drier) plugged; power element or temperature bulb charge lost or line plugged; compressor valves faulty; blower fans inoperative; temperature control thermostat does not cut out; moisture or freeze-up.

GENERAL MOTORS CARS

Buick & Buick Special (1963)
Cadillac (1963)
Chevrolet Pass. Cars (1963)
Chevy II (1963)
Corvair (1963)
Chevrolet Trucks (1963)
Oldsmobile & Oldsmobile F-85 (1963)
Pontiac & Pontiac Tempest (1963)

►CHANGES, CAUTIONS, CORRECTIONS

► *1963 BUICK MOAN OR RUMBLE NOISE CORRECTION:* May be caused by compressor suction hose vibrating. If grasping hose about 6" from rear of compressor eliminates noise, correct by installing 2 front stabilizer bar bushings on suction hose, positioning bushings on hose for best possible dampening effect.

DESCRIPTION

Conventional type air conditioning systems similar in design and operation to previous models. All units are mounted in engine compartment or on front of dash. Cadillac Series 75 has an additional evaporator and blower assembly in trunk.

LEAK TESTING & TROUBLE SHOOTING

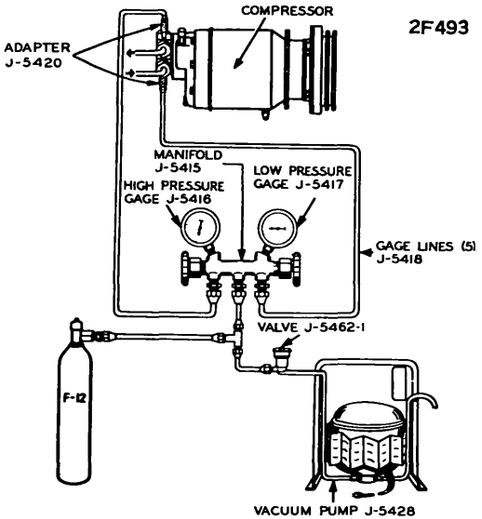
See "Leak Testing & Trouble Shooting" at beginning of Air Conditioning Section.

ADJUSTMENT

Compressor Belt

See "Belt Adjustment" on individual Car Model pages.

SERVICING



► *SERVICE CAUTION: Before disconnecting any part of air conditioning system or lines, see "Air Conditioning Service Cautions" at beginning of Air Conditioning Section.*

Gauge Set Installation

Connect gauge set into system (see illustration and "System Gauge Connection Note" below). *NOTE - For purging or adding oil to system, Freon tank and Vacuum Pump are not connected to center connection on manifold.* Make sure that shut-off valves on gauge set are fully closed and that shut-off valves on compressor head (cars with this type valve) are turned fully COUNTERCLOCKWISE (back seated).

SYSTEM GAUGE CONNECTION NOTE - Usual location for gauge set connections is at the compressor, however some cars may have high pressure valve at compressor muffler inlet and low pressure valve in line near air intake pipe at dash panel. On cars with suction throttle valve (freeze protection valve), a low pressure gauge valve is also located on suction throttle valve (or on a pipe attached to valve). *CAUTION - Gauge valve at suction throttle valve MUST NOT BE USED TO CHARGE SYSTEM unless there is no low pressure valve at compressor, or severe damage to suction throttle valve will result.*

SCHRADER TYPE VALVE CONNECTION CAUTION - On cars using this type valve in place of hand operated shut-off valves in refrigerant lines at compressor head, it is necessary to connect Adapters J-5420 to gauge connecting lines and to make sure that both valves on gauge set are completely closed before connecting adapters to Schrader type valves as the adapters will automatically open these valves.

GAUGE SET INSTALLATION

HAND OPERATED SHUT-OFF VALVE NOTE - These are two-way valves. When turned COUNTERCLOCKWISE (back seated), compressor is connected to refrigerant lines and line to gauge fitting is closed. This is the normal operating position. When turned CLOCKWISE (front seated), compressor is closed off from refrigerant lines and open to gauge fitting. When valves are turned to middle position, compressor is open to both refrigerant lines and to gauge fitting. In this position gauge readings can be taken with system in operation.

HIGH PRESSURE GAUGE CAUTION - Due to high operating capacity of compressor, a 600 lb. gauge must be used.

Purging The System

All (Except Cadillac, Chevrolet, Corvair) - Connect gauge set and turn hand shut-off valves (where equipped) partially clockwise. Open high pressure gauge valve so refrigerant escapes through gauge set and out the center fitting and hose. *CAUTION - DO NOT open gauge valve too much as oil and liquid refrigerant will escape. Refrigerant should escape in vapor form only.* When hissing stops, all refrigerant has been discharged from system. Close gauge high pressure valve. Leave gauge set connected in preparation for evacuating and charging.

Cadillac - Install Adapters J-5420 on high and low pressure valve fittings. Tighten adapters to depress valve cores until a **slight** hissing sound is heard. When hissing stops, system is discharged. *CAUTION - DO NOT overtighten adapters or oil and liquid refrigerant will escape. Refrigerant should escape in vapor form only.* Remove adapters as soon as system is purged.

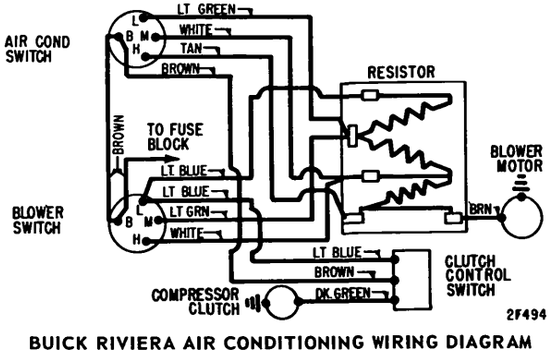
Chevrolet & Corvair - Connect gauge set. Remove cap from gauge center connection and open high pressure gauge valve, being careful not to open it too far, and slowly discharge **vapor** through center connection. *CAUTION - Opening valve too far will cause compressor oil to be discharged with refrigerant.* When pressure is reduced below 100 lbs. on high pressure gauge, open low pressure gauge valve and continue discharging until all refrigerant has been released or pressure does not exceed 5 lbs. Close both gauge valves. Leave gauge set connected in preparation for evacuating and charging.

Evacuating The System

Without Vacuum Pump - Connect gauges as indicated in illustration, but substitute a bottle or other suitable container in place of vacuum pump (container will catch the evacuated oil so it may be measured and a like amount of clean oil replaced). *CAUTION - Be sure the fitting on discharge valve is open to compressor with no restriction from valve closure, caps, or plugs in attached line before starting engine.* Turn both high and low pressure valves on compressor clockwise to gauge position. Leave low pressure gauge valve tightly closed, carefully open high pressure gauge valve and hand shut-off valve (vacuum line valve), being careful to avoid any accidental discharge of liquid refrigerant. Discharge refrigerant, air, and any oil into bottle. Start engine and set at slow idle speed and turn air conditioner to maximum cooling position. *Maintain engine speed at slow idle at all times during evacuation.* Turn high pressure service valve to shut-off position. Operate system at slow idle for five minutes, then turn off engine and air conditioner and close hand shut-off valve immediately. If system holds 26-28" of vacuum *(see "Vacuum Note" below)* for 10 minutes, system is not leaking. If not, locate and correct leak. Close high pressure gauge valve, open low pressure gauge valve and charge system with refrigerant at cylinder pressure, then repeat evacuation as indicated above. Again close high pressure gauge valve and open low pressure gauge valve and then complete charging with correct amount of refrigerant *(see "Charging System" below).*

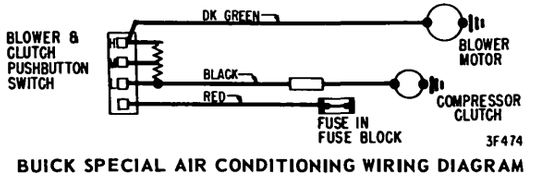
With Vacuum Pump - Connect gauge set, vacuum pump, and container of refrigerant as shown in illustration. Check fluid level in vacuum pump and add correct oil if necessary. Make sure dust cap on discharge side of vacuum pump has been removed. Open high and low pressure valves on gauge set. *CAUTION - Shut-off valve on vacuum pump must be closed.* Start vacuum pump and SLOWLY open shut-off valve at pump. *NOTE - If oil is blown from pump, oil must be replaced.* Operate pump to obtain approximately 28" of vacuum *(see "Vacuum Note" below)* for 10 minutes. If vacuum of 28" cannot be obtained, close valve at pump and note low pressure gauge to see if vacuum in system holds. If vacuum holds, pump or gauge may be at fault. If vacuum will not hold, charge system with refrigerant, check for leaks, and repair as necessary, then purge system. Repeat evacuation procedure and when vacuum of 28" has been obtained for 10 minutes, close valve at pump, stop pump and check vacuum to see that it will

(Continued)



GENERAL MOTORS CARS (Cont.)

hold If vacuum holds and no leaks are apparent, open refrigerant container valve to charge system to cylinder pressure, then close valve Evacuate system again and close gauge valves The system is now ready for a complete charge



VACUUM NOTE - Vacuum specification of 28" is for sea level For each additional 1000 feet of elevation above sea level, lower vacuum specification by 1"

Charging The System

With system completely evacuated (gauge set and refrigerant tank connected), place refrigerant cylinder in a bucket of hot water (not to exceed 125°F) *CAUTION - Do not heat r frigerant cylinder above 125°F because fusible plug in cylinder valve melts at 157°F and softens at a slightly lower temperature* Place cylinder and bucket on a suitable scale and record total weight Open low pressure valve on gauge set (high pressure valve on gauge set closed) Set both high and low pressure service valves on compressor in gauge position Wearing goggles to protect eyes, fully open refrigerant cylinder valve and allow refrigerant vapor to flow into system Operate engine at slow idle speed until the correct amount of refrigerant has been charged into the system (see "Refrigerant Capacity Table" below) *NOTE - It may be necessary to reheat water in bucket to maintain required pressure* Close both valves on gauge set, close valve on cylinder and remove cylinder from bucket Operate compressor with engine running at 1600 RPM, and check general performance of air conditioner If performance satisfactory, stop engine, then firmly backseat both high and low pressure service valves on compressor Remove gauge lines and replace protective caps over gauge connections and shut-off valves Check compressor oil level (see below)

BUICK RIVIERA AIR CONDITIONING WIRING DIAGRAM

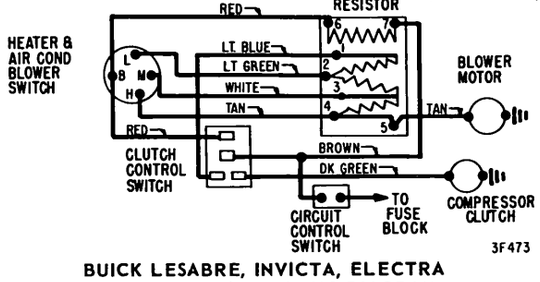
BUICK SPECIAL AIR CONDITIONING WIRING DIAGRAM

1963 Refrigerant Capacity Table

Car Model	Capacity
Buick LeSabre, Invicta, Electra	4 lbs
Riviera	3½ lbs
Special	2½ lbs
Cadillac Series 60, 62	4 lbs
Series 75	5¼ lbs
Chevrolet Cars (All Weather System)	3¾ lbs
(Cool Pack System)	3 lbs
Chevy II	2½ lbs
Corvair	5 lbs
Chevrolet Trucks	3¾ lbs
Oldsmobile Except F-85	4¼ lbs
F-85	2½ lbs
Pontiac	4¼ lbs
Tempest	3 lbs

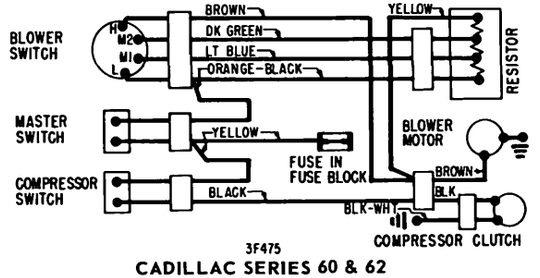
Checking & Adding Oil

CAUTION - Use only 525 viscosity refrigeration oil See table below for system total capacities



1963 System Oil Capacity

Car Model	℄ Capacity
Buick & Buick Special	10½ ozs
Cadillac Series 60, 62	10½ ozs
Series 75	13½ ozs
Chevrolet Cars, Chevy II, Corvair	11 ozs
Chevrolet Trucks	11 ozs
Oldsmobile, Except F-85	10½ ozs
F-85	10 ozs
Pontiac & Tempest	11 ozs



℄ - Fluid measure

1) Compressor - Ordinarily compressor oil level need not be checked unless there has been a major oil loss from a broken hose or severe leak, or due to a collision To check and determine how much oil to install, remove

compressor, then drain and measure oil. If more than 4 ozs. drained, add the same amount. If less than 4 ozs drained, add 6 ozs.

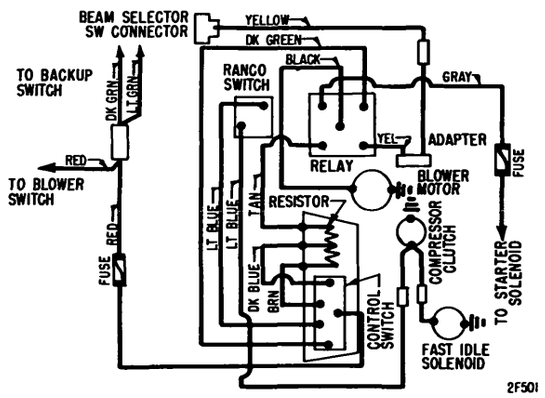
2) Other Components - If a system component (evaporator, condenser, receiver-dehydrator) being replaced (no major oil loss), pour oil directly into new unit according to table below. If there has been a major oil loss, add oil according to table below plus amount for compressor as in **1)** above.

1963 System Component Oil Capacity

Component	℄ Capacity
Evaporator	3 ozs.
Condenser	1 oz.
Receiver-Dehydrator	1 oz.

℄ - Fluid measure.

REMOVAL & INSTALLATION



CAUTION - To prevent dirt and moisture entering air conditioning system, it is very important to cap all openings and to complete work on system as soon as possible.

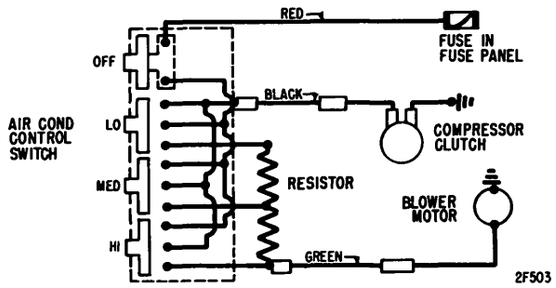
COMPRESSOR REMOVAL NOTE (TO WORK ON ENGINE) - If practicable or desirable, compressor may be repositioned in engine compartment for work on engine without disconnecting refrigerant lines. Follow procedure listed below but do not discharge system or disconnect compressor hoses.

Compressor

Buick (Except Special) - Purge system, then remove valve retaining plate from rear of compressor. Cover openings in lines and compressor. Disconnect clutch coil wire, loosen bolts, and remove compressor from mounting bracket. To install, reverse removal procedure.

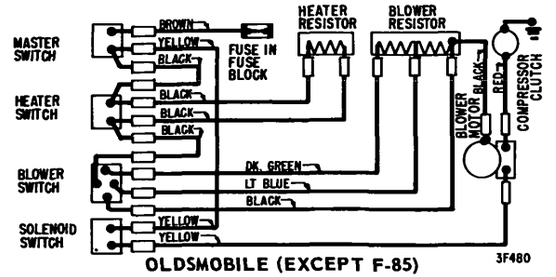
Buick Special (V6 Engine) - Purge system, then remove line retaining plate bolt and remove lines from rear of compressor. Disconnect clutch wire from compressor, then remove belts. Remove compressor adjustment bolts and pivot bolts, then remove compressor. To install, reverse removal procedure.

CORVAIR AIR CONDITIONING WIRING DIAGRAM



Buick Special (V8 Engine) - Discharge system and disconnect hoses from compressor. Raise car and disconnect front stabilizer bar. Disconnect compressor adapter from front bracket (or oil pump front bracket), then remove bolt holding compressor rear brace and rear head to cylinder block. Disconnect rear head from rear brace Support compressor with stabilizer bar, roll compressor over and remove adapter from front head. Remove belt from pulley, slide stabilizer bar forward and remove compressor. To install, reverse removal procedure.

Cadillac - Purge system and disconnect hoses from compressor. Disconnect clutch coil wires and remove belt from compressor. Disconnect compressor from mounting brackets and remove compressor To install, reverse removal procedure.

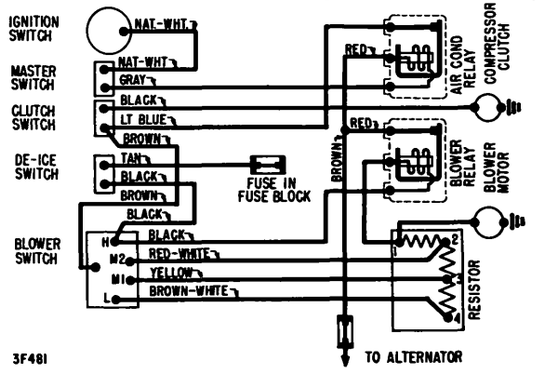


Chevrolet Pass. Cars & Trucks - Purge system, and remove hose connector from compressor. Disconnect clutch coil lead, then loosen brace and pivot bolts and remove belt. Disconnect compressor brackets from mounting bracket and remove compressor. To install, reverse removal procedure.

Chevy II - Purge system, then remove service valve connector from compressor. Disconnect clutch coil lead and remove compressor belt Disconnect compressor brackets from mounting bracket and remove compressor. To install, reverse removal procedure.

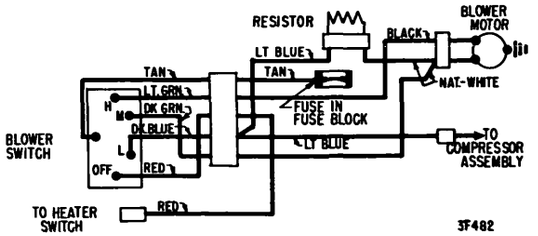
Corvair - Removal - Purge system, remove fittings block, and cap openings. Remove nut from compressor mounting bracket pivot bolt and remove compressor-to-adjusting bracket attaching parts. Remove belt. Disconnect electrical wires from compressor. Remove bolts attaching triangular bracket to front of compressor Work long pivot bolt forward until threaded end is moved out of compressor rear mounting boss. Remove compressor.

OLDSMOBILE F-85
AIR CONDITIONING WIRING DIAGRAM



OLDSMOBILE (EXCEPT F-85)
AIR CONDITIONING WIRING DIAGRAM

Installation - Support compressor on mounting bracket and work mounting bracket pivot bolt rearward through compressor rear mounting boss Loosely install pivot bolt nut and washer. Attach triangular bracket to compressor Connect wiring, install drive belt, and compressor-to-adjusting bracket attaching parts. Adjust belt tension, then tighten pivot bolt nut to apply light pressure on rubber mounting.



Oldsmobile (Except F-85) - Purge system, disconnect clutch coil wire, and remove belts Remove fittings connector from compressor and cap openings. Remove alternator from compressor, then remove compressor from brackets. To install, reverse removal procedure.

Oldsmobile F-85 - With Power Steering - Drain radiator and remove power steering pump pulley and belt. Remove power steering pump front and rear stud nuts. Purge system and disconnect hoses from compressor. Raise car and remove compressor front and rear pivot bolts and compressor adjusting bolts (leave front compressor bracket attached to compressor) Loosen power steering pump bracket-to-cylinder block bolt Lower car and remove compressor bracket-to-engine front cover bolts, then remove power steering pump and bracket. Disconnect compressor bracket from cylinder head, and remove compressor by rotating pulley upwards. To install, reverse removal procedure

Without Power Steering - Drain radiator, then purge system and disconnect hoses from compressor. Raise car and remove compressor front and rear pivot bolts and adjusting bolts (leave front compressor bracket attached to compressor) Loosen compressor bracket-to-cylinder block lower bolt Lower car and disconnect brackets from engine front cover and cylinder head. Remove compressor and hoses by rotating pulley upward. To install, reverse removal procedure. *(Continued)*

PONTIAC AIR CONDITIONING WIRING DIAGRAM

TEMPEST AIR CONDITIONING WIRING DIAGRAM

GENERAL MOTORS CARS (Cont.)

Pontiac & Tempest - *NOTE - Procedure below is for compressor removal to service engine (without disconnecting refrig rant lines).* Disconnect wiring from compressor, then remove drive belt. Disconnect rear brace from cylinder head, then remove compressor front plate and lower adjusting mounting bolts. Disconnect compressor rear plate from mounting bracket. Place compressor on fender. *CAUTION - Do not kink or place excessive tension on hoses.* To install, reverse removal procedure.

Condenser

Cadillac - Purge system and disconnect lines from condenser and sight glass. Remove cradle support-to-lock pilot bracket. Remove Eldorado horn. Disconnect condenser from support brackets on radiator cradle, then remove condenser and receiver-dehydrator assembly. To install, reverse removal procedure.

Chevrolet Pass. Cars - Remove hood lock catch support, catch, and horns. Purge system and disconnect lines from condenser and receiver-dehydrator. Remove condenser-to-radiator support attaching bolts and remove condenser. To install, reverse removal procedure.

Chevy II - Purge system. Remove bumper, bumper filler panel, grille, grille support, hood lock catch support and catch. Disconnect hoses from condenser and disconnect hoses from condenser baffle. Remove condenser-to-radiator support attaching bolts and remove condenser. To install, reverse removal procedure.

Corvair - *See "Engine Access Procedure Note" under TUNE-UP on Car Model pages.*

Chevrolet Truck - Purge system and remove radiator grille. Disconnect hoses from receiver-dehydrator and condenser. Disconnect upper ends of radiator support rods (if equipped). Remove power steering oil cooler from bracket in front of condenser (do not disconnect hoses). Remove condenser attaching bolts and remove condenser. To install, reverse removal procedure.

Oldsmobile F-85 - Remove fan shield, and radiator. Purge system. Disconnect lines from condenser and remove condenser attaching bolts. Remove condenser. To install, reverse removal procedure.

Pontiac & Tempest - Purge system, then remove front fender cross brace and fan shield. Remove hoses from condenser. Remove condenser attaching bolts and remove condenser. To install, reverse removal procedure.

CHRYSLER CORP. CARS

Chrysler & Imperial (1963)
Dodge, 880, & Dart (1963)
Plymouth (1963)
Valiant (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 DODGE (EXCEPT 880 & DART) & PLYMOUTH AIR CONDITIONING CONTROL CIRCUIT PRODUCTION CHANGE:* Later cars have new type Pushbutton Vacuum Switch and magnetic clutch control relay has been eliminated. *See wiring diagrams for details.*

►*COMPRESSOR REPLACEMENT CAUTION:* When replacing compressor assembly, turn crankshaft by hand at least two complete revolutions to clear oil accumulation from compressor head before clutch is energized to avoid damaging compressor reed valves.

►*ANTI-FREEZE PROTECTION CAUTION:* Engine cooling system must be protected to a temperature of +15°F for summer operation to prevent heater core from freezing (not applicable to models with "Cool Aire" type system).

DESCRIPTION

Chrysler, Imperial, Dodge, Plymouth - A combination air conditioning and heating unit, dash mounted, and operated by pushbuttons. An additional evaporator, located in truck (on roof at rear on station wagons), is optional.

Dart & Valiant - Cooling type air conditioner with separate heater. Evaporator and blower assembly mounted on floor under instrument panel. Unit has no additional air ducts and controls are integral with unit.

SERVICE CAUTIONS

Before disconnecting any part of air conditioning system or lines, see "Air Conditioning Service Cautions" at beginning of Air Conditioning Section.

LEAK TESTING & TROUBLE SHOOTING

See "Leak Testing & Trouble Shooting" at beginning of Air Conditioning Section.

SERVICING

Compressor Belt

See "Belt Adjustment" on Car Model Pages.

Gauge Set C-3740 Installation

NOTE - Use Modification Kit C-3741 to convert previous Gauge Set C-3627 for use on present system.

1) Connect Evaporator Suction Gauge (left side of gauge manifold) to compressor suction service port. When adapter installed and tightened, stem of valve opens service port valve.

2) Connect Discharge Pressure Gauge (center of gauge manifold) to compressor discharge service port. Needle valve below the gauge is used to dampen out gauge needle oscillations.

3) Connect Compressor Inlet Gauge (right side of gauge manifold) to compressor inlet service port by special adapter. This gauge and evaporator suction gauge must be accurately calibrated with both needles at "O" before making tests. This gauge has no passage to gauge manifold and is used when checking Evaporator Pressure Regulator Valve (except Dart & Valiant).

4) Center Manifold Outlet with long hose is used for discharging, evacuating, and charging the system. When making Compressor Capacity Test, remove hose and install special cap over connection.

Discharging The System

With gauge set manifold attached and long hose attached to center manifold outlet, open gauge set manifold needle valve and close both of the gauge set gauge valves. Adjust engine speed to 1250 RPM, turn blower on "High", move temperature control to "off", and push "fresh cool" button. Allow system to operate at full capacity for at least 15 minutes to force compressor oil to crankcase. Open discharge (right hand) gauge valve a small amount, allowing refrigerant vapor to discharge slowly. *CAUTION - Do not allow system to discharge rapidly or compressor oil will be drawn out.* Continue discharging system until pressure registers zero. Open left hand valve to release any vapor trapped at the suction side of system.

Sweep-Test Charge

This charge is used to pressurize system to make a leak test, and also is used to dry system by sweeping out trapped moisture. Close both gauge set manifold valves and open gauge set needle valve. Attach free end of long hose at center manifold outlet to refrigerant dispensing manifold and attach a single can (15 oz.) of Refrigernat 12 to dispensing manifold. Place refrigerant in 125°F pan of water. Operate engine at 1250 RPM with car windows open, blower on high, and "fresh cool" button pushed in. Slowly open left hand gauge valve to meter refrigerant into system. When full can has been metered into system, close valve and refrigerant manifold valve. *NOTE - Make complete leak test if system has been opened for repair or replacement to make sure system is sealed or when system has accidentally lost its charge.* To remove sweep-test charge, remove refrigerant can and dispensing manifold and discharge system in the usual manner (see above).

Evacuating The System

NOTE - After air conditioning system has been open to the atmosphere, it is absolutely essential that the system be evacuated and swept with refrigerant to remove all air and moisture. With gauge set manifold connected and long test hose from center manifold outlet connected to vacuum pump, open both gauge set manifold valves and needle valve. Start vacuum pump and operate until evaporator suction gauge registers at least 26" of vacuum, then continue to operate pump for at least 5 minutes while gauge registers 26-28" of vacuum. Close both gauge valves, turn off vacuum pump, and disconnect from system. System is now ready for charging. *NOTE - Failure to maintain at least 26" of vacuum indicates leak in system or faulty vacuum pump.*

Charging The System

NOTE - See "Refrigerant Capacity Table" below. Refrigerant furnished in 15 oz. cans or in bulk. Special dispensing manifold permits 3 cans (45 ozs.) to be charged into system at one time (this is normal charge on most systems). With gauge set manifold attached to compressor, attach long hose from center manifold outlet to refrigerant dispensing manifold. Turn dispensing manifold valves fully open (counterclockwise), remove caps, and attach refrigerant cans to manifold. Close dispensing manifold valves (clockwise) to puncture cans, then open valves (counterclockwise). Slightly loosen hose at gauge set manifold to purge air, then tighten securely. Place refrigerant in 125°F water.

(Continued)

CHRYSLER CORP. CARS (Cont.)

With engine at 1250 RPM, car windows open, blower on high, and "fresh cool" button pushed in, charge system through suction side by slowly opening left hand gauge set valve Adjust valve to maintain 50 lbs maximum charging pressure When system fully charged, close gauge set valves and dispensing manifold valves, and remove gauge set manifold

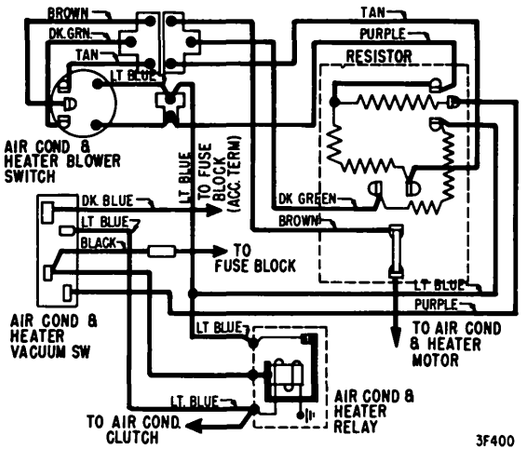
Refrigerant Capacity Table

Model	Capacity
Chrysler, Imperial, Dodge, 880, Plymouth	
Single Unit (Front Only)	① 2 5/8-2 7/8 lbs
Dual Unit (Front & Rear)	② 3 5/8-3 7/8 lbs
Dart & Valiant	③ 2 1/4 lbs

① - 42-46 ozs ② - 58-62 ozs ③ - 36 ozs

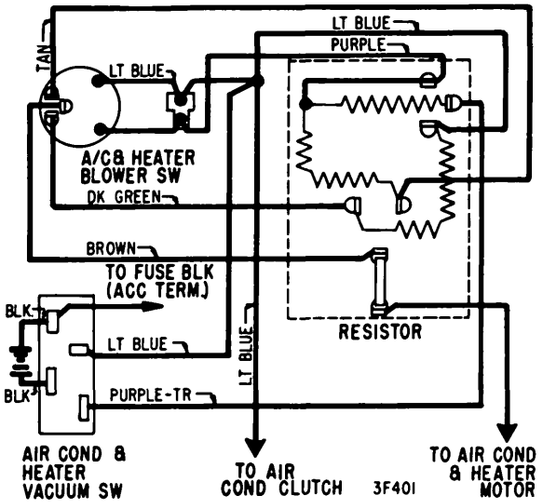
REMOVAL & INSTALLATION

Compressor



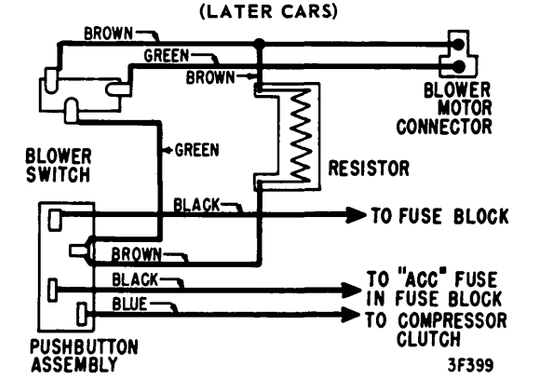
Discharge the system Measure and record oil level so that replaced or repaired unit will have the same oil level *NOTE - If level not known, adjust level to 2" when installing* Remove suction and discharge lines, being sure to cap or plug all lines as soon as disconnected to keep dirt and moisture out of system Disconnect magnetic clutch wires, and remove compressor belts Remove compressor attaching bolts and remove compressor To install, reverse removal procedure

Magnetic Clutch



NOTE - Unnecessary to remove compressor to replace magnetic clutch

Removal - Remove belts and disconnect field coil wire Remove locking bolt and washer from crankshaft at front center of clutch and insert a 5/8"-11x2½" capscrew into threaded part of hub and shoe assembly Tighten this screw until clutch is removed Remove field coil assembly mounting screws and remove assembly



Installation - Install field assembly on base of compressor bearing housing, making sure coil is placed so lead wire points up and can be routed between compressor cylinder heads Tighten mounting screws to 17 inch-lbs Install woodruff key clutch on crankshaft Install washer and **new** self-locking nut and tighten to 20 ft lbs Install field lead wire and belts

DODGE (EXCEPT 880 & DART) & PLYMOUTH AIR CONDITIONING CONTROL WIRING DIAGRAM (EARLY CARS)

DODGE (EXCEPT 880 & DART) & PLYMOUTH AIR CONDITIONING CONTROL WIRING DIAGRAM (LATER CARS)

CHRYSLER, IMPERIAL, & DODGE 880 AIR CONDITIONING CONTROL WIRING DIAGRAM

OVERHAUL

Magnetic Clutch

Testing - To test coil for open or short circuit, use an ammeter in series with fully charged battery and coil lead Current draw at 12 volts should be 2 5-2 9 amperes

Disassembly - Remove small snap ring from drive hub Use Puller C-3787 to remove drive hub from bearing Remove bearing snap ring from pulley assembly Press bearing from pulley using arbor press and suitable drivers *NOTE - New bearing must be used each time clutch is disassembled*

Reassembly - Reverse disassembly procedure *NOTE - Pulley assembly and hub assembly are mated parts and must not be replaced separately*

FORD MOTOR CO. CARS

Ford Falcon, Fairlane, & Galaxie (1963)
Mercury Comet, Meteor, & Monterey (1963)
Lincoln Continental (1963)
Thunderbird (1963)

DESCRIPTION

Conventional design air conditioning system similar to previous models Two types system used Larger (Select Aire) type has evaporator used in conjunction with conventional heater system to allow use of both fresh and recirculated air for cooling Smaller "hang-on" (Polar Aire) type uses recirculated air only, and evaporator and air ducts are a self-contained unit

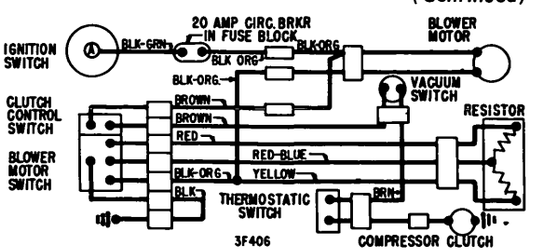
ADJUSTMENT

Compressor Belt

S "B It Adjustment" n individual Car Mod l pag s

Control Adjustments

See 1962 Final Data, Page 541



SERVICING

See 1962 Final Data, Page 542, and note the following

Compressor Oil Level

Operate engine at 1500 RPM with compressor running, for 15 minutes, then turn off engine and isolate compressor Remove oil filler plug from compressor and insert a flattened 1/8" diameter rod in oil filler hole until it bottoms *NOTE - On some compressors, it may be necessary to bend rod slightly or rotate crankshaft by hand so dip rod will reach to bottom of compressor* Oil level on rod should be as indicated in

(Continued)

THUNDERBIRD AIR CONDITIONING WIRING DIAGRAM

(FOR OTHER CARS, SEE 1962 FINAL DATA, PAGES 541 & 542)

FORD MOTOR CO. CARS (Cont.)

table below Add refrigerant compressor oil as necessary *NOTE - If oil level too high, withdraw oil as necessary.* Replace filler plug, evacuate and cut compressor back into air conditioning system

Compressor Oil Level
(York Compressor)

Mounting	① Initial Charge Depth	Minimum Depth
Vertical	1"	7/8"
Horizontal	1 1/4"	3/4"

(Tecumseh Compressor)

Mounting	② Initial Charge Depth	Minimum Depth
Vertical	1 5/16"	7/8"
Horizontal	1 9/16"	7/8"

① - Initial oil charge 10 ozs
② - Initial oil charge 11 ozs.

REMOVAL & INSTALLATION

See 1962 Final Data, Page 543.

STUDEBAKER

Studebaker, All Models (1963)

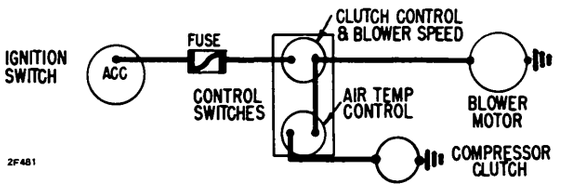
DESCRIPTION

Design and operation is similar to previous 1961-62 models Sight glass is integral part of expansion valve and is located on right side of evaporator

LEAK TESTING & TROUBLE SHOOTING

See "Leak Testing & Trouble Shooting" at beginning of Air Conditioning Section.

ADJUSTMENT



Compressor Belt

Loosen idler pulley retaining nut and move pulley as required to tighten belt so a pull of 20 lbs will deflect belt ½" with spring scale located midway between compressor pulley and idler pulley (6 Cyl.), between compressor pulley and fan pulley (V8).

SERVICING

SERVICE NOTE - All service operations except for removal and installation of compressor for engine repairs should be performed by a competent refrigerant service man.

Refrigerant Capacity - 3 lbs.

STUDEBAKER AIR CONDITIONING CONTROL WIRING DIAGRAM

Compressor Removal (When Necessary to Disconnect Hoses) - Remove caps and close the upper and lower service valves on compressor, then remove capscrews securing the two valves to compressor. Place tape over openings in compressor and valves. Remove compressor from engine compartment. *CAUTION - Keep compressor in horizontal position.*

Installation - Reverse removal procedure and install new valve-to-compressor gasket. Secure both valves in position before opening valves. *NOTE - Before installing compressor belt, turn compressor over a few times by hand to discharge any oil that may have collected on top of piston.*

RAMBLER

Rambler, All Series (1963)

DESCRIPTION

Similar in design and operation to previous models with a manually operated temperature control thermostat **Temperature Control Thermostat (Manually Operated Type)** - Located on left side of instrument panel over control console provides a temperature control range and a continuous operation feature. Control has variable temperature range of 32-58°F. When knob is turned clockwise through detent (click) position, system will run continuously in cold range of 32°F. *CAUTION - Do not use continuous operation position in high humidity areas as evaporator coil will freeze up and result in loss of cooling.*

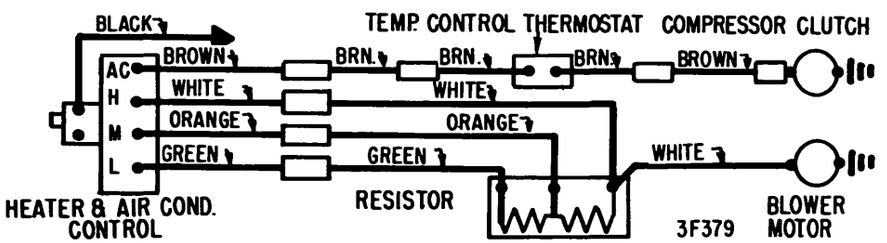
LEAK TESTING & TROUBLE SHOOTING

See "Leak Testing & Trouble Shooting" at beginning of Air Conditioning Section.

SERVICING

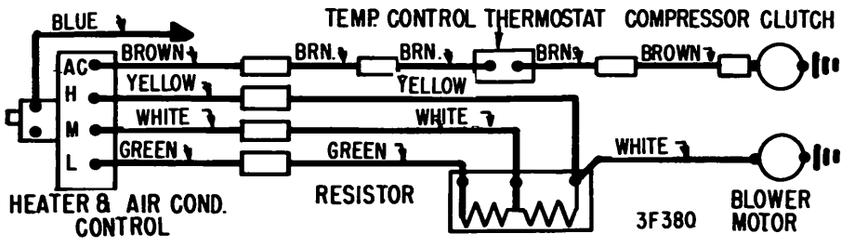
See 1960 Final Data, Page 539, or later Manual edition and note the following:

Compressor Belt



Use a strand tension gauge and place gauge between longest span between pulleys and move idler pulley or power steering pump in adjusting slots to obtain a reading of 70-80 lbs. (used belt), 110-120 lbs. (new belt).

Compressor Oil Level



Initial capacity is 7 oz. of 280-300 Saybolt refrigeration oil. Check level with compressor in normal operating position Hold a fabricated dipstick as vertical as possible and at lowest possible point through oil check plug (at rear of crankcase near pump cover plate on York type; at center on right side on Tecumseh type). Oil depth should be 3/4".

Freon Capacity

2 3/4 lbs. with 6 c.c. of methanol on all models.

RAMBLER CLASSIC & AMBASSADOR AIR CONDITIONER CONTROL WIRING DIAGRAM

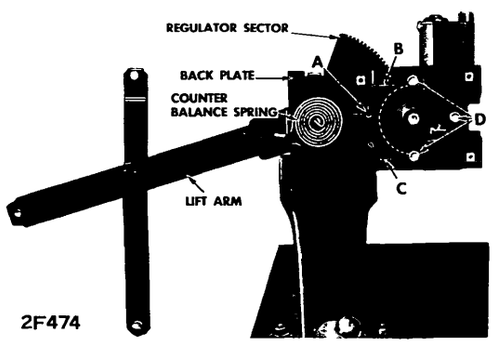
GENERAL MOTORS CARS

Buick & Buick Special (1963)
Cadillac (1963)
Chevrolet Pass. Cars (1963)
Chevy II (1963)
Corvette (1963)
Oldsmobile & F-85 (1963)
Pontiac & Tempest (1963)

DESCRIPTION

Door Windows

Window regulators individually powered by reversible electric motors in each door which are geared directly to regulator assembly. On some models, front ventilator windows are also power operated. On Cadillac, rear ventilator windows power operated also. Two-way switches on each door and a master control switch on left front door control window operation.



Tailgate Window

Dropping type window in tailgate operated by a reversible electric motor in tailgate. Control is by a switch on instrument panel. Tailgates which are hinged at the bottom have a lock switch in center of tailgate outer panel. Three-seat station wagons have additional passenger control switch at rear of rear quarter inner panel trim.

OLDSMOBILE NOTE - On all electrically controlled windows, a control relay wired to power source and to ignition switch prevents window operation until ignition switch is in ON or ACC positions.

TAILGATE EMERGENCY OPENING

If tailgates hinged at bottom cannot be opened because of inoperative window, proceed as follows: Remove tailgate follower board, then remove inner cover panel by removing attaching screws and pulling cover upwards to disengage from under lower retainer. Remove panel access hole covers and window lower sash channel cams and manually lower window into tailgate. *NOTE - If window fully raised, remove regulator attaching screws and lower window and regulator enough to remove lower sash channel cam attaching screws.*

FRONT DOOR REGULATOR ASSEMBLY

TROUBLE SHOOTING & DIAGNOSIS

Door & Quarter Windows

All Windows Inoperative - Power feed circuit faulty. Check feed wires, feed circuit breaker, and control relay (if equipped).

One Window Inoperative From Both Switches - Faulty circuit wiring; both switches faulty; motor defective; mechanical bind or failure in linkage.

One Window Inoperative From One Switch Only - The other switch or wiring from that switch is defective.

Tailgate Window

Window Inoperative From All Switches - Power feed circuit or control relay defective. Safety switch faulty or motor not grounded. Motor faulty. Mechanical bind or failure in linkage.

Window Inoperative From One Switch Only - Circuits to or from affected switch are defective. Affected switch is faulty. If both instrument panel and rear quarter switches are inoperative, check for faulty control relay.

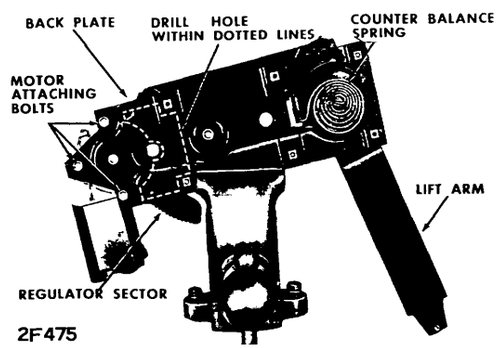
Window Cannot Be Raised From Any Switch - Up cycle feed wire defective. Motor faulty.

REGULATOR REMOVAL & INSTALLATION

CAUTION - Do not operate regulator motor after window assembly is disengaged from regulator. Operation with load removed will damage motor.

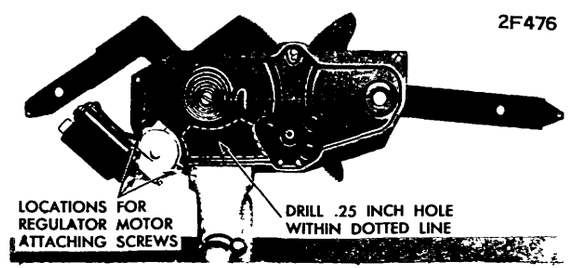
Front Doors

Buick Special & Oldsmobile F-85 - Sedan & Station Wagon - Remove door trim panel and detach water deflector. On 2-door models, remove inner panel cam attaching bolts, slide cam rearward to disengage nylon roller of regulator balance arm, then remove cam through access hole. On all models, raise window and tape securely in "up" position. Remove control assembly and ventilator division channel lower adjusting stud and nut. Remove regulator attaching screws, disconnect wiring, and remove regulator and motor assembly. To install, reverse removal procedure.



Hardtop & Convertible - Remove door trim panel and detach water deflector. Remove ventilator division channel lower adjusting stud and nut, ventilator casting-to-frame attaching screws, and remove casting. Remove ventilator attaching screws and remove ventilator. Remove inner panel cam attaching bolts, slide cam rearward to disengage nylon roller of regulator balance arm, then remove cam through access hole. Remove window uptravel stop and glass run channel outer strip assembly. Raise window until lower sash channel cam is visible above inner and outer panels, slide window forward, and remove from door. Remove regulator attaching screws, disconnect wiring, and remove regulator and motor assembly. To install, reverse removal procedure.

Buick Riviera - *NOTE - Door has r movable outer panel and it is unnecessary to remove inner trim panel and arm rest assembly.* Remove door outer panel and prop window in fully raised position. Remove window lower sash channel cam, disconnect wiring from motor, and remove regulator attaching bolts. Slide regulator forward to disengage balance arm roller from inner panel cam and remove regulator and motor assembly. To install, reverse removal procedure.



Corvette - Remove door trim panel and access covers. Remove door frame reveal molding. Remove ventilator window lower mounting nut and push stud through inner panel. On hardtop, remove ventilator regulator mounting plate, window drive pin retaining screw, then remove regulator from drive pin. Pry upper glass run channel out of door a little, tilt ventilator to rear, and remove. On convertible, remove ventilator mounting screws and nut and remove ventilator. On all models, position window so sash retaining nuts can be removed, lower window about ¾ of its travel, then pull up out of door. Disconnect motor wiring, remove regulator attaching screws, remove lower guide rail-to-door panel screws, then remove regulator and motor assembly. To install, reverse removal procedure.

All Others - Lower door window, then remove door trim panel assembly and detach inner panel water deflector. Disconnect wiring harness feed wires from regulator motor at connector. Remove ventilator division channel lower adjusting stud and nut. On hardtop and convertible models, remove door ventilator assembly (see below). Disconnect lower sash channel cam from sash channel and remove cam. On hardtop and convertible models, remove window front and rear stops and remove window. On other models, prop window in "up" position. On all models, remove regulator assembly attaching screws, disengage regulator balance arm from inner panel cam, then remove regulator and motor assembly. To install, reverse removal procedure.

(Continued)

REAR DOOR AND QUARTER WINDOW REGULATOR ASSEMBLY

TAIL GATE REGULATOR ASSEMBLY

GENERAL MOTORS CARS (Cont.)

Front Door Ventilators

Hardtops & Convertible (Except Buick Riviera) - *NOTE - Regulator and motor assembly can be removed after door trim panel and water deflector removed. Procedure below is for complete ventilator assembly removal (for door regulator removal).* Remove door trim panel assembly and detach inner panel water deflector. Lower door window and remove ventilator-to-door outer panel return flange attaching screw. Break cement bond holding front door hinge pillar sealing strip (at belt) to ventilator assembly (at front of ventilator). Remove ventilator division channel lower adjusting stud and nut. On electrically operated types, disconnect motor and regulator assembly from vent frame and remove motor and regulator assembly through large access hole. Loosen ventilator frame adjusting stud nut and remove ventilator attaching bolts. Lift ventilator assembly upward and rearward, and remove from door. To install, reverse removal procedure.

Buick Riviera - *NOTE - Door has removable outer panel and it is unnecessary to remove inner trim panel and arm rest assembly.* Raise door window and remove door outer panel. Remove ventilator assembly as follows: Remove ventilator lower frame adjusting stud nut (at door hinge pillar panel), then disconnect ventilator division channel from adjusting plate at bottom of door. Disconnect ventilator from inner panel, and disconnect motor wiring. Tilt lower part of division channel to rear to disengage adjusting stud from door hinge pillar panel, then remove ventilator assembly. Regulator and motor assembly may now be removed from ventilator at the bench.

Sedan, Station Wagon, Limousine - Raise door window and remove door trim panel assembly, then detach inner panel water deflector. Disconnect ventilator regulator motor wires at connector. Remove ventilator tee shaft attaching bolt and ventilator regulator attaching screws. Disengage the ventilator regulator shaft from tee shaft and remove regulator and motor assembly through door access hole. To install, reverse removal procedure.

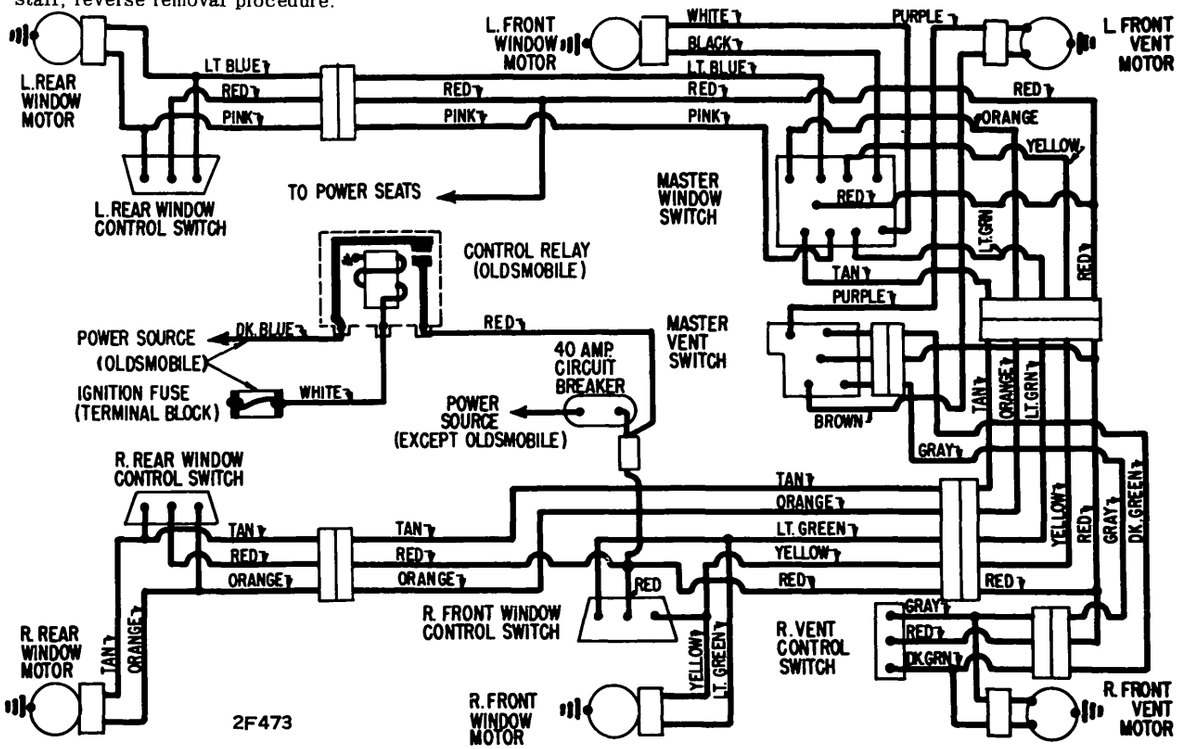
Rear Doors

All Models - Lower door window and remove door trim panel assembly and detach inner panel water deflector. Remove door window lower sash channel cam and raise window and prop in "up" position. Disconnect wiring harness from motor at connector. On hardtop models, loosen rear guide cam upper attaching screws and remove lower adjusting stud and nut (to permit regulator removal). Remove regulator attaching screws, disengage balance arm from inner panel cam and remove regulator and motor assembly through access hole. To install, reverse removal procedure.

Rear Door Ventilator

Cadillac - Raise door window, remove door trim panel assembly, and detach inner panel water deflector to expose large door access hole. Disconnect wiring harness from ventilator motor connector. Remove ventilator tee shaft attaching bolt and ventilator regulator attaching screws. Disengage regulator from tee shaft and remove regulator and motor assembly. To install, reverse removal procedure.

Rear Quarter Window (Except Buick Special & Oldsmobile F-85)



Sedan - Lower window and remove rear quarter trim assembly, then remove access hole cover from inner panel. Remove front guide upper attaching screw and glass run channel attaching screw. Disconnect wiring from motor at connector. Remove regulator attaching screws, disengage regulator arm roller from lower sash channel cam and remove regulator and motor assembly through access hole. To install, reverse removal procedure.

Hardtop (Except Buick Electra & Riviera, Cadillac, & Oldsmobile 98) - Remove rear seat cushion and back assembly, rear quarter trim and arm rest, and inner panel access hole cover. Disconnect wiring from motor at connector. Remove rear guide attaching screws, disengage rear guide from roller on lower sash channel and remove guide. Place window half-way down and remove lower sash channel cam attaching screws. Remove cam and front guide adjusting stud nuts. Disengage front guide adjusting studs from stud holes in inner panel, then disengage front guide from rollers on window. Remove window by lifting upward and inward. Remove regulator attaching screws and remove regulator and motor assembly through access hole. To install, reverse removal procedure.

Buick Electra, Cadillac & Oldsmobile 98 - Remove rear seat cushion and back, arm rest and trim panel, and inner panel access hole cover. Disconnect wiring from motor at connector. Remove rear guide. Place window half-way down and remove lower sash channel cam attaching screws, detach cam from regulator arm roller and remove cam. Scribe mark position of lower stop on front guide for reassembly, loosen lower stop attaching screw and slide stop to bottom of guide. Lower window so lower roller on sash channel frame runs out of front guide channel at bottom, then lift window upward and inboard to disengage upper roller on sash channel from rear channel on front guide. Remove window assembly. Remove regulator attaching screws and remove regulator and motor assembly through access hole. To install, reverse removal procedure.

Buick Riviera - Remove rear quarter trim and inner panel access hole cover. Put window about half-way down and remove male wedge plate through inner panel access hole. Disconnect wiring from regulator motor. Remove rear guide attaching screws and remove guide. Remove lower sash channel cam attaching screws, disengage cam from roller on regulator lift arm, then remove cam. Lower window completely. Loosen front guide upper adjusting stud nuts, remove center and lower adjusting stud nuts, then move front guide down as far as possible. Lift window upward and inboard to

(Continued)

G.M. (EXCEPT CADILLAC) WINDOW CONTROL WIRING DIAGRAM

GENERAL MOTORS CARS (Cont.)

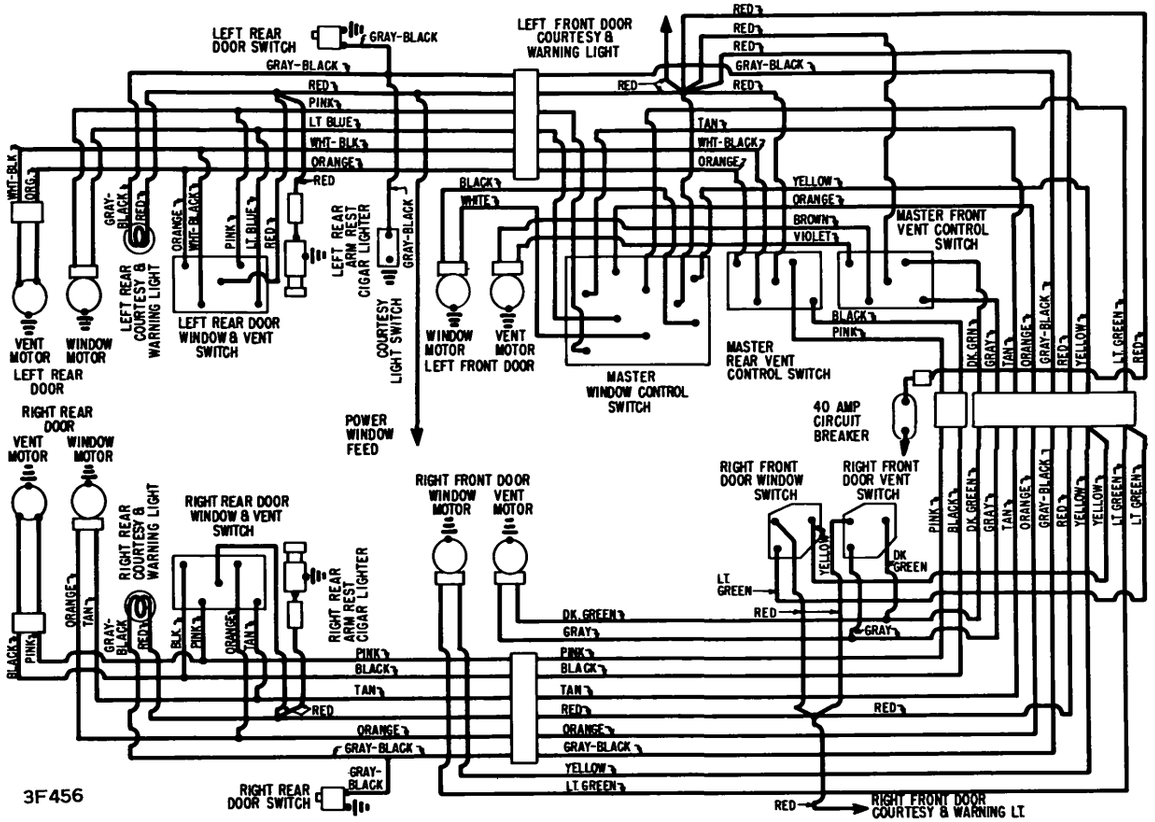
disengage rollers from front guide, then remove window (front edge first). Remove regulator attaching screws, then remove motor and regulator assembly through access hole. To install, reverse removal procedure.

Convertible - Remove rear seat cushion and back, top compartment side trim panel and rear quarter trim assembly. Remove inner panel access hole cover, then operate window to full "up" position and prop in place. Disconnect feed wire plug from motor, then remove regulator attaching screws. Disengage regulator lift arm roller from lower sash channel cam and remove regulator assembly through access hole. To install, reverse removal procedure

Rear Quarter Window (Buick Special & Oldsmobile F-85)

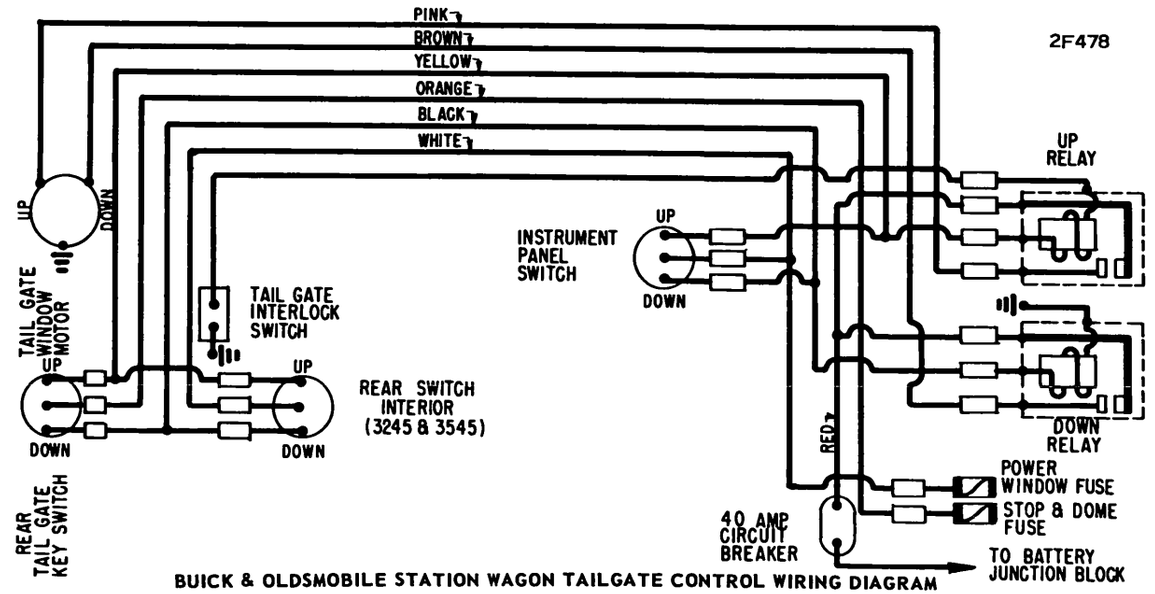
Sedan - Remove rear quarter trim panel, inner panel access hole cover, and inner sealing strip. With window up, remove window rear guide, then lower window enough to tilt rearward and disengage regulator lift arm roller from lower sash channel. Lift window upward and rearward to disengage lower sash channel roller from front guide, then remove window assembly. Disconnect wiring from motor at connector, remove front guide upper attaching bolt and regulator attaching bolts, then remove regulator and motor assembly through access hole. To install, reverse removal procedure.

Hardtop - Remove trim panel and large inner panel access hole cover. With window almost completely down, remove lower sash channel-to-lower support assembly attaching screws. Bring window half-way up, disengage from lower support assembly, and remove window. Remove window rear guide and front guide adjusting stud nuts so front guide and lower support assembly can be disengaged from inner panel. Disengage regulator lift arm roller from lower support cam. Disconnect wiring from motor at connector, remove regulator attaching bolts, and remove regulator and motor assembly. To install, reverse removal procedure.



Convertible - *Procedure is same as for other car models (see above).*

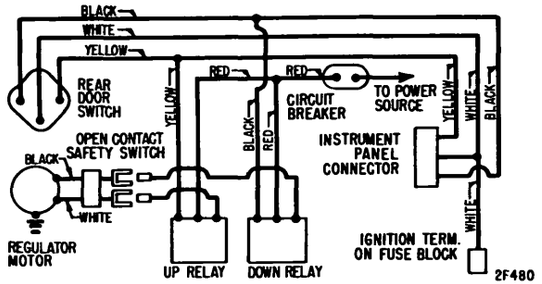
Tailgate Window



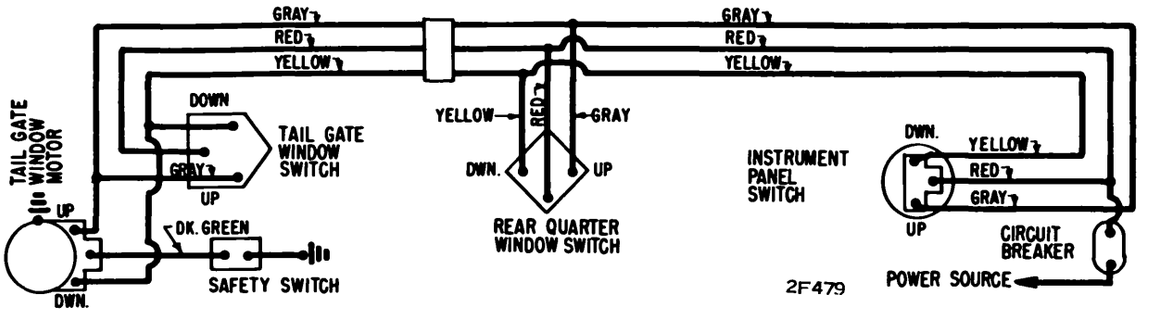
Types Hinged At Bottom - Remove skid strips, inner cover finish moldings, and tailgate inner cover panel. Remove water deflector, and inner panel access hole cover. Lower window until lower sash right and left cam attaching bolts are accessible, remove bolts, disengage cams from lower sash channel, and pull window from tailgate. Detach lock remote control right connecting rod from remote control, disconnect wiring harness from motor, remove regulator attaching screws, and remove regulator and motor assembly through access hole. To install, reverse removal procedure.

Types Hinged At Top - Remove right and left stationary windows as follows: Lower dropping window, remove all garnish moldings, then disengage rubber channel filler strip from stationary window rubber channel (pull strip inboard). Remove dropping window upper

(Continued)



CADILLAC WINDOW CONTROL WIRING DIAGRAM



BUICK & OLDSMOBILE STATION WAGON TAILGATE CONTROL WIRING DIAGRAM

GENERAL MOTORS CARS (Cont.)

glass run channel attaching screws and remove glass run channel. Remove division post attaching screws and both division posts. Remove glass by pushing inward. Remove dropping window as follows: Remove tailgate inner cover panel, then operate window to lower it about 1". Move window to right side to disengage regulator rollers from lower sash channel cams, then lift window and remove from body. Disconnect wiring from regulator motor, remove lock inside handle

BUICK SPECIAL, OLDSMOBILE F-85, PONTIAC TEMPEST STATION WAGON TAILGATE CONTROL WIRING DIAGRAM

CHEVROLET, CHEVY II, PONTIAC STATION WAGON TAILGATE CONTROL WIRING DIAGRAM

remote control attaching screws, disconnect remote control from connecting rod and remove remote control. Disconnect remote control support plate and disengage inner panel cam from regulator arm roller, then remove support plate. Remove regulator attaching screws, and remove regulator and motor assembly. To install, reverse removal procedure.

REGULATOR MOTOR REMOVAL

Clamp regulator and motor assembly securely in a vise, then drill a ¼" hole through back plate at the location indicated in illustrations. *NOTE - Drill the ¼" hole in front door window regulators at either "A", "B", or "C" (see illustration), depending on position of lift arm. On other regulator assemblies, drill the hole within the area outlined by dotted lines in illustration. Do not locate hole less than ½" from edge of back plate or sector.* Insert a 3/16" bolt through hole in back plate and sector and install a nut but do not tighten. Remove motor attaching bolts and remove motor assembly from regulator. Clean all chips from regulator and motor pinion gear after drilling. To install, reverse removal procedure. *CAUTION - Be sure to remove temporary nut and bolt from regulator before installing in car.*

CHRYSLER CORP. CARS

Chrysler & Imperial (1963)
Dodge & 880 (1963)Ⓒ
Plymouth (1963)
Valiant (1963)Ⓒ

Ⓒ - Station Wagon tailgate window only on Dart & Valiant.

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 ELECTRIC WINDOW WIRING PRODUCTION CHANGE & MODIFICATION NOTE:* On later cars, a relay is used in control circuit to permit window operation only with ignition "on". Relay may be bypassed as follows:

All (Except Dart & Valiant) - All leads from single stud terminal block (under left cowl trim panel) transferred to load side of circuit breaker (load side is stud on breaker without male blade terminal).

Dart & Valiant - Both red wires at relay removed from relay and spliced together.

DESCRIPTION

Door Windows - Each door window operated by an electric motor and controlled by individual door switches with master control on left front door. On Imperial, front door vent windows also electrically operated. An optional safety switch may also be found on left front door which permits window operation from master control panel only.

Tailgate Window - Electrically operated window controlled by a key operated switch in exterior locking handle, and by a switch on instrument panel. On 3-seat suburbans, an additional roof rail switch provided for passenger control of window. Optional "Child Guard" control for 3-seat surburbans consists of an up relay, a down relay, and a vacuum switch in one of the rear doors. Vacuum switch controls roof rail switch. When rear door is locked, vacuum switch is open, roof switch is not grounded, and is inoperative. However, window can be controlled from lock or instrument panel switches in the usual manner.

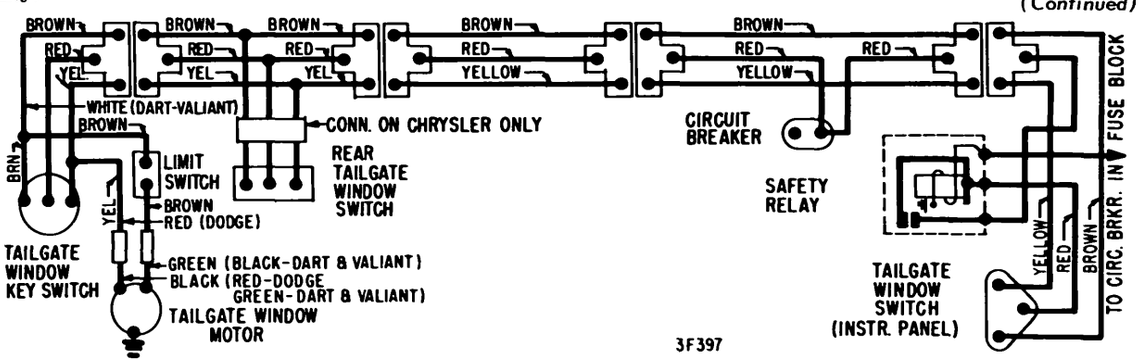
TROUBLE SHOOTING & DIAGNOSIS

Window Operates From Individual Door Switch Only - Master switch faulty. Wiring harness broken.

All Windows Inoperative From All Switches - Circuit breaker, or feed to circuit breaker faulty. Control relay faulty.

One Window Inoperative From All Switches - Circuit breaker faulty. Both master switch and individual door switch faulty. Gear box jammed. Coupling between motor and gear box broken. Motor burned out. Short in wiring.

Window Operates In One Direction Only - Wiring faulty. Motor burned out.



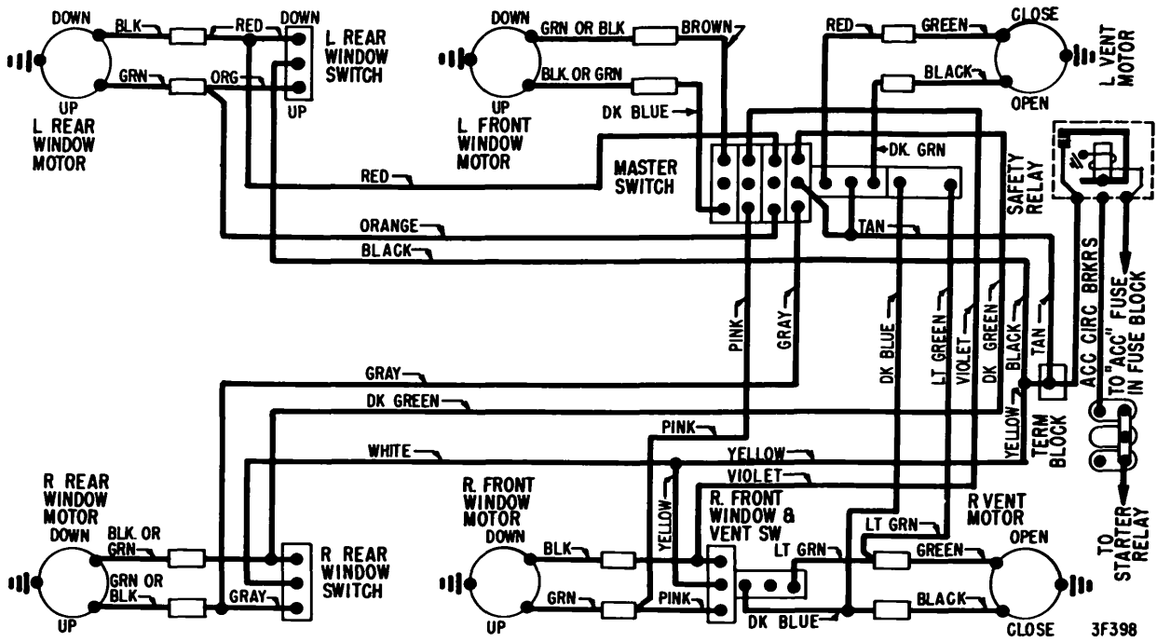
Circuit Breaker "Clicks" But Window Inoperative - Feed wiring shorted. Switch faulty.

REMOVAL & INSTALLATION

Window Regulator & Motor

Removal - Disconnect battery and remove garnish molding, then remove door trim panel and disconnect

(Continued)



SUBURBAN TAILGATE WIRING (TYPICAL)

CHRYSLER CORP. CARS (Cont.)

wires from switch Remove clips from regulator pins holding lower glass channel Raise glass manually, then remove regulator attaching screws, pivot guide retaining pin and remove motor and regulator through opening in door If necessary to replace gear box, first remove regulator counter-balance spring *NOTE - The gear box is replaced only as a complete assembly and is permanently lubricated*

Installation - Place regulator and motor through door opening and insert pivot arm pin into guide Install regulator screws finger tight, but DO NOT TIGHTEN at this time Remove window prop and lower glass, then insert control arms into glass channel, using a leather washer on each side of channel and secure with a clip Connect wires to motor and connect battery, then operate window several times and stop glass halfway Tighten regulator screws Check operation as follows Connect an ammeter into circuit and operate window Ammeter reading should be constant at approximately 14 amps (all models except rear doors of 4-door hardtop models), 20 amps (4-door hardtop models) If ammeter reading fluctuates, there is a bind in glass or linkage Adjust glass down stop so window is flush with garnish molding Install trim panel, garnish molding, and other parts

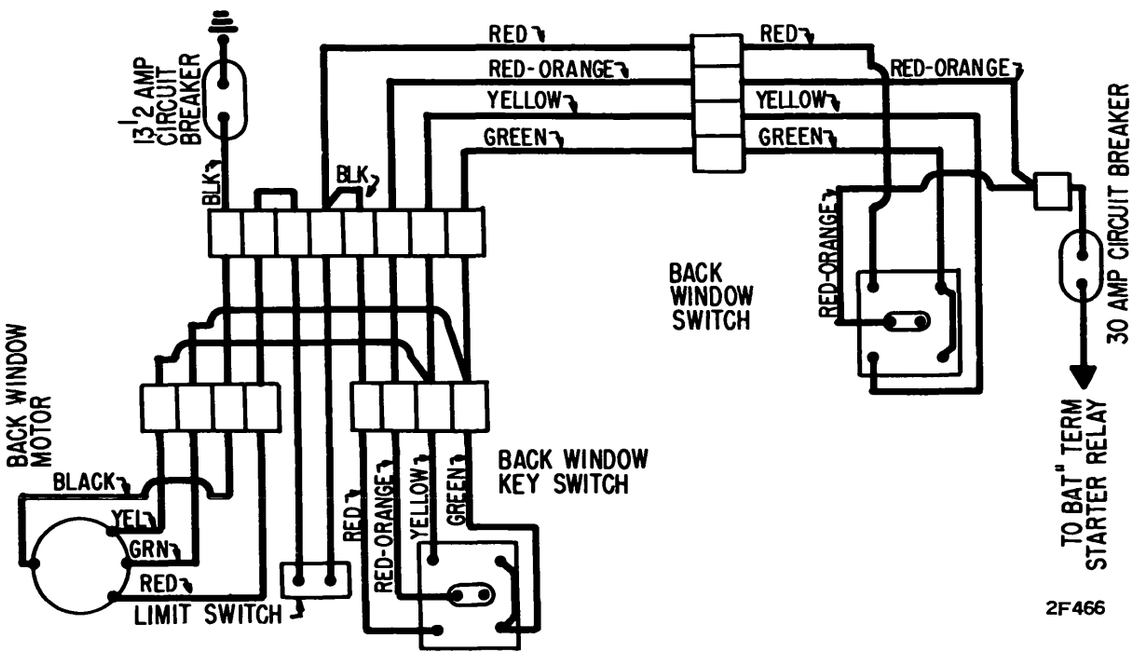
CHRYSLER CORP ELECTRIC WINDOW WIRING DIAGRAM

FORD MOTOR CO. TAIL GATE WINDOW

Ford Falcon, Fairlane, Galaxie Station Wagon (1963)
Mercury Comet, Meteor, Monterey Station Wagon (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*SAFETY RELAY BYPASS NOTE*. If desired, safety relay (on dash panel in engine compartment, or on right radiator support) which permits window operation only with ignition switch ON, may be bypassed as follows Disconnect lead from relay "A" terminal and connect to relay "B" terminal Disconnect wire from relay "F" terminal, bend back, and tape to wiring harness



DESCRIPTION

Electrically controlled station wagon tailgate window operated by a reversible electric motor and a window regulator mechanism in tailgate Control is through a key operated lock switch on upper center of tailgate outer panel, and a toggle or push-pull switch on left front door or instrument panel for driver control A limit switch located at right side of tailgate pillar post prevents operation of window when tailgate is open

EMERGENCY MANUAL OPENING

If Window Fully Raised

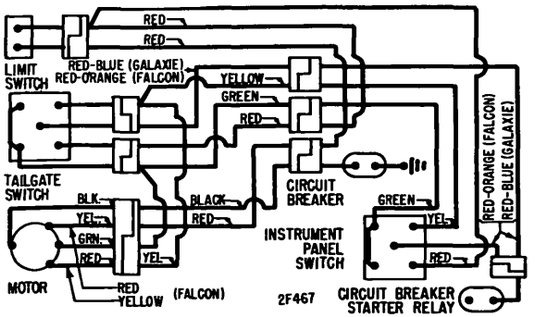
Remove trim panel retaining screws, trip lock handle to relieve pressure, then remove trim panel by pulling up and forward to slide it out of lower retainer Remove water shield and access hole cover from inner panel Remove regulator arm roller retaining pins and disengage rollers from regulator arms Push window into full down position and open tailgate *(Continued)*

COMET, METEOR, MONTEREY STATION WAGON TAILGATE WINDOW WIRING DIAGRAM

FORD MOTOR CO. TAIL GATE WINDOW (C ntinu d)

If Window Partially Raised

Remove quarter window rear garnish moldings, and quarter window outside rear moldings. Remove tailgate window glass upper side run retaining screws. Open tailgate and window as an assembly by removing upper runs simultaneously.



TROUBLE SHOOTING & DIAGNOSIS

CAUTION - When testing circuits with tailgate lowered and limit switch h ld closed, operate circuit only momentarily. Continuous operation of window in horizontal position will damage motor.

Wind w Will N t Op rat Through Either Switch Circuit - Check control circuit for continuity. Check feed and ground circuit breakers, and safety relay. Check all wiring for continuity. Motor armature or field coil windings may be faulty. Limit switch or wiring may be defective (down cycle).

Wind w Op rates Thr ugh One Switch Only - The other switch is defective. Wiring from other switch faulty.

Wind w Op rat s In On Direction Only - Check for continuity of wiring for the inoperative cycle. Check relay or circuit breaker. Check for faulty limit switch or motor.

FALCON, FAIRLANE, GALAXIE STATION WAGON
TAILGATE WINDOW WIRING DIAGRAM

REMOVAL & INSTALLATION

Window

Lower tailgate, disconnect hinge supports at tailgate, remove trim panel and water shield. Remove retainers from window channel rollers and disconnect regulator arms from rollers. Remove window.

Motor

Remove window (see above), disconnect wiring from motor, and remove motor-to-regulator attaching nuts. Remove motor.

Regulator

NOTE - Motor and regulator may be removed as an assembly if desired. Remove window (see above), disconnect motor wiring at motor, and remove regulator attaching nuts. Remove regulator and motor assembly.

Limit Switch

Lower tailgate. If switch not visible, remove access cover behind tail light or trim panel and water shield as necessary. Remove limit switch attaching screws and remove switch.

Lock Switch

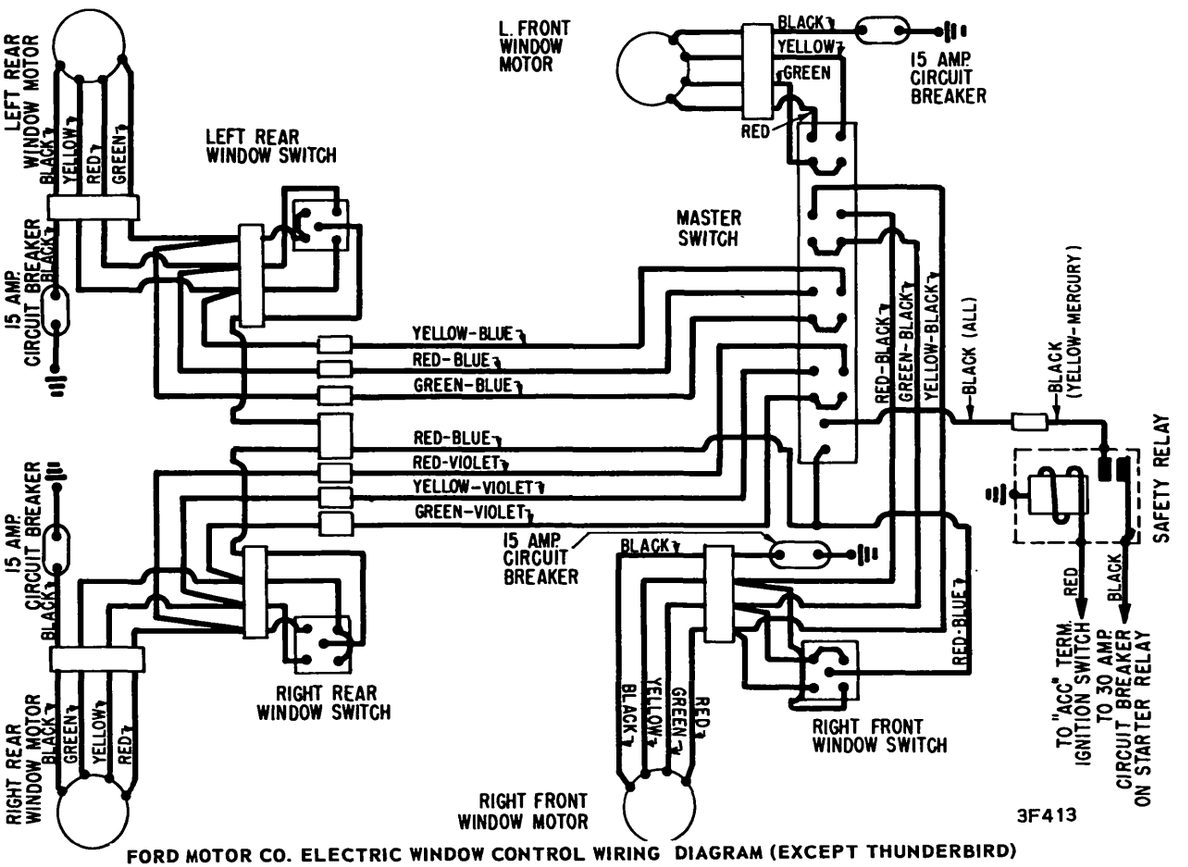
Switch can be removed after window, motor, and regulater are removed.

FORD MOTOR CO. WINDOWS

F rd Galaxi (1963)
Mercury M nter y (1963)
Thund rbird (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*SAFETY RELAY BYPASS NOTE:* If desired, safety relay (on dash panel in engine compartment) which permits window operation only with ignition switch ON, may be bypassed as follows: Disconnect lead from relay "A" terminal and connect to relay "B" terminal. Disconnect wire from relay "F" terminal, bend back, and tape to wiring harness.



DESCRIPTION

Electrically controlled windows operated by a reversible type motor combined with each individual window regulator assembly. Individual switches located near each window for separate control, and a master control switch on left front door to control all windows. A lock-out switch on master control switch enables windows to be operated only by the driver of the car. On Mercury Monterey, vertical rear window controlled by individual switch on instrument panel. On all windows, a safety relay on dash panel in engine compartment prevents window operation except when ignition switch is in ON or ACC positions. *NOTE - For electrically op rated stati n wagon tailgate window, see "Ford Motor Co. Tailgate Window" in this section.*

TROUBLE SHOOTING & DIAGNOSIS

All Windows Will N t Operate In Either Direction - Trouble will be in main feed circuit breaker, safety relay, ignition switch, or lock-out switch; or any of appropriate control wiring. Test for current at various parts of control circuit with a voltmeter or jumper wire.

(Continued)

FORD MOTOR CO. ELECTRIC WINDOW CONTROL WIRING DIAGRAM (EXCEPT THUNDERBIRD)

FORD MOTOR CO. WINDOWS (Continu d)

One Window Will Not Operate In Either Directi n Through Either Switch Circuit - If motor runs freely, it is loose and pulled away from coupling. Check for defective motor circuit breaker, faulty wiring from switches to motor (or faulty switch feed wire), motor armature or field windings faulty.

One Window Operates In One Direction Through Either Switch - Check for faulty switch or faulty wiring between switch and motor. Check for faulty motor field coil.

Window Operates In Both Directions Through One Switch Only - Check for defective switch or faulty wiring between switch and motor.

Window Operates Opposite To Switch - Check for improperly mounted switch or reversed wiring.

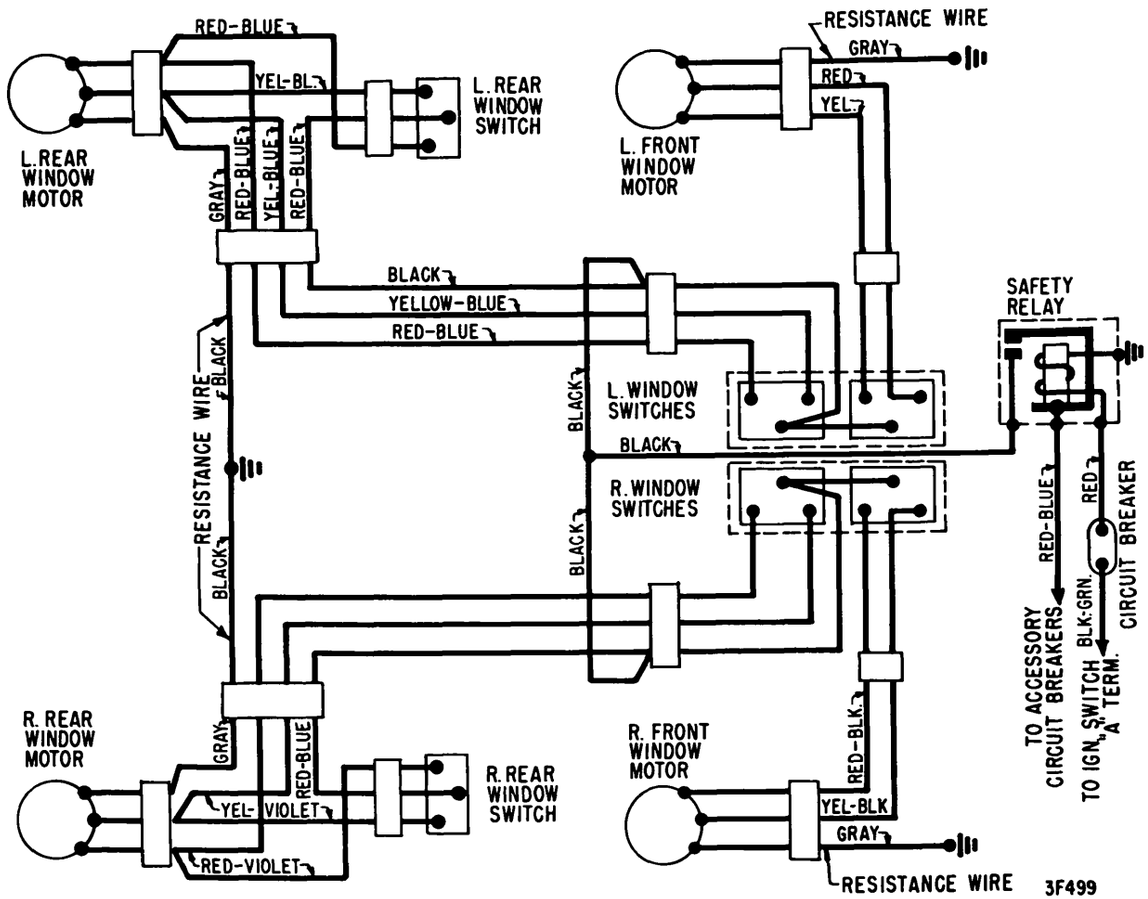
Window Operates Sluggishly - Check regulator and window runs for binding. Check for frayed insulation on wires which may cause partial ground. Check that paint does not insulate ground wires or ground circuit breakers. Check for loose connections or corrosion causing high resistance. Check motor current draw with an ammeter. Normal current draw during operation should not exceed 20 amperes. Current draw with mechanism against a stop should be 30-50 amperes. If current draw excessive, replace motor. Motor no-load current draw should not exceed 14 amperes at 12 volts.

REMOVAL & INSTALLATION

Motor

Ford & Thunderbird - Remove door trim panel, disconnect wires, remove motor mounting nuts and motor brace. Pull motor free of rubber coupling and remove motor.

Mercury - Front Doors - Disconnect battery, remove door trim panel and trim water shield. Disconnect motor wires, and remove motor bracket attaching screw. Disconnect motor and coupling from regulator assembly, then remove motor.



Rear Doors, Quarter, or Back Window - Motor removed with regulator as an assembly. See *"Regulator Removal" below.*

Window Regulator

REGULATOR ARM TENSION SPRING REPLACEMENT NOTE - Spring can be replaced after regulator removed. Regulator arm must be at point of maximum upward travel to reduce amount of spring tension to be overcome.

Front Door - Ford - Remove door trim panel and loosen water shield. On 2-door and 4-door hardtop models, disconnect regulator at arm and plate. On other 4-door models, disconnect regulator from glass channel roller. Secure glass by hand in raised position. On 4-door models (except hardtop), disconnect front run bracket from inner panel to provide access. On all models, remove regulator retaining screws and remove regulator. To install, reverse removal procedure.

M rcury - *NOTE - Procedur is for r moval of regulator and motor as an assembly.* Disconnect battery, remove door trim panel and trim water shield. Remove window lower stop. Disconnect motor wires. With wire hook, remove retainers from window rollers and separate regulator arm pivots from rollers. Secure window in fully raised position. Remove regulator assembly attaching screws and remove regulator and motor assembly.

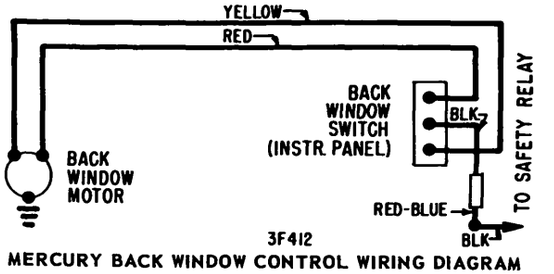
THUNDERBIRD ELECTRIC WINDOW CONTROL WIRING DIAGRAM

Thunderbird - Remove door trim panel and loosen water shield. Block window in fully raised position, and remove regulator arm from plate assembly. *NOTE - If arm and plate assembly are to be removed, lower window and disconnect arms from the two glass roller assemblies, then remove arm and plate.* Remove regulator assembly retaining screws and remove regulator. To install, reverse removal procedure.

Rear Door - Ford - Remove door trim panel and loosen water shield. Lower glass about halfway and disconnect regulator arms, then support glass in fully raised position. Remove regulator retaining screws, slide equali zer arm out of bracket or guide, then remove regulator. To install, reverse removal procedure.

M rcury - With window fully raised, disconnect battery, remove door trim panel and trim water shield. On 4-door hardtop, remove window upper stop. On all models, disconnect motor wires, and remove retainers from window rollers with a wire hook. Separate regulator arms from rollers and prop window up. On 4-door hardtop, remove center guide assembly. On all models, remove regulator and motor bracket mounting screws. Slide equalizer arm out of bracket and remove regulator and motor as an assembly. To install, reverse removal procedure.

Rear Quarter - Ford - Remove rear seat cushion and back, remove trim panel and pull water shield away from access holes. Lower window, disconnect regulator from glass channel rollers, and support window in fully raised position. Remove regulator retaining screws, slide regulator arm out of equalizer bracket, and remove regulator. To install, reverse removal procedure.



Mercury - Remove rear seat cushion, back and trim panel. Lower window, remove retainer clips from window rollers, separate regulator arms from rollers, then remove rollers. Secure window in fully raised position. Remove motor from regulator. Disconnect regulator from quarter panel, slide equalizer arm out of equalizer arm bracket and remove regulator assembly. To install, reverse removal procedure.

(Continued)

FORD MOTOR CO. WINDOWS (Continu d)

Thunderbird - Remove quarter trim panel and water shield Remove window upper stop. Disconnect regulator arms from glass channel. Lower glass, lift glass from front guide, then remove glass assembly. Remove regulator retaining bolts, slide regulator equalizer arm roller out of bracket, and remove regulator. To install, reverse removal procedure.

Back Wind w - M rcury - Remove seat cushion and back, and both window division bar moldings. Remove lower garnish molding. Remove seat back support, and inner weatherstrip. Remove cover from rear window housing. Disconnect window side channel from one side of housing, then remove hairpin clip from each roller in glass channel. Press regulator arms to rear to free from rollers, lift side channel off studs, then let window slide to lower end of channels. Remove window. Disconnect motor wires from harness in luggage compartment. Disconnect regulator from housing, then slide regulator arm and roller out of equalizer bracket. Turn motor shaft coupling manually until regulator gear is free of pinion, disconnect motor from regulator and from shaft coupling. Remove motor and regulator. To install, reverse removal procedure, installing regulator to motor and pinion in approximate position for fully raised window

MERCURY BACK WINDOW CONTROL WIRING DIAGRAM

LINCOLN CONTINENTAL WINDOWS

Linc ln C ntin ntal (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*SAFETY RELAY BYPASS NOTE:* If desired, safety relay (under instrument panel on right side on early cars, on engine side of firewall on later cars) which permits window operation only with ignition switch ON, may be bypassed as follows: Disconnect lead from relay "A" terminal and connect to relay "B" terminal. Disconnect wire from relay "F" terminal, bend back, and tape to wiring harness.

►*1963 AUTOMATIC REAR WINDOW CIRCUIT WIRING PRODUCTION CHANGE FOR IMPROVED PERFORMANCE:* To prevent door open warning light being lighted when doors are closed, automatic window lowering circuit was revised approximately June 3, 1963. Operation of window remains the same. *See Wiring Diagrams for details.*

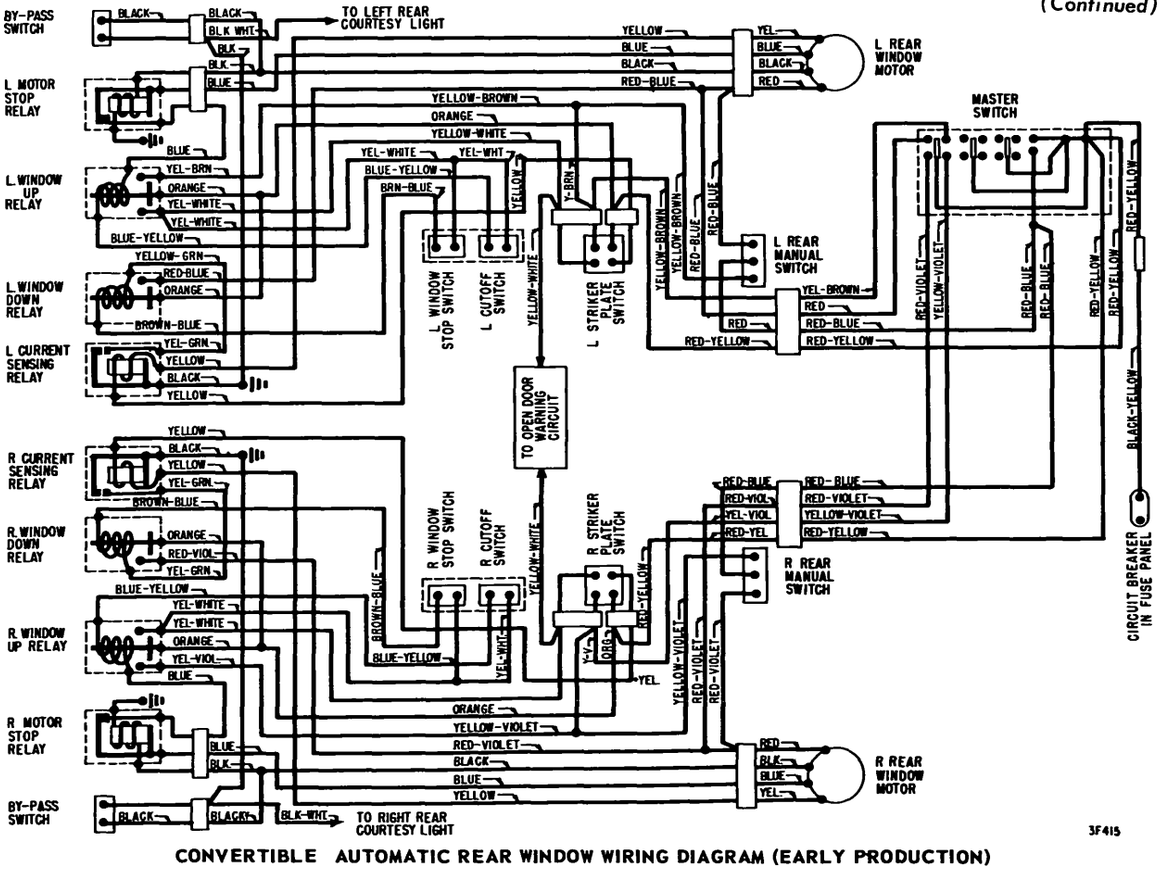
DESCRIPTION

Sedan - Conventional electric window control similar in design and operation to previous models. Series wound type motors used with no armature lead from control switch to motor. Front door ventilator windows are also electrically controlled and are built into the circuit.

C nv rtibl - Front door and ventilator windows are same as conventional sedan windows (see above). Rear windows are automatic type and are built around conventional system. Automatic system consists of additional switches and relays which automatically lower rear door window approximately 6" when door is opened, hold window in position, then return window to fully raised position when door is closed. Window can be operated in the usual manner from either switch except that it cannot be raised manually after it has lowered automatically. *See "Manual Operation Note" b low.*

OPERATION (AUTOMATIC TYPE)

►*MANUAL OPERATION & CUT-OFF SWITCH FUNCTION NOTE:* **1)** If window has been lowered more than 7" before door is opened, cut-off switch is actuated (contacts open) and relay circuit is disconnected so no automatic window operation will take place.



2) When window has been lowered automatically and door is open, motor up field can be completed only through No. 2 contacts of door striker plate switch when door is closed. Therefore window cannot be raised manually from either master or door switch.

3) With door open and window lowered automatically, either switch can be operated to lower window completely. However cut-off switch contacts will be opened and window will not raise automatically when door is closed. Window must be raised with either master or door switch after door is closed to reset circuit for automatic operation.

Window Down Cycle

1) When door inside handle or outside pushbutton is moved to open door, door striker plate switch upper

(Continued)

CONVERTIBLE AUTOMATIC REAR WINDOW WIRING DIAGRAM (EARLY PRODUCTION)

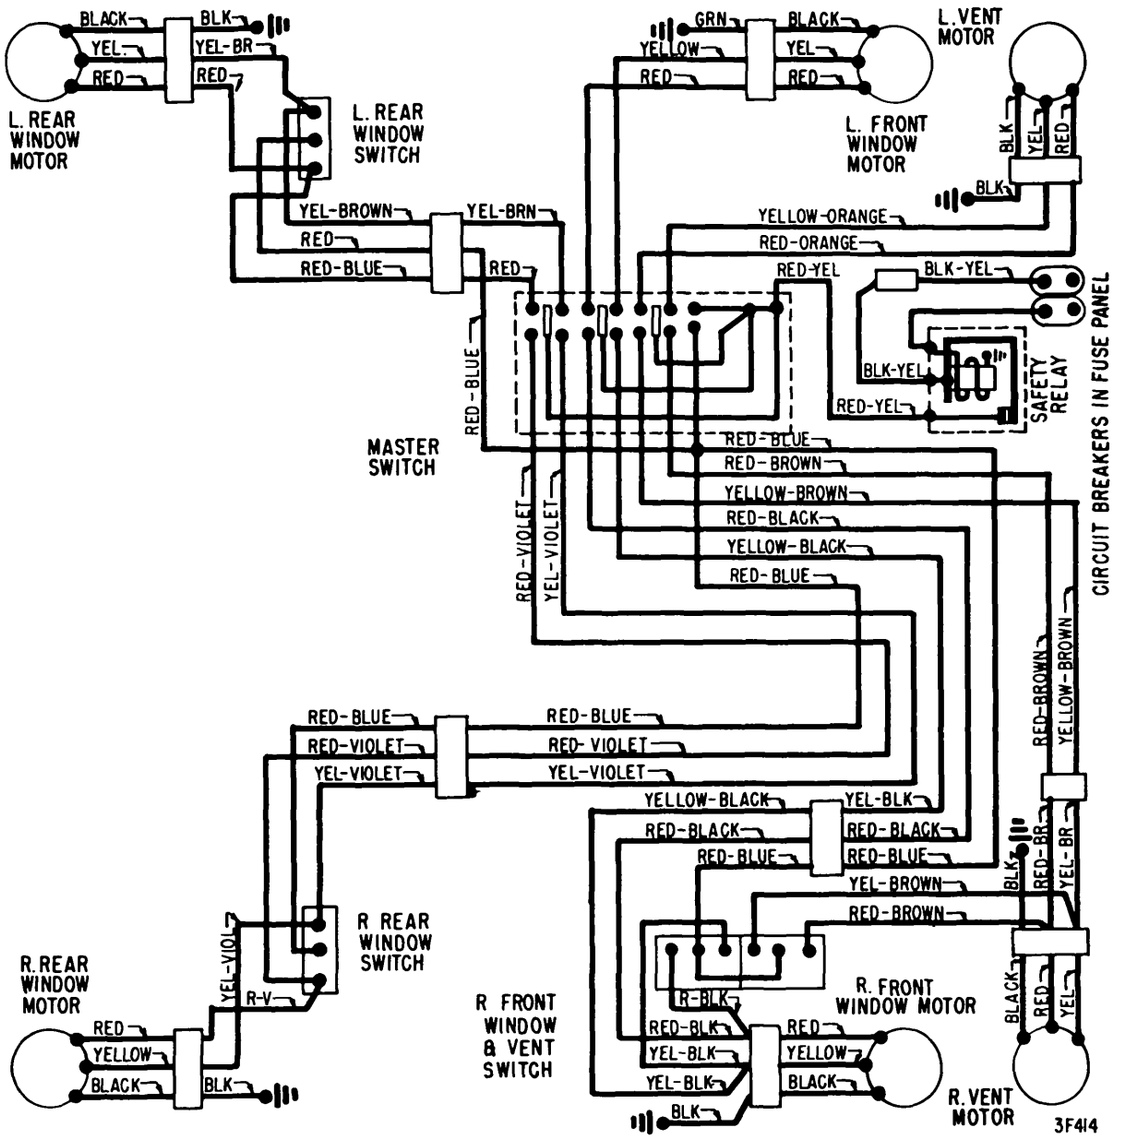
LINCOLN CONTINENTAL WINDOWS (C ntinu d)

contacts are closed. Up-travel field circuit of motor is opened, feed circuit to control winding of down-travel relay is closed, and also feed circuit to control winding of up-relay is closed. Current flows through striker plate switch, window stop switch, down relay windings and through current sensing relay contacts to ground. Motor is energized and window is lowered.

2) When window has lowered approximately 6", window stop switch is actuated (contacts opened) to open down relay circuit and stop downward movement of window.

Window Up Cycle

1) The up relay is already energized from the beginning of the down cycle. Current flows through striker plate switch, to window cut-off switch, to up relay winding, to stop relay winding, to ground. Up relay contacts are closed and remain closed until door is closed and window is fully raised, however window will not raise until door is closed because striker plate switch position with door open keeps motor up field feed circuit open. Thus a "lock-in" circuit is made (with up relay contacts closed) which continues to energize up relay coil after door is closed. In the "lock-in" circuit current flows through up relay contacts, cut-off switch, up relay coil, stop relay contacts, to bypass switch to ground.



2) When door is closed, striker plate switch lower contacts close and complete the circuit from up relay contacts, through winding of current sensing relay, to up field of motor. Motor operates and closes window. *NOTE - Current sensing relay in down relay circuit prevents feed-back through down relay so that both up and down fields of motor cannot be energized at the same time.*

3) About ¼" before window is fully raised, bypass switch is actuated (contacts open). *NOTE - Bypass switch circuit prevents stop relay from cutting out if motor needs more than the normal operating current before window is fully raised.* Stop relay coil now carries full motor current. When window upward movement stops, motor stalls, and stall current opens stop relay contacts. Ground circuit of up relay windings is then opened and entire up circuit becomes inactive.

ELECTRICAL COMPONENTS & LOCATIONS (AUTOMATIC WINDOWS)

The following list of electrical components and their locations will aid in testing and in trouble shooting.

20 Ampere Circuit Breaker - On fuse panel at right end of glove box.
Motor - Lower inner door panel.
Window Stop & Cut-Off Switches - Single unit on switch plate inside door panel above door lock.
Bypass Switch - Inside door panel at top of door on window up-stop bracket.
Striker Plate Switch - On door latch striker plate.
Curr nt Sensing R lay - Relay panel behind rear seat.
St p R lay - Relay panel behind rear seat.
Up R lay - Relay panel behind rear seat.
D wn R lay - Relay panel behind rear seat.

LINCOLN CONTINENTAL CONVENTIONAL WINDOW WIRING DIAGRAM (INCLUDING VENT WINDOWS)

TROUBLE SHOOTING & DIAGNOSIS

Conventional Windows

Bypass the switches and relays as necessary when making tests. Use a continuity light for checking circuits.

On Wind w Op rates In On Dir ction Only Thr ugh Eith r Switch - Motor field or field circuit wiring open or shorted.

Window Operates In Both Dir cti ns Thr ugh On Switch Only - Switch defective or open wiring.
One Window Totally Inoperativ - Motor armature and/or field windings, or circuit wiring open or shorted. Motor circuit breaker improperly grounded or faulty.
All Wind ws T tally In perativ - 20 ampere main feed circuit breaker or main feed wiring defective.

(Continued)

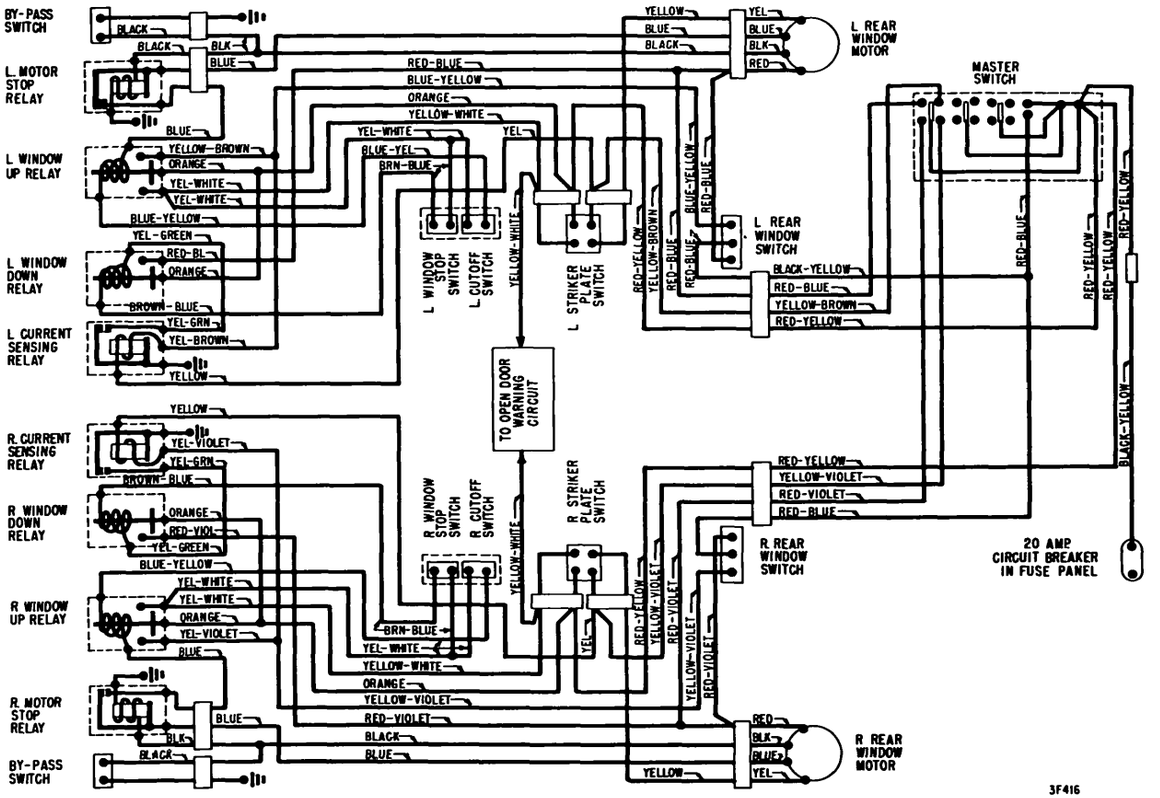
LINCOLN CONTINENTAL WINDOWS (Continued)

Vent Windows

Use a voltmeter or test lamp for making tests. Check circuits and wiring in the usual manner.

On Wind w Op rat s In One Direction Only Through Eith r Switch - One motor field winding has an open or short circuit.
Window Op rat s Thr ugh One Switch Only - Defective switch or open wiring.
On Wind w In p rativ - If window will not operate in either direction from either switch, check for open circuits or faulty motor.
B th Wind ws In p rativ - Feed circuit breaker faulty.

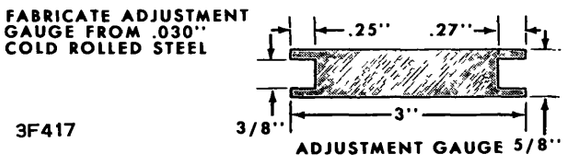
Automatic Windows



NOTE - Sinc automatic window circuit is built around conv ntional lectric window system, make sure that c nv ntional part of syst m is in proper operating condition befor ch cking automatic window circuits. Us th following guid f r automatic window checks.
Wind w Will N t G D wn - Check the following: 20 ampere circuit breaker, striker plate switch, down relay, window stop switch, motor down field winding, current sensing relay.
Wind w C ntinu s All Th Way Down - Spring on stop switch actuator lever broken; Stop Switch faulty; Down relay faulty.

Wind w Will N t R turn To Up Position - Check the following: 20 ampere circuit breaker, up relay, motor up field winding, cut-off switch, striker plate switch.
Wind w Cl s s But M t r Continues To Operate - Stop relay faulty or bypass switch improperly adjusted or shorted contacts.
Wind w Rais s Part Way Only After Door Closed - By-pass switch faulty. Motor stalled due to tight window channels.

ADJUSTMENT



Automatic Wind w Switches

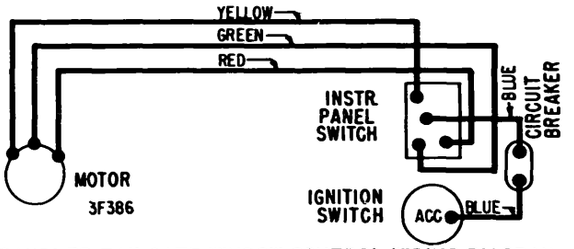
Bypass Switch - With window fully lowered, open door, remove trim panel, disconnect battery and switch leads. Mark window up stop position and remove stop and bypass switch as an assembly. Adjust switch so threaded part of switch is flush with lower surface of window stop bracket. *NOTE - Threaded part must not protrud b yond brack t.* Reinstall switch and window stop.

CONVERTIBLE AUTOMATIC REAR WINDOW WIRING DIAGRAM (LATER PRODUCTION)

Striker Plate Switch - *Make a gauge as shown in illustration.* With window in full down position, switch should click when plunger depressed with .25" end of gauge, but should **not** click when depressed with .27" end of gauge. Adjust switch as necessary by loosening locknut and turning switch retaining nut. *One full turn of retaining nut will change operating point of switch plunger 1/32".* Tighten locknut and check window operation. Window should start downward movement when door is open 1/8"±1/64".
Cut-Off & Stop Switches - No adjustment. Switches molded into a single sealed unit, and are serviced as an assembly only. *NOTE - When replacing switch s, short screw must be used to attach lower part f assembly to mounting plate.*

STRIKER PLATE SWITCH ADJUSTMENT GAUGE

RAMBLER WINDOWS



Rambl r, Exc pt American (1963)

DESCRIPTION

D r Wind ws - Window regulators are individually powered by electric motor in each door. Motors are controlled by individual switches on each door panel and a master switch mounted on left front door panel. All switches are retained to trim panel by spring type retaining clips at top and bottom. A 30 ampere circuit breaker mounted under instrument panel protects wiring harness and a 15 ampere circuit breaker is used to protect each motor.

Tailgate Window - Used on both vertically and horizontally hinged tailgates. Window regulator operated by electric motor in tailgate and controlled by switch on instrument panel, and also by a key lock switch on horizontally hinged tailgate. Horizontally hinged tailgate also has plunger type safety switch mounted at rear edge of cargo compartment floor on left side of spare wheel cover. This switch prevents window operation when tailgate is open. Circuit breakers mounted on left side of foot brake bracket used as follows: One 25 ampere circuit breaker for vertically hinged tailgate. Two 25 ampere circuit breakers for horizontally hinged tailgate.

(Continued)

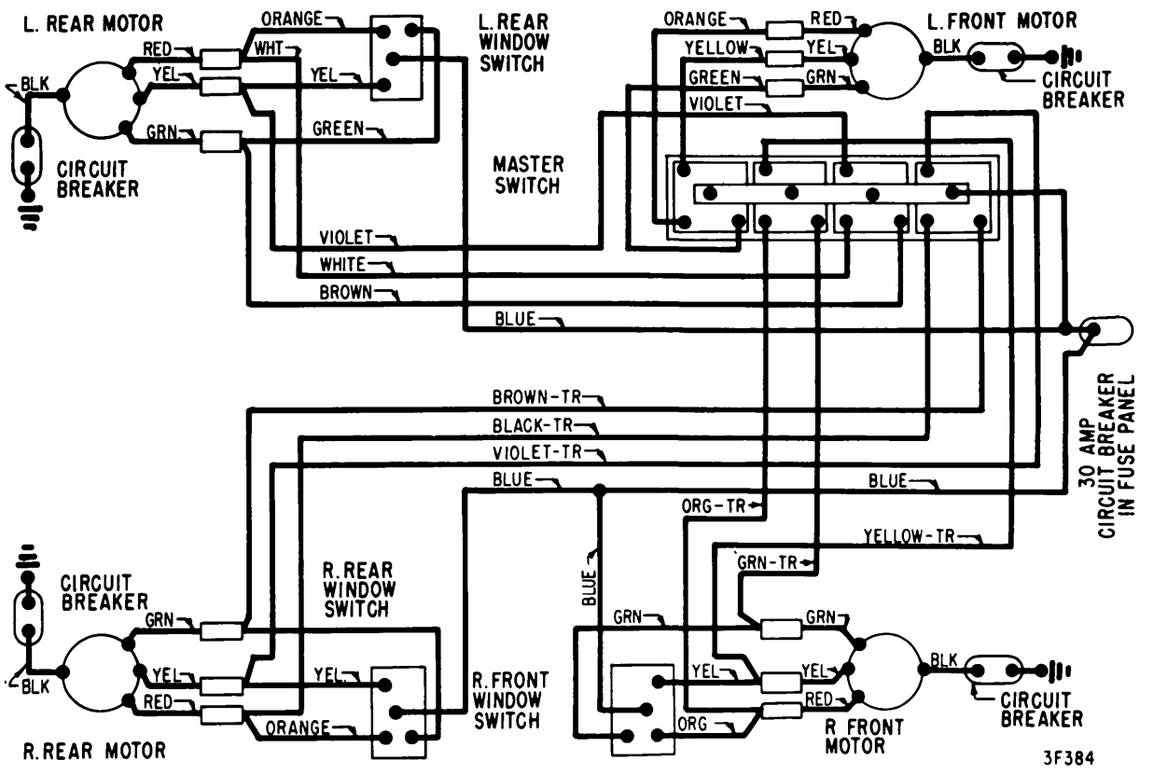
RAMBLER TAILGATE WINDOW CONTROL WIRING DIAGRAM (VERTICALLY HINGED TYPE)

RAMBLER WINDOWS (Cont.)

REMOVAL & INSTALLATION

NOTE - Regulator and motor must be removed together
Front Door Window Regulator - With ignition off, remove door trim panel. *NOTE - Do not remove window switch from trim panel, nor disconnect switch wiring .* Raise window to within 4" from top (if regulator inoperative, turn rubber coupling on shaft between motor and transmission counterclockwise while raising glass by hand). Hold glass in raised position. Disconnect glass bottom channel from slide channel and slide off regulator arm roller. Disconnect remote control and lower to bottom of door. Remove ventilator division channel adjusting nut, lockwasher, and stud. Disconnect motor circuit breaker. Disconnect regulator from door and lower toward hinge, lift regulator arm to outside of remote control, then lower arm and move regulator toward door outer panel under end of ventilator division channel. Move assembly to large access hole, disconnect motor wires and remove.

Rear Door Window Regulator - Raise window to within 2" of top of frame (if regulator inoperative, remove switch from trim panel and disconnect wiring). Remove door trim panel and ash tray mounting panel. Turn rubber coupling on shaft between motor and transmission counterclockwise to raise glass while pulling glass by hand, then prop glass in up position. Remove retainer from quadrant plate and link assembly stud (releases regulator arm from stud on link). Pry top part of quadrant link up to raise glass and relieve all pressure on stud. Disconnect motor wires, and disconnect regulator assembly from door. Move assembly so regulator arm and quadrant come out of large access hole at top of door, then remove assembly through this hole.



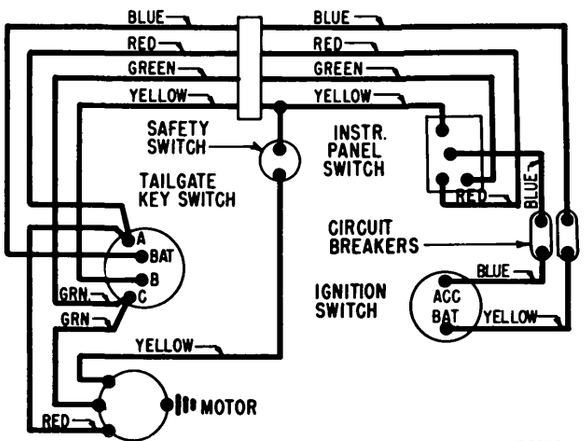
Tailgate Window Regulator - *NOTE - On horizontally hinged type, if window is stuck in raised position, proceed as follows: Remove cargo compartment rug and spare tire. Remove access hole cover panel screws as far down as possible, then cut this panel across at top of spare tire compartment opening and remove. Reach through opening and remove screws holding glass bottom slide channels (hold glass up), then push regulator arms toward tailgate outer panel and lower glass into tailgate. Open and lower tailgate.* Remove lock latch release handle and all screws holding inner panel to outer panel. Remove inner panel. Disconnect slide section from glass bottom channel, then remove slide section from regulator arms. Remove glass on horizontally hinged type. On vertically hinged type, tie glass to top of door frame. Remove regulator and motor assembly.

Door Switch - Insert putty knife or similar tool at top of switch between switch housing and mounting plate and depress retaining spring by pushing downward on both springs at top and bottom. Tilt switch away from panel at top and insert putty knife at retainer locations. Tag each wire and mark terminals for proper reassembly, then remove switch.

Tailgate Instrument Panel Switch - Reach under instrument panel and press both spring clips at switch. Push switch from panel.

Tailgate Safety Switch - Used on horizontally hinged type only. Switch mounted at rear edge of cargo compartment floor on left side of spare wheel cover. Can be removed after spare tire cover and jack removed.

Tailgate Key Lock & Switch - Accessible after tailgate regulator and motor assembly removed.



RAMBLER ELECTRIC DOOR WINDOW CONTROL WIRING DIAGRAM

TROUBLE SHOOTING

All Windows Fail To Operate In Either Direction or Operate Slowly - Battery low or dead. Circuit breaker faulty. Battery ground loose, or terminal in control circuit loose or corroded.

Windows Operate Intermittently - Loose wires on circuit breaker or switches, or circuit breaker faulty.

One Window Fails To Operate - Loose or broken connections at dash circuit breaker and switch in door. Bypass the switch and check the motor separately.

RAMBLER TAILGATE WINDOW CONTROL WIRING DIAGRAM (HORIZONTALLY HINGED TYPE)

STUDEBAKER TAIL GATE WINDOW

Stud baker (1963)ℂ

ℂ - Station Wagons with sliding roof panel.

DESCRIPTION

Electrically operated tailgate window controlled by switch on instrument panel and by key operated switch in tailgate. Window will operate only with ignition on.

SERVICING

Operation With Ignition Off

To avoid burning distributor points when operating electric window during servicing, use the following ignition bypass procedure: Connect a jumper wire between rear (M) and center (B) terminals of window lift relay (on left front fender apron). Window may now be operated with ignition switch off.

REMOVAL & INSTALLATION

Regulator & Motor

Lower tailgate and remove access hole covers. Remove window opening weather seals and remove window assembly. Remove regulator retaining nuts and washers, disconnect wiring from motor, and remove regulator and motor assembly. To install, reverse removal procedure, making sure wires are connected to proper terminals.

Tailgate Lock Assembly

Disconnect battery, lower tailgate and remove access hole covers. Remove tailgate window. Disconnect motor wiring, then disconnect regulator and motor assembly and move out of way. Remove switch lock attaching nuts and remove from tailgate. To install, reverse removal procedure.

BUICK, OLDSMOBILE, PONTIAC VACUUM TRUNK LOCK

Buick, Except Sp cial (1963)
Oldsmobile (1963)
Pontiac (1963)

DESCRIPTION & OPERATION

Vacuum operated trunk unlocking device consists of control lever in glove box, vacuum reserve tank in engine compartment, and vacuum power unit in trunk lock mechanism. Vacuum reserve tank vacuum supply line located either at intake manifold, or in "T" fitting in distributor vacuum advan ce line near carburetor. A check valve in tank prevents vacuum loss when intake manifold vacuum drops. If vacuum unit fails, trunk can be unlocked with key in the usual manner.

►*TRUNK LOCK & DISTRIBUTOR CAUTION:* On units where vacuum supply line is in distributor vacuum advance line, engine must be run above idle speed to restore vacuum to supply tank as there is no distributor vacuum advance at idle speed. Also, make sure that vacuum line from "T" fitting to reserve tank is in good condition and that there are no leaks at fittings or distributor vacuum advance will fail to operate.

REMOVAL & INSTALLATION

Trunk L ck Cylinder

Disengage tab on lock anchor plate from lock cylinder retainer. Pull slotted retainer toward right side of body to disengage retainer from lock cylinder, then remove lock cylinder and gasket from rear end panel. To install, reverse removal procedure.

Vacuum R l as Unit

With lock cylinder removed (see above), remove vacuum release unit attaching screws. Disengage unit from trunk lock, disconnect vacuum hose, and remove unit. To install, reverse removal procedure.

CADILLAC VACUUM TRUNK LOCK

Cadillac (1963)

DESCRIPTION

Vacuum operated trunk lid locking system used with a rotary bolt type lock. Vacuum release unit is attached to lock, and vacuum storage tank is located on cowl under hood. A vacuum switch located in glove compartment controls unit. A mechanical type lid closing unit is used in conjunction with vacuum lid lock to reduce effort required to close trunk lid.

OPERATION

Vacuum System - Operating vacuum switch in glove compartment introduces vacuum to vacuum unit which then pulls the lock to unlock the trunk lid. Trunk can be unlocked and opened with a key in the usual manner. **Mechanical Closing Unit** - When trunk lid is lowered manually and lid lock engages striker, mechanical closing unit pulls lid to closed position. A hydraulic cylinder attached to a bellcrank at right trunk lid hinge and to closing unit by a cable acts as a safety feature to slow action of closing unit. When lid is lowered and lock latches to striker, but before mechanical closing unit is tripped, hydraulic piston extends to full out position. As lid is lowered to actuate mechanical closing unit, piston compresses fluid in cylinder to retard closing action of spring.

ADJUSTMENT

1) To actuate mechanical pull-down unit, trunk lid lock must properly engage striker arm and depress detent lever of pull-down unit. Check engagement by lowering trunk lid and visually checking lock and striker alignment. Make lateral adjustment at lock attaching screws, and vertical adjustment at pull-down unit attaching screws.

2) *NOTE - Cable tension must be properly adjusted for proper operation of pull-down unit. If cable too tight, pull-down unit will not return to full up position and "cock". If cable too loos , pull-down ffort in unit is l ssened and trunk lid will b misaligned (too high). Adjust cabl as follows:* To increase tension, place hydraulic cylinder end of cable in upper slot on lower end of cylinder. If more tension required, loosen cable adjusting bracket attaching screw and adjust bracket downward to increase cable travel. To decrease cable tension, place hydraulic cylinder end of cable in lower slot on hydraulic cylinder. For finer adjustment, move cable attaching bracket upward. *CAUTION - Point of contact between toggle and detent lever must be lubricated with Lubriplate to avoid excessive effort required to trip (unlock) pull-down unit.*

REMOVAL & INSTALLATION

Vacuum Release Unit

Remove lid lock cover panel and lid lock cylinder assembly. Remove vacuum unit attaching screws, disconnect vacuum line and remove unit. To install, reverse removal procedure.

Lid Lock

Remove lid lock cylinder assembly and vacuum release unit (see above). Remove lid lock attaching screws and remove lid lock. To install, reverse removal procedure.

Mechanical Pull-Down Unit

Remove pull-down unit cover panel, depress striker slightly to relieve tension on cable, then disengage clip holding cable to pull-down unit control arm. Disconnect clip holding cable conduit to cable adjusting bracket, then disengage cable and conduit from pull-down unit. Remove warning light switch attaching screw and remove switch from pull-down unit. Scribe mark position of pull-down unit to aid installation, then remove attaching screws and remove pull-down unit. install, reverse removal procedure.

Pull-Down Unit Cable

Pull clip from cable at lower end of hydraulic cylinder, then disengage cable from slot in cylinder. Disengage cable conduit retaining clip from support on wheelhouse and remove cable and conduit from support. Repeat procedure at other end of cable, then remove cable. To install, reverse removal procedure.

Hydraulic Cylinder

Remove cable from lower end of cylinder (see above). Lift cylinder to disengage upper end from shoulder of shaft on link assembly, then remove hydraulic cylinder. To install, reverse removal procedure.

CHRYSLER IMPERIAL ELECTRIC DOOR LOCK

Imperial (1963)

DESCRIPTION & OPERATION

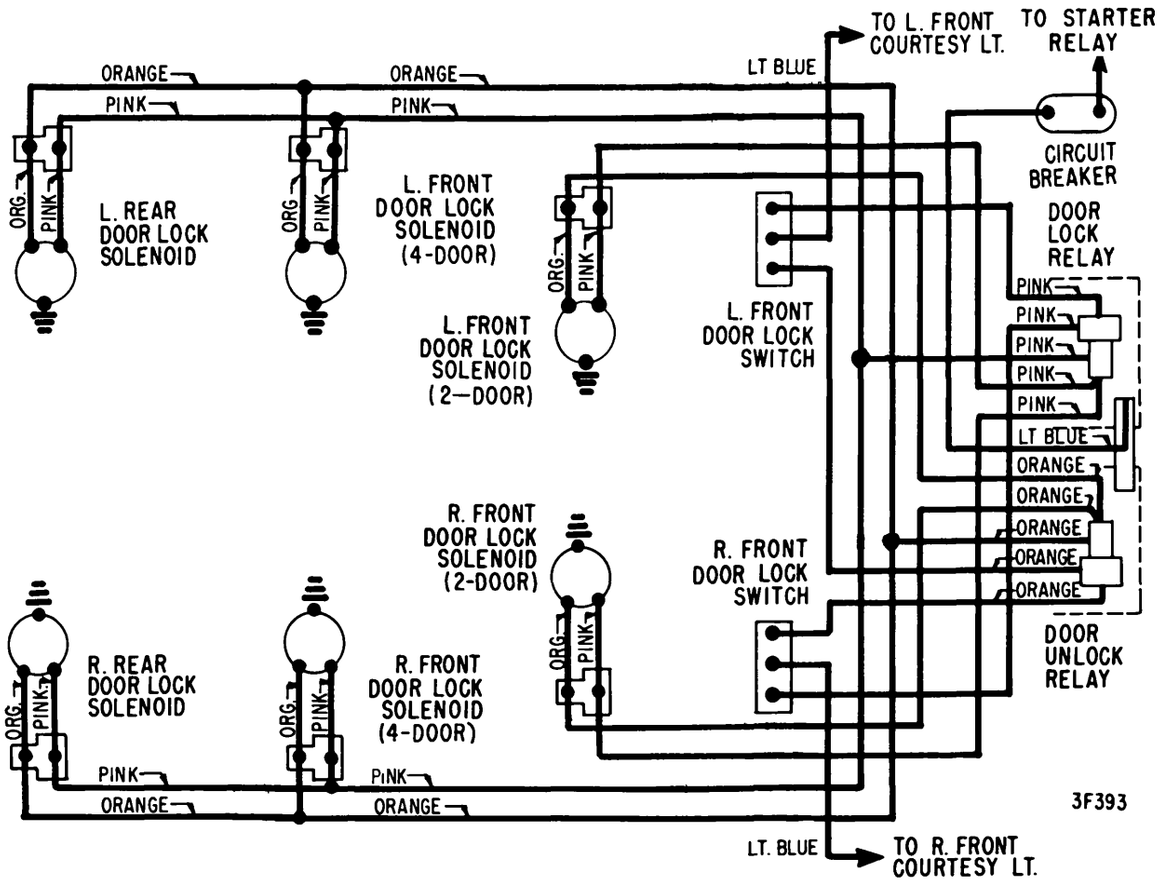
Operated by a push-pull double acting solenoid, attached by a connecting rod to door lock actuating lever in each door. A single pole double throw switch is mounted on each front door. Switches control the lock and unlock relays which actuate solenoids. Doors may be locked electrically by depressing either switch. Lift switch to unlock. Doors may be locked and unlocked mechanically in the usual manner.

SOLENOID

Removal

Remove door trim panel and disconnect lock connecting rod at solenoid. Disconnect wires and remove solenoid.

Installation



Attach solenoid to door and connect wires. Tighten mounting screws finger tight, then connect lock connecting rod to solenoid. Adjust solenoid by moving up or down in slotted holes so solenoid will push and pull lever far enough to lock and unlock door. Tighten mounting screws securely and install trim panel.

LINCOLN CONTINENTAL VACUUM DOOR LOCK

Lincoln Continental (1963)

DESCRIPTION & SERVICING

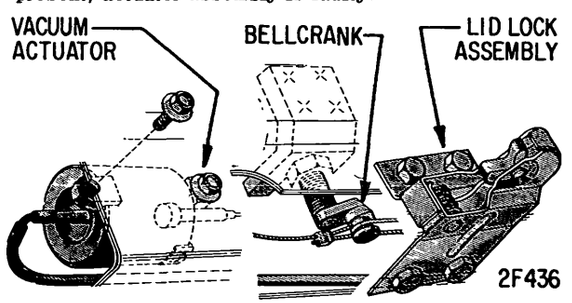
Vacuum lock system similar in design and operation to 1961-62 models. Rear door warning light system is same as late production 1961 models (light flashes or glows only when a rear door is open or not completely closed). *For Wiring and Vacuum Diagrams, Removal and Installation, Testing and Trouble Shooting, see Page 520 in 1961 Final Data.*

CHRYSLER IMPERIAL ELECTRIC DOOR LOCK WIRING DIAGRAM

LINCOLN CONTINENTAL VACUUM TRUNK LOCK

Lincoln Continental 4-Door Sedan (1963)

►CHANGES, CAUTIONS, CORRECTIONS



►*1963 INOPERATIVE TRUNK LOCK CONTROL CORRECTION:* May be caused by too much slack in lock control actuating wire which cancels part of cycling action of vacuum cylinder. To correct, remove lock assembly from trunk inner panel (to expose wire loop) and shorten actuating wire about 1". Install lock and check operation.

DESCRIPTION

Vacuum operated system consisting of a control valve assembly (switch) located in glove compartment, and a door lock actuator assembly (vacuum motor) located on luggage compartment back panel. Vacuum source for system is from vacuum door lock system through a tee connection at door lock vacuum distributor supply line. Trunk lid can also be unlocked in the usual manner with a key.

TROUBLE SHOOTING

CAUTION - DO NOT apply air pressure to system or serious damage to vacuum actuator will result. If system inoperative, proceed as follows: With engine running, listen for any obvious air leaks. Disconnect left hand hose from control valve in glove compartment and touch a finger to hose end. If vacuum not present, trouble is at source from door lock system. If vacuum present, reconnect hose. Disconnect right hand hose from control valve. If vacuum not present at hose, control valve is faulty. If vacuum present, reconnect hose. Unlock trunk lid with key and disconnect hose at actuator. Have a helper operate control valve and touch a finger to end of hose. If vacuum not present, hose from control valve to actuator is faulty. If vacuum present, actuator assembly is faulty.

LINCOLN CONTINENTAL VACUUM TRUNK RELEASE MECHANISM

BUICK & CADILLAC VACUUM DOOR LOCK

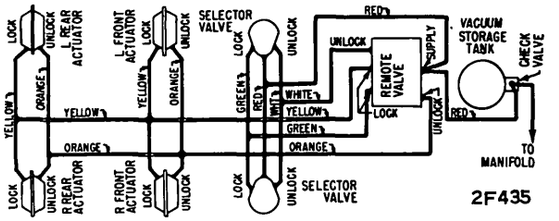
Buick (1963)
Cadillac (1963)

DESCRIPTION & OPERATION

Consists of vacuum storage tank, vacuum lock remote control valve assembly, selector valve, and actuator assemblies.

Vacuum Tank - Attached to front of power brake mounting support on left side of body. Connected by hose to engine manifold with check valve in the line. A minimum of three complete cycles of operation (lock and unlock) is available immediately after engine has been shut off.

R m t Contr l Valv - Attached with screws below right hand defroster duct. Supplies vacuum from tank to lock actuators when selector valve is actuated.



S l ct r Valv - Located on each front door trim assembly.

Actuat r Ass mbli s - Located in each door are double acting vacuum diaphragms with vacuum supplied to each side. Diaphragm moves a linkage or bellcrank connected to locking lever of lock.

NOTE - All Vacuum hos s and corresponding actuator ports ar color coded. S diagram.

TROUBLE SHOOTING

Syst m Inoperativ - Hoses crossed at vacuum supply tank; vacuum supply hose pinched at remote control valve; door valve supply hose pinched at remote control valve; vacuum supply hose disconnected at tank, remote valve or engine; remote valve diaphragm leaking.

BUICK & CADILLAC
VACUUM DOOR LOCK CONTROL DIAPHRAGM

All Doors Can Be Locked But Not Unlocked - Main supply hose crossed with lock supply hose at remote control valve, unlock selector hose or supply hose disconnected at remote valve.

All Doors Can Be Unlocked But Not Locked - Main supply hose crossed with unlock hose on remote control valve, lock selector hose or supply hose disconnected at remote valve.

Moving Either Door Valve to Unlock or Lock Produces the Opposite Action of All Locks - Door lock selector valve hoses (small) crossed at remote control valve, actuator supply hoses (large) crossed at remote valve.

Moving One of Door Valves to Lock or Unlock Produces the Opposite Action of the Lock - Valve selector hoses crossed at one door valve, door selector valve reversed in trim assembly.

System Will Not Lock From Door Valve or System Will Not Unlock From One Door Valve - Lock or unlock selector valve hose pinched or disconnected from affected door valve.

L ck M v m nt n Any D r N t Synchr niz d with Oth r Doors - Hoses crossed at affected door lock actuator.

One Door Lock Lags Behind Other When Locked r Unlocked - Lock or linkage binding.

System Inoperative From One Door Valve - Vacuum supply hose pinched or disconnected at affected door valve.

One Door Lock Will Not Lock or Unlock - Actuator hoses pinched or disconnected.

System Will Not Hold Vacuum for 48 Hours - Leak at remote control valve, any two door locks, storage tank and check valve, any part of harness connections.

Locks Inoperative with Front Door Closed, But Operative with Door Open - Door valve vacuum supply hose pinched at front body hinge pillar on side affected.

TESTING

For leaks not severe enough to be heard, use a suitable water testing device made from a quart jar and flexible tubing. I.D. of tube connected to remote control valve should be 7/32", and I.D. of tube connected to storage tank should be 5/32". Install tester hose not protruding into the water on bottom of check valve on tank. Install hose with end in the water to hose leading to remote control valve. After pressures in system normalized, a bubble will appear in water every 15 seconds or faster if there is an appreciable leak in system. Isolate system in usual manner by pinching hoses when making tests.

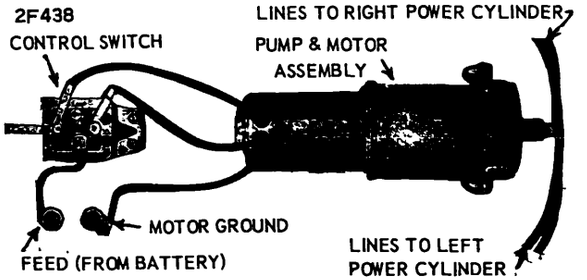
Rambl r Am rican (1963)
Stud bak r Lark (1963)
Valiant (1963)

DESCRIPTION

Similar in design and operation to models previously used. System is a sealed unit and is not vented to the atmosphere, making it unnecessary to replace hydraulic fluid periodically. System is "self-air bleeding".

HYDRAULIC SYSTEM

Checking Fluid Level



With top in raised position, disconnect positive or negative battery cable. Remove pump and motor shield, in rear compartment, and place absorbent material below reservoir. Remove filler plug from reservoir. On motor and pump assemblies installed horizontally, fluid should be at lower edge of filler cap hole. If fluid low, add hydraulic fluid Delco No. 11 (GM Hydraulic Brake Fluid Super No. 11).

Replacing Fluid After Repairs

Cylinders and hydraulic system contains more fluid than one filling of reservoir will supply. Check reservoir frequently during refilling of system. Air in system will automatically bleed out with a few operations of top.

Checking Hydraulic Pressures

Remove motor and pump assembly. Install plug in one port and pressure gauge in port to be checked. Actuate motor with an applied terminal voltage of 9.5-11.0 volts. Gauge should show a pressure as specified below. Check pressure in other port. *NOTE - A difference in pressure readings may exist between pressure port for top of cylinders and port for bottom of cylinders. This condition is acceptable if both readings are within limits specified.* If pressure not within specified limits, unit is defective and should be repaired or replaced.

PUMP, MOTOR & SWITCH ASSEMBLY

Hydraulic Pressure - 340-380 lbs. (General Motors Cars), 240-280 lbs. (Rambler & Studebaker).

Lift Cylinder Operation Checks

Remove rear seat cushion and folding top compartment side panel assembly. Operate folding top control switch and observe lift cylinders during up and down cycles for these conditions:

1) If movement of cylinder rods is not coordinated or sluggish when motor is actuated, check hydraulic hoses from the motor and pump to cylinders for kinks.
2) If one cylinder rod moves slower than other, cylinder with slow moving rod is defective and should be replaced.
3) If both cylinder rods move slowly, or do not move at all, check pressure of pump (see above).

Motor & Pump Assembly

Se "P wer Op rated T p M tor & Pump (R tor Type)" in Misc llaneous S cti n of Manual.

THUNDERBIRD ELECTRIC TOP CONTROL

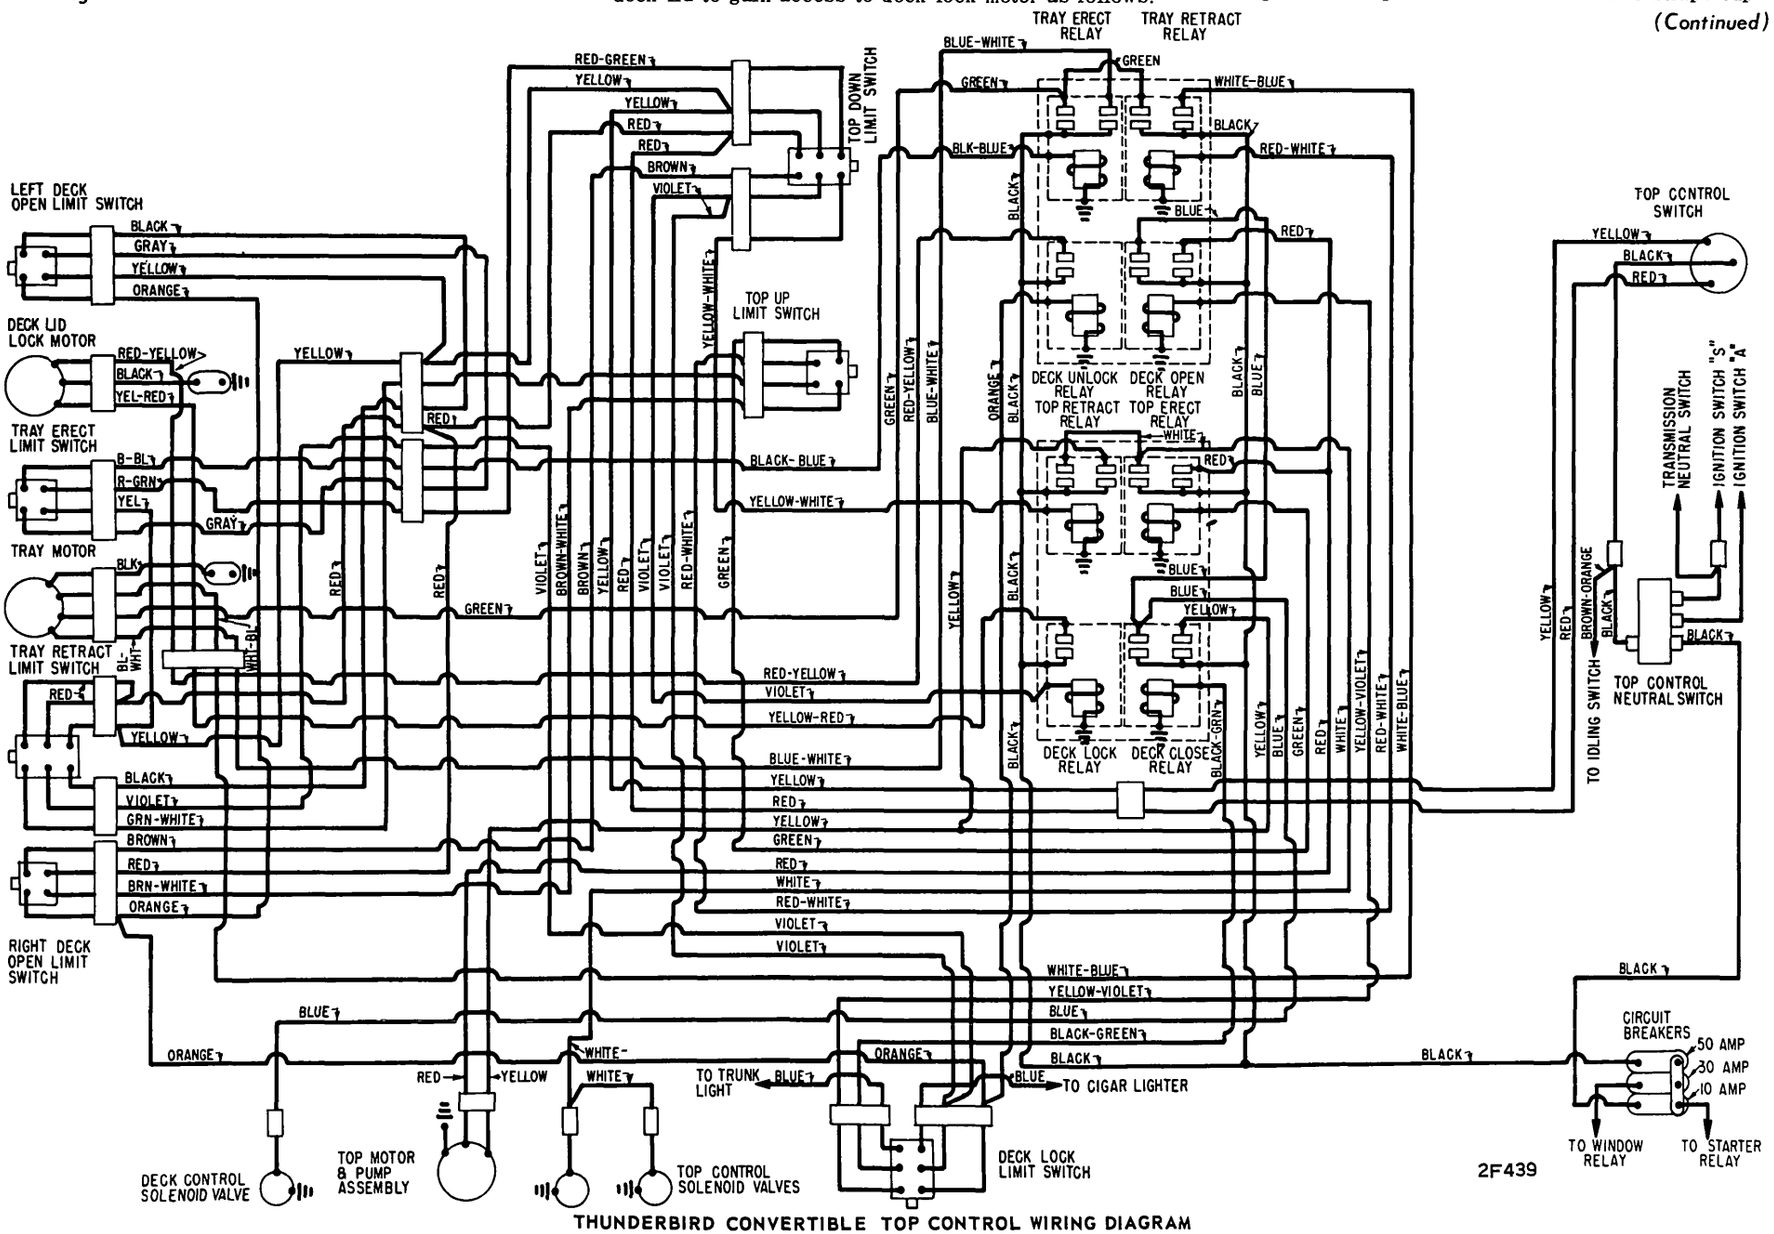
Ford Thunderbird (1963)

DESCRIPTION & OPERATION

See "Ford Thunderbird Top Control" on Page 530 in 1960 Final Data or later Manual edition and note the following:

Relays - Deck solenoid power relay and top solenoid power relay are not used. *See 1963 Wiring Diagram for details.*

EMERGENCY MANUAL OPERATION



Unlocking Deck Lid

If deck lock motor fails to operate, manually unlock deck lid to gain access to deck lock motor as follows: Place floor jack under frame rear crossmember and raise car approximately 10". Remove each deck lid lock retaining screws (underside of each wheelhouse). Lift front edge of deck lid about 1" and operate top control switch to complete opening of deck lid.

Opening Deck Lid

Unlock deck lid by operating top control switch or by using the above procedure. Loosen the two straps sup-

(Continued)

THUNDERBIRD CONVERTIBLE TOP CONTROL WIRING DIAGRAM

THUNDERBIRD ELECTRIC TOP CONTROL (C nt.)

porting the fuel tank and lower tank approximately 1" DO NOT remove straps or tank From beneath lower back panel, remove both deck cylinder retaining screws from each side Complete opening of desk lid If deck lid locks have been released from wheelhousings the nut and housing portion of locks will remain attached to deck lid.

Erecting Top

It may be necessary to erect top manually if: Electric-hydraulic motor fails; there is an open circuit in motor feed; the top solenoid valves fail; there is an open circuit in the feed line, a top cylinder or linkage fails Unlock and open deck lid Energize both top solenoid valves using suitable jumper wires and 12-volt source If either valve is inoperative, disconnect hydraulic lines connected to valves so that there will be no hydraulic block in top cylinders, then manually erect top

TROUBLE SHOOTING & DIAGNOSIS

TESTING NOTE - Usual cause of top malfunction is a defective or improperly adjusted switch. Make switch checks before making further tests.

Supply Circuit Test

Use a continuity light between ground and various points in supply circuit. With ignition switch in ON or ACC position and selector lever in N or P, check the following in sequence: Circuit breakers, neutral switch relay, actuator switch, and relay power bus bar

Switch Circuit Test

Check switch for improper adjustment by depressing switch stem. Check for electrical failure by bypassing switch with jumper wire directly at switch contact terminals or wire connectors *NOTE - Continuity light cannot b us d to test switch circuits as current draw required by light will not allow relay coils to energiz* . To bypass switch circuit, connect jumper wire between relay bus bar and relay coil terminal. If motor or solenoid operates, check switch circuit for defects If audible "click" of relay is heard, switch circuit troubles are indicated If motor or solenoid fails to operate and relay operates, check for defective motor, solenoid, or respective circuits

Motor & Solenoid Test

Use a 12-volt power source and jumper wire directly to motor or solenoid, or bypass motor ground circuit breaker to isolate trouble

Unit & Operation Test

Use a 100 ampere scale ammeter between main feed 50 ampere circuit breaker on starter relay and motor supply lead (black wire) supplying control relay bus bars If a switch is improperly adjusted so it closes the relay circuit for any cycle but still does not open the cycle just finishing, or if switch is faulty, ammeter reading will indicate the trouble *See "Electrical Test Sp cifications" below*

ADJUSTMENT

Top Down Switch

Place switch in midpoint of adjustment slots, then lower top to full down position. Adjust switch as necessary to delay or advance deck lid closing operation.

Deck Closed Switch

Use Tool T61B-15780-A Pull apart the switch quick disconnect and attach a continuity test light to wires that go to bottom set of contact terminals Press tool firmly into the locknut and adjust switch upward until the test light attached to bottom set of contacts just goes on, then tighten switch mounting screws and remove tool.

Deck Closed Switch Actuator

Use Tool T61B-15780-A. Position tool over lock screw, press tool firmly against lock screw shoulder Pivot tool to line up with switch actuator. Bend actuator until it touches raised portion of tool If operation of deck lid disclosed that deck lid pops up when opening, the switch actuator may be bent very slightly away from deck lid.

Top Up Switch

Raise top to full up position. Place 060" shim between end of switch shaft and roof hinge arm Adjust switch firmly to the end of its travel against shim. Tighten switch mounting screws and remove shim

Tray Erect Switch

Extend package tray on the deck lid to end of its travel Place 060" shim between end of switch shaft and switch actuator on the tray support arm Adjust switch firmly to the end of its travel against the shim Tighten switch mounting screws and remove shim

Tray Retract Switch

Retract the package tray on the deck lid to the end of its design travel Place 100" shim between end of switch shaft and the switch actuator on tray support arm Adjust switch firmly to the end of its travel against shim Tighten switch mounting screws and remove shim

Deck Open Switches

Both right and left deck open switches are adjusted in same manner Raise deck lid to full open position, place 060" shim between end of switch shaft and actuator Adjust actuator so that the switch shaft is fully depressed Tighten actuator mounting screws and remove shim

Deck Lock Adjustment

NOTE - F r ad quate s al, d ck lock scr w ass mbly must be adjusted to engage properly with the lock nut assembly.

Deck Lock Screw Assembly - Loosen two nuts retaining lock screw assembly to deck lid and adjust the assembly fore and aft to align with lock nut assembly

Deck Lock Nut Housing Support - Loosen two screws retaining lock nut housing support to quarter panel and adjust support side to align with lock screw

Deck Lock Nut Set Screw - Loosen set screw retaining the lock nut in housing assembly and turn lock nut in or out to the required position. The Tool T57P-53510-A may be used to turn lock nut as necessary *CAUTION* - DO NOT attempt any trial locking of deck unless set screw is properly tightened

Deck Lock Nut Housing Height - The foot of the lock nut housing assembly may be adjusted up or down from the wheelhouse to insure the correct positioning of the "O" ring The "O" ring should be centrally located in housing support

1963 ELECTRICAL TEST SPECIFICATIONS

Operation	Maximum Amperage Draw	① Amper s
Deck Lid Unlock		.20
Deck Lid Open		63
Package Tray Extend		30
Package Tray Fold		20
Top Erect or Retract		65
Deck Lid Close		60
Deck Lid Lock		22

① - Battery must be 11 5-12 5 volts for these tests

Unit	Electrical Unit Current Draw	② Amper s
Pump Motor	(Normal)	54-60
	(Bypassing)	42-50
Tray Motor	(Normal)	10-32
	(No Load)	14-18
	(Stalled)	45-58
Lock Motor	(Normal)	16-20
	(No Load)	12-15
	(Stalled)	32-40
Solenoids	(Each)	10

② - With 100 ampere scale ammeter between 50 amp circuit breaker and relay feed wire.

Hydraulic Checks

NOTE - Faulty hydraulic system operation can be caused by lack of fluid, leaks, air in system, obstructions or kinks in hoses, or faulty operation of cylinder or pump

Fluid Level - Retract top, remove filler plug and check fluid level (bottom edge of filler hole) If low, check for leaks, adding heavy duty brake fluid as necessary

Lift Cylinder Operation - Operate top control switch and observe operation of lift cylinders If movement of piston rod is sluggish or uneven, check hoses from pump to cylinders for kinks If one piston rod moves more slowly than the other, the cylinder with the slower rod is defective and should be replaced If both rods move slowly or not at all, disassemble and repair pump

LINCOLN CONTINENTAL ELECTRIC TOP CONTROL

Lincoln Continental (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 TOP CONTROL RELAY NOISE CORRECTION:* If noise occurs when shifting transmission through Neutral, relay may be vibrating on its mounting. To correct, replace relay (use No. C3VY-14512-D) and install a sound absorption pad between relay and its mounting surface.

►*1963 TOP OPERATES INTERMITTENTLY OR NOT AT ALL CORRECTION:* May be caused by mold flash on push-on relay wiring connectors at relay panel (right quarter panel area). Remove any mold flash to provide a good, clean electrical connection and make sure that connector is completely assembled on relay terminals.

DESCRIPTION

Completely automatic power top mechanism which is the same as latest 1961 production with all of the production changes included.

OPERATION

Same as latest 1961 production with all of the production changes included. *See 1961 Final Data, Page 530.*

EMERGENCY MANUAL OPERATION

See 1961 Final Data, Page 532, and note the following: **Manually Opening Deck Lid (Control Circuit Inoperative)** - If top control circuit inoperative, bypass control circuit components to open deck lid as follows: Remove rear seat back and remove multiple plug from deck unlock relay. Make a three-ended jumper wire and energize deck unlock motor directly through multiple plug. *NOTE - If motor does not operate, unlock deck lid manually.* If deck lid will not operate through top control switch, remove multiple plug from deck open relay and energize deck motor and pump assembly directly through multiple plug. *NOTE - If motor inoperative, open deck lid manually.*

ELECTRICAL COMPONENTS & LOCATIONS

See 1961 Final Data, Page 532, and note the following: **Top Control Neutral Relay** - Located on horn relay mounting plate behind right cowl panel.
50 Ampere Power Circuit Breaker - Located on horn relay mounting plate behind right cowl panel.
10 Ampere Control Circuit Breaker - Located in fuse box.

TESTING & TROUBLE SHOOTING

See 1961 Final Data, Pag 532.

WIRING DIAGRAM

See 1961 Final Data, Page 531.

SWITCH ADJUSTMENTS

Deck Lock Limit Switch

With a test lamp attached to the two top terminals of switch, adjust switch so test lamp is lighted when deck lock screws contact deck lock nuts but goes out after lock screws engage lock nuts by one or two threads.

Top Down Limit Switch

With top retracted and a test light attached to upper terminals of switch, adjust switch against pivot arm until test light goes out, then tighten mounting screws.

Back Panel Erect Limit Switch

With top erected, deck lid raised, and back panel partially open, loosen switch mounting screws so switch plunger is not depressed when back panel fully open. With test light attached to two upper terminals of switch and back panel fully open, move switch against actuator until plunger is depressed and test light goes out. Tighten mounting screws.

Back Panel Retract Limit Switch

With top erected, deck lid raised, and back panel partially open, loosen switch mounting screws so switch plunger is not depressed when back panel fully folded. Attach test light to top terminals of switch. Fold back panel until rubber pads on underside of deck lid are compressed and back panel motor stalls. Move switch against actuator until plunger is depressed and test light goes out, then tighten mounting screws.

Top Lock Limit Switch

With top erected, but unlocked, remove access cover in No. 1 bow and move switch so plunger will not be compressed when top is locked. Operate top motor until top locks and motor stalls, then release control switch. With a test light attached to red wire terminals of switch, adjust switch against actuator until switch plunger is fully depressed and test light is on, then tighten mounting screws.

Top Unlock Limit Switch

With top erected and No. 1 bow access cover removed, raise deck lid and back panel until top just starts to unlock. Loosen switch so plunger will not be depressed when top is unlocked. Insert a .060" shim between switch plunger and actuator then unlock top fully until lock arm is firmly seated to rubber stop. With a test light attached to yellow and brown wire terminals of switch, adjust switch plunger against actuator until light goes out and plunger is fully depressed. Remove shim and tighten mounting screws. *CAUTION - Lock linkage stop must be adjusted so switch actuat r will not hit switch body.*

Top Up Limit Switch/Top Lock Limit Switch No. 1

With No. 1 bow access cover removed and switch loosened, raise top until No. 1 bow rests firmly on windshield header and lock hooks are aligned with hook pockets. Attach a test light to yellow and red wire terminals of switch and adjust switch forward until test light comes on, then tighten mounting screws.

Top Up Limit Switch (In Main Pivot Casting)

With top up and locked to windshield header and with deck lid open, attach a test light to red wire terminals of switch and adjust switch plunger against top linkage until test light goes out, then tighten mounting screws.

Deck Open Limit Switches No. 1 & 2

With deck lid partially open, move switches so they will not be activated when deck lid fully open. Attach a test light to yellow wire terminals of switch and move deck lid to fully opened position. Adjust switches against actuators until test light goes out, then tighten mounting screws.

Top Lock Cut-Off Switch

With deck lid fully raised and back panel completely folded under so it contacts rubber pads, place a .060" shim between switch plunger and actuator. Attach a test light to red and orange wire terminals of switch. Adjust switch until plunger is fully depressed and test light is out. Remove shim and tighten mounting screws.

HYDRAULIC SYSTEM

Checking Fluid Level

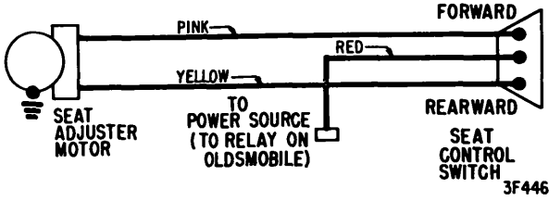
Loosen filler plug in end of reservoir. Start engine and run at fast idle while cycling top three times to bleed air from system. With top erected and deck lid open, remove filler plug. If fluid does not run out of opening, add heavy duty brake fluid so fluid is level with edge of filler plug hole. Install filler plug.

G.M. 2-WAY SEAT CONTROL

Buick (1963)
Cadillac (1963)
Oldsmobile 88, S88, 98 (1963)

DESCRIPTION

Consists of a single motor located at right front of seat bottom frame which actuates a jackscrew and gearnut at each side of seat. Gearnuts connected by a drive cable, and control switch is located at seat side panel (left side on full-width type seat). On models with bucket type seats, two adjuster units are used, one for each seat.



TESTING & TROUBLE SHOOTING

Motor Does Not Operate In Either Direction - Check wiring for open or short circuit. Check for faulty switch by bypassing switch. Check motor operation with a jumper wire from power source to one motor terminal, then check other terminal. If motor inoperative, repair or replace as necessary.
Motor Operates In One Direction Only - Faulty control switch. Motor feed wires or motor faulty (check motor as indicated above).

REMOVAL & INSTALLATION

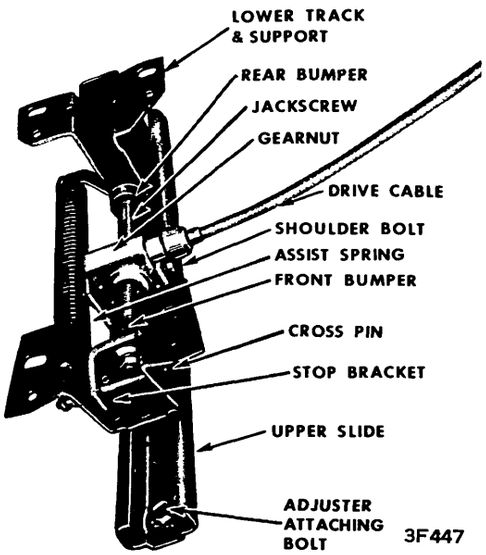
Front Seat Assembly

Removal - Disconnect control switch wire harness from feed wire harness and detach switch harness from floor pan. Turn back carpet, remove seat adjuster-to-floor pan attaching bolts and remove assembly.
Installation - Reverse removal procedure. *NOTE* - Adjusters must be parallel and "in phase" with each other. If "out of phase" (one adjuster reaches limit of its travel before the other), proceed as follows: Actuate

G-M. 2-WAY SEAT ADJUSTER WIRING DIAGRAM

seat until one adjuster reaches limit of its travel in one direction. Disconnect drive cable and operate seat in same direction until other adjuster reaches limit of its travel. Connect cable and check operation.

Seat Adjuster



Remove seat assembly and detach drive cable from adjuster being removed. Remove adjuster-to-seat bottom frame bolts and remove adjuster. To install, reverse removal procedure.

Gearnut & Jackscrew

Remove seat assembly and detach drive cable from gearnut and jackscrew being serviced. With a clutch type screwdriver, remove shoulder bolts holding gearnut to upper slide part of adjuster. Remove retainer holding stop bracket crosspin to adjuster front pedestal and remove crosspin. Remove gearnut and jackscrew assembly. To install, reverse removal procedure. *NOTE - When installing new gearnut only, remove cotter pin, washers, and rubber bumper from rear of jackscrew. To replace jackscrew, remove parts from front end of jackscrew also.*

Adjuster Plastic Shoes

Remove front seat assembly and the adjuster being serviced. Remove shoulder bolts with a clutch type screwdriver. Slide lower track and support base part of adjuster (with gearnut and jackscrew) forward until it

G.M. 2-WAY SEAT ADJUSTER ASSEMBLY

disengages from upper slide assembly. Remove plastic shoes from slots in lower track. To install, reverse removal procedure, making sure groove in plastic shoe fits into track with thin part of shoe protruding above track surface.

Actuator Motor

Disconnect drive cable and switch wire harness from motor. Remove bolts holding motor support bracket to weld nuts at front of seat bottom frame and remove motor and bracket. When installing a new motor, transfer ground wire and support bracket from old motor to new one. To install, reverse removal procedure.

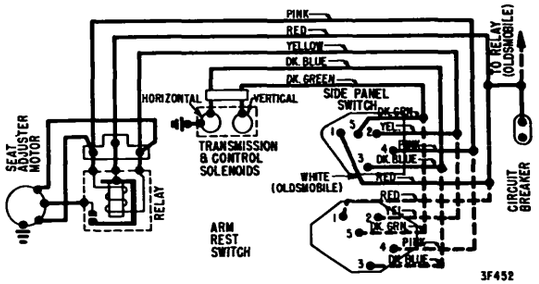
G.M. 4-WAY SEAT CONTROL

Buick & Buick Special (1963)
Cadillac (1963)
Oldsmobile & F-85 (1963)
Pontiac & Tempest (1963)

DESCRIPTION & OPERATION

Consists of a 12-volt reversible type shunt wound motor with integral circuit breaker, and control relay mounted either on motor case or on seat track. Motor is installed at left side of seat assembly and energized by toggle-type switch in seat side panel (left side on full-width type seat). On models with bucket type seats, two separate units are used, one for each seat (if both seats so equipped). Operating mechanism consists of a transmission assembly which includes two solenoids and drive cables leading to seat adjusters. One solenoid controls rear vertical seat movement, and other solenoid controls horizontal movement. When control switch is actuated, motor and one solenoid energized simultaneously, then solenoid plunger engages driving gear dog. Driving gear rotates drive cables and operates both adjusters. When adjusters reach limit of their travel, drive cables stop turning and torque is absorbed by rubber coupler between motor and transmission. When control switch is released (contacts open), a return spring brings solenoid plunger to original position and disengages it from driving gear dog.

TROUBLE SHOOTING & DIAGNOSIS



Motor Inoperative - Wiring between power source and switch or motor faulty. Motor relay faulty. Motor, control switch, or circuit breaker faulty.
Motor Operates But Seat Does Not Move - Short or open circuit between switch and affected solenoid. Solenoid faulty. Control switch faulty.

Motor Operates In One Direction Only - Short or open circuit between motor relay and control switch. Motor field coil faulty. Control switch faulty.

TESTING

Feed Circuit

At Motor Relay - Remove connector from motor relay, insert one test light lead into relay power feed connector slot on harness and ground other tester lead. If test light does not come on, feed circuit is either open or shorted.
At Control Switch - Connect one test light lead to switch block feed terminal and ground other lead to body metal. If test light does not come on, feed circuit to switch is either open or shorted. *(Continued)*

G.M. 4-WAY SEAT ADJUSTER WIRING DIAGRAM

G.M. 4-WAY SEAT CONTROL (Continued)

Control Switch

Substitute known good switch or use a 3-way jumper wire connected to switch block to produce desired seat movement. Connect two pieces of 12 gauge wire together and insert joined section into feed location in switch block. Insert other ends into a field and a solenoid location (see wiring diagram for switch block numbering) as follows:

1) To raise seat, jumper in 1, 2, 5.
2) To lower seat, jumper in 1, 4, 5.
3) To move seat forward, jumper in 1, 3, 4.
4) To move seat rearward, jumper in 1, 2, 3.

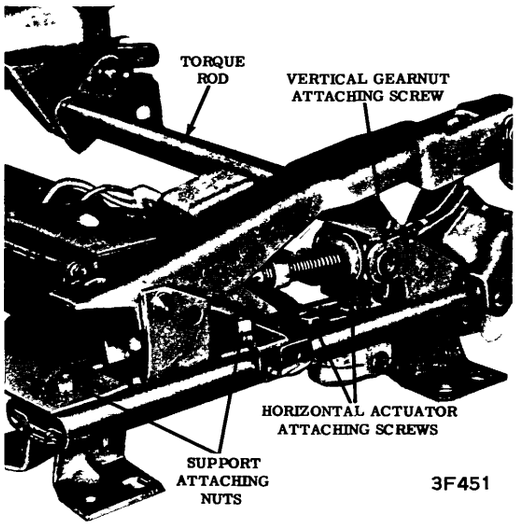
Motor Relay

Disconnect wiring to motor at relay. Connect a jumper wire to one relay motor field feed studs, and ground other end of wire. Connect one test light lead to motor armature feed stud on relay and ground other lead. Energize field stud which is not grounded, using a jumper wire. *CAUTION - Do not energize grounded side.* If test light does not come on, relay is faulty.

Motor

Disconnect field leads from motor and connect a jumper wire from battery positive post to one field lead and to armature wire. If motor does not operate, repair or replace as necessary.

Solenoid



Make sure solenoid ground strap properly connected. Connect one end of jumper wire to battery positive post and other end of wire to solenoid lead. *CAUTION - Do not energize solenoid for more than 1 minute.* Use control switch to operate solenoid being checked. If adjusters do not move and are in good condition, solenoid is faulty. *NOTE - If solenoid good, "click" will be heard when solenoid plunger operates.*

REMOVAL & INSTALLATION

Seat Assembly

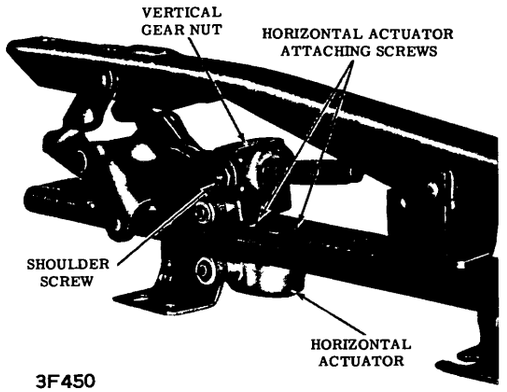
Removal - Turn back carpet. Operate seat as necessary for access to front and rear adjuster-to-floor pan attaching bolts. Remove attaching bolts, disconnect wiring, and remove seat.

Installation - Reverse removal procedure, make sure ground strap is properly attached under an attaching bolt, and be sure adjusters are "in phase" with each other as follows: If adjusters "out of phase" (one adjuster reaches limit of its travel before the other), actuate seat forward until one adjuster is fully forward, disconnect drive cable, and operate seat forward until other adjuster is fully forward, then connect cable. Repeat for vertical movement, operating seat upward.

G.M. 4-WAY SEAT ADJUSTER ASSEMBLY (BUCKET SEAT)

Adjuster Assembly

With seat assembly removed, disconnect drive cables, remove adjuster-to-seat bottom frame attaching bolts, and remove adjuster. To install, reverse removal procedure and make sure adjusters are "in phase" with each other (see Seat Assembly Installation above).



Adjuster Gearnut

With seat assembly removed, remove vertical gearnut drive cable from opposite nut, then use a clutch-type screwdriver to remove shoulder screws holding linkage to vertical gearnut. Remove jackscrew down stop from jackscrew. Use a portable power source to actuate vertical gearnut until disengaged from jackscrew, then disconnect drive cable from gearnut. *NOTE - If necessary, manually raise or lower upper rear part of adjuster for clearance.* To install, reverse removal procedure.

Horizontal Actuator

Full Width Seat - Remove adjuster vertical gearnut, remove screws holding horizontal actuator from adjuster lower track, and remove actuator. To install, reverse removal procedure and note the following: Adjust actuator so drive gear is fully engaged with teeth on lower channel. When actuator attaching screws are tightened, there must be no free movement between upper and lower channels.

Bucket Seat - With seat removed, use a clutch-type screwdriver to remove shoulder screws holding linkage to vertical gearnut, then actuate vertical gearnut until it is against jackscrew down stop (use portable power source). Disconnect drive cable from actuator, remove screws holding actuator to adjuster lower track, and remove actuator. To install, reverse removal procedure and note the following: Adjust actuator so drive gear is fully engaged with teeth on lower channel. When actuator attaching screws are tightened, there must be no free movement between upper and lower channels.

G.M. 4-WAY SEAT ADJUSTER ASSEMBLY (FULL WIDTH SEAT)

Adjuster Jackscrew

Remove adjuster vertical gearnut (see above), then remove adjuster-to-seat bottom frame attaching bolts on side affected. Remove jackscrew-to-adjuster linkage attaching rivet and remove jackscrew. To install, reverse removal procedure, and use new rivet, No. 5715154.

Motor

With seat assembly removed, disconnect wiring harness from motor, disconnect motor support from seat bottom frame (full width seats only), disconnect motor from support and remove. To install, reverse removal procedure.

Adjuster Cables

With seat assembly removed, detach both cables from seat adjuster. Disconnect cable endplate from transmission and remove cables. To remove cable from endplate, remove knock-out plug. To install, reverse removal procedure.

Adjuster Transmission

With seat assembly removed, disconnect wiring and endplates from transmission. Remove transmission attaching bolts, disconnect transmission from rubber coupler, and remove transmission. To install, reverse removal procedure.

Torque Tube (Bucket Seats)

With seat assembly removed, remove adjuster-to-seat bottom frame attaching bolts, and nuts holding motor and transmission support to inboard adjuster. Disengage adjuster from support and torque tube and remove adjuster. Disengage torque tube from opposite adjuster and remove torque tube. To install, reverse removal procedure.

G.M. 6-WAY SEAT CONTROL

Buick (1963)
Cadillac (1963)
Ch vr l t Pass. Cars (1963)
Oldsm bil (1963)
P ntiac (1963)

DESCRIPTION

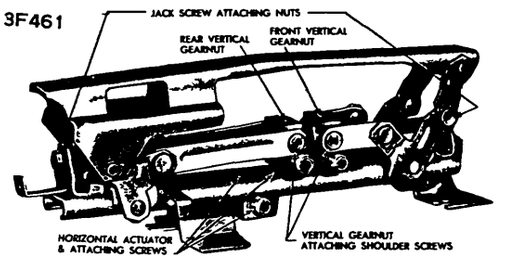
Six-way seat control consists of a single 12-volt reversible shunt wound motor, a transmission assembly with three solenoids, and seven drive cables to actuate transmission and seat adjusters. Control switch consists of three units for horizontal, vertical, and tilt movement, and is located either in seat left side panel or left front door arm rest.

OPERATION

When a control switch button is actuated, motor and one solenoid are energized at the same time. Solenoid plunger engages large gears with a driving gear. Driving gear rotates large gears which turn drive cables and operate both adjusters. When switch released (contacts opened) a spring returns solenoid plunger to original position and disengages large gears from driving gear.

TROUBLE SHOOTING & DIAGNOSIS

M t r In p rativ - Circuit between power source and switch and motor faulty; Motor relay, motor, control switch, or circuit breaker faulty.
M t r Op rat s In B th Directions But Adjusters Not Actuat d - Wiring between switch and solenoid faulty; Solenoid or control switch faulty.
M t r Op rat s In On Direction Only - Wiring between motor relay and control switch faulty; Motor field coil faulty; Control switch faulty.



TESTING

Feed Circuit

At Mot r R lay - Remove connector from motor relay, insert one test light lead into relay power feed connector slot on harness and ground other tester lead. If test light does not come on, feed circuit is either open or shorted.
At C ntr l Switch - Connect one test light lead to switch block feed terminal and ground other lead to body metal. If test light does not come on, feed circuit to switch is either open or shorted.

Control Switch

Substitute known good switch or use a 3-way jumper wire connected to switch block to produce desired seat movement. Connect two pieces of 12 gauge wire together and insert joined section into feed location in switch block. Insert other ends into a field and a solenoid location (see wiring diagram for switch block numbering) as follows:

G.M. 6-WAY SEAT ADJUSTER ASSEMBLY

With Switch in Seat Side Panel -
1) To raise front edge, jumper in 1, 6, 5.
2) To lower front edge, jumper in 1, 3, 5.
3) To raise rear edge, jumper in 1, 6, 4.
4) To lower rear edge, jumper in 1, 3, 4.
5) To move seat forward, jumper in 1, 6, 2.
6) To move seat rearward, jumper in 1, 3, 2.

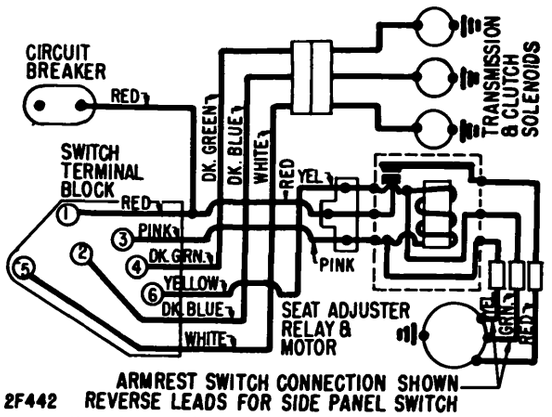
With Switch In Door Arm Rest -
1) To raise front edge, jumper in 1, 3, 5.
2) To lower front edge, jumper in 1, 6, 5.
3) To raise rear edge, jumper in 1, 3, 4.
4) To lower rear edge, jumper in 1, 6, 4.
5) To move seat forward, jumper in 1, 3, 2.
6) To move seat rearward, jumper in 1, 6, 2.

Motor Relay

Disconnect wiring to motor at relay. Connect a jumper wire to one relay motor field feed stud, and ground other end of wire. Connect one test light lead to motor armature feed stud on relay and ground other lead. Energize field stud which is not grounded, using a jumper wire. *CAUTION - Do not energize grounded side.* If test light does not come on, relay is faulty.

Motor

Disconnect field leads from motor and connect a jumper wire from battery positive post to one field lead and to armature wire. If motor does not operate, repair or replace as necessary.



Solenoid

Make sure solenoid ground strap properly connected. Connect one end of jumper wire to battery positive post and other end of wire to solenoid lead. *CAUTION - Do not energize solenoid for more than 1 minute.* Use control switch to operate solenoid being checked. If adjusters do not move and are in good condition, solenoid is faulty. *NOTE - If solenoid good, "click" will be heard when solenoid plunger operates.*

REMOVAL & INSTALLATION

Seat Assembly

Disconnect wiring, turn back carpet, remove adjuster track covers, then remove adjuster-to-floor pan attaching bolts on both sides. Remove seat assembly. To install, reverse removal procedure, making sure ground wire is securely attached under a right adjuster-to-floor pan attaching bolt.

ARMREST SWITCH CONNECTION SHOWN
2F442 REVERSE LEADS FOR SIDE PANEL SWITCH
G.M. 6-WAY SEAT CONTROL WIRING DIAGRAM

Adjuster Assembly

Removal - With seat assembly removed, detach drive cables from adjuster, remove adjuster-to-seat bottom frame attaching bolts, and remove adjuster.
Installation - Reverse removal procedure. Black cable attaches to horizontal actuator, yellow cable to front vertical gearnut, and blue cable to rear vertical gearnut. Make sure adjusters are parallel and "in phase" with each other as follows: If adjusters "out of phase" (one adjuster reaches limit of its travel before the other), actuate seat forward until one adjuster is fully forward, disconnect drive cable, and operate seat forward until other adjuster is fully forward, then connect cable. Repeat for vertical movement, operating seat upward.

Vertical Jackscrew Gearnuts & Springs

With seat assembly and appropriate adjuster removed, use clutch-type screwdriver in drive cable slot in rear vertical gearnut to actuate gearnut rearward. Actuate front vertical gearnut rearward to release tension from front assist spring. Remove jackscrew front attaching nut. Lift front of jackscrew to disengage from support and remove front assist spring and silencer. Actuate front and rear gearnuts forward to relieve tension on rear assist spring, then remove rear nut from jackscrew. Disengage rear of jackscrew from support and remove jackscrew with gearnuts and spring. Remove rear assist spring, silencer, and vertical gearnuts from jackscrew. To install, reverse removal procedure and note the following: Jackscrew must be installed with unthreaded shoulder at rear of adjuster and with gearnuts installed. Rear vertical gearnut with larger cable attachment must be installed to rear, and gearnut with smaller cable attachment to front. Both vertical gearnuts must have cable attachment at bottom of adjuster inner side.

(Continued)

G.M. 6-WAY SEAT CONTROL (Continu d)

Horizontal Actuator And Upper & Lower Channels

With seat and adjuster removed, disconnect horizontal actuator from adjuster and remove. Slide adjuster lower channel from upper channel, and remove plastic shoes from lower channel track. To install, reverse removal procedure and note the following: Horizontal actuator must be installed so drive gear is fully engaged with teeth on lower channel. When actuator screws are tightened, there should be no free movement between upper and lower channels.

Motor & Motor Drive Cable

With seat assembly removed, disconnect motor from seat frame, move motor to left to disengage drive cable, then remove motor. Remove cable by removing endplate from transmission. To install, reverse removal procedure.

Horizontal & Vertical Drive Cables

With seat assembly removed, disconnect cables from seat adjuster. Remove transmission endplate and remove cables. To install, reverse removal procedure.

Transmission Assembly

With seat assembly removed, disconnect wiring from transmission, remove cable endplates from transmission, remove transmission attaching bolts and remove transmission. To install, reverse removal procedure.

LINCOLN & MERCURY SEAT CONTROL

Lincoln Continental (1963)
Mercury Monterey (1963)

DESCRIPTION

The 6-Way Seat Adjuster provides horizontal, vertical, and tilting adjustments. Seat is driven by a single motor through a transmission and six flexible drive cables encased in housings. Control switches are mounted on left seat side shield. Front switch controls vertical movement or tilt of front part of seat. Rear switch controls vertical movement or tilt of rear part of seat. Center switch controls both horizontal and vertical movement. Switches control operation of the three solenoids through relays (except horizontal movement, which is controlled directly by switch). See *Wiring Diagram.*

TROUBLE SHOOTING

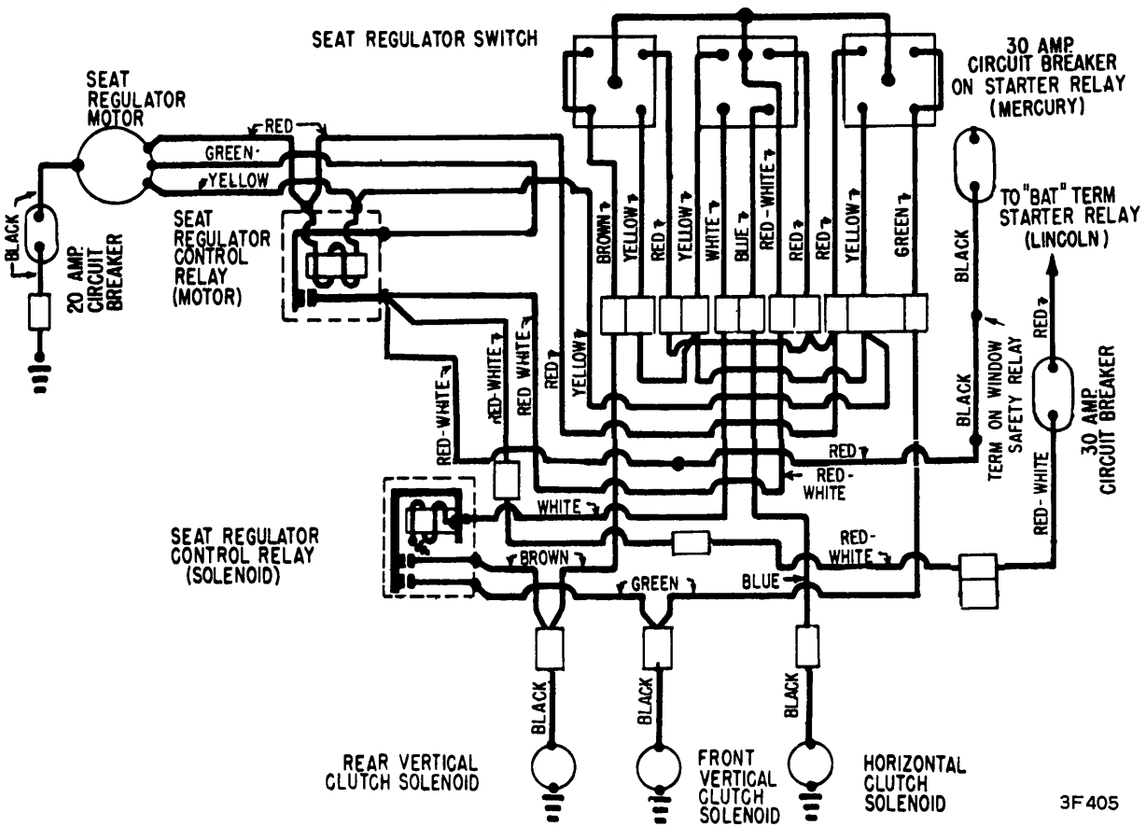
Motor Operates But Seat Does Not Move - Shaft or coupling between motor and transmission faulty; Solenoid not engaging transmission; Solenoid relay not engaging solenoid.
Motor Inoperative - Circuit breaker faulty; Motor relay faulty; Control switch faulty; Motor faulty; Wiring broken or loose.
Seat Will Not Move In One Direction - Appropriate solenoid inoperative; Transmission binding; Control switch faulty; Flexible drive cable broken.

REMOVAL & INSTALLATION

Seat

Disconnect battery and remove nut and washer from front end of each seat actuator. Remove capscrew and lockwasher from rear of each seat actuator. Disconnect motor mounting bracket from floor pan. Disconnect main wiring harness from lead to circuit breaker. Remove seat and regulator from car, then remove seat from actuator. To install, reverse removal procedure.

Motor Replacement



With seat and regulator assembly removed, disconnect motor leads from connectors, and disconnect motor from mounting bracket. Slide motor out of shaft coupling and off bracket. To install, reverse removal procedure.

Relay Replacement

With seat and regulator assembly removed, disconnect wiring connector from seat regulator relay and from motor control relay. Remove screws holding relays to mounting bracket and remove relays. To install, reverse removal procedure, making sure motor control relay is toward driver's side of seat.

Transmission Replacement

With seat and regulator assembly removed, disconnect wiring from solenoids on transmission. Remove cable housing retainer from each end of transmission, then separate cables and housings from transmission. Disconnect transmission from mounting bracket and remove. To install, reverse removal procedure, making sure solenoid wires are properly connected *(s Wiring Diagram).*

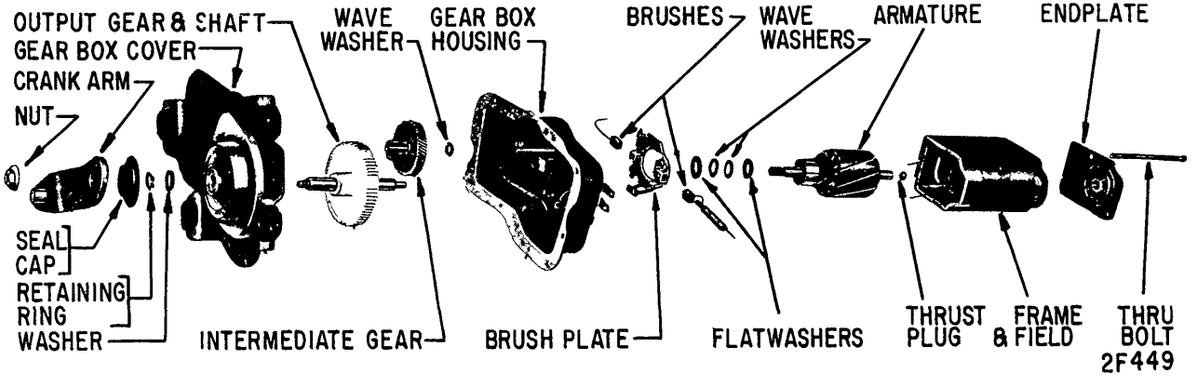
ℂ - 2-Speed Wiper is "Round Motor" type *See "G M Two & Three Speed Electric Wiper & Washer (Round Motor)" in this section*
② - On F-85 Deluxe 2-Door Hardtop (Series 3147), 2-Speed wiper is "Round Motor" type *See "G M Two & Three-Speed Electric Wiper & Washer (Round Motor)" in this section*

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 PONTIAC INOPERATIVE WIPERS NOTE* If back-up lights are also inoperative and fuse is blown (both wipers and back-up lights on same circuit), check for short circuit or broken wiring at back-up lights (between rear bumper and body)

WIPER

DESCRIPTION



Single speed motor is a rectangular shaped shunt wound type motor similar to previous models Two-speed motor is also rectangular shaped and is compound wound (series and shunt field) Gear train consists of a helical gear at end of armature shaft which drives an intermediate gear and pinion assembly Pinion drives output gear and shaft, and crank arm, attached to output gear shaft, drives wiper transmissions through connecting link arms No internal circuit breaker in motor is used Circuit protection for wipers is through a fuse on fuse block *See individual Car Model Wiring Diagram on Car Model Pages*

TESTING & TROUBLE SHOOTING

1-SPEED

On Car

Wiper Inoperative - Check fuse, check for proper wiring harness terminal connections ground strap at wiper properly connected, dash switch mounted securely Disconnect wiring harness from wiper and check for voltage at harness terminals No voltage indicates faulty car wiring *CAUTION - DO NOT connect a hot line to No 1 wiper terminal* Connect 12 volts to No 2 wiper terminal and a jumper wire from No 1 terminal to ground If wiper operates, dash switch or wiring is faulty If wiper does not operate, disconnect transmission from crank arm If wiper operates, linkage or transmission is faulty If wiper does not operate, remove wiper and check as described under "Off Car" below
Wip r Will Not Shut Off - If wiper shuts off with wiring at dash switch disconnected, dash switch is faulty If wiper operates with dash switch wiring disconnected, connect 12 volts to wiper No 2 terminal *CAUTION - DO NOT connect any jumper wire to No 1 terminal* If wiper shuts off correctly, lead between No 1 terminal and dash switch is grounded If wiper does not shut off, remove wiper and check as described under "Off Car" below
Wiper Operates Intermittently - Check for loose ground strap, dash switch mounting, or loose connection
Blades Fail To Return To Park Position - Check for dirty or broken park switch (remove wiper from car to check)

WINDSHIELD WIPER MOTOR & DRIVE ASSEMBLY (EXPLODED)

Off Car

Wiper Inoperative - Connect a battery and ammeter to No 2 wiper terminal and a jumper wire from No 1 terminal to ground If current draw 0 amps , check solder connection at terminal board, or disassemble motor (if necessary) and check all splice connections If current draw 1-1 5 amps , disassemble motor and check for open armature, sticking brushes, improperly positioned brush springs or faulty brush pigtail connections at splice joints If current draw 10-12 amps , check for open shunt field circuit, or broken gear
Wiper Runs Slow, Vibrates, and Current Draw Approximately 7-9 Amperes - Check for gear train binding, or shorted armature
Wiper Shuts Off Before Crank Arm Reaches Park Positi an - If crank arm stops rotating as soon as jumper wire is disconnected from wiper No 1 terminal, check for dirty, broken, or bent park switch contacts *NOTE - When crank arm reaches park p sition, crank arm index grooves will line up approximately with ridges on gear box c over*
Wiper Will Not Shut Off - If crank arm does not stop in park position when jumper wire removed from wiper No 1 terminal, check that park switch contacts are opening, and that there is no ground in internal motor lead to No 1 terminal

2-SPEED

On Car

Wiper In perative - Check wiring harness, wiper ground strap, and dash switch for proper connections and mounting Check fuse Check for voltage at wiper No 2 terminal To bypass switch, disconnect wiring at motor and connect a jumper wire from No 1 & 3 terminals to ground, and a 12-volt source to No 2 terminal If wiper does not operate, disconnect transmissions from crank arm and operate If wiper still does not operate, remove from car and test as indicated under "Off Car" below
Wiper Will Not Shut Off - *NOTE - Wiper must operate in low speed during parking cycle* Determine whether wiper has both speeds, low speed only, or high speed only, then operate wiper by bypassing switch as detailed under "Wiper Inoperative" above If wiper operates correctly and had both speeds, lead to switch from No 1 terminal is grounded If wiper had low speed only, lead to switch from No 3 terminal is grounded If wiper had high speed only, lead to switch from No 3 terminal is open If wiper still does not operate, remove from car and check as indicated under "Off Car" below
Wiper Operates In Low Speed Only and Shuts Off With Dash Switch In High Position - Reverse harness leads connecting to wiper No 1 & 3 terminals
Blades Do Not Return To Park With Wiper Off - Wiper ground strap may not be connected properly, or park switch contacts may be dirty, bent, or broken
Wiper Speed Normal In Low, But Too Fast In High - Terminal board resistor may be open (remove from car to check)
Wiper Operates Intermittently - Loose wiper ground strap or dash switch mounting

Off Car

NOTE - Use ammeter of reading of 30 amperes minimum in feed wire circuit
Wiper Inoperative - Connect an ammeter and battery to No 2 terminal, and a jumper wire from No 1 & 3 terminals to ground (wiper will operate at low speed) If ammeter reading is 0, check for loose splice joints, or loose solder connection at No 2 terminal If reading 1-1 5 amps check for sticking brushes, open armature, or loose splice joint If reading 11 0 amps , check for broken gear or other stalling condition
Wiper Will Not Shut Off - If wiper had both speeds, park switch contacts may not be opening, or internal motor lead to No 1 terminal is grounded If wiper had low speed only, shunt field coil may be grounded, or internal wiper lead to No 3 terminal is grounded If wiper had high speed only, shunt field is open or internal lead to No 3 terminal is open

(Continued)

G.M. 1 & 2-SPEED WINDSHIELD WIPER & WASHER (Cont.)

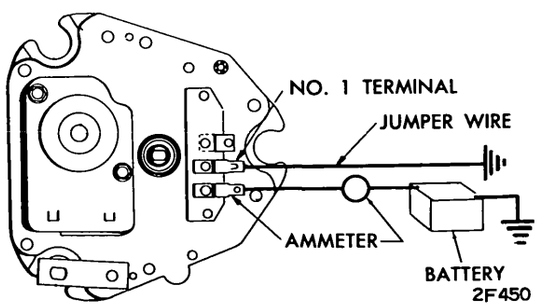
Wiper Operates Intermittently - Check for sticking brushes, loose splice joints, or other loose connections.

REMOVAL & INSTALLATION

Transmission

Remove arm and blade assemblies. Remove air intake grille and washer nozzles if equipped. Remove retaining clips holding crank arms to drive arms. Remove transmission attaching screws, and remove transmission. To install, reverse removal procedure.

Motor



NOTE - On some cars, motor is mounted under air intake grille. On other cars, motor is mounted on engine side of firewall and connected to transmission arm on inside of car. Remove air intake grille if necessary. Remove hoses and wiring from motor, then disconnect motor crank from transmission arm. Remove motor attaching screws and remove motor (and w asher pump). To install, reverse removal procedure.

OVERHAUL

Gear Box

Disassembly - If equipped with washer pump, remove pump from wiper. Remove pump drive gear if required by wedging off shaft with two screwdrivers. Loosen crank arm retaining nut, then remove seal cap, retaining ring and endplay washers. Drill out gear box cover rivets and remove cover. *CAUTION - Mark ground strap location for reassembly.* Remove output gear and shaft assembly, then slide intermediate gear and pinion assembly off shaft. Remove terminal board and park switch by unsoldering motor leads from terminals and drilling out rivets holding terminal board and park switch ground strap to plate.

Reassembly - *NOTE - Service kit is available which contains necessary screws, nuts, and washers to replace rivets removed at disassembly.* Reverse disassembly procedure and make sure cover is located properly over locating dowel pins . Be sure to install ground strap. Install crank arm on output shaft so identification marks line up with marks in cover. Clamp crank in vise before tightening retaining nut.

SINGLE SPEED WIPER TEST CONNECTIONS

Wiper M tor

Disassembly - After gear box disassembled (see above), remove through bolts, tap motor frame lightly, and remove motor from mounting plate. Release brush spring tension and slide armature and endplate from motor frame. Pull endplate from armature. *NOTE - Some models have a thrust plug between armature shaft and endplate.* Remove endplay adjusting washers (note arrangement for proper installation).

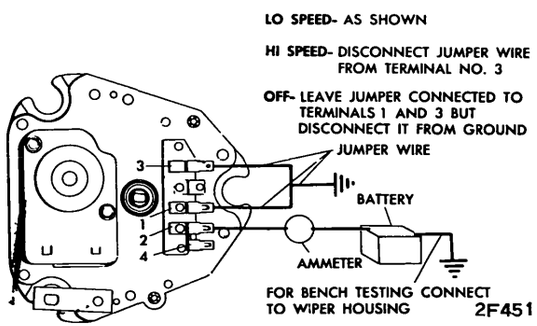
Reassembly - Reverse disassembly procedure. Lubricate armature shaft bushings with light machine oil. *CAUTION - Armature endplay is automatically controlled by proper installation of endplay adjusting washers. Install washers with concave side of washers toward each other.*

1963 Wiper Specifications

	1-Speed	2-Speed
Current Draw (Amps.)		
No Load	3.0 max.	3.6 max.
Dry Windshield	3.5 max.	4.5 max.
Stall	11.0 max.	12.0 max.
Shunt Field Resistor		24 ohms
Crank Arm Speed (RPM - No Load)		
Low Speed	43 min.	34 min.
High Speed		65 min.

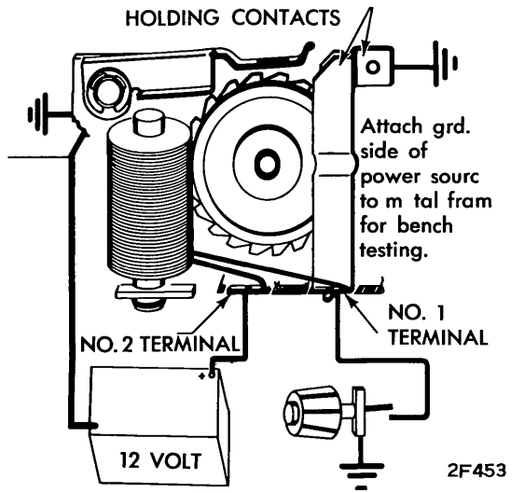
WASHER

DESCRIPTION



Positive displacement, bellows type pump mounted on shaft of wiper output gear. Starting and completion of a wash cycle is accomplished electrically and mechanically by a relay assembly and ratchet wheel arrangement. Washer is controlled by a dash switch washer button which mechanically turns on wipers when washer button is depressed.

TESTING & TROUBLE SHOOTING



On Car

Washer Inoperative - **1)** Check the following: Sufficient water solution in jar; hoses undamaged and connections tight; screen in jar cover hose not plugged; electrical connections tight; nozzle not plugged.

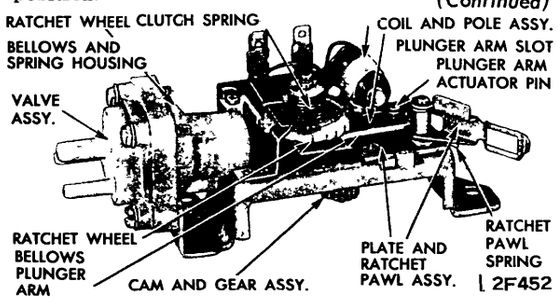
2) If washer inoperative after items listed above are checked, start **wiper motor only,** then push washer button and listen for "click" of washer relay. If no

TWO SPEED WIPER TEST CONNECTIONS

WASHER PUMP TEST CONNECTIONS

"click" heard, check for voltage at washer No. 2 terminal. No voltage indicates faulty wiring. If "click" is heard, proceed to **4)** below.

3) If voltage correct in **2)** above, connect a jumper wire from washer No. 1 terminal to ground and turn on wiper. If washer relay "clicks" and pump operates correctly, dash switch is faulty, or there is an open circuit between pump and switch. If no "click" heard, relay coil is open.



4) If relay "click" was heard in **2)** above, listen for soft clicking of pump ratchet wheel rotating. If soft click not heard, pump is faulty. If soft click is heard and pump does not operate, valve assembly is faulty.

Off Car

Washer Inoperative - **1)** Remove pump cover and connect a battery to washer No. 2 terminal and to ground. Connect a jumper wire from washer No. 1 terminal to ground. Turn ratchet pawl so holding contacts are closed. Pawl should be pulled toward relay pole and engage ratchet teeth. If not, relay coil is open.

2) If relay and ratchet pawl operate correctly in **1)** above, manually rotate three-lobe cam 1 lobe clockwise (looking at cam). Relay holding contacts should close and pump plunger arm should be released from lock-out position.

(Continued)

WASHER PUMP & DRIVE ASSEMBLY

G.M. 1 & 2-SPEED WINDSHIELD WIPER & WASHER (C nt.)

3) Disconnect jumper wire from No. 1 terminal. Relay coil should remain energized and hold ratchet pawl against ratchet wheel. If not, holding contacts are dirty.
4) If pump operated properly in 3) above, manually rotate three-lobe cam until ratchet wheel has turned 360° or 21 teeth. At this point holding contacts should be opened by "hump" on wheel and pump plunger arm should be in lock-out position.
Valv Ass mbly Ch cking - Attach a hose to intake (large) pipe. You should be able to blow through pipe, but not draw through it. Attach a hose to each exhaust (small) pipe. You should be able to draw through each pipe but not blow through them. If any valve allows air to pass in both directions, valve assembly is faulty.

OVERHAUL

Relay

Remove washer pump cover and unsolder coil leads from terminals. Remove coil retainer clip and remove coil assembly from mounting bracket. To install, reverse removal procedure.

Ratchet Pawl

Remove washer pump cover and disengage spring from ratchet pawl. Remove "E" ring and slide pawl from shaft. To install, reverse removal procedure, and make sure spring is properly assembled before replacing pump cover.

Valve Assembly

Remove valve assembly-to-bellows housing attaching screws and remove valve. *CAUTION - If necessary car fully pry bellows lip ut of valv body groov .* To install, reverse removal procedure and make sure bellows lip is in valve body groove.

Bellows

Remove valve body (see above), then manually operate pump to release pump from lock-out position. Hold bellows plunger arm from moving, push in on bottom of bellows with thumb and twist bellows 90°. Bellows and bellows spring should be released. To install, reverse removal procedure.

1963 Washer Pump Specifications

Number of Squirts - 12 (at full pressure).
Pressure - 11-15 lbs.
Coil Resistance - 20 ohms.

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 BUICK WIPER LINKAGE MALFUNCTION CORRECTIONS:* 1) If link broken at center bracket bellcrank, usual cause is linkage misalignment. Pin in reversing arm must be perpendicular to *DO NOT bend b llcrank to liminate interference*. To correct, install new right hand drive link and housing, retainer, and bellcrank and bracket assembly.
►*1963 BUICK RIVIERA INOPERATIVE WIPER CORRECTION:* May be caused by water corrosion of motor contacts. Water enters engine compartment at triangular opening between inner fender skirt and frame just ahead of No. 1 body mount bracket. To correct, install Deflector Package, No. 1396398, over this opening. Also, seal weld flange seam between inner and outer fender skirts near wiper motor with plastic body sealer.
►*1963 PONTIAC INOPERATIVE WIPERS NOTE:* If back-up lights are also inoperative and fuse is blown (both wipers and back-up lights are on same circuit), check for short circuit or broken wiring at back-up lights (between rear bumper and body).

WIPER

DESCRIPTION

Two or three-speed electric wiper consisting of a compound wound motor and a gear box section containing gear mechanism with relay control which operates wiper transmissions through link and crank arm arrangement. Wiper blade operation is either tandem or overlapping system. On three-speed (Cadillac) type, "Medium" speed is obtained by connecting 13 ohm resistor in dash switch in parallel with resistor in motor shunt field circuit.

ADJUSTMENT

Wiper Blades

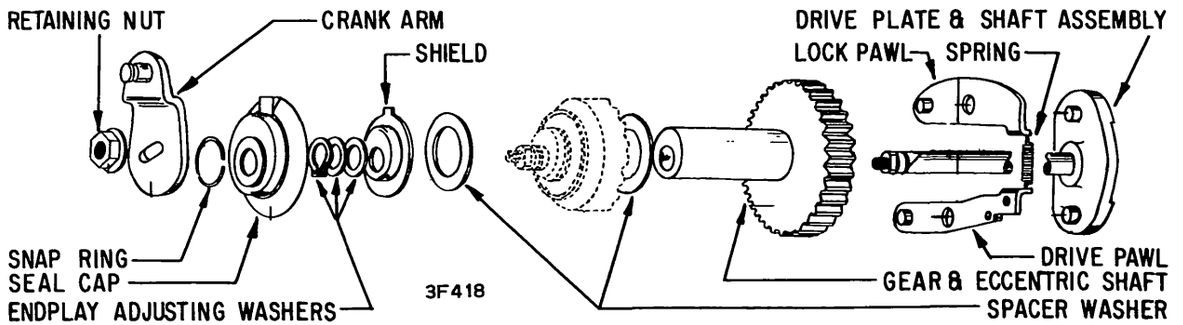
On "Overlap" type systems, proceed as follows: Set motor in parked position. Adjust right and arm assembly on transmission shaft so blade is parallel to windshield and rubber of blade is on surface of windshield molding. Install left blade and arm assembly on transmission shaft so blade slants downward and so outboard end of blade rubber just touches top of windshield molding.

TROUBLE SHOOTING & DIAGNOSIS

Wiper Inoperative - Car wiring (feed circuit) faulty; Wiper ground strap loose or disconnected; Dash switch faulty or not grounded to instrument panel; Latching mechanism binding; Relay control faulty; Motor faulty.
Wiper Will Not Shut Off - Latching mechanism binding; Relay control switch faulty.
Wiper Operates Too Fast in "High But Has Normal Speed in "Low" - Loose connection between motor and terminal board; Terminal board resistor open; Motor shunt field open.
Wiper Has Low Speed Only - Dash switch faulty; Lead between dash switch and terminal board grounded; Motor internal leads grounded.
Wiper Has High Speed Only - Dash switch faulty; Lead between dash switch and terminal board is open.

TESTING

On Car



Wiring - Make sure all wiring is properly connected and that wiper ground strap is securely fastened. Turn ignition switch on and check for 12 volts at No. 2 (center) terminal of wiper. Also check for 12 volts at lead to washer pump.

Switch - 1) Make sure switch is mounted tightly for proper ground connection. Operate wiper independently of switch as follows: Connect 12 volts to No. 2 terminal and jumper wire from No. 1 terminal to ground. Wiper should operate in "High". To check "Low" operation, connect additional jumper wire from No. 3 terminal to ground. If operation not correct, switch is faulty.

2) Determine if washer pump or switch is faulty by bypassing washer switch as follows: With wiper operating independently of wiper switch, connect 12 volts to either washer terminal, and jumper wire from other terminal to ground. If operation not correct, washer switch is faulty.

Linkage - Disconnect drive links from crank arm and manually operate each transmission to check for binding or damaged linkage.

(Continu d)

WINDSHIELD WIPER GEAR BOX ASSEMBLY (EXPLODED)

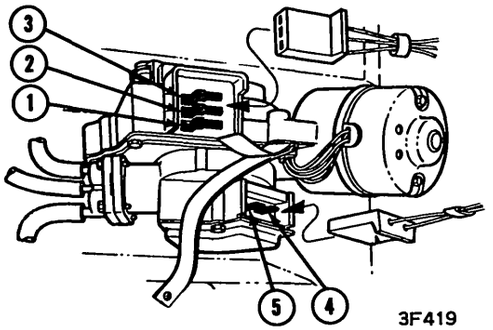
G.M. 2 & 3-SPEED WINDSHIELD WIPER & WASHER (C nt.)

Off Car

Relay Control & Latch Mechanism - 1) Manually operate relay armature to check for binding or hanging-up condition. Connect battery positive post to No. 2 terminal and negative post to housing. Check for 12 volts at terminal to which green lead is attached. No voltage indicates open circuit breaker or broken leads. If voltage present, connect jumper wire from No. 1 terminal to housing. If relay armature does not pull in, relay coil is open or weak.
2) With battery and jumper wire connected as in 1) above, check for 12 volts at switch terminal yellow lead. If relay pulls in properly but no voltage reading obtained, relay switch is faulty. Disconnect jumper wire from No. 1 terminal. Relay armature should move away from coil pole. *NOTE - If gear mechanism in full park position, disconnect coil spring between drive and lock pawls to release pressure of drive pawl switch actuator against switch tab.* No voltage at switch terminal yellow lead indicates faulty relay switch. Now manually push switch stop tab toward relay coil. If voltage reading obtained, switch is faulty.
Motor - 1) With motor disassembled (field coil left in housing), check armature, case, brushes and springs, solder connections, and circuit breaker in the usual manner.
2) Check motor field as follows: Connect ohmmeter between relay switch yellow lead and field lead brush holder. No reading indicates open series field. Connect ohmmeter between yellow lead and motor black lead. No reading indicates open shunt field. Disconnect yellow lead from relay switch, be sure steel case and ground strap are not touching housing, and use a test light to check between yellow lead and field laminations. If lamp lights, field is grounded.

Motor Bench Test

To test motor operation on bench, make sure brass ground strap is connected to wiper housing, then proceed as follows: For "Low" speed, connect battery to No. 2 terminal, ground housing, and connect jumper wires from No. 1 & 3 terminals to ground. For "High" speed, disconnect No. 3 terminal jumper wire. To stop, disconnect both No. 1 & 3 jumper wires.



REMOVAL & INSTALLATION

Transmission

Remove arm and blade assemblies. Remove air intake grille and washer nozzles. Remove retaining clips holding crank arms to drive arms. Remove transmission attaching screws, and remove transmission. To install, reverse removal procedure.

Motor

NOTE - Motor may be mounted under air intake grille, on engine side of firewall at center, or at extreme left side of firewall where left fender meets the body. Remove air intake grille and left hood hinge if necessary. Remove hoses and wiring from motor, then disconnect motor crank from transmission arm (on some models connected on inside of car under dash, or under left kick pad). Remove motor attaching screws and remove motor and washer pump assembly. To install, reverse removal procedure.

WINDSHIELD WIPER WIRING TERMINALS

OVERHAUL

Motor

Disassembly - Remove through bolts and armature endplay adjusting screw. Strike case lightly to loosen from housing and motor field. Push against armature shaft through adjusting screw hole to back off case, use a suitable tool to hold brushes away from armature, then pull armature from case. Remove felt washer, thrust plate, and rubber thrust disc from case bearing. Remove thrust ball in armature shaft by dissolving retaining grease in solvent. Cut field leads extending through case, and at brush holder. Scribe mark housing and field, and carefully press field assembly from housing.

Reassembly - Splice field leads to housing and brush leads, align field assembly to housing, and press field into housing until field bottoms against machined ridge. Install thrust ball into armature shaft and retain with high melting point grease, then install rubber thrust disc, thrust plate, and felt washer. Hold armature in assembled position in case, then start armature worm shaft through field and housing assembly until shaft starts to mesh with worm gear. *NOTE - Rotate armature slightly if necessary.* Align case holes with housing holes, being careful not to pinch any wires, then push case on to field until case butts against housing. Install through bolts. Install armature endplay adjusting screw, tighten until finger tight, then back off 1/4-turn and tighten locknut.

Relay Control & Latch Mechanism

Disassembly - Disconnect gear box cover or washer pump from gear box. Disconnect coil spring, remove "E" ring, and lift latch and follower assembly from pivot pin and relay armature. Remove stop assembly retaining screw, move stop assembly to one side, and remove relay control assembly and unsolder leads.
Reassembly - Solder wiper leads to relay control switch, and relay coil lead to terminal board, then reverse disassembly procedure.

Drive Gear Mechanism

Disassembly - Remove crank arm retaining nut, crank arm, rubber seal, retaining ring, endplay washers, and shield and spacer washer. Remove gear box cover or washer pump, then disconnect coil spring, remove "E" ring, and lift latch and follower assembly from pivot pin and relay armature. Remove stop assembly retaining screw. Remove gear mechanism from gear box and slide spacer washer off eccentric shaft. Slide drive plate and shaft from gear assembly, remove lock and drive pawls, and remove coil spring.
Reassembly - Reverse disassembly procedure and adjust the number of endplay washers between seal cap and shield to obtain .006" (except Pontiac), .005" (Pontiac) gear assembly endplay.

1963 Wiper Specifications

Current Draw (No Load)	3-4.5 amps.
(Wet Windshield)	3.5-5 amps.
Blade Wipes Per Minute (Low Speed)	35-45
(High Speed)	70-85

WASHER

DESCRIPTION

Positive displacement, bellows type pump mounted on wiper gear box and controlled by a dash switch washer button.

OPERATION

When wiper operates normally, washer pump is held in idling position by a relay mechanism in washer assembly housing. When washer button on instrument panel is pushed, relay circuit is closed, actuating pump which starts to pump water. At same time, wiper dash control switch is automatically turned to "Low" position. *NOTE - If wiper was turned on before button pushed, wiper will continue to operate at speed originally selected.* Washer pump continues through one complete cycle (mechanically controlled), pumping a pre-determined amount of water on to windshield. At end of cycle, pump shuts off automatically. Wipers must then be turned off manually.

TESTING & TROUBLE SHOOTING

On Car

Washer Inoperative - 1) Check the following: Sufficient water solution in jar; hoses undamaged and connections tight; screen in jar cover hose not plugged; electrical connections tight; nozzle not plugged.

(Continued)

G.M. 2 & 3-SPEED WINDSHIELD WIPER & WASHER (Cont.)

2) If washer inoperative after items listed above are checked, start **wiper m tor only,** then push washer button and listen for "click" of washer relay. If no "click" heard, check for voltage at washer No. 2 terminal. No voltage indicates faulty wiring. If "click" is heard, proceed to **4)** below.

3) If voltage correct in **2)** above, connect a jumper wire from washer No. 1 terminal to ground and turn on wiper. If washer relay "clicks" and pump operates correctly, dash switch is faulty, or there is an open circuit between pump and switch. If no "click" heard, relay coil is open.

4) If relay "click" was heard in **2)** above, listen for soft clicking of pump ratchet wheel rotating. If soft click not heard, pump is faulty. If soft click is heard and pump does not operate, valve assembly is faulty. **Wash r Pumps C ntinu usly When Wiper Operate s** - Disconnect pump wiring. If pump stops, wiring or switch is faulty. If pump does not shut off, remove for "Off Car" checks (below).

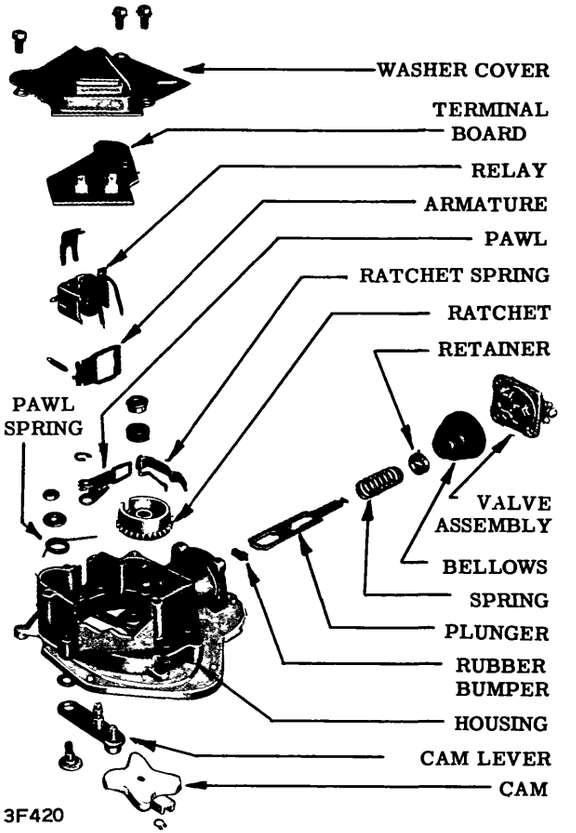
Off Car

Wash r In p rativ - Connect 12-volt battery to one washer terminal and ground other terminal. Manually rotate rotor cam and check if relay armature pulls in. If relay does not pull in, relay coil is open or solder connections are poor. If relay pulled in, manually rotate rotor cam counterclockwise (looking at motor) through complete cycle (360° or 21 teeth). At this point holding contacts should be opened by "hump" on wheel and pump plunger arm should be in lock-out position. Check for binds or any other type of malfunction.

Valve Assembly Checking - Attach a hose to intake (large) pipe. You should be able to blow through pipe, but not draw through it. Attach a hose to each exhaust (small) pipe. You should be able to draw through each pipe but not blow through them. If any valve allows air to pass in both directions, valve assembly is faulty.

OVERHAUL

Relay Terminal Board



Remove terminal board cover, slide spring clip from relay mounting stud, then rotate nylon rotor cam to free ratchet pawl from relay armature. Lift out terminal board. *NOTE - Save terminal insulator for reassembly.* To install, reverse removal procedure and manually rotate pump cam through a complete cycle (ratchet rotated 21 teeth) to check pump operation.

Valve Assembly

Remove screws holding valve assembly to housing and pry bellows lip out of valve body. Remove valve. To install, reverse removal procedure.

Bellows

Remove valve assembly. If pump in idling position, push relay armature toward relay coil so wire stop spring engages armature, then turn rotor cam until pumping action takes place. Bellows will now extend part way out of housing. Put a small block of wood between cam lever arm and housing. Push bottom of bellows in and turn bellows 90°. Bellows should be released from pumping arm. To install, reverse removal procedure.

WINDSHIELD WASHER ASSEMBLY (EXPLODED)

RAMBLER ELECTRIC WINDSHIELD WIPER

Rambl r, Exc pt Am rican (1963)

DESCRIPTION

Electrically operated windshield wiper controlled by a variable rheostat type switch on instrument panel, thus providing many wiper blade speeds. Drive is through a link and crank arm arrangement.

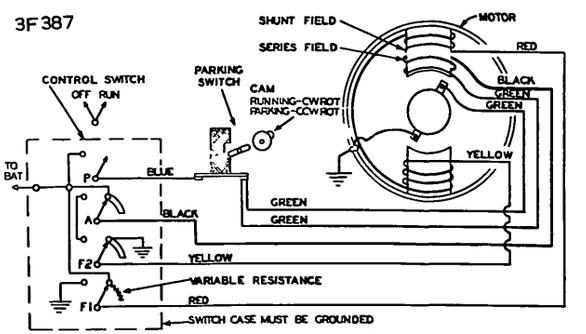
REMOVAL & INSTALLATION

Wip r Arm - Lift arm against spring tension and slide cap away from serrated pivot shaft with screwdriver. To install, reverse removal procedure and note that motor should be in park position and that right blade should rest above left blade.

Wip r M t r - Remove wiper arms and blades, and pivot shaft hexagon nuts, washers, and spacers. Remove cowl vent air intake cover-to-cowl top screws. Slide right side of cover forward to disengage spring clip, then lift cover off pivot shafts and remove. Slide link retainer clip off motor arm stud (accessible through cowl top opening). Disconnect control cable and wiring from motor. Remove motor attaching screws and remove motor.

Pivot Shaft & Link - Remove wiper arms and blades, and pivot shaft hexagon nuts, washers, and spacers. Remove cowl vent air intake cover-to-cowl top screws. Slide right side of cover forward to disengage spring clip, then lift cover off pivot shafts and remove. Slide link retainer clip off motor arm stud (accessible through cowl top opening). Remove pivot shaft attaching screws and remove pivot shaft and link assemblies as a unit.

ADJUSTMENT



Parking Angle & Position - Crank should park pointing inward 7½°±½° after passing a line parallel to motor centerline. Adjust by turning switch plate, then make final adjustment after installation by moving wiper arm at pivot as necessary, using a wet windshield.

SPECIFICATIONS

Fi ld C il Draw - 1.8-2.0 amps. at 12 volts & 70°F (shunt winding).

No Load Draw - 3.0 amps. max. at 14 volts & 70°F (full field).

Armature Endplay - .005" max. To adjust, turn screw at drive end of armature shaft. Replace screw if nylon lock is worn so screw will not h old setting.

RAMBLER ELECTRIC WINDSHIELD WIPERS WIRING DIAGRAM

CHRYSLER CORP. ELECTRIC WINDSHIELD WIPER

Chrysler & Imperial (1963)
Dodge & 880 (1963)
Plymouth (1963)
Valiant (1963)

DESCRIPTION

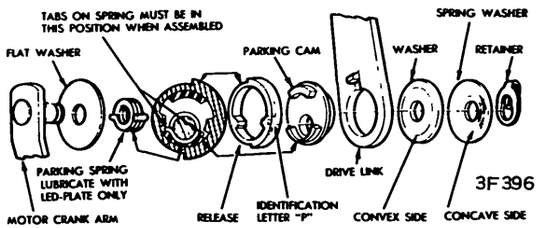
Single and variable speed types used. Circuit breaker is built into wiper switch on single speed type, and attached to "B" terminal of switch on variable speed type. Variable speed type has "Off Glass" parking feature accomplished by reversing of motor and use of parking cams at pivot pins of intermediate crank arm. Variable speed type also has bar resistance plate in wiper switch (rheostat type control) to provide many wiper speeds.

TROUBLE SHOOTING & DIAGNOSIS

Wiper Operates Slowly - Linkage binding. High resistance in motor or ground connection. Control switch faulty.
Wiper Inoperative - Linkage binding. Motor faulty. Control switch faulty. Wiring open or grounded.
Motor Will Not Park - Parking spring in parking switch plate bent too low and not breaking contact. Motor switch contact points dirty or worn.
Blades Will Not Park Properly - Link spring broken or not releasing. Link spring trip not engaging stop on linkage.
Blades Slap Windshield Mouldings - Wiper arm improperly adjusted. Motor lever or other drive parts loose.
Blades Chatter - Arm twisted (holds blade at wrong angle to glass). Wrong type blade used. Wax on glass.

TESTING

Wiper Switch (1-Speed)



Remove switch from instrument panel. Connect a test light between switch "B" terminal and battery negative post. Connect battery positive post to switch "P" terminal. Light should be lighted with switch in either "on" or "off" positions. If light does not light, circuit breaker is faulty. Now connect battery positive post to switch "R" terminal. Light should go on when switch turned "on" and go out when switch turned "off".

Wiper Switch (Variable Speed)

Remove switch from instrument panel. Connect battery positive post to switch case and to "F1" switch terminal. Connect a test lamp between battery negative post and switch "B" terminal. Lamp should light when switch turned "on" and gradually dim when switch rotated clockwise. Lamp should go out when switch turned "off".

Single - Speed Motor Bench Test

Connect battery negative terminal to motor ground strap, then connect black and blue wires to battery positive terminal. Motor should run. Remove black wire from battery (leave blue wire connected). Motor should park,

DART & VALIANT PARKING MECHANISM (OTHERS SIMILAR)

Variable Speed Motor Bench Test

1) Connect yellow wire to motor ground strap, then connect battery negative terminal to motor ground strap. Connect red and black wires to battery positive post. Motor should operate in wipe direction.
2) Connect yellow and blue wires to battery positive post, and connect red wire to ground strap. Connect battery negative post and ground strap. Momentarily touch black wire to yellow and blue wires. Motor should park.

ADJUSTMENT

Wiper Blade Park Position

Wiper blades should park in a ½ cycle of wiper motor operation. If blades do not park in ½ cycle, make one or more of the following corrections:
1) Motor Park Switch Adjustment - Adjust timing of motor park switch to provide motor shut-off at lowest point of wiper blade travel under both wet and dry glass conditions.
2) Wiper Pivot Adjustment - Loosen blade arms at pivots and place blades 1" above windshield moulding (single speed), against windshield moulding (variable speed), and tighten pivot attaching nuts.
3) Park Mechanism Assembly - Parking spring release and parking cam may be improperly assembled. It is possible to assemble these parts improperly and system will operate normally except for parking operation. Make sure parts are assembled correctly (see illustration).

Armature Endplay

Turn endplay adjusting screw in until it bottoms and back out ¼-turn.

REMOVAL & INSTALLATION

Wiper Motor

Chrysler & Dodge 880 - Remove glove box door and glove box. Disconnect motor bracket from cowl panel and from instrument panel brace. Disconnect wiring from motor. Disconnect links at pivot cranks (remove clips by lifting top tab and sliding sideways out of engagement with groove in pivot crank pin). Remove spacer washer and link from pivot crank. Slide motor and link assembly to left so right hand link clears glove box opening, then remove assembly. *Do not bend links.* To install, reverse removal procedure and adjust blades.
Imperial - Disconnect battery. Disconnect upper and lower mouldings at center of instrument panel and slip mouldings out from behind passenger assist handle. Loosen heater bezel-to-instrument cluster attaching screws (do not remove bezel). Remove speaker grille, and radio speaker and mounting plate. Remove glove box. Disconnect wiper links at pivots. Remove panel support bracket from wiper motor mounting bracket. Disconnect motor wiring, then disconnect motor bracket from cowl panel. Remove motor (with both links attached) out through glove box opening. To install, reverse removal procedure.
Dodge (Except 880 & Dart) & Plymouth - Remove radio speaker and grille (on padded dash models, remove padding to remove grille). Disconnect wiper motor bracket from cowl panel and instrument panel brace, then disconnect wiring. Disconnect links at pivot cranks (remove clips by lifting top tabs and sliding sideways out of engagement with groove in pivot crank pin). Tip motor and bracket on its side and remove left link. Remove right defroster tube, and pencil brace between instrument panel reinforcement and motor mounting. Remove motor and bracket through speaker opening. To install, reverse removal procedure.
Dart & Valiant - Disconnect wiper link at motor (note position of follower cam on variable speed type), then disconnect motor wires. Remove motor bracket-to-cowl panel attaching nuts and pull motor and bracket assembly down and out from beneath instrument panel. To install, reverse removal procedure.

OVERHAUL

Disassembly (1-Speed)

Disassemble wiper links from motor crank arm being careful to note exact position and sequence of all parts for correct reassembly. Remove switch plate, then remove motor crank nut, washers, and motor crank arm, being careful to note exact position and sequence of washers for reassembly. Remove nylon gear after noting it position. Remove endplate through bolts and remove endplate. Remove armature.

Disassembly (Variable Speed)

Remove switch plate and cover plate. Remove crank arm nut. washers, crank arm, and gear, and note exact position and location of parts for reassembly. Remove endplate through bolts and pull out endplate being careful not to break brush holder lead wire. Remove armature.

Inspection & Repair (All)

Clean, inspect, and test motor parts in the usual manner for electric motors. Commutator may be refaced and mica undercut in the usual manner if necessary.

Reassembly (All)

Reverse disassembly procedure and note the following: Be sure gear teeth are covered with long fibre grease. On single speed type, after armature, nylon gear and crank arm are installed, index contact plate on nylon gear with slot pointing in same direction as motor crank arm. On variable speed type, install contact follower with open cam pointing in same direction as motor crank arm. Reassemble wiper links in same order as they were originally assembled (see illustration).

FORD MOTOR CO. ELECTRIC WINDSHIELD WIPER

Ford Falcon, Fairlane, Galaxie (1963)
Mercury Comet, Meteor, Monterey (1963)
Ford & Econoline Trucks (1963)

►CHANGES, CAUTIONS, CORRECTIONS

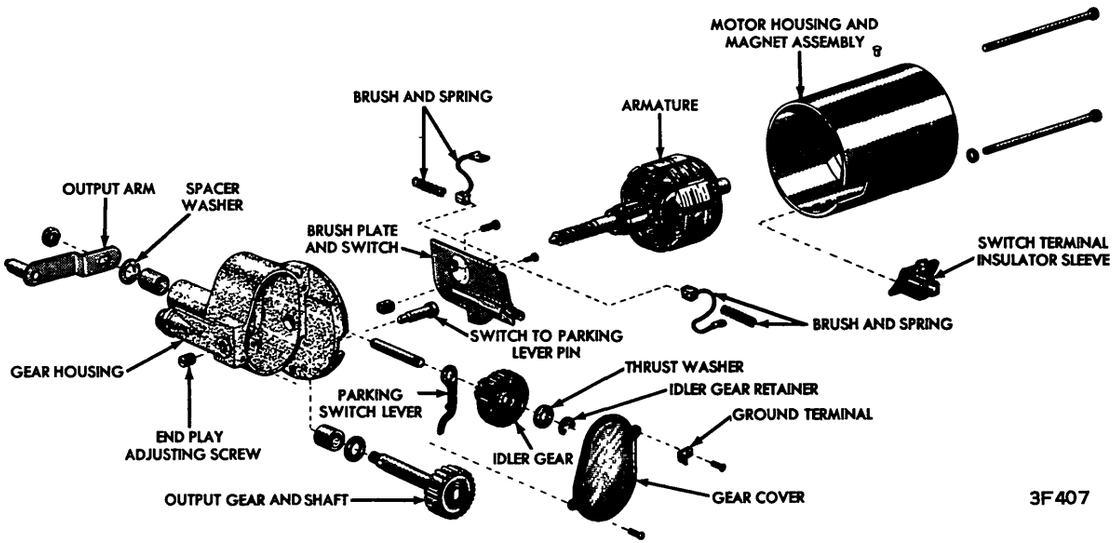
►*1963 COMET WIPER LINKAGE NOISE CORRECTION:* Make sure there is a spring washer, No. 374669-S2, installed between motor drive arm and swivel bearing end of right wiper mounting arm; between right wiper mounting arm and swivel bearing end of left wiper mounting arm.

►*1963 FALCON & COMET WIPER WILL NOT SHUT OFF OR PARK PROPERLY CORRECTION:* May be caused by control switch shaft binding on switch retaining nut. To correct, remove switch retaining nut and enlarge guide hole to ¼"; also remove burr at "D" hole in switch mounting bracket.

►*1963 COMET & FALCON 1-SPEED WIPER INTERMITTENT OPERATION CORRECTION:* On units **without** windshield washer, may be caused by improperly connected wiring. Inspect single wire connectors at firewall and make sure both white wires are connected together.

►*1963 2-SPEED WIPER JAMMED IN "PARK" CORRECTION & WIRING PRODUCTION CHANGE:* May be due to open in low speed (red wire) circuit; or faulty low speed position in control switch. To correct, install new nylon input gear, No. C2AZ-17A479-B, as it will have been damaged, then check wiring continuity and correct or replace control switch as necessary. Then cut green wire at motor connector and splice into red wire at same connector. *NOTE - This splice made in production on later cars and will make wipers inoperative if low speed (red wire) circuit is open, but will prevent jamming in "Park".*

►*1963 GALAXIE & MONTEREY WIPER FAILURE CORRECTION (1 OR 2-SPEED):* May be caused by water entering gear box or motor due to excessive wear on lip of wiper mounting bracket seal gasket. To correct, replace motor and install new gasket as follows: Insert gasket tangs into mounting bracket opening and snap into place. Apply Lubriplate generously to seal gasket cavity (side of seal facing motor housing) and install motor.



►*1963 1-SPEED WIPER MOTOR THUMPING NOISE CORRECTION:* Caused by excessive motor armature shaft endplay. To correct, install new type spring-loaded armature shaft setscrew, No. C3AZ-17A549-A, as detailed under "Single Speed Motor Reassembly" below.

DESCRIPTION

Single or two-speed electric type motors used to drive wiper arm and blade assemblies through link and crank arm arrangement. Design is similar to that used on previous models.

TROUBLE SHOOTING & DIAGNOSIS

Disconnect linkage at motor and make sure there is no bind or misalignment of linkage. Check all wiring for continuity in the usual manner and repair or replace parts as necessary.

SINGLE-SPEED WIPER MOTOR & GEAR ASSEMBLY (EXPLODED)

ADJUSTMENT

Wiper Blade Park Position

Install wiper arms on pivot shafts so blades lie flat against lower edge of windshield. On 1-speed type, park position adjustment is made during assembly after overhaul.

REMOVAL & INSTALLATION

Wiper Motor

On Galaxie & Monterey with Air Conditioning, remove glove box, radio and speaker, and speaker grille. Disconnect wiper drive links from wiper drive shaft, and disconnect wiring from motor. Remove motor attaching bolts and remove motor. To install, reverse removal procedure.

OVERHAUL

1-Speed Type

Disassembly - Remove ground terminal and gear cover, then remove idler gear retainer, thrust washer, and idler gear. Remove motor through bolts, motor housing, switch terminal insulator sleeve, and armature. *NOTE - Do not pound on motor housing magnet assembly or ceramic magnets will be damaged.* Remove armature endplay adjusting setscrew. Mark output arm in respect to output shaft for reassembly, then remove output arm retaining nut, flat washer, output gear and shaft assembly, thrust washer, and parking switch lever. Remove brushes and brush springs. Remove brush plate and switch assembly, then remove switch contact-to-parking lever pin from housing.

Cleaning & Inspection - Clean and dry all parts. Check armature electrically in the usual manner. Check thrust ball for pitting or discoloration due to high heat. Output gear must not be loose on output shaft, and cam surface should not be worn. If motor housing magnet assembly has cracked magnet, or if thrust button is hollowed out greater than 1/32" diameter, replace housing assembly. If brushes 5/16" long or less, replace them. Check brush plate assembly for cracks. Brush holders must be securely fastened to plate. Check contact points for burning or pitting. Replace all defective parts.

Reassembly - **1)** Install parking switch lever on idler gear shaft with cam rider pointing toward gear housing output shaft hole (lever must bottom against casting). Use a light film of Sun Prestige grease on output gear teeth and shaft bearing surface, install thrust washer on shaft, and insert shaft in bearing (parking switch lever must be clear of cam and gear assembly).

2) Install spacer washer on shaft, place output arm on shaft, aligning marks made at disassembly, then install mounting nut. Install brushes and springs in brush holder, hold brushes retracted, then push insulated brush connector on switch terminall Install switch contact-to-parking lever pin in gear housing, install brush plate assembly, and tighten mounting screws.

3) Adjust switch contact points by turning adjusting screw clockwise until inner points just open, then back off adjusting screw (counterclockwise) 1½-turns (parking lever must be riding on lower part of output gear cam). Insert .030" feeler gauge between center and outer contact points and bend outer arm as necessary for .030" gap.

4) Put grease on ball bearing in end of armature shaft, and install armature into housing and remove brush retracting wires. Install terminal insulating sleeve, motor housing and magnet assembly, and through bolts to gear box assembly. Put sealer at area where terminal insulator sleeve seats against motor and gear housings. Put grease on worm gear and idler gear, and install idler gear, thrust washer, and retainer.

5) On models without spring-loaded armature endplay adjusting screw, install screw and adjust armature endplay to .003". On models with spring-loaded adjust-

(Continued)

FORD MOTOR CO. ELECTRIC WINDSHIELD WIPER (C nt.)

ing screw, install screw as follows: Use Sun Prestige grease generously on end of setscrew, install locknut on setscrew and install setscrew into housing. Insert a .030" feeler gauge between setscrew and armature shaft end and tighten setscrew until spring-loaded pin just seats against feeler gauge, then continue to turn setscrew until pin is fully depressed in setscrew and setscrew just touches feeler gauge. *CAUTION - Do not force setscrew or pin may be damaged.* Tighten locknut to 15 inch-lbs. and remove feeler gauge. To check, hold worm gear and move armature shaft back and forth. Spring-loaded pin in setscrew should maintain pressure against shaft regardless of movement.

6) Generously grease end of armature shaft, install gear housing cover and ground terminal.

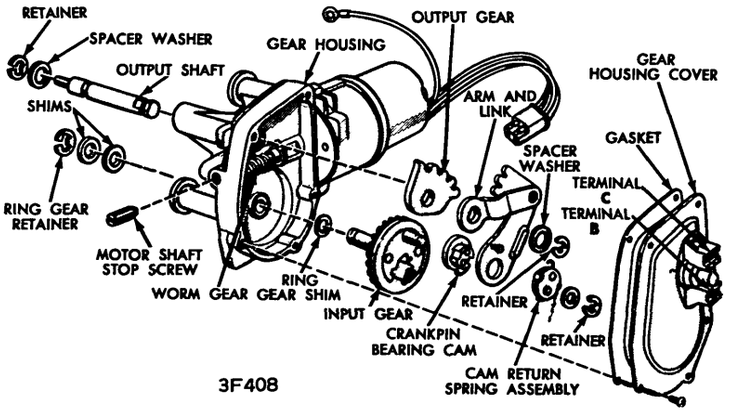
2-Speed Type

TESTING NOTE - To test unit operation on the bench, refer to illustration for test connections.

Disassembly - Remove gear housing cover plate and gasket. Remove output shaft retainer and spacer washer, then remove crankpin bearing retainer and remove spacer washer and cam return spring assembly. Remove arm and link assembly, and crankpin bearing cam. Remove input gear retainer and outer spacer shim, and remove input gear and inner spacer shim. Remove wiper arm lever nut and lockwasher. Remove wiper arm lever and spacer, and output shaft and gear assembly from housing. Tap output shaft out of gear with soft hammer if necessary. *NOTE - Do not disassemble motor.*

Reassembly - **1)** Make sure motor cover is fastened securely, then turn armature endplay adjusting screw so there is .000-.005" shaft endplay (measure with feeler gauge between adjusting screw and armature shaft). Install input gear shim on gear shaft and install in gear housing. Endplay should be .005-.010". To adjust, add or remove shims under input gear retainer, then install retainer. Install output gear on output shaft, making sure gear is bottomed on shaft.

2) Install output shaft and gear into housing with gear teeth facing motor. Install 1 spacer washer on outside end of output shaft, then install wiper arm lever with linkage studs facing away from and above shaft. Install lever lockwasher and nut. Install bearing cam on crankpin (small diameter part of cam facing out). Install arm and link assembly on bearing cam. When arm is placed on shaft, gears must be meshed and the link (riveted to arm) must be installed to output shaft at same time. Gear is properly indexed when bottom tooth of arm and gear segment mesh with bottom valley of output shaft gear.



3) Install output shaft spacer washer and retainer. Output shaft endplay should be .005-.010". To adjust, add or remove spacer washers under shaft retainer. Install cam return spring assembly. Install bearing spacer and retainer. *NOTE - If retainer cannot be installed, one or more coils of spring clutch are out of place.* If bearing has too much endplay on crankpin, projection of bearing may ride out of semi-circular slot in endplate. Add spacer washers under retainer if necessary.

4) Apply a generous amount of Sun Prestige No. 41 grease to all moving parts, and install gear housing cover plate. Test motor operation on bench (see illustration for connections). *CAUTION - When testing motor on bench, do not get fingers between wiper lever and case, or inside the gear housing.*

TESTING CONNECTIONS

TWO-SPEED WIPER GEAR BOX ASSEMBLY (EXPLODED)

LINCOLN & THUNDERBIRD HYDRAULIC WINDSHIELD WIPER

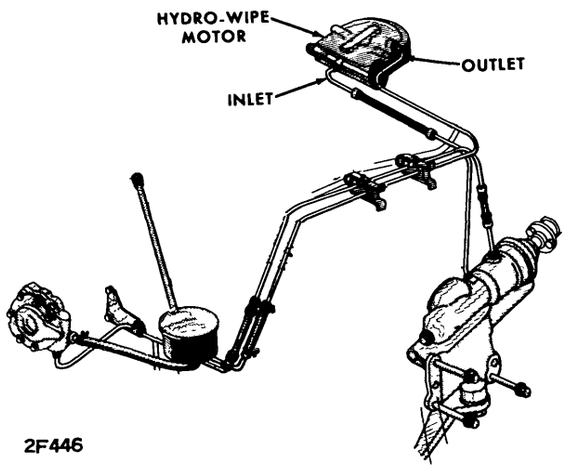
Ford Thunderbird (1963)
Lincoln Continental (1963)

DESCRIPTION

Wipers - Windshield wiper motor hydraulically operated by power steering return line fluid. A pressure regulator valve integral with wiper motor controls wiper speed. Wiper arms are link driven in tandem from an auxiliary drive assembly above wiper motor through a pivot assembly for each wiper arm and blade assembly.

Washer - An electric pump with a reservoir is mounted on fender apron and controlled by washer switch mounted on windshield wiper control on instrument panel.

OPERATION



Wipers - When not in operation some hydraulic fluid is directed to wiper motor to be available to operate hydrostatic coupler in regulator valve when wipers turned on. Rest of fluid bypasses wiper motor and returns to power steering pump reservoir. When wipers turned on, control cable from instrument panel control opens throttle valve in wiper motor allowing control fluid to operate hydrostatic coupler in pressure regulator valve. Coupler decreases bypass port opening in regulator valve and allows greater fluid pressure to flow to wiper motor. Wiper motor then drives wiper arms. The construction of the regulator valve allows throttle valve to control wiper motor speed.

Washer - When washer button is pressed, electric pump is energized and pumps fluid from reservoir through the pump to the washer nozzles and against windshield. At the same time washer button is pressed, engine vacuum through washer switch actuates wiper motor throttle valve to start wiper operation. Pump will continue to pump fluid against windshield until washer button released. After washer button released, windshield wipers will continue to operate at medium speed for eight cycles until vacuum is bled from wiper vacuum control line at washer control valve. An adjusting screw at washer control valve regulates number of cycles wiper will operate after washer button released.

TROUBLE SHOOTING

If power steering pump is operating properly but wipers do not, check control cable for proper operation and wiper arms for binding. Check for dirt in control valve (remove and clean as necessary). If these items operate correctly, but wiper still does not, replace pressure regulator and motor assembly.

(Continued)

LINCOLN CONTINENTAL & THUNDERBIRD HYDRAULIC CONTROL WINDSHIELD WIPER

LINCOLN & THUNDERBIRD HYDRAULIC WINDSHIELD WIPER (C nt.)

REMOVAL & INSTALLATION

Thunderbird

Wiper M t r - Remove radio speaker and grille. Disconnect antenna at radio. Remove wiper arm and blade assemblies, pivot shaft nuts, and bezels. Remove cowl top panel with antenna. Disconnect both pivot shaft links at wiper motor, and remove carburetor air cleaner. Disconnect inlet line at wiper motor, then remove fitting from motor. Remove inlet line seal plate and seal from dash panel. Disconnect motor from mounting bracket, disconnect outlet line and control cable from motor, then remove motor. To install, reverse removal procedure.

Lincoln Continental

Pivot Shaft & Housing - Remove wiper arms and blades and cowl top ventilation grille and screen. On right side, disconnect drive arm from pivot shaft. On left side, disconnect drive arm from pivot shaft and from auxiliary drive. Remove pivot shaft retaining screws and nuts and remove pivot shaft and housing. To install, reverse removal procedure.

Wiper Motor - Remove washer coordinator hose, and oil return, feed, and control lines from motor. Disconnect control cable at motor. Disconnect motor from auxiliary drive and remove motor. To install, reverse removal procedure *and bleed power steering lines.*

Auxiliary Drive - Remove wiper arms and blades, ventilation grille and screen, and both washer nozzles. Disconnect pivot shaft drive arm from auxiliary drive. Remove attaching screws and remove auxiliary drive assembly. To install, reverse removal procedure.

ADJUSTMENT

Control Cable

Adjust control cable so control knob on instrument panel moves valve control lever on motor from off to full on.

STUDEBAKER ELECTRIC WINDSHIELD WIPER

Stud bak r, All M dels (1963)

►CHANGES, CAUTIONS, CORRECTIONS

►*1963 AVANTI WIPER FAILURE TO RETURN TO PARK POSITION CORRECTION:* May be caused by wiper switch not properly grounded. To correct, remove switch knob and escutcheon and make sure that raised nibs in instrument panel face are not covered by applique material.

►*1963 AVANTI ABNORMAL WIPER DRIVE ROUGHNESS, BLADE OVERTRAVEL, LOCKING, OR FIBREGLASS PANEL FAILURE AT RIGHT DRIVER MOUNT CORRECTION: May be due to improper location of wiper motor in relation to right driver. This dimension is extremely important. See "Driver & Control Arm Installation" and "Wiper Motor Installation" below.*

DESCRIPTION

Two-speed electric type windshield wiper with drive to wiper blades through link and crank arm arrangement.

ADJUSTMENT

Wiper Blade Park P sition

If wiper blades do not park correctly at end of stroke, adjust contact plate on motor drive assembly (or lever on plate) to left or right as necessary.

Wiper Arm Tension

Hook a spring scale under wiper arm at point where connected to blade. Pull away from windshield at right angle until blade is just off glass. Jiggle wiper arm with free hand until arm reaches free rest position. Scale reading should be 7½-8½ ozs. If below 7½ ozs., oil tension spring and arm pivot rivet. If tension does not increase, replace arm. If reading above 8½ ozs., bend outer section of arm slightly. If correct pressure cannot be obtained by bending, replace arm.

TESTING

Wiper blade speed should be 80-90 sweeps per minute (low speed), 132-135 sweeps per minute (high speed) on wet windshield (or with paper boot on blade). If wiper speed slow, check for fully charged battery and good electrical connection. Wiper arm tension may be too high (see "Adjustment" above). Links and drivers may be binding. If speed not within limits with main link disconnected from motor, motor is faulty.

TROUBLE SHOOTING

Wipers Inoperative - Loose connections, incorrect wiring at control switch, faulty control switch. Linkage misaligned or binding. Wiring between motor switch plate and control switch open or grounded.

Wiper Operates Sluggishly - High resistance in motor. Linkage misaligned or binding. Wiring connections faulty.

Wiper Does Not Park Properly - Motor switch plate improperly adjusted. Control switch wiring incorrectly installed. Motor switch plate contacts pitted or corroded.

Blades Slap Moulding & Park High on Glass - Spring trip assembled incorrectly.

REMOVAL & INSTALLATION

Wiper Motor

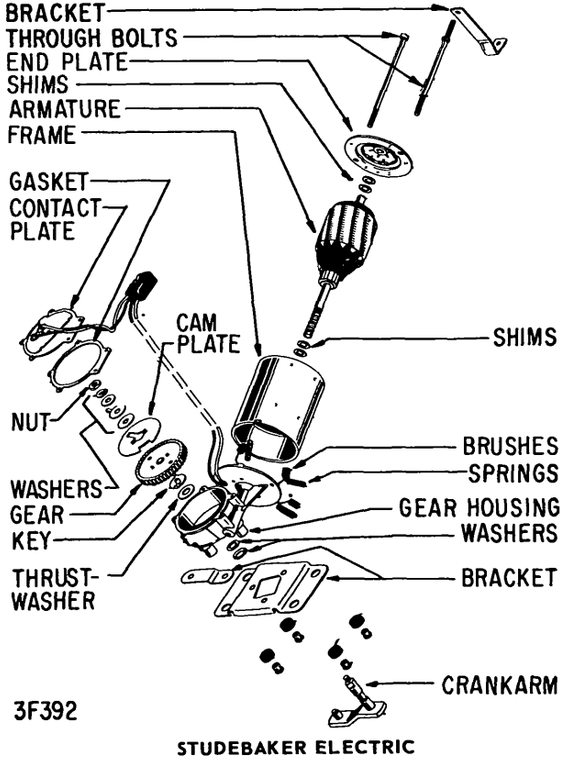
Lark, Cruiser, Hawk - Removal - Remove air intake grille from cowl air intake chamber. Disconnect motor wiring at connector, then remove motor retaining bolts and support bracket. Disconnect motor lever pivot from drive arm and remove motor.

Installation - Reverse removal procedure.

Avanti - Removal - Disconnect wiring from motor at connector. Disconnect crank arm from motor shaft, remove motor retaining bolts and remove motor.

Installation - *CAUTION - Location of motor in relation to right driver must be measured and adjusted accurately for proper wiper operation.* Reverse removal procedure and tighten motor attaching bolts loosely. Using a tram gauge, measure the true straight-line distance from center of right wiper drive shaft (arm and blade assembly removed) to the depression in center of motor gear box. This distance must be 18 1/32" to 18 5/32". *CAUTION - This distance must be accurate and measured correctly.* Move motor as necessary and tighten attaching bolts securely. *NOTE - It may be necessary to elongate mounting screw holes in dash panel and also dash panel center hole.*

Driver & Connecting Arm



Lark, Cruiser, Hawk - Remove arm and blade assemblies and air intake grille panel. Disconnect left driver link from right driver arm. Disconnect right driver link from motor shaft crank arm. Remove driver shaft retaining nut, metal washer, and seal washer. Remove driver. To install, reverse removal procedure.

Avanti - Removal - With wiper in park position, remove arm and blade assemblies. Remove driver shaft retaining nuts, washers, and sealer gaskets. Disconnect crank arm from motor drive shaft, then remove drivers and connecting arms.

Installation - Reverse removal procedure, making absolutely certain that the distance between centers of each driver shaft is 20 47/64".

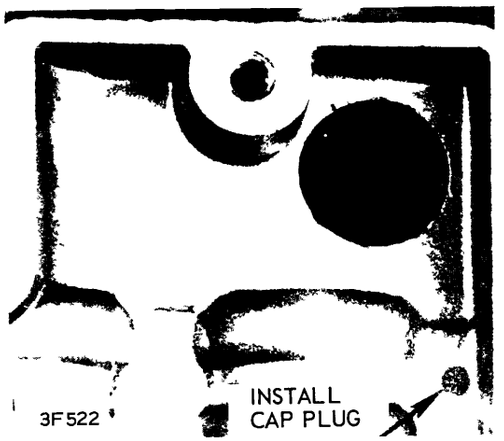
Motor Crank Arm

When assembling motor crank arm and drive arm together, "L" on trip lever must face upward.

STUDEBAKER ELECTRIC WINDSHIELD WIPER MOTOR & DRIVE ASSEMBLY

AMERICAN MOTORS

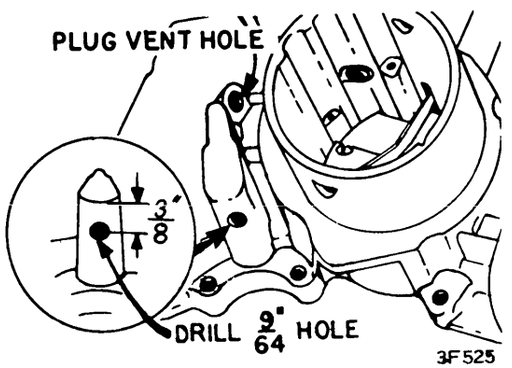
Rambler



►*1962-63 RAMBLER SIX & V8 AUTOMATIC TRANSMISSION REAR BAND ADJUSTMENT SPECIFICATION CHANGE:* Loosen locknut on right hand side of transmission case and install Adapter J-21111 on adjusting screw, then tighten adjusting screw to 10 ft lbs (all models) *NOTE - This supersedes previous specification of 7 ft lbs (6 Cyl), 9 ft lbs (V8)* Back off screw ¾ turn (6 Cyl), 1½ turns (V8) and tighten locknut to 30 ft lbs

►*1950-55 10 SERIES & 1958-63 AMERICAN FRONT SPRING SPACER (TO CORRECT LEANING):* An aluminum front spring spacer, Part No 3204474, is available for installation on front spring seat to assist in leveling the car Install spacer on spring seat with cushion and spring resting on spacer One ¼" spacer will raise affected corner approximately 3/8" and two spacers will raise corner about ¾" *NOTE - If two spacers are required on a spring, place one spacer on upper spring seat and the other on lower spring seat*

►*1962 AMERICAN "E-STICK" CLUTCH CHATTER CORRECTION:* The clutch chatter condition which is apparent upon initial engagement can be corrected by installing a new clutch driven plate Part No 3167005 When this new plate is used to replace the original equipment plate, Part No 3163651, the servo check valve (see illustration on Page 334 of 1962 Final Data) must be removed from front part of servo



►*1962 RAMBLER AMERICAN & SERIES 10 CAST IRON ENGINE OIL PAN LEAKAGE CORRECTION* On early engines not having the revised oil pan (identified by a daub of red paint located below the seal area at rear of oil pan), the ends of the oil pan (cork) gasket may not contact rear main bearing cap side seals, resulting in oil seepage past the gasket and side seals It is recommended that a bead of Permatex No 1 be applied the width of main bearing cap at corner areas of pan gasket surface of cylinder block and rear main bearing cap *NOTE - Do not cement rear seal to oil pan as seal will not properly compress during installation of pan*

►*1962-63 AMERICAN & SERIES 10 AUTOMATIC TRANSMISSION LOSS OF DRIVE WHILE IN GEAR CORRECTION:* This condition which may occur after the front pump suction pipe and 'O' ring have been replaced can be corrected by installing a special cup plug Part No 3204940 in the valve body "converter out" check ball passage lower relief hole Remove oil pan and front oil screen, then start the cap plug in ball check passage lower relief hole (see illustration), using a 3/32" pin punch Tap plug flush using a 3/16" punch Stake plug in position with a center punch *NOTE - If hole is partially covered due to casting variations, it will be necessary to remove and disassemble the valve body to the extent of removing the separator plate Remove converter check ball and spring and install the plug from ball and spring side (not necessary to stake in place)*

CHECK BALL PASSAGE RELIEF HOLE REWORK (1962-63 RAMBLER AMERICAN & SERIES 10)

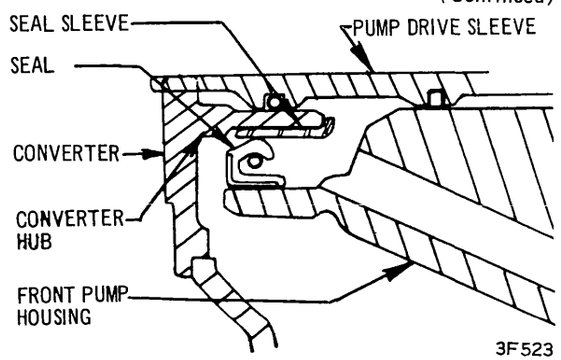
►*1963 RAMBLER AMERICAN & SERIES 10 (WITH HOLLEY 1909 CARBS) ENGINE ROUGH IDLE, DYING, & SURGE AT LOW SPEED CORRECTION.* These conditions may be caused by dirt entering carburetor through the bowl vent To correct, install Kit, Part No 3205160 as follows With carburetor on engine remove bowl cover and clean foreign material from fuel bowl Clean idle feed restriction by inserting a 028" drill, then blow out passage with air Drill a 9/64" hole in accelerator pump tower (see illustration) and remove all drill chips Insert a plug into original bowl vent passage from inside, then install new fuel inlet fitting and screen assembly Check dry float setting then assemble carburetor and install air cleaner

HOLLEY MODEL 1909 CARBURETOR REWORK

CHRYSLER CORP.

Chrysler & Imperial
Dodge, Dart & Lancer
Plymouth & Valiant

►*1960-62 6 CYL ENGINE DISTRIBUTOR REMOVAL (IF SEIZED IN BLOCK).* If distributor cannot be easily removed by normal methods, apply a good manifold heat control valve solvent to penetrate corrosion If this procedure does not loosen distributor, chill distributor body with carbon dioxide from a fire extinguisher When installing distributor, install "O" ring, Part No 2095740 at top of distributor body pilot if not already present Coat body pilot with lubricant



►*1960-63 6 CYL ENGINE OIL PRESSURE RELIEF VALVE NOTE (CARS USED FOR HEAVY SERVICE - POLICE, FLEET & TAXICAB).* It is recommended that the oil pump relief plunger be removed and cleaned once a year just prior to cold weather Remove oil pressure relief valve plug and lift out spring and plunger, then use a suitable carburetor cleaner to remove all residue and varnish Remove scratches, nicks, burrs, and polish plunger with crocus cloth Start engine after installation and check for leakage

►*1962 DART & VALIANT REAR AXLE ADJUSTMENT PROCEDURE CHANGE* *See "Dart & Valiant Hypoid" on Page 351*

►*1962 (EXCEPT DART & VALIANT) AXLE SHAFT BEARING SEAL REPLACEMENT NOTE* *See "Chrysler Corp (Except Dart & Valiant Hypoid) on Page 349*

►*1954-60 POWERFLITE & 1957-61 TORQUEFLITE CONVERTER HUB DAMAGE NOTE* A new Sleeve & Seal Package, Part No 2421277 is available for field installation to avoid replacement of torque converter, if torque converter hub only has become damaged To install the new parts, proceed as follows Clean torque converter hub then coat outer diameter of hub with MoPar "Perfect Seal" Part No 1057794 Start seal

(Continued)

POWERFLITE & TORQUEFLITE TRANSMISSION CONVERTER HUB SLEEVE & SEAL REPLACEMENT

Latest Changes & Recommended Corrections

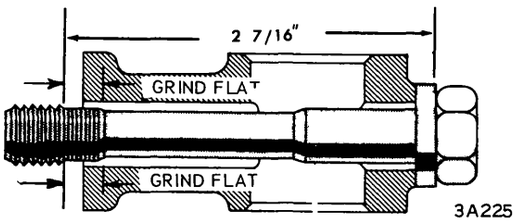
FOR PREVIOUS MODELS & 1963 MODELS

CHRYSLER CORP. (C nt.)

sleeve onto hub by hand and use a suitable driver (flat surface against sleeve end) and drive sleeve onto hub until curled end of sleeve bottoms against end of torque converter hub Wipe off all sealing compound and wash sleeve with solvent Remove old seal from transmission front pump housing and apply a very thin coat of "Perfect Seal" to outer 38" of housing bore Drive new front pump seal into housing with a suitable tool (C-3278) until seal is flush with front edge of housing *CAUTION - The new seal and sleeve are designed to be used together Do not use one part without th other*

► *1963 DODGE, DART, PLYMOUTH & VALIANT "GROANING" WHILE DEPRESSING THE CLUTCH (SYNCHRO-MESH TRANSMISSION) CORRECTION.* This condition is caused by interference at corners of clutch release fork To correct, grind off corners of the "L" shaped clutch fork pivot at point of interference

► *1960-62 DODGE, LANCER, PLYMOUTH & VALIANT 6 CYL ENGINE HARD STARTING (DURING WET WEATHER) CORRECTION* A new distributor cap, Part No 2448273 (includes rotor and spark plug cables) has been released for service replacement to correct the above condition The new cap has wider inserts, revised tower heights and the new rotor has been redesigned



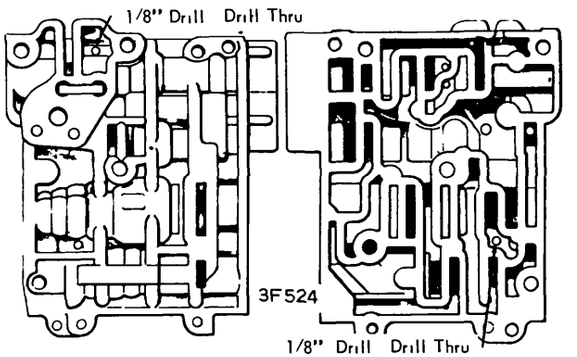
► *1960-62 DODGE, LANCER, PLYMOUTH & VALIANT 6 CYL ENG SPARK PLUG FOULING CORRECTION:* Install Champion N14Y spark plugs which have a more compatible heat range for normal engine operation *NOTE - Use spark plug gaskets in addition to the aluminum tubes Install new tube seals, Part No 1947708, each time spark plugs are removed*

FORD MOTOR CO.

Comet, Falcon, Fairlane
Galaxie, Monterey, Meteor
Lincoln, Thunderbird

► *1960-62 FORD, MERCURY, COMET & FALCON EXCESSIVE TEMPERATURE INDICATED ON INSTRUMENT PANEL GAUGE CORRECTION·* This may be due to an incorrect temperature sensing device in engine cylinder head The correct unit is identified by the numeral "250" stamped on hexagon wrench fitting

► *1960-61 COMET & FALCON ROCKER ARM SHAFT NOISE CORRECTION & PRODUCTION CHANGE.* Remove No 6 (rear) rocker arm support bolt and grind a flat to root diameter of bolt threads (see illustration) on opposite side of bolt, then clean all metal particles from bolt Centers of flat surfaces on bolt must be 180° apart *NOTE - Cars built after Feb 28, 1961 (Comet), May 1, 1961 (Falcon) have a revised rear rocker arm support and it is not necessary to rework support bolt as indicated above* Remove left rear cylinder head bolt then crank engine (do not start) for 30 seconds or until normal oil flow is noted from head bolt hole **If normal oil flow is obtained,** install a newly designed left rear cylinder head bolt, Part No C1GY-6065-A and tighten bolt to 75 ft lbs (do not tighten remainder of cylinder head bolts) Install reworked support bolt and tighten reworked bolt and remaining rocker shaft support bolts to 30-35 ft lbs Adjust valve lash and make sure there is adequate lubrication to entire rocker shaft assembly **If normal oil flow was not obtained** from head bolt hole (when engine was cranked), remove cylinder head, then insert a cleaning rod (use 1/8" welding rod of suitable length) into oil outlet at top face of block, down through hole in camshaft rear bearing, and into camshaft groove Turn engine over with starter for several seconds, then remove rod and continue cranking engine until oil flows from outlet hole in top of block Remove oil pressure sending unit and blow out the oil passage Install sending unit, using sealing compound Reinstall cylinder head, using a newly designed bolt, Part No C1GY-6065-A in left rear bolt hole only Disassemble rocker arm assembly and replace any parts that show wear and galling, then assemble rocker arm and shaft assembly and tighten support bolts to 30-35 ft lbs *NOTE - If available, install a complete rocker arm support, Part No C1DE-6531-A in place of reworking the No 6 rocker arm support bolt as outlined above*



COMET & FALCON
ROCKER ARM SHAFT SUPPORT BOLT REWORK

► *1960-62 FORD MOTOR 144" & 170" ENG & 1961-62 FORD MOTOR 223" & 262" 6 CYL ENG LOSS OF OIL PRESSURE CORRECTION·* Distributor shaft socket and oil pump intermediate shaft may be worn sufficiently to prevent positive engagement of drive surfaces Correct by installing new type distributor shaft and intermediate shaft *NOTE - The above correction for the 223" & 262" Eng applies only to engines equipped with rotor type oil pump*

► *1960-62 144" & 170" ENGINE OIL PUMP DRIVE FAILURE CORRECTION* On engines built before May 28, 1962, if oil pump drive failures are encountered install a new distributor shaft, Part No C2DZ-12175-B, which is longer The new shaft also has the hex hole drilled deeper and is cross drilled at the annular groove for lubrication of oil pump intermediate shaft A new oil pump intermediate shaft (C0DZ-6A618-A, 1960 models), or C1DE-6A618-A 1961-62 models) should also be installed *NOTE - Before installing the oil pump on 1961-62 engines, insp ct pump for missing or improperly installed rotor bore cup plug (which could permit intermediate shaft to drop lower than normal operating position and result in partial engagement) To check, note length of wear pattern on old intermediate shaft If pattern is less than 5/16", install a new oil pump drive rotor and shaft assembly* Lubricate intermediate shaft hex socket with a small amount of rear axle lubricant

► *1961 TO EARLY 1963 AUTOMATIC TRANSMISSION (3-SPEED) HARSH REVERSE ENGAGEMENT CORRECTION & MAIN VALVE BODY PRODUCTION CHANGE.* On cars built before Feb 1, 1963 (see table below for transmission models), a kit is available to rework the main control valve assembly to correct the above condition Later cars have been changed in production In addition to installing the parts included in the kit, it is necessary to drill two holes in upper valve body (see illustrations below) Remove upper valve body from lower body assembly, then remove and discard control valve body separator plate, throttle valve body, throttle valve body separator plate and the three throttle valve body to upper valve body screws Completely disassemble upper valve body, then drill two 1/8' holes as shown in illustration *NOTE - Do not center punch to start hole Start hole by turning drill by hand* Clean all chips and burrs from valve body Install new throttle valve and throttle valve retainer (plug) Assemble throttle valve body to upper valve using the new separator plate and screws Assemble upper valve body, then assemble upper valve body to lower valve body using a new separator plate

1961-63 AUTOMATIC TRANSMISSION (3 SPEED)
MAIN VALVE BODY REWORK

Kit Part No.	Year	Transmission M d l

► *1962 FAIRLANE & METEOR FRONT WHEEL ALIGNMENT SPECIFICATION CHANGE* Adjust front wheel alignment to specifications shown for 1963 models

See Page 374

►*1962 THUNDERBIRD (WITH TRIPLE CARBURETORS) 3-SPEED AUTOMATIC TRANSMISSION HARSH UPSHIFT CORRECTION.* This condition can be improved by installing Kit Part No C3SZ-7D245 (includes shift valve spring, inner and outer compensator valve springs and a governor body assembly) All parts must be installed together *CAUTION - Do not install this kit on cars used for drag racing, or premature failure will occur*

►*1963 "PCE" 3-SPEED AUTOMATIC TRANSMISSION (EXC 390" ENGINES WITH TRIPLE CARBS & POLICE INTERCEPTOR) HARSH 1-2 UPSHIFT CORRECTION* In addition to installing a new type 1-2 shift valve spring (as shown on 1963 Ford Motor Co 3-Speed Automatic Transmission pages), greater improvement can be made by installing a new main control valve assembly, Part No C3SZ-7A100-D *NOTE - This new control valve assembly can also be installed on 1962 Thunderbird 390" Engs with 4-Bbl Carbs, however, the original 1962 manual valve must be installed in the new control valve assembly*

GENERAL MOTORS

Buick

►*1961-62 BUICK SPECIAL FRONT SUSPENSION LOWER BALL JOINT REPLACEMENT* Earlier 'threaded" type ball joints can be replaced by the later "pressed-in" type ball joints *See "Buick Special & Oldsmobile F-85 Front Suspension" on Page 385*

►*1962 BUICK SPECIAL V6 & V8 ENGINE VALVE TIMING NOTE* - Refer to illustrations on 1963 Buick Car Pages for correct location of 1962 timing marks

►*1962 BUICK SPECIAL PROPELLER SHAFT CONSTANT VELOCITY JOINT BALL SEAT "UNSEATING" CORRECTION (4-SPEED SYNCHRO-MESH TRANSMISSION CARS)* This condition which may occur under sudden high torque application can be corrected by installing Repair Kits 5678340 and 5677032

►*LATE 1962 & EARLY 1963 BUICK SPECIAL 4-SPEED SYNCHRO-MESH TRANSMISSION OUTPUT SHAFT COMPANION FLANGE REMOVAL & INSTALLATION CAUTION:* A thin flat washer, which may be found between output shaft and companion flange dust seal on some cars, MUST be reinstalled before companion flange is reinstalled Failure to reinstall this washer on cars so equipped will cause distortion of companion flange and interference with extension case bushing

Cadillac

►*LATE 1962 & ALL 1963 CADILLAC CARTER CARBURETOR INSTALLATION CAUTION & FAILURE OF ENGINE TO IDLE NOTE:* Two 1/8" diameter holes holes (idle spoil ports) have been drilled through carburetor flange into idle system on some 1962 cars and all 1963 cars to prevent engine idling if stainless steel shim is omitted between carburetor and intake manifold Failure to install this shim will result in damage to carburetor because of exhaust gas corrosion Failure to idle properly indicates shim not installed

Chevrolet

►*1961-62 CHEVY II & CHEVROLET PASS CAR REAR AXLE SHAFT BEARING & SEAL REPLACEMENT PROCEDURE CHANGE: Use the procedure outlined for 1963 models* *See Page 359*

►*1962 CHEVROLET 409" V8 ENGINE NCTE:* All procedures and specifications for the 1963 409" Engine apply to the 1962 model *See "Chevrolet V8" in this edition*

►*1955 & LATER CHEVROLET 235" & 261" 6 CYL ENGINE REAR BEARING SEAL REPLACEMENT:* A new lip-type synthetic rubber seal molded over a steel core, replaces the former wick-type seal To install, remove old seal and clean out grooves Remove any imperfections on crankshaft sealing area with crocus cloth or a fine stone Dip seals in engine oil, then insert upper seal in engine block, with lip of seal toward front of engine and rotate seal into groove (similar to main bearing installation) Install lower seal in bearing cap with lip of seal to front of engine

Pontiac

►*1962 3-SPEED (4-STAGE) HYDRA-MATIC GOVERNOR PRODUCTION CHANGE* Later production transmissions have been equipped with a cast iron governor assembly to eliminate governor ring wear Dimensional changes make it necessary that care be taken when assembling rear bearing retainer over governor assembly to prevent breaking a governor ring Position governor ring hook ends in a straight line so they can be observed as they are pushed down in ring groove Make sure they do not become unhooked or broken A gasket is not required when installing a cast iron governor on current or past model transmissions

►*1962 PONTIAC "PA' MODEL TRANSMISSION GOVERNOR REPLACEMENT NOTE* A new governor assembly, Part No 8622645 should be used for replacement to assist in eliminating the possibility of not obtaining a full throttle 3-4 Upshift

►*1961-62 PONTIAC 4-SPEED SYNCHRO-MESH GEAR REPLACEMENT CAUTION* Two ratios were used in production requiring the use of different replacement gear packages For identification, count the number of teeth on 1st speed gear of counter gear assembly 2 54 ratio 1st gear has 30 teeth on counter gear, and the 2 20 ratio has 28 teeth on counter gear *DO NOT interchange parts*

►*1962 PONTIAC (EXC TEMPEST) AUTOMATIC TRANSMISSION REFILL NOTE:* Transmission refill capacities have been revised and are now the same as for 1963 models *See "Automatic Transmission Servicing" in this edition*

►*1961-63 PONTIAC TEMPEST FRONT TIRE RUBBING (ON TURNS) CORRECTION* To correct, drive a Wheel Stop Sleeve, Part No 9770659 on forward ends of right and left hand lower control arm strut

KAISER JEEP CORP.

►*1963 & EARLIER JEEP OHC 6 CYL ENG OIL FILTER LEAKAGE CORRECTION* If leakage is caused by improper seating of filter on mounting pad, check for interference between filter base and raised portion of cylinder block at oil filter location If necessary, grind off enough material to allow proper seating of filter *DO NOT grind off an excessive amount of material*

►*1963 & EARLIER JEEP OHC 6 CYL ENG ROCKER ARM COVER & GUIDE INSTALLATION NOTE. Previous installation procedures are superseded by the following*

Rocker Arm Guide - When installing rocker arm guide make sure that all rocker arms are aligned correctly and that all tabs of guide fit into rocker arm cavities This will prevent misalignment of rocker arm and forcing of guide through rocker arm cover

Rocker Arm Cover - Oil seal washers must have minimum thickness of 222" Replace if necessary Make sure rocker arm cover distortion at bottom edge does not exceed 020" at any point Install gasket into cover **without sealer,** install oil seal washers on cover studs, then place cover in position Install a flat washer on rear stud, and spark plug cable brackets on front three studs (flat washers not necessary) Install crown nuts and tighten to 6-8 ft lbs *NOTE - Correct torque of crown nuts is important to prevent distortion and oil leaks*

STUDEBAKER CORP.

Studebaker

►*1961-63 STUDEBAKER AUTOMATIC TRANSMISSION (EXCEPT M-35) DELAYED REVERSE OPERATION CORRECTION:* This condition which may occur when manual selector lever is moved from "D" or "L" to "R" with engine at idle and with transmission at normal operating temperature, may be caused by sticking front clutch friction discs To determine if this is the cause, adjust transmission pressure to correct specifications and make sure fluid level is as specified then proceed as follows When selector lever is moved from "P" or "N" to "R", no abnormal delay in reverse should be noted When selector lever is moved between "D", "L" and "R", engine idle speed will remain the same, even during delay reverse period Move selector lever from "D" or "L" to "N" A gear whine of a few seconds may be heard If the above conditions exist and there is an abnormal delay in reverse, replace front clutch friction discs with new friction discs, Part No 1542734

►*1961-62 6 CYL ENGINE BURNED EXHAUST VALVE REPLACEMENT NOTE* Whenever one or more burned exhaust valves are found, replace ALL exhaust valves with heavy duty type, Part No 1552346

① - When installing on air conditioned cars, install Unitized Package, Carter No 202-44U

② - Replaces Carburetor Nos 2333S, SA, 2334S, SA

③ - Replaces Carburetor Nos 2543S, 2544S

④ - Replaces Carburetor Nos 2372S, 2373S When used on air conditioned cars (front carb), install Unitized Package, Carter No 202-100U

⑤ - Replaces Carburetor Nos 2583S, 2584S When used on air conditioned cars (front carb), install Unitized Package, Carter No 202-111U

⑥ - Replaces Carburetor Nos 2691S, 2692S When used on air conditioned cars (front carb), install Unitized Package, Carter No 202-111U

⑦ - Both Carter & Rochester Carburetors used on 1957-58 cars with single carburetor after 1957 Eng No 101833

⑧- When used on air conditioned cars, install Unitized Package, Carter No 202-114U

►CHANGES, CAUTIONS, CORRECTIONS

►*1955 CARTER & ROCHESTER CARBURETOR PRODUCTION CHANGE.* "Later" 1955 carburetors listed above were used after approximately the first 3000 cars These carburetors have larger Secondary Throttle Bore, Secondary Main Venturi, and Secondary Metering Jets

►*1955 CADILLAC "OFF-IDLE LEANNESS" AT 20-30 MPH DURING LIGHT ACCELERATION (Rochester Carburetors before Engine No. 44710)·* May be accompanied by slight vibration and is caused by insufficient fuel during initial action of accelerating pump Correct by installing new parts listed below. *NOTE–Carburetors marked "A-5" on brass tag (Engine No. 34110 to 44710) have later type Pump Plunger Assy. and Power Valve Piston Assy. Carburetors marked "B5X" (used beginning Eng. No. 44710) have latest type parts and do not require modification.*

Late Type Carburetor Parts

Carburetor Type:	Single 4GC	Eldorado (Two 4GC)
Pump Plunger Assy	7000208	7007807
Power Valve Piston Assy	7000204	-
Primary Venturi Cluster	7008768	7008770

►*1954-55 CADILLAC CARBURETOR "ICING" CORRECTION:* This condition generally noted after consistent high speed driving with outside temperature of 32-65°F and high relative humidity. Causes loss of power and high fuel consumption and may result in stalling Icing can be prevented by installing Sheet Metal Baffle No. 1463839 on radiator support tie bar to reduce gap between tie bar and radiator upper tank and prevent outside cold air entering engine compartment. Edge of baffle must be 1/8" from radiator upper tank and must not pinch wiring harness. *NOTE–This baffl installed in production on later 1955 cars.*

►*1955 CADILLAC "FLAT-SPOT or SHUDDER" at 20-40 MPH ON PART THROTTLE ACCELERATION·* May be caused by over-rich Idle Mixture Setting and Idle Adjustments must be made exactly as detailed below. *ROCHESTER CARBURETOR NOTE–See "Off-Idle Leanness Correction" above also.*

►*1955 CADILLAC HIGH IDLE SPEED (First Cars)* May be caused by loose or improperly positioned throttle valves or improperly adjusted secondary throttle linkage causing throttle valves to remain slightly open. Check throttle valve position and linkage adjustment.

►*1955 CADILLAC ROUGH IDLE OR DETONATION* May be caused by vacuum advance ports in carburetor being too low, causing distributor vacuum advance mechanism to operate and provide too much advance at idling speeds. Check for this condition by connecting a vacuum gauge at the vacuum advance line fitting on the carburetor If gauge reading is over 5" with engine idling, ports are incorrectly located Correct by replacing carburetor throttle body

►*1956 FLAT SPOT & SHUDDER CORRECTION (Eldorado Engines with Carter Carburetors before Engine No 014141)* Install Accelerator Pump Jet Housing, Cadillac Part No 7002451 The later type housings have larger bores and longer jets which reduce flat spots and shudder The later type housing is installed in production after the above engine number

►*1956 FLAT SPOT CORRECTION (Eldorado Eng with Carter Carburetors before Engine No 044963 without Air Condition, or No 044986 with Air Conditioning)* Install all parts furnished in special kit, Cadillac No 3630751, as detailed below *NOTE* - Later carburetors with **black** tag have these parts installed in production and modification is not required

1) Carburetor Parts Changes–Install new Metering Rods, Vacumeter (vacuum piston) Springs, and Primary Jet Clusters furnished in kit

2) Carburetor Setting Changes–Secondary Throttle Shaft Torsion Spring should be wound up one additional turn This will assure better idle stability

3) Transmission Changes–Accumulator Inner Spring (furnished in kit) must be installed inside original accumulator outer spring (under accumulator piston in Servo & Accumulator Body) on transmissions prior to Transmission No 56-5239 This spring is required due to increased engine torque when carburetor changes are made (above) and will change Throttle Valve adjustment from 18 flats to 24 flats *NOTE*–Do not install this accumulator inner spring on transmissions after No 56-5239

►*1956 FULL THROTTLE LEANNESS OR SURGE CORRECTION (Cars with Carter Carburetors)* This condition may be caused by air leaking around metering rod dust cover and can be corrected by filing down the

CONTINUED ON NEXT PAGE

CADILLAC CARBURETORS (C nt.)

heavy flashing at both ends of cover until cover is level and will seat properly It may also be necessary to file edge of cover at air horn to prevent interference at this point

►*1956 ENGINE STALLING CORRECTION (Cars with Carter Carburetors)* This stalling condition is noticeable when a hard right or left hand turn is made at zero throttle opening and is caused by air leakage between air horn and bowl gasket Correct by installing an extra bowl gasket and securely tightening air horn-to-bowl screws Readjust float level, metering rods and choke

►*1956 IMPROVED PERFORMANCE & ELIMINATION OF ACCELERATION (Cars with Carter Carburetors, except Eldorado Engines)* A kit, Cadillac Part No 1467454 consisting of late model metering rods and vacumatic spring is available for service replacement on cars before Engine No 080810 In the event a late model throttle body, Carter Part No 1-1436S (same as used on 2543S, 2544S, 2545S) is installed on earlier carburetors, the new kit should also be installed *NOTE* - It will not be necessary to install the throttle stop adjusting screw

►*1956 JET & IDLE ADJUSTING SCREW PRODUCTION CHANGE (Cars with Carter Carburetors, except Eldorado)* To improve idle stability, new Primary & Secondary Metering Rod Jets, Carter Nos 120-163 & 120-185 are being used in production beginning with Engine No 113864 The diameter of the idle adjusting screw has also been changed

►*1956 IMPROPER AUTOMATIC CHOKE OPERATION NOTE (All Models)* Oil leakage at rear of right hand rocker arm cover may affect stroke operation. If oil is indicated in choke housing, the choke housing should be removed and cleaned and the rocker arm cover gasket should be replaced

►*1956 ENGINE STUMBLE CORRECTION (Cars with Carter Carburetors)* Loss of power after a sharp left turn may be caused by fuel leakage from carburetor bowl into the choke vacuum passage To correct, install a brass standpipe, Carter No 145-142, tapping it into the choke vacuum passage in carburetor body

►*1956 THROTTLE LEVER ADJUSTING SCREW CHANGE (Cars with Carter Carburetors, except Eldorado Engine)* Beginning with Engine No 126955, the throttle lever adjusting screw has been eliminated A 3/16" hole in each secondary venturi skirt will provide increased air for the idle by-pass system

►*1956 FLAT SPOT CORRECTION (Cars with Rochester Carburetors)* On carburetors with original **brass** tag new Primary Metering Jet, No 7002651 can be installed to correct this condition *NOTE* - Later carburetors with **black** or **red** tag have this new jet installed in production

►*1957 ROCHESTER FLOAT ADJUSTMENT PROCEDURE CHANGE: See "Adjustments (Rochester)" below.*

►*1957 ROCHESTER FLOAT DROP SPECIFICATION CHANGE:* Adjust float drop on both primary and secondary floats to 1 13/16"±1/32". This supersedes previous setting of 1 7/8".

►*1957 ROCHESTER CARBURETOR FLOODING CORRECTION:* Perform the following operations as outlined.

1) Install the new type filter element, Part No. 854467 (dyed red for identification), and replace the rubber center gasket with the later type gasket, Part No. 854475 which has a cotton reinforcement. The later type gasket is identified by its square shape. On cars without air conditioning rotate the complete filter downward 30° below horizontal to allow dirt to settle in the glass bowl.

2) On early cars with carburetor Nos. 7010100 & 7010101 and on later cars with carburetor Nos. 7012000 & 7012001 not having the letter "A" stamped on brass identification tag, install a new float needle valve and seat assembly, Part No. 7012144. This later valve is made of a harder material and the seat width contacting the needle has been reduced from .010" to .005".

3) On cars before Eng. No. 075598 enlarge the 3/32" holes in the primary and secondary sides of the float bowl that feed fuel into the balance channel between the bowls, to 3/16". The bowl casting should be removed for this operation. Carburetors having this change made in production are identified by the letter "C" stamped on the identification tag.

4) Adjust floats, using the new procedures. *See "Adjustments" below.*

►*1957 ROCHESTER STALLING OR HARD STARTING WHEN HOT CORRECTION:* Adjust idle speed and mixture using a vacuum gauge and a tachometer to obtain peak vacuum and RPM at the same time, and adjust the mixture screws midway between "Rich" and "Lean" limits. Make sure that throttle return check is correctly adjusted. To avoid flooding the manifold, the accelerpedal should be held only part way down and it should not be pumped. A new vented throttle body-to-bowl gasket, Part No. 7011979 has been released for service replacement (installed in production in carburetors having the letter "C" stamped on identification tag) to reduce the cranking time when engine is hot. The new gasket permits external vapor venting of the throttle bores while parked.

►*1957 ROCHESTER STALLING OR HARD STARTING WHEN COLD CORRECTION:* Install a new choke piston, Part No. 7010522 which has a deeper slot than the earlier type piston. Carburetors having the later type piston are identified by the letter "D", or later, stamped on the identification tag. In cases of cold stalling at closed throttle, check the intermediate choke rod adjustment *(see "Intermediate Choke Rod Adjustment" below).* In cases of hard starting, or in cold stalling when throttle is opened, set the choke thermostat two notches rich and reset the fast idle speed to 1500 RPM on high step of fast idle cam. *(NOTE* - This is the summer adjustment, which should be changed back to index setting and the conventional 1700 RPM adjustment for cold weather). In cases of hard starting, especially when car has been parked for several days, remove sight plugs and check fuel level. If fuel level is up, readjust choke as indicated above. If level is down, check bowl casting for leaks. If level is down only slightly, remove bowl cover and check slot in side of pump well for the specified depth of 3/8". If slot is too shallow, remove bowl and file slot to correct depth.

►*1957 ROCHESTER ENGINE "CUT-OUT" ON TURNS CORRECTION:* This condition can be corrected by drilling two additional vent holes in top of air horn as follows: Remove air horn from carburetor and drill a .125" hole in each of the "blind die-cast holes" that are identical to the existing diagonally opposite vent holes now in top of air horn. Carburetors having this change are identified by the letter "E" or later stamped on the identification tag.

►*1958 CADILLAC ROCHESTER CARBURETOR PRODUCTION CHANGE* Beginning with Engine No 045250, new carburetors, Nos 7012910 & 7012811, having new vacuum assist type primary float, are used in production Adjustment procedures for primary float setting is different as indicated below

►*1958 CADILLAC EARLY CARBURETOR PRODUCTION CHANGE & REWORK NOTE* Beginning with Engine No 057758 (Air Cond Cars), No 058491 (Others), new carburetors (2862S, 2863S) having a new fast idle cam, choke coil, and enlarged restriction entered production Earlier carburetors (2696S, 2697S, 2802S) can be modified for improved performance as follows

Fast Idle Cam - To reduce engine idle speed when a warmed-up engine has been restarted after a short cool down period, install a new fast idle cam, Carter No 181-262

Choke Coil - A new "softer" choke coil ("AD" Type), Carter No 170AD-521S should be installed Set the new coil at "index" instead of 1 notch lean as on previous type coil

Choke Restriction - Enlarge the choke restriction in bowl casting to 089" (No 43 drill) This will enable choke to come off sooner

DESCRIPTION· Four barrel downdraft types with idle air bypass system as described below *See "Carter & Rochester Carburetor Design Changes" below for differences in 1955-56 & 1957-58 carburetors*

Cadillac Idle System—Consists of SEPARATE Primary Idle Fuel System and Idle Air System (new) as described below Vapor vent passages located in throttle bores directly above the throttle valves dissipate spill-over fuel from above throttle valves and improve hot idling performance

Idle Fuel System—Primary idle fuel system is similar to previous models with Idle Mixture Adjusting Screw controlling fuel discharge through lower idle port below the throttle valves Throttle valves are COMPLETELY closed at low idle and air is admitted through Idle Air System (below) Secondary idle fuel system has been modified by elimination of closed throttle idle ports (below primary throttle valves) so that the secondary idle system does not operate during closed-throttle idling At part-throttle positions, the secondary idle system discharges fuel through the ports located **ab v** the primary throttle valves

Idle Air System—Consists of air by-pass passage (primary barrels only) through which air for closed-throttle idling is taken from above the throttle valves and discharged into the manifold below the valves through a metered (non-adjustable) orifice and an adadjustable orifice in each primary barrel An Idle Speed Screw (single screw for both barrels) controls this ad-

CONTINUED ON NEXT PAGE

CADILLAC CARBURETORS (Cont.)

justable orifice and all Idle Speed Adjustments are made by means of this screw (No throttle stopscrew used). Throttle valves are COMPLETELY closed at low idling speed.

►*CARTER & ROCHESTER CARBURETOR DESIGN CHANGES:* Design is similar to 1955-56 types except for the following:

Carter WCFB - The throttle body has been changed to lower carburetor height, and the velocity type auxiliary throttle valves have been incorporated in the bowl assembly. Primary and secondary floats are of different types and the secondary float setting has been changed.

Carter AFB - This new carburetor has the float bowl (main body assembly) cast integrally with the throttle body. Two separate float bowls are used, each of which supply fuel to both the primary and secondary sections.

Rochester - New type "Spring Balanced" float assemblies are used. New velocity type secondary auxiliary throttle valves are included which replace the former counterweighted type valves. The automatic choke has been moved from the air horn to the float bowl and is now connected to the choke valve by an intermediate choke rod. Secondary throttle actuating rod has been moved from choke housing side to throttle lever side of carburetor. The idle air adjusting screw has been moved to rear of throttle body.

ADJUSTMENTS (On Engine): *See "Off Engine Adjustments" for Carter & Rochester Carburetors below.*

Initial Idle Speed & Mixture Adjustment: If initial adjustment required to allow engine to be started and warmed up, turn Idle Air Adjusting Screw and both Idle Mixture Screws in to a lightly seated position, then back Idle Air Adjusting Screw out 3 turns. Back out both Idle Mixture Screws as indicated in table below.

Initial Idle Setting

Carburetor	Adjustment
Carter 2185S, 86S, 2255S, 66S, 67S	½-1½ turns
Carter 2354S, 55S	¾-1¾ turns
Carter 2333S, SA, 34S, SA, 70S	1¾-2¾ turns
Carter 2543S, 44S, 45S	1-2 turns
Carter 2582S, 83S, 84S, 2690S, 91S, 92S	¾-1¾ turns
Carter 2479S, 80S, 2696S, 97S	¾-2¼ turns
Carter 2802S, 62S, 63S	¾-2¼ turns
Rochester (All Carbs.)	2 turns

Idle Speed & Mixture Adjustments (Single & Dual Carburetors): With engine at normal operating temperature, transmission in "N" (Neutral), choke fully off and carburetor on "slow" idle, loosen throttle lever jam nuts at carburetor trunnion. Place transmission selector lever in either "D" (Drive) range. Adjust engine idle to correct speed (see table below), using the idle air bypass screw (idle speed adjusting screw) on throttle body. Turn one idle mixture screw until highest engine RPM is reached and highest vacuum is obtained at the same time, then repeat this operation with the other screw (on the same carburetor if two carburetors are used). On cars with two carburetors, adjust idle mixture screws on the other carburetor in the same manner. Repeat the above procedure until turning mixture screws will not increase engine RPM, and the smoothest idle is obtained with the highest vacuum.

►*CARBURETOR CONTROL ROD ADJUSTMENT (Dual Carburetors):* Remove air cleaner and adjust interconnecting rod between both carburetors so that rod is free in throttle lever holes and both throttle valves are seated in their bores.

Idle Speed ℂ

Model	Engine RPM
1955 Single Carb.	② 400
1955 Dual Carbs.	② 480
1956 Single Carb.	② 420
1956 Dual Carbs.	② 490-510
1957 Single Carb.	② 420
1957 Dual Carbs.	② 520
1958 All Carbs.	③ 450

ℂ - Transmission selector lever in either "D" (Drive) range.

② - Air Conditioner turned "ON".

③ - Air Conditioner turned "OFF".

Fast Idle (Single & Dual Carburetors): With engine at normal operating temperature, transmission in "N" (Neutral), choke valve fully open and engine speed properly adjusted (see above), proceed as follows: On Rochester Carburetors, hold throttle lever closed so fast idle adjusting screw is on highest step of fast idle cam. On Carter Carburetors, hold choke rod down by pressing on end of cam trip lever. Open primary throttle valves slightly and rotate fast idle cam to its stop against spring tension, so that screw is on high step of cam. Adjust fast idle screw to obtain an engine speed of 1700 RPM (Single Carbs.), 2000 RPM (Dual Carbs.).

Throttle Check Adjustment (Single & Dual Carbs.): With engine at normal operating temperature, set parking brake and apply foot brake. Place transmission in "D" (Drive) position *(NOTE - Allow engine to idle and make certain that throttle check plunger is not in contact with screw in throttle relay lever).* Open the throttle wide momentarily to allow engine manifold vacuum to drop off and throttle check plunger to come out. Let throttle snap shut. If engine races, clearance is too small. If engine stalls, clearance is too great. Adjust screw on relay lever so that engine will not quite stall during the above procedure. *CAUTION - Do not perform the above operation too frequently as transmission may become overheated.*

►*1956 THROTTLE RETURN CHECK ADJUSTMENT CAUTION (Beginning with Engine No. 033849):* Cars built after the above engine number have a new camshaft which results in lower manifold vacuum which may cause Throttle Return Check to open throttle when vacuum is low if check valve gap is set as low as 140". Set gap on these cars to 185".

Idle Speed-up Control (Air Conditioned Cars): With engine warm and air conditioner compressor "ON", and with transmission selector lever in "N" (Neutral) position hold speed-up control stem with a wrench and adjust the hex head screw to maintain an idle speed of 900 RPM.

CADILLAC (Single Carburetor) (Rochester)

ADJUSTMENTS (Off Engine): *See "On Engine Adjustments" above. NOTE* - The following adjustments must be made in the sequence given, however, they may be classified into the following separate groups: (1) Float Level and Float Drop. (2) Accelerator Pump and Atmospheric Idle Vent *(NOTE - When group No. 2 is performed separately, the Fast Idle Adjustment must also be made.)* (3) Choke, Fast Idle, Choke Rod, Unloader, Secondary Throttle Opening, Secondary Throttle Lockout, Intermediate Choke Rod. *NOTE - When one adjustment of a group is made, the rest in the group must also be performed.*

►*FLOAT ADJUSTMENT PROCEDURE CHANGE NOTE:* Previous adjustment procedures have been superseded by the following:

Float Level (Except Primary Floats on Carburetor Nos. 7012910 & 7012811 with "Vacuum Assist" Type Primary Floats): With bowl cover removed from carburetor and inverted (with cover gasket in place), place correct gauge (see table below) so it is centered in bore of of cover and positioned over highest points of floats. Bend float arms at rear of float assembly until floats just clear top portion of gauge between gauge legs.

Float Level (Primary Floats on Carburetor Nos. 7012910 & 7012811 with "Vacuum Assist" Type Primary Floats): With bowl cover gasket in place, invert bowl cover, then install float level gauge (see table below) under heel of floats. With gauge vertical, floats should just contact gauge. To adjust, bend float arms at rear. Slide gauge under toe of float. In this position lower surface of float should just touch gauge. Lower surface of float should now be parallel to air horn surface and gauge should slide freely under floats. With gauge still under floats, hold lug on lower surface of gauge against inside of air horn casting. Floats should center in cutout section between gauge legs. If alignment required, bend float arms horizontally (directly back of floats) until floats are centered at heel and toe. Make sure floats do not rub sides of gauge legs under any conditions.

Float Level Setting

Model	Height & Gauge No. Primary	Height & Gauge No. Secondary
1955-56	1 19/32" J-5683	1 19/32" J-5683
1957	1 3/8" BT-132	1 3/8" BT-132
1958 ℂ	1 3/8" BT-132	1 3/8" BT-132
1958 ②	236" BT-148	1 3/8" BT-132

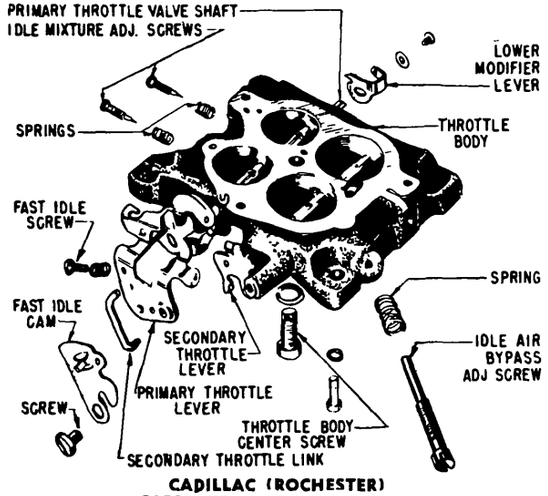
ℂ - Early carburetor without "Vacuum Assist" primary float.

② - Later carburetors with "Vacuum Assist" primary float.

Float Side Play: *(NOTE - This new adjustment replaces the final steps of the previous level adjustment).* Align the gasket with bowl cover by dropping two attaching screws through mating holes of gasket and bowl cover. Sight down on top of floats and position floats as required to center them sideways in the gasket cutouts. Sides of floats must be parallel to adjacent edges of gasket. *(NOTE* - Position floats by grasping float across diagonally opposite corners so as not to distort the sides. Be careful not to change float volume by denting or crushing). Recheck float positioning with bowl cover tilted 90° to either side, or with floats moved to left

CONTINUED ON NEXT PAGE

CADILLAC CARBURETORS (C nt.)



and right extreme positions. By removing power piston, each float assembly can be held at mid point of float arms to check the side play without bending the arms. If any portion of float overhangs gasket cutout, reposition float as required. If necessary, replace float assembly, hinge pin, or bowl cover to reduce sideplay of float assembly.

Fl at Tip: After float level and float sideplay have been adjusted and with bowl cover inverted, raise the gasket and sight across flat surface of casting. The lower edge of each float at the tip should be flush with this surface within 1/16". To adjust, carefully bend each float arm as required. Recheck float level after adjustment is made.

Fl at Drop: *NOTE - Float drop must be adjusted accurat ly because of the new type spring balanced floats.* With air horn upright and floats hanging freely, distance from air horn gasket to lower edge at float tip should be 2¼" (1955), 2 1/8" (1956), 1 13/16" (1957), 1 5/16" (1958). Adjust by bending float tang.

Acc lerator Pump: With fast idle screw backed out and with throttle valves held tightly closed, distance from bowl cover surface to bottom of pump plunger rod should be 63/64" (1955, exc. Eldorado), 1 1/16" (1955 Eldorado), 63/64" (1956), 29/32" (1957-58). Adjust by bending throttle connector rod at lower angle.

Atmospheric Idle Vent: With primary throttle valves closed against a .063" wire gauge (BT-79) bend idle vent tang with Tool BT-69 so that tang just touches face of valve.

CADILLAC (ROCHESTER) CARBURETOR THROTTLE BODY

Aut matic Choke: Centered (At Index). Adjust choke modifier as indicated below.

Chok Modifier: Loosen thermostat lever retaining screw. Rotate metal pointer counter-clockwise from free position until thermostat spring starts to close choke valve. Continue counter-clockwise until metal pointer lines up with index position on choke cover.

Fast Idl Adjustm nt ("Off" Engin): *(CAUTION - Make final adjustm nt "On Engin " as detail d above).* Hold choke valve tightly closed and hold throttle in closed position so that fast idle screw rests on high step of fast idle cam. Turn fast idle screw in until throttle valve opening or clearance between edge of valve and air horn is .020" (Gauge BT-67).

Choke Rod Adjustment: *(NOTE - This rod connects choke valve shaft to fast idle cam).* Position fast idle cam and primary throttle so that fast idle screw contacts second step of fast idle cam, and rests against shoulder of the highest step. Hold choke valve closed with choke trip lever in contact with choke counterweight lever. Hold linkage in this position and check choke valve opening or clearance between upper edge of choke valve and dividing wall in air horn using Gauge BT-102 (.040"). Adjust by bending choke rod.

Choke Unloader: Move throttle to wide open position and hold trip lever down in contact with choke counterweight. Check choke valve opening or clearance between upper edge of choke valve and dividing wall in air horn using Gauge BT-102 (.125"). Adjust by bending tang on fast idle cam using Tool BT-69.

Secondary Throttle Opening: With carburetor inverted, move choke valve to wide open position. Move throttle lever to wide open position and check opening of secondary throttle valves which should reach wide open position at same time as primary valves. If adjustment required, remove fast idle cam and connecting link. Check wide open stops on primary and secondary throttle shafts, and bend tangs with heavy pliers as required to obtain wide open positions. Tangs should contact stops at same instant.

Secondary Throttle Lockout: With choke valve partially closed and throttle valves fully closed, check clearance between upper edge of lockout lever tang and edge of slot in fast idle cam using a feeler gauge. Clearance should be .015". Adjust by bending tang horizontally using Tool BT-18.

Secondary Throttle Contour Clearance: With choke valve wide open, open throttle valves so tang on secondary lockout lever rides over top of fast idle cam. Measure clearance between tang and fast idle cam edge using feeler gauge. Clearance should be .015". Adjust by bending tang up or down using Tool BT-19.

Intermediate Choke Rod (1957-58 Models Only): *NOTE - This rod connects choke valve shaft to lever on automatic choke control.* Remove automatic choke cover and baffle plate. With choke valve held fully closed, bend intermediate rod as necessary so choke piston is flush to 1/32" out of choke piston sleeve.

CADILLAC (Single Carburetors) (Carter AFB)

ADJUSTMENTS (Off Engine): *See "On Engine Adjustments" above. NOTE -* The following adjustments must be made in the exact sequence given.

Float Alignment: Adjust float so it is parallel to outer edge of bowl cover casting by bending float lever. *NOTE -* Bend float lever by applying pressure to end of float with finger while supporting float lever with thumb. After aligning float, remove as much clearance as possible between arm of float lever and lugs on bowl cover. Arms of float lever should be as parallel to inner surface of lugs as possible. Be sure that floats operate freely without excessive play on hinge pin.

Float Level: With bowl cover inverted, bowl cover and gasket in place, and needle seated, there should be 5/16" clearance between top of float at outer end and bowl cover gasket. Check and adjust float level, using Gauge J-818-9. Adjust by bending float arm. Recheck float alignment after adjusting level.

Float Drop: Hold bowl cover in upright position and measure distance from top of outer end of each float to bowl cover gasket. The distance should be 3/4" (1957), 23/32" (1958). To adjust, bend stop tabs on float brackets.

Accelerator Pump: Back out fast idle screw so throttle valves are fully closed, making sure that choke is wide open. Distance from top of bowl cover to top of plunger shaft should be 15/32". Adjust by carefully bending throttle connector rod at lower angle using Tool J-1137.

Choke Piston Lever: .040" clearance (Gauge T109-193) between choke lever and stop in piston housing with choke valve held closed. To adjust, bend choke connector rod.

Choke Modifier: Place choke coil housing on index and remove lower end of connecting rod. Loosen clamp screw and rotate metal pointer until it is in line with raised pointer on coil housing. Align scribed line on lever so it is in a horizontal position and tighten clamp screw. Seat throttle valves (hold choke wide open). Reposition pointer so it is in line with raised pointer on housing. Bend connector rod at upper angle so that lower end of rod will slide freely into hole in modifier lever on primary throttle shaft.

Choke Shaft Lever: With choke valve fully closed and choke lever and arm in contact, adjust choke connector rod to align index mark on fast idle cam with fast idle screw.

Fast Idle: *(CAUTION - Make final adjustment "On Engine" as detailed above).* With choke valve tightly closed and fast idle screw centered on index mark on fast idle cam, clearance between lower edge of throttle valve and carburetor bore on side opposite idle ports should be .023". Turn fast idle screw to obtain correct clearance.

Unloader: Rotate primary throttle to full open position and insert a 9/32" drill between upper edge of choke valve and inner wall of bowl cover assembly. Choke valve should give a slight drag on gauge under finger pressure. To adjust, bend unloader lip on throttle lever using Tool J-1137.

Secondary Throttle Lever: Block choke valves wide open. With 23/64" clearance between lower edge of primary throttle valves and bores (side opposite idle ports), secondary valves should just start to open. To adjust, bend throttle operating rod. *NOTE - At wide open throttle, secondary valves will be a few degrees from wide open position.* With primary and secondary valves in tightly closed position, there should be .017-.022" (1957), .010-.030" (1958) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

S c ndary Thr ttl L ck ut: Crack throttle valves and manually open and close the choke valve. Tang on

CONTINUED ON NEXT PAGE

CADILLAC CARBURETORS (C nt.)

secondary throttle lever should engage freely in notch of lockout dog. Adjust by bending tang on secondary throttle lever. With lockout dog held tight against stop on flange casting and secondary throttle valves partially open, there should be .020" clearance between tang on secondary throttle lever and lockout arm. Check this clearance using Tool J-1388. Adjust by bending arm at slot on lockout dog. *NOTE* - Fast idle cam may be removed to ease gauging and adjusting.

CADILLAC (Single & Dual Carburetors) (Carter WCFB)

ADJUSTMENTS (Off Engine): *See "On Engine Adjustm nts" abov . NOTE* - The following adjustments must be made in the sequence given, however, they may be classified into the following separate groups: (1) Float Level & Float Drop. (2) Accelerator Pump, Metering Rod, Atmospheric Idle Vent. (3) Choke Modifier, Choke Rod, Unloader, Secondary Throttle Opening, Secondary Throttle Lockout, Fast Idle. *NOTE - When one adjustment of a group is mad , th rest in the group must also be performed.*

Fl at Lev l: *NOTE - Primary and Secondary Float Settings ar diff rent. VERTICAL & HORIZONTAL adjustm nts must b made on both floats.* With bowl cover assembly removed from carburetor, **remove cover gasket** and place correct gauge (see table below) directly under center of floats with notched portion of gauge fitted over edge of cover. **Lat ral Adjustment** - Sides of float should just clear vertical uprights of gauge. Adjust by bending float arm as required. **Vertical Adjustment** - Floats should just clear horizontal portion of gauge (see table for vertical distance between tops of floats and machined surface of cover). Adjust by bending float arms up or down.

Cart r WCFB Fl at Level (1955-56)

	Ch cking Gauge	Vertical Distance
Primary (All)	①T109-232	.1/8"
Secondary (All)	②T109-222	. 3/16"

①—Cadillac No. J-5457. ②—Cadillac No. J-5458.

Cart r WCFB Float Level (1957)

Fl at	Ch cking Gauge	Vertical Distance
Primary	① T109-232	1/8"
Secondary	② T109-223	1/4"

① - Cadillac No. J- 5457. ② - Cadillac No. J-5228.

Fl at Dr p: Hold bowl cover assembly upright so floats hang down freely. Use scale to measure distance from machined lower surface of bowl cover (gasket removed) to top of floats at center. Distance should be 5/8". (Primary floats 1955-57), 1/16" (Secondary floats 1955-56). 3/4" (Secondary floats 1957).

Acc l rator Pump: Install pump connector link in **outer hole** (1955-56), **inn r hole** (1957) of pump arm with end extending toward countershaft. Seat throttle valves in carburetor bore, then remove dust cover and gasket and hold a straightedge across dust cover boss at pump arm. Flat on top of pump arm should be parallel to straightedge. Adjust by bending throttle connector rod at lower angle.

M t ring R d: *Mak this adjustm nt aft r "Acc lerator Pump Adjustm nt".* Seat throttle valves in bore of carburetor and loosen metering rod arm clamp screw. With metering rods in place, press down on vacumeter link until metering rods bottom in carburetor body casting. Hold rods in downward position, throttle valves seated, and revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and tighten clamp screw.

Atmospheric Idle Vent: With throttle valve seated in bores, clearance between lower edge of vapor vent valve and dust cover should be 1/16" (Gauge T109-197). To adjust, remove dust cover, bend vapor vent arm up or down.

Automatic Choke: Set cover assembly as indicated in table (below).

Automatic Choke Setting

Model	Setting
1955 (All)	Centered (At Index)
1956 (Single Carb.)	1 Point Lean
1956 (Dual Carbs.)	Centered (At Index)
1957 (Dual Carbs.)	Centered (At Index)

Choke Modifier: Set cover assembly as indicated above. Loosen clamp screw and remove lower end of connector rod. Rotate metal pointer until it is in line with raised pointer on housing. Align scribed line on lever so it is straight up and down. Hold in place and tighten clamp screw. Seat throttle valve (hold choke valves wide open) and with pointer in line with raised pointer on coil housing, lower end of rod must slide freely into hole in throttle arm. To adjust, bend rod at upper angle. Reconnect rod.

Choke Rod: Loosen choke lever clampscrew on choke shaft. Insert a .020" (1955), .015" (1956) feeler gauge between lip of fast idle cam and boss on flange casting. On 1957 models, lip of fast idle cam should lightly contact boss of flange casting. Hold choke valve tightly closed and remove all slack from linkage by pressing choke lever toward closed position. Tighten clampscrew while holding lever in this position.

Unloader: Move throttle lever to wide open position. Check choke valve opening or clearance between upper edge of valve and inner wall of air horn using Gauge T109-39 (13/64"). Adjust by bending unloader lip on throttle lever shaft using Tool T109-41.

Secondary Throttle Lever (All Carburetors): With the choke valve wide open, move primary throttle valves to wide open position and note movement of secondary throttle valves which should reach wide open position at same time as primary valves. If no adjustment required, remove secondary throttle operating link, check wide open stops for both primary and secondary valves and adjust by bending tangs so that wide open position can be secured, connect link. Bend link using heavy pliers so that both throttle shafts contact wide open stops at the same instant. With both primary and secondary throttle valves tightly closed, measure clearance between positive closing shoes on primary and secondary levers using Tool T109-29. If clearance not .017-.022", adjust by bending shoe on primary lever.

NOTE—Secondary throttle link should be connected in inner hole (nearest throttle shaft center) on both the primary and secondary throttle shaft levers.

Secondary Throttle Lockout (All Carbs. Exc. 1956 Duals): *NOTE - See "Auxiliary Throttle Lockout (1956 Dual Carbs.)".* With choke rod properly adjusted (see above), hold choke valve tightly closed and tighten fast idle screw until there is .015" (Exc. 1957 Dual Carbs.), .010" (1957 Dual Carbs.) opening between primary throttle valves and bore of carburetor on side opposite idle ports. Lock pawl should now be in unlocked position; if not, adjust by bending tang on lock pawl. Hold primary throttle valves half way open. Open choke valve fully, then open primary throttle valves all the way. Tang on secondary throttle arm should engage in notch on lockout lever preventing secondary throttle shaft movement. With choke valve wide open, close primary throttle valves all the way. Lockout lever should fall free allowing secondary throttle valves to be open before primary throttle valves are fully open. To adjust, bend tang on secondary throttle lever to provide clearance for proper operation of lockout lever.

Auxiliary Throttle Lockout (1956 Dual Carbs.): With choke valve held fully closed, hook on lockout arms should have maximum contact with locking step on auxiliary throttle shaft. Open choke valve slowly. Auxiliary throttle valves should become unlocked and free to open just before choke valve reaches wide open position. Adjust by bending tang on choke trip lever under lockout arm using long nosed pliers.

Fast Idle: *(CAUTION - Make final adjustment "On Engine" as detailed above).* With fast idle adjusting screw on high step of fast idle cam, clearance between primary throttle valves and side of bore opposite idle ports should be .008".

OVERHAUL: *See "Carter WCFB 4-Barrel", "Carter AFB 4-Barrel" and "Rochester 4GC 4-Barrel" Carburetors.*

SERVICE PARTS: Gasket Sets - Carter No. 262 (2185S, 2186S); Carter No. 263 (2255S, 2266S, 2267S, 2354S, 2355S); Carter No. 277 (2333S, SA, 2334S, SA, 2370SA, 2371S, 2372S); Carter No. 277A (2543S, 2544S, 2545S); Carter No. 295 (2582S, 2583S, 2584S, 2690S, 2691S, 2692S), Carter No. 315 (2479S, 2480S, 2696S, 2697S, 2802S, 2862S, 2863S). ⑦ - Synchro-mesh transmission.
⑧ - Automatic transmission.
⑨ - Carter Carburetor No. 2103S can be used in place of 2142S.

►CHANGES, CAUTIONS, CORRECTIONS

►***1954 BUICK METERING ROD PRODUCTION CHANGE (All Series with 2082S Carburetor):*** Metering Rod No. 75-1108 used on later carburetors and supersedes No. 75-995 used on early carburetors.

►***1954 BUICK ACCELERATING PUMP PLUNGER LEATHER TURNING BACK CAUSING IMPROPER ACCELERATION & THROTTLE RESISTANCE (Early Cars with carburetors tag-dated "L3" through "C4"):*** Caused by too long pump stroke allowing leather to catch in overflow slot in pump cylinder at closed-throttle. Correct as detailed below. ***CAUTION—Unless these changes made, replacement of pump plunger will result in recurrence of trouble.***

(1) Install new Pump Plunger and READJUST PUMP STROKE (see Accelerating Pump data below).
(2) Adjust Metering Rods (see below).
(3) Remove Pump Jet Cluster Hold-down Screw and rework inner slotted end to assure full stroke of pump discharge needle. Screw has slotted projection extending 1/16" beyond end of threads. Grind off one side of projection entirely and reduce height of opposite side from 1/16" to 1/32". Reinstall screw.

►*1955 BUICK CARBURETOR CHOKE PISTON CHANGE TO IMPROVE WARM-UP PERFORMANCE (First Carburetors tag-dated "L-4" & Earlier):* If rolling, loading, or stalling noted immediately after engine started, and this is not caused by leak in Intake Manifold or vacuum lines (Windshield Wiper, Washer, or Power Brake), install new type Choke Piston furnished in Carter Unitized Pkg. No. 160-140U or Buick Kit, No. 1169567. Attach new Copp r identification tag (furnished in kit) which will indicate modification has been made. *NOTE—Carburetors tag-dated "M-4" and later have this piston installed in production.*

►*1956 BUICK METERING ROD PRODUCTION CHANGE (For Increased Fuel Economy):* In later production, a new metering rod, Carter No. 75-1235 is being used in production and can be used for service replacement. Carburetors having the later metering rod can be identified by the letter G, H, J, etc., following the carburetor number stamped on the brass tag attached to carburetor.

CONTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (C nt.)

►*1956 ENGINES CUTTING OUT ON LEFT HAND TURN CORRECTION* A new standpipe, Carter Part No. 145-142 may be installed into the choke vacuum passage in main body casting. The standpipe (bushing) is tapered and should be tapped lightly into place. The use of this part provides a more positive seal and prevents fuel leakage from bowl into choke vacuum passage.

►***1954 CADILLAC IDLE SPEED SETTING CAUTION ON AIR-CONDITIONED CARS:*** Idle speed setting should be adjusted seasonally (1) When air-conditioning use discontinued for winter months, (2) When air-conditioning is put into use for summer months This is necessary to compensate for compressor load when engine idling in "Dr" ***See Idling Adjustment below. CAUTION—Engine may stall during summer months, or operate at too fast an idle speed during winter months, if proper procedure not followed.***

►*1955 CHEVROLET LOADING (WHEN STARTING PARTIALLY WARM ENGINE)* Choke setting has been changed to **2 P ints L an** (superseding Centered setting) which will improve this condition

►*1955 CHEVROLET HARD STARTING (AFTER FLOODING)* May be caused by primary throttle valves not opening wide which prevents Unloader operating Check throttle linkage to make certain that primary throttle valves wide open when accelerator pedal pressed to floorboard Check Unloader setting *See ADJUSTMENTS below*

►*1955 CHEVROLET AIR CLEANER INSTALLATION CAUTION* When installing air cleaner, make certain that cutouts in gasket line up with carburetor bowl vent tubes and use care that gasket does not rotate when cleaner installed *Blocking of carburetor bowl v nts will int rf r with carburetor operation*

►*1956 CHEVROLET CORVETTE (TWO CARBS) IMPORTANT NOTE: Th PARTS CHANGES and new ADJUSTMENT PROCEDURES listed below are recommended for improved idling and low speed operation on cars quipped with C rvette Engine (with Two Carburetors)*

►*1956 CHEVROLET CORVETTE (TWO CARBS) RECOMMENDED CHANGES FOR IMPROVED IDLING & LOW SPEED OPERATION:* **Make the following changes in Carter WCFB 2419S, 2362S carburetors and adjust carburetors in accordance with revised idling adjustment procedure below**

1) Carbur t r Parts Changes - Install following new low speed jets and metering rods in BOTH carburetors On REAR carburetor only, install an idle speed screw in the tapped boss on the carburetor (Screw No 101-376, Spring No 61-291, Washer No 136-174) This screw is used to adjust engine idle speed

Carbur t r Parts Changes

	Original Part No.	New Part No.
Low Speed Jets	11-294S	11-263S
Metering Rods (Std)	75-1255	75-1356

2) Carbur t r Installati n & Flang Gask tM dificati n - Install each carburetor with TWO gaskets (1A-114 or 1A-113) which have been modified by cutting out entire center section as follows Cut along centerline between two primary barrel bores and two secondary barrel bores, cut along line ¼" out and parallel to centerline between each primary bore and adjacent secondary bore

3) Carburetor Idle Adjustment - *On both front and rear carburetors, turn Idle Air Adjusting Screw IN until just seated and LEAVE SCREW IN THIS POSITION SO THAT NO AIR IS ADMITTED THROUGH THIS PASSAGE These screws are NOT used for carburetor adjustment* Then adjust carburetors as directed under "Idle Adjustment" below using the idle speed screw on the REAR carburetor to adjust the idle speed *(NOTE - Throttle valves in FRONT carburetor remain seated at idle speed) Adjust throttle linkage as follows*

4) Throttle Linkage Adjustment - Remove carpet adjacent to accelerator pedal Remove air cleaners and throttle pull back springs on carburetors With REAR carburetor throttle valves wide open, accelerator pedal should be 3/8" from toeboard Adjust by changing length of accelerator linkage rod at rear carburetor (remove clip and turn trunnion nut on rod), then holding rear carburetor throttle valves wide open check FRONT carburetor for throttle valves being wide open and against throttle stop Adjust by turning nut on front carburetor control shaft *NOTE - With correct linkage adjustment, front carburetor throttle valves begin to open with rear carburetor at half-throttle*

►*1959 CHEVROLET STALLING WHEN COLD (Automatic Transmission Cars with 348" Engine and Single Carburetor)* Correct by changing Choke Piston Lever Adjustment setting to new specification shown in ADJUSTMENTS below This new setting used in production on later cars

►*1959 CHEVROLET STALLING AFTER COLD START (3-Speed Transmission Cars with 283" Engine and Single Carburetor)* Correct by changing Automatic Choke Setting to 1 Notch Lean Make this change ONLY to correct the above complaint

►*CHRYSLER 300B & DESOTO ADVENTURER (With Two Carburetors)* Special Idle Adjustment procedure must be followed to insure balanced operation of the two carburetors *See Chrysler & DeSoto car model data for complete procedure*

►*1955-56 DESOTO (EXCEPT ADVENTURER) ENGINE STALLING CORRECTION* Adjust slow idle speed to 500 RPM, and fast idle speed to 1200 RPM Change choke setting to 1 notch rich (1956), 2 notches lean (1955). Adjust dashpot so plunger moves 1/16" when throttle closed. Check manifold heat control for free operation. Check manifold to carburetor heat tube as follows Move asbestos cover to expose a small portion of tube, then run engine for one minute. Tube should be too hot to touch. If not, tube is cracked or loose in manifold.

►*1957 CHRYSLER C-300 STUMBLE OR STALLING CORRECTION:* Poor idle, stumble or hesitation on acceleration, stalling on stops or sudden turns conditions can be improved by making the following service corrections. Remove both carburetors from engine and disassemble each carburetor into three major sections (air horn, main body and throttle body). Remove floats and fuel inlet valves from air horn. Proceed as follows:

V nt Passage R w rk - Using a No. 42 drill (.0935"), drill holes through wall of air horn and vent passage boss into vent passage at each end of the two vent tubes (these are the vented tubes extending across and above primary and secondary bores in air horn). Holes into vent passages should be located 11/16" (primary side), 13/16" (secondary side) below top of air horn wall and aligned with centerline of vent tube at a point where vent tube is closest to inner side of air horn wall. Cut away choke housing-to-air horn gasket on rear carburetor for access to vent passage boss behind choke housing.

Idle Tube Well Enlargement - Remove main nozzle plug rivets or primary side of carburetor and remove the two primary idle tubes. Enlarge idle tube wells for their full length (into main nozzle passage), using a No. 4 drill (.209"). Idle tube wells are approximately 8° from vertical and care must be taken to prevent damaging the idle tube seat located just below threads in carburetor main body.

Main Body Pilot Bosses - File projecting pilot bosses on primary side of under side of main body to a height of 1/32". Clean carburetors thoroughly, making sure that all passages are clean and free of metal chips. Reassemble carburetors and note the following changes that must be made.

Secondary Metering Jet Change (Front Carburetor) - Install secondary metering jets, Carter No. 120-193 in **front carburetor only.** Use original jets in rear carburetor.

Metering Rod Change (Front & Rear Carburetors) - Install metering rods, Carter No. 75-1160 in **both front and rear carburetors.**

Float Setting Change - Adjust float level to 1/4" (primary floats), 5/16" (secondary floats).

Carburetor Installation - Install carburetors on engine using a new 1/8" thick flange gasket.

Idle Speed & Idle Setting Procedure Change - Close off completely the idle by-pass screws of both carburetors by turning them in until fully seated. *(NOTE - L av these screws in the closed position and adjust idl speed with the idle speed screws on the throttle l v r).* With engine at normal operating temperature, connect tachometer to engine and adjust front carburetor idle speed screw to obtain 650-700 RPM. Adjust rear carburetor idle mixture screws for best performance, then adjust front carburetor idle mixture screws for best performance. Reset front carburetor idle speed screw to obtain 650-700 RPM.

►*1957 DESOTO, DODGE & PLYMOUTH (CARS WITH TWO 4-BARREL CARBURETORS) IDLE ADJUSTMENT CHANGE NOTE* The "idle by-pass" screw formerly used for idle adjustment is no longer used and must be screwed in against its seat. *See individual car model pages for idle setting procedure.*

►*1957 CHRYSLER, DESOTO, DODGE & PLYMOUTH TWO 4-BARREL CARBURETOR PRODUCTION CHANGE:* Carburetor Nos. 2534S, 2535S, 2631S, 2632S, 2633S, 2634S, 2635S, 2636S, had a lead ball driven into hole in face of flange to seal over head of screw holding flange onto body. This lead ball must be removed

C NTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (C nt.)

before flange is separated from carburetor body. On later production carburetors, the lead ball has been replaced with a copper washer (Carter No. 136-199), which should be used instead of the lead ball when servicing these carburetors.

►*1957 DESOTO ADVENTURER REAR CARBURETOR THROTTLE LEVER LOSSENESS CORRECTION:* This condition is caused by excessive side strain on throttle lever due to improper adjustment and alignment of the inter-connecting linkage rod. To correct, remove carburetor and place it on a vise so end of throttle shaft (away from lever) is firmly supported. Peen end of shaft, tapping lightly, to tighten lever. Adjust interconnecting link for freeness and alignment.

►*1957 DODGE D-500 STUMBLE & LEANNESS CORRECTION:* On early cars with WCFB 2532S carburetor, install metering rod, Carter No. 75-1251 to replace 75-1327. On later cars with WCFB 2622S carburetor, install metering rod, Carter No. 75-1251 to replace 75-1373

►*1957 LINCOLN & MERCURY ENGINE STUMBLE OR CUTTING OUT ON TURNS: This condition may be* caused by a poor seal between carburetor body and air horn. Inspect gasketed surfaces and remove any small nicks or burrs with a stone. Make sure that top surface of inner wall of bowl is in good contact with gasket. Before installing air horn, check lateral and vertical float adjustments and float drop.

►*1957 HUDSON, NASH, RAMBLER ROUGH ENGINE IDLE CORRECTION: If idle adjustments do not correct* rough idle condition, check for an air leak at front left hand corner of carburetor (with carburetor on engine) by squirting gasoline between throttle body flange and main body at this location. If an air leak exists, a drop in engine RPM will be noted. To correct, remove carburetor from engine, and with carburetor inverted (choke coil housing on left hand side) remove the upper right hand main body-to-throttle flange screw and coat threads with Permatex or other sealing compound. Replace carburetor and recheck for air leakage.

►*1957 HUDSON & NASH VAPOR LOCK OR LOW PRESSURE CORRECTION (Early Cars):* If either of these conditions exist on cars prior to Serial No. V-18114 (Nash), Y-11786 (Hudson), check the carburetor-to-fuel tank return elbow. This elbow must have a .034-.036" (No. 65 drill) restriction. If hole is larger or not drilled through, replace elbow with Part No. 3152259.

►*1956-57 LINCOLN & CONTINENTAL HARD STARTING, STALLING & BACKFIRING CORRECTION (When Caused by Defective Automatic Choke Control Heat Tube):* A new tube, Part No. ECU-9890-B having a larger center section and a larger runout radius at each end replaces the tube formerly used. When replacing intake manifold, make sure later heat tube is installed.

►*1955 PACKARD ROUGH ENGINE IDLE, POOR PERFORMANCE & POOR ECONOMY (Due to high vacuum at Distributor Advanc Unit)·* High vacuum may be caused by foreign material deposits in either primary or secondary throttle bores, or insufficient clearance of secondary throttle valves in bores. This condition makes it necessary to open primary valves too far to obtain the correct 400 RPM idle speed and results in distributor vacuum port being uncovered, causing distributor vacuum advance to operate at idle speed. The resulting too early ignition at idle speed and late timing throughout the rest of the range will not only cause a rough idle but also poor performance and poor gasoline economy. Check and correct this condition as follows·

Checking for High Vacuum—Connect vacuum gauge at distributor line fitting on carburetor. Idle engine at 400 RPM with selector lever in Drive Range. Vacuum must not exceed 5" Hg.

Correcting High Vacuum—Examine throttle bores for foreign material deposits at the throttle valves. Correct by cleaning throttle body in carburetor cleaner. If no deposits noted, reposition secondary throttle valves on shaft as follows Loosen secondary throttle valve screws, place a .002" shim ¼" wide between upper edge of valves and carburetor bore, retighten screws while holding valves in this position.

►*1956 PLYMOUTH FURY IMFROPER CHOKE ACTION CORRECTION* This condition may be caused by interference between carburetor throttle lever and dashpot mounted on intake manifold. Correct by installing three gaskets, Plymouth Part No. 1731516.

►*1956 PLYMOUTH (POWERFLITE) DASHPOT ELIMINATION.* The carburetor dashpot has been eliminated on later production cars.

►*1955 PONTIAC LOADING OR CARBURETOR FLOODING May be caused by excessive fuel pump pressure. See "Fuel Pump" under CARBURETOR on Car Model page for corrective procedure.*

►*1955 PONTIAC HARD STARTING CORRECTION (DUE TO UNSATISFACTORY UNLOADER OPERATION AFTER FLOODING.* If this condition not corrected by regular Unloader Adjustments, follow the procedure given below and install new parts as indicated.

1) Install new Throttle Flex Spring, Pontiac No 7008801, on carburetor (spring is linked between throttle shaft dog and outer throttle lever). New spring is lighter type and will reduce effort required to unload carburetor

2) Install new Engine Throttle Control Bracket Assembly, Pontiac No. 521986 This is a redesigned assembly

3) Adjust throttle control linkage (see "Throttle Linkage Adjustment (Hydra-Matic drive Cars)" under CARBURETOR on car model page) and adjust the throttle control intermediate rod as follows Push rod downward until end of accelerator pedal rod lever is felt to touch the end of its travel, shorten the intermediate rod enough to allow 1/8" clearance between end of accelerator pedal rod lever and rubber bellows assembly (3 turns of the trunnion nut). This adjustment will provide maximum allowable accelerator pedal travel

4) Inspect accelerator pedal Replace pedal if hinge pin or pedal rod holes worn oversize or out-of-round

5) Check for interference between accelerator pedal lever and throttle control dash bracket at wide open throttle position If interference noted grind 1/16' relief on dash bracket at point of contact *NOTE*—This interference will be noted particularly on cars where 4-barrel carburetor installed in the field

►*1956 PONTIAC HARD STARTING CORRECTION (With Partially Warmed-up Engine):* Change choke setting from one notch rich to center index. If hard starting is *not completely eliminated with this change,* set choke to one point lean.

►*1956 PONTIAC CARBURETOR FLOODING CORRECTION (Early Cars)·* Install fuel filter, Part No. 854345 which is a precipitation type filter having an impregnated fibre element.

►*1956 PONTIAC COLD ENGINE STALLING & WARM UP OPERATION IMPROVEMENT* On carburetors tagdated before M-5, install ALL of the following parts and change settings as follows

1) Vacumeter Spring No. 61-478, identified by a free length of approximately 1½" (supersedes 61-496).

2) Choke Piston No 160-138 (supersedes 160-110S)

3) Automatic Choke Setting—1 Point Rich (changed from Centered setting)

NOTE—Carburetors tag-dat d M-5 and later have these changes made in production

►*1956 STUDEBAKER 259' & 289" ENGINE CARBURETOR "BLOW-UP" PREVENTION NOTE·* To prevent gasoline collecting in air horn pockets in which bowl vapor vents are located (and igniting from engine backfire), drain holes must be provided through wall of choke valve chamber, on both sides of carburetor as follows Remove and disassemble air horn. With air horn inverted, locate the holes in wall of air horn at a point 3/8" from center line of choke chamber baffle (one hole on each side of baffle), and 5/32" below air horn gasket surface. Locate the other two holes in same location in wall at opposite end of baffle. Using a 1/16" (No. 53) drill, drill the holes from inside of air horn into pocket at an angle of approximately 20°. Clean all chips from air horn and reassemble.

►*1955-56 STUDEBAKER ENGINE STALLING ON SHARP LEFT TURN CORRECTION (CARS WITH CARTER WCFB 4-BARREL CARBURETORS):* Make sure that carburetor fuel level is correct and that float valve is seating properly. Check to see if air horn is sealing properly against carburetor body. This can be determined as follows: Remove air horn assembly from carburetor body and inspect gasket for the imprint of the air horn body rib around the choke passage hole and idle tube crossover passages. If no imprint is found, use a new gasket and cut out the center web (if present). If a definite imprint cannot be obtained with a single gasket, use two gaskets, Part No. 537189. Reassemble carburetor and tighten the center screws first, then tighten the outer screws.

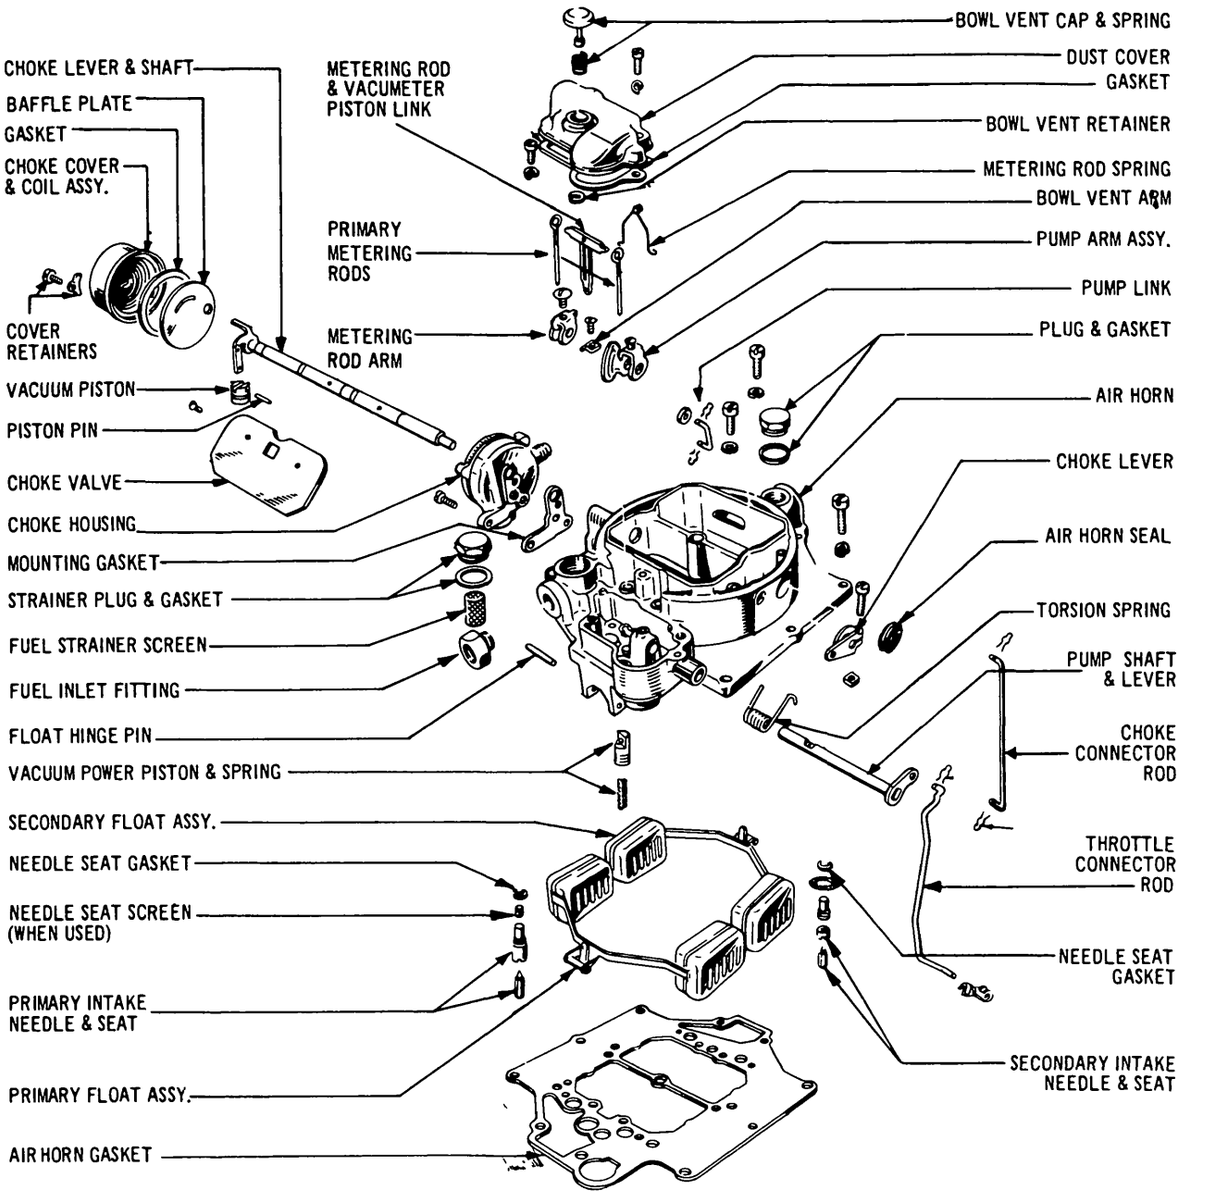
►*1958 STUDEBAKER & PACKARD HESITATION ON ACCELERATION WITH COLD ENGINE CORRECTION* To eliminate stumbling or hesitation when accelerating rapidly with a cold engine, it is recommended that the choke piston be replaced with Carter Part No 160-117 Adjust Climatic Control so that it is set 2 notches to rich side from the index mark (standard setting is 1 notch rich)

CONTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (C nt.)

►*1959 STUDEBAKER STUMBLE OR HESITATION AFTER COLD ENGINE START:* Above complaint can be corrected by installing improved Choke Piston, Carter No. 160-117 (superseding original piston No. 160-159). When installing this piston, choke operation will be improved setting the automatic choke1 or 2 Points Rich (original setting 1 Point Rich).

DESCRIPTION



DESCRIPTION: These models are essentially double dual (two-barrel) carburetors with a conventional dual **primary** unit supplemented by a similar dual **secondary** unit for maximum engine performance. Both the primary and secondary units have separate fuel bowl and float systems, idle systems, main metering and discharge systems, and interconnected throttle valves as described below. Only the primary unit has an accelerating pump system and choke valve with an automatic choke control (the secondary throttle valves or auxiliary throttle valves are locked closed for starting and warming up and remain closed during part-throttle operation). ***See Throttle Linkage data below.***

Fuel System: A single fuel inlet is used (located on secondary side of bowl cover) with a passage in the cover leading to the fuel inlet valve for each float chamber. Each bowl has a twin float assembly controlling the fuel inlet valve. Bowls are vented to the air horn by vent tubes and have additional vent passages terminating at the air cleaner mounting flange. ***See Idle Vent data below also.***

Idling & Low Speed—Entire idle system is duplicated for both the primary and secondary sides of the carburetor except that idle mixture adjusting screws are provided only on the primary side (adjusting screw holes closed by plugs on secondary side). Fuel is discharged into each of the carburetor barrels and secondary idle system continues to function through-out the part throttle range until the secondary throttle valves also begin to open. Secondary throttle valves (auxiliary throttle valves on Buick carburetors) are locked out by the choke mechanism when the engine is cold and even when the engine is warm these valves do not begin to open until primary throttle valves are 50-60% open.

Driving Range (Less than 50-60% Throttle)—The primary throttle valves are directly connected to the accelerator pedal and open as the pedal is depressed (secondary throttle valves are linked to the primary throttle valves and remain closed until primary valves are 50-60% open). Opening of the primary throttle valves bring the main discharge nozzles into action and the primary idle systems drop out (secondary idle systems continue to operate as long as secondary throttle valves are closed). Fuel for these main nozzles is metered by primary main metering jets (these jets have the usual vacumeter type metering rods). Under conditions of low manifold vacuum (hill climbing, acceleration, etc.), the vacuum piston spring lifts the metering rods out of the metering jets and permits a greater fuel flow to the nozzles.

High Speed or Full Power (Mor than 50-60% Throttle)—At 50-60% throttle, the linkage between the primary and secondary throttle valve levers begins to open the secondary valves. These secondary valves open at a relatively greater rate so that both the primary and secondary valves reach the "wide open" position at the same time. In this range, fuel is discharged through all four carburetor barrels to provide maximum engine power. Secondary fuel is metered by secondary main metering jets and discharged through secondary main nozzles in exactly the same manner as on the primary side except that **no metering rods are used with the secondary metering jets.**

CARTER WCFB 4-BARREL CARBURETOR AIR HORN & FLOAT ASSY. (TYPICAL)

Accelerating Pump—Used only on primary side of carburetor. Pump is conventional type with pump plunger linked to primary throttle valve lever so that the additional fuel needed for acceleration is discharged through the pump jets into the primary carburetor barrels when the primary throttle valves are opened for acceleration. A relief check valve is located in the pump discharge channel to prevent excessive pressures in the pump circuit (opening of

C NTINUED N NEXT PA E

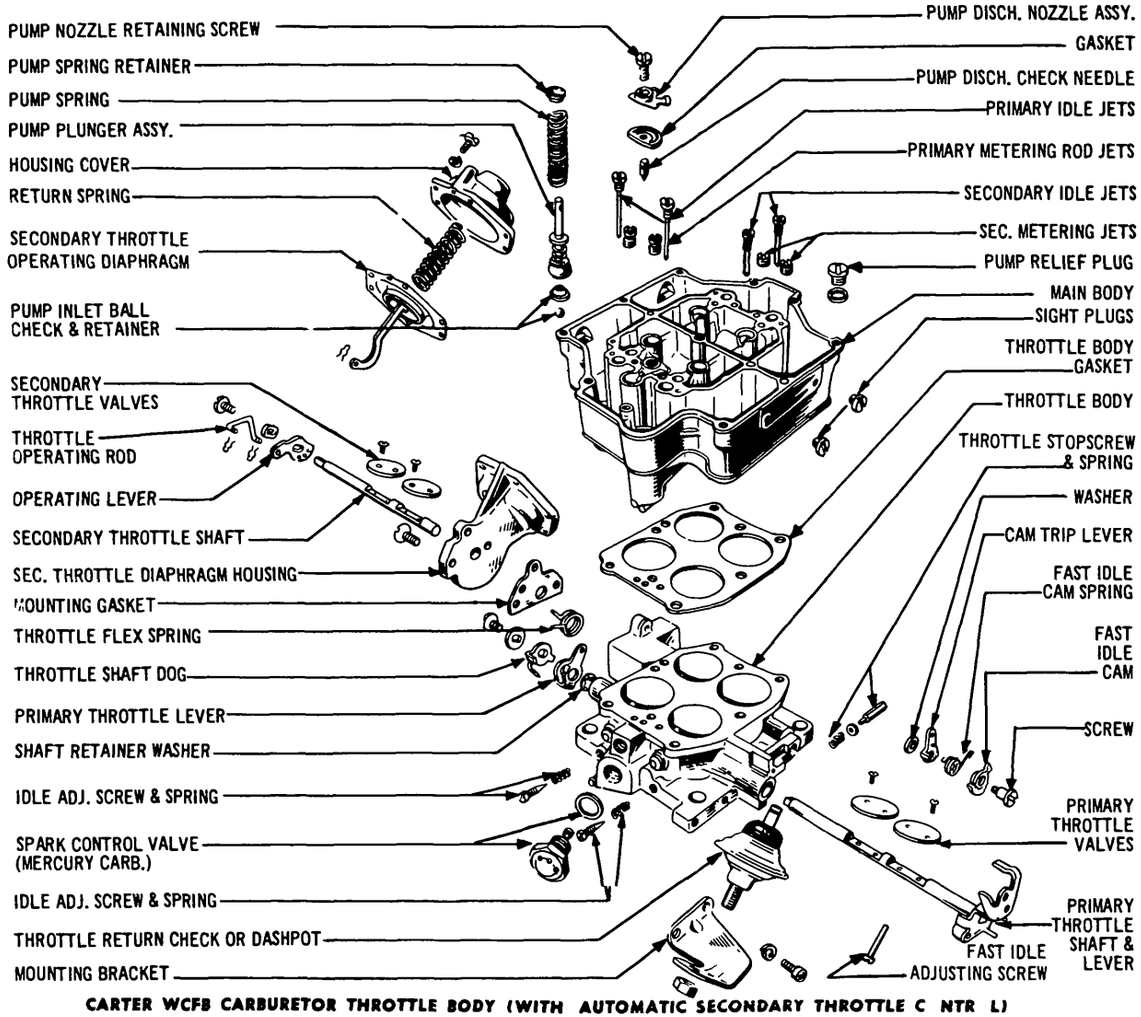
CARTER WCFB 4-BARREL CARBURETORS (C nt.)

check valve permits by-passing of fuel back into the bowl). Pump is effective only at car speeds below 30 MPH. (at higher speeds, pump plunger bottoms in cylinder and air is drawn through the jets from a vent passage opening into the bowl above the fuel level).

Atmospheric Idle Air Vent: *CAUTION—Several types have been used in production as follows:*

First Type (In Air Horn Casting)—Consists of a ball or disc type check valve located in the air horn casting under the dust cover and actuated by an arm on the pump countershaft. Valve is opened when throttle valves are closed to provide an external bowl vent which minimizes hot weather starting and idling difficulties due to fuel vapor formation in the fuel bowl. Vent valve closes when the throttle valves are opened. *NOTE*—On first carburetors produced after this type vent discontinued, a spacer collar was used to cover the flat area around the tapped hole in countershaft (to hold metering rod lever in correct position on countershaft).

Later Type (On Dust Cover)—Consists of a cap type valve on top of dust cover actuated by arm on pump countershaft (arm contacts lower end of valve stem and raises valve off its seat). Vent operates in same manner as first type (above).



►*ADDITIONAL FEATURES NOT FOUND ON ALL CARBURETOR MODELS: Various carburetors, as indicated under "Adjustment" below, will have one or more of the following features.*

Primary & Secondary Throttle Linkage (Except Carburetors with Automatic Secondary Throttle Control): Secondary throttle valve lever is linked to a secondary actuating lever on primary throttle valve shaft with an overrun provision so that secondary valves do not begin to open until primary valves are 50-60% open. The linkage provides a more rapid opening of the secondary valves so that both the primary and secondary valves reach wide open position at the same time. This linkage must be checked and adjusted to insure this synchronized opening. *See Adjustment data.*

Automatic Secondary Throttle Control: Consists of a vacuum type control unit which opens and closes secondary throttle valves in accordance with air velocity through primary venturi (vacuum passage connected at primary venturi). Mechanical override linkage insures that secondary valves will always close with primary valves.

Auxiliary Throttle Valves: Velocity type valves located either over secondary throttle valves in main body or in throttle body. Auxiliary valve action is controlled by counterweight on shaft and valves are not operated by throttle linkage. On some carburetors, these valves are locked out when choke is operating and this lockout must be adjusted. *See Adjustment data.*

Secondary Throttle Lockout (Auxiliary Throttle Lockout on some Models): A means is provided by which the choke mechanism locks the secondary or auxiliary throttle valves closed while the choke is in operation so that no choke valve is required on secondary side of carburetor. This lockout mechanism differs on various carburetors but all types must be checked and adjusted to insure unlocking of the secondary valves for normal operation. *See Adjustment data.*

CARTER WCFB CARBURETOR THROTTLE BODY (WITH AUTOMATIC SECONDARY THROTTLE CONTROL)

Spring Loaded Primary Throttle Valves: Consists of a torsion spring on the throttle shaft between flex dog and throttle spring arm with a stop pin located on throttle shaft dog.

"Cross-Over" Type Automatic Choke: On the models using this type choke, the Thermostatic Coil Assembly is mounted in a well in the manifold and is linked to choke shaft lever by a rod (a plain cover is used on choke housing on air horn and a lever is mounted in end of choke shaft where it extends through cover). This type of automatic choke is adjusted differently.

Automatic Choke (Chevrolet 2816S, 2817S, 2818S, 3059S, 3060S, 3061S Carburetors): Automatic choke assembly is mounted on bracket on carburetor throttle body and is linked to choke valve lever by a connector rod. A special Choke Piston Rod Adjustment is required. See *Adjustments below.* On all other carburetors, automatic choke is mounted on air horn in the conventional manner.

ADJUSTMENT

►*CAUTION: Adjustments should be made in the sequence indicated below.*

CONTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (C nt.)

IDLE SETTING

Idl S tting (Except Cars with Two 4-Barrel Carburetors): With engine at normal operating temperature, automatic choke not operating (choke valve wide open), fast idle inoperative (fast idle screw on low step of fast idle cam), proceed as follows *(NOTE* - If initial adjustment required to allow engine to be started and warmed up, set both idle mixture adjusting screws as indicated in table below). Adjust idle speed adjusting screw for correct engine idle speed (see table below), then adjust each idle mixture adjusting screw (one screw for each primary barrel - two screws only) until engine idles smoothly and vacuum reading and RPM are at a maximum (use Vacuum Gauge and Tachometer) Readjust idle speed Adjust Throttle Return Check and Speed-up Control (where used) as directed on car model pages

Idle Setting (Cars with Tw 4-Barrel Carburetors): See individual car model pages for adjustment procedures and note the following·

►*1956 CHEVROLET CORVETTE RECOMMENDED CHANGE FOR IMPROVED IDLING & LOW SPEED OPERATION See 'Changes, Cautions, Corrections above for recommended changes to be made on these carburetors* Adjust carburetors as follows Adjust idle speed screw on REAR carburetor *(CAUTION - This is throttle stopscrew, NOT Idle Air Adjusting Screw which is not used for adjustments)* for correct hot or slow idle speed (see table below), then adjust both idle mixture screws on each carburetor (rear carburetor first front carburetor last) for highest vacuum reading and engine RPM with best engine idle "feel" Reset idle speed, recheck idle mixture screw setting, check and reset engine idle speed

►*1957-60 CHEVROLET CORVETTE WITH TWO CARBURETORS* Set throttle stopscrew on RFAR carburetor for correct idle speed *(NOTE - Throttle valves on FRONT carbur tor should remain closed at idle speed)* Adjust both idle mixture screws on each carburetor (rear carburetor first, front carburetor last) for best performance and engine idle "feel" Reset throttle stopscrew for correct engine RPM readjust idle mixture screws, recheck and reset engine idle speed

►***1957 CHRYSLER C-300 STUMBLE & STALLING CORRECTION: See "Chang s, Cautions, Corrections" above for idle s tting on these cars***

►*OLDSMOBILE 1955 NOTE* Manufacturer recommends that after setting idle as above (for highest vacuum reading and RPM), each screw should be turned out (Rich) ¼ turn which will provide desired idling performance Check this setting by opening throttle to 1000 RPM point and then snapping throttle closed If engine rolls from richness, turn each screw in (Lean) ⅛ turn

Ⓒ - With selector lever in either "D" (Drive) range, Air Conditioner "ON" (Summer), "OFF" (Winter)
② - With selector lever in "D" (Drive) range
③ - 800-850 RPM with special camshaft
⑭ - With selector lever in "N" (Neutral) range
⑤ - 650-750 RPM on C-300 Models with reworked carburetor *See "1957 Chrysler C-300 Stumble & Stalling C rr ction" abov*
⑥ - 475 RPM with Air Conditioner turn "ON"
⑦ - With selector lever in "H" (High) position
& - With Std Camshaft ③ - With Special Camshaft

CARTER WCFB 4-BARREL CARBURETORS (C nt.)

►*CADILLAC IDLE SPEED SETTING PROCEDURE* Set idle speed in accordance with season as follows When air-conditioning being used (Summer months), place selector lever in "Dr," turn Air-conditioner "ON," set idle speed at 400 RPM When air-conditioning not being used (Winter months), place selector lever in "Dr," see that Air-conditioner "OFF," set idle speed at 400 RPM (it will be necessary to cut idle speed setting down from summer setting to maintain this 400 RPM idling speed)

Throttle Return Check (Dashpot) Adjustment: Used with some automatic transmissions. *See "CARBURETOR" n individual car model pages.*

Cadillac Idle Speed-up Control (Air Conditioned Cars): *See "CARBURETOR" on individual car model pages.*

Float Setting: *CAUTION - Primary & Secondary Float Assemblies must be checked and adjusted separately and both FLOAT LEVEL and FLOAT DROP must be checked for each assembly.* Remove bowl cover and float assembly from carburetor for these checks.

Float Level - Check and adjust as follows. Remove bowl cover gasket (take out float hinge pins, remove float assemblies and intake needles attached, remove gasket, reinstall floats). Invert bowl cover. Install correct gauge for each float assembly (see table below) on bowl cover under center of floats with notched ends of gauge fitted tightly against sides of bowl cover casting. Both floats should just clear horizontal section of gauge (adjust by bending float arms as required) and each float should barely touch vertical uprights on gauge (bend arms sideways for this clearance). This sideways adjustment is extremely important to prevent floats hanging up on sides of bowl casting.

"WEDGE TYPE" FLOAT CHECKING CAUTION: Float measurements (both horizontal and vertical) should be made near free end of floats

Float Setting

Ⓒ - Supersedes previous setting of 1/8"

Ⓑ - Supersedes previous setting of 3/16".

Float Drop - *Primary & Secondary Float Drop is different on some carburetors Check and adjust all carburetors as follows* Hold bowl cover assembly upright so that floats hang down freely Use a scale to measure from machined lower surface of bowl cover (gasket removed) to top of float at center (or bottom of float at free end on carburetors noted in table) If distance not correct as shown in table below, adjust by bending stop tabs on float bracket

Float Drop Setting

►*ADJUSTMENT CAUTION* When making pump stroke adjustment (above), throttle connector link should be bent at upp r angle on the following carburetors 2082S (Early), 2181S (Early), 2253S (Early), 2302S,SA, SB (Early), 2303S, SA SB, 2317S, 2432S (Early), 2442S (Early), 2443S, SA (Farly), 2444S, 2445S, 2474S (Farly), 2476S

►*STUDEBAKER ADJUSTMENT NOTE* On carburetors with dashpots, there should be 015" clearance between countershaft arm and dashpot bracken when making pump stroke adjustment (above) If necessary, bend throttle connector rod slightly

Metering Rods (Primary Side): No gauge required for this adjustment and no metering rods are used on secondary side. With dust cover removed and primary throttle valves fully seated (as for Pump Stroke Adjustment), loosen setscrew in metering rod arm on pump countershaft just enough so that arm has slight bind on shaft, lift arm slightly, Depress metering rod link until metering rods just bottom in bowl casting, position metering rod arm so that it just contacts link, tighten arm setscrew. Then adjust Atmospheric Idle Vent (below).

ATMOSPHERIC IDLE VENT

Atmospheric Idle Vent (Bowl Vapor Vent): *NOTE - This vent not used on all carburetors* Vent is located on dustcover and operated by arm on pump countershaft within dustcover recess Check and adjust vent as follows Make certain that gasket is in place and that dustcover is tight Back out throttle stopscrew so that throttle valves are fully closed Use gauge to check clearance between lower edge of vapor vent valve and valve seat on top surface of dustcover If clearance not correct (see table below) adjust by removing dustcover and bending vapor vent arm

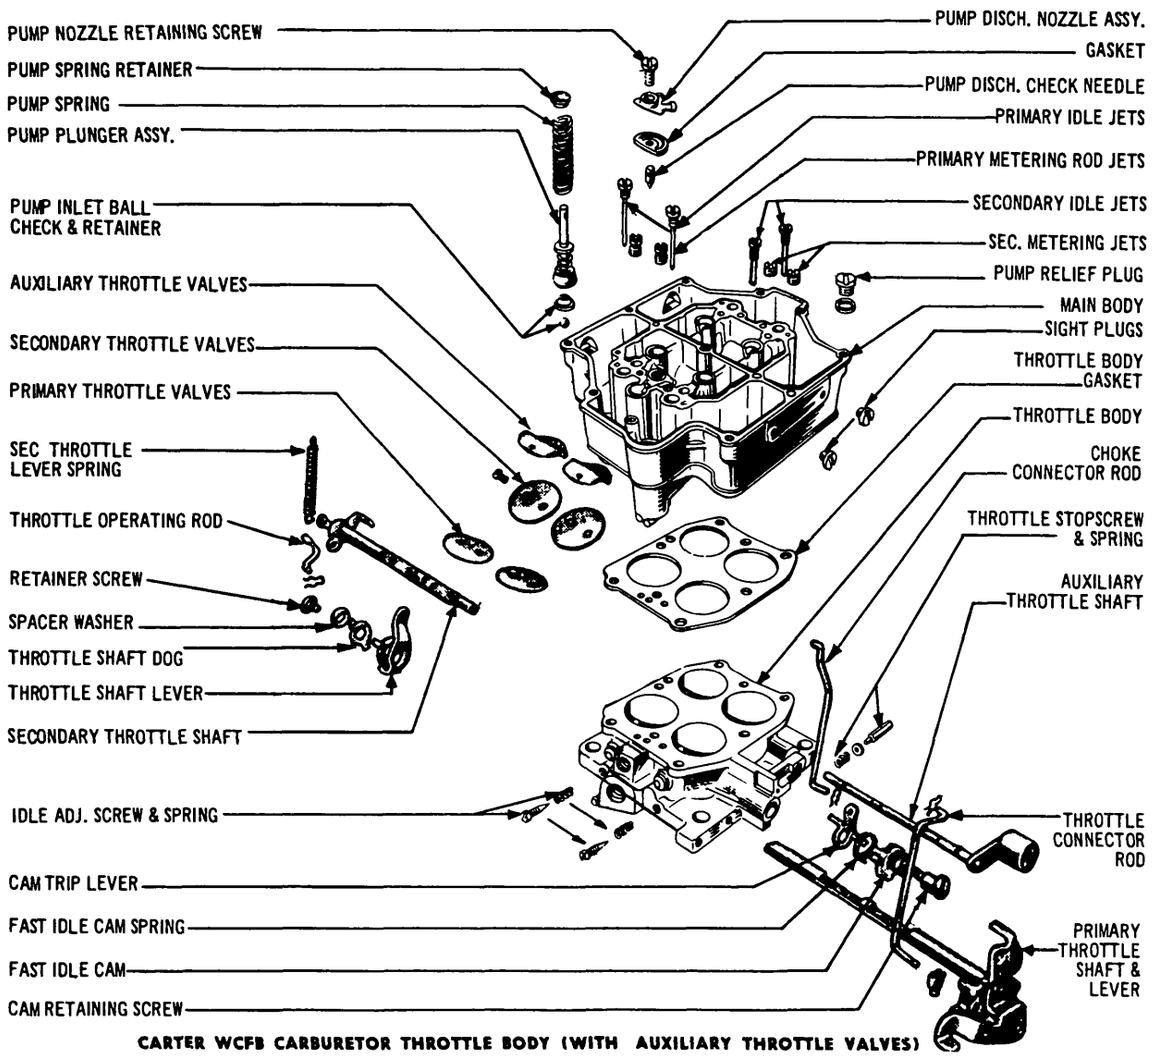
AUTOMATIC CHOKE



►*AUTOMATIC CHOKE NOTE: Choke Modifier is used on all Cadillac carburetors and a "Cross-Over" type choke is used on some DeSoto, Dodge & Plymouth Carburetors* Chevrolet carburetors with Automatic Choke mounted on throttle body require special Choke Piston Lever Adjustment (choke piston located in air horn) as directed below Adjust each type automatic choke as follows

Choke Setting (Except Choke Modifier & "Cross-Over" type Chokes): Adjust by loosening choke cover screws and rotating cover and coil assembly to align index mark on cover with correct mark on choke housing See table below for settings.

►*CHEVROLET ADJUSTMENT CAUTION (2816S, 17S, 18S, 3059S, 60S, 61S)* On these models with automatic choke assembly mounted on throttle body, thermostatic coil and housing assembly is reversed and should be rotated **counterclockwise** for leaner setting (clockwise on other models)

Choke Setting ("Cross-Over" Type Choke): DeSoto 2532S, Dodge 2532S, 2622S, SA, 2698S, 2660S, Plymouth 2302S, SA, SB. 2442S, 2530S - "Cross-Over" type choke is mounted in a well in manifold casting To adjust, with unit off engine, loosen mounting post locknut and turn mounting post with screwdriver until index mark on disc is centered on scale. When choke is installed on engine, lift cover disc and open and close choke valve manually to make sure connector rod clears sides of hole in housing cover If rod does not clear, replace unit (bending the rod will affect choke calibration) *See "Carter & Stromberg (Cross-Over) Automatic Choke" for complete data.*

Choke Setting (Cadillac Carbs. with Choke Modifier): Loosen choke cover retaining screws, rotate cover assembly as required (see table below for settings), then tighten cover screws to retain this setting. Disconnect choke modifier rod at lower end and rotate metal pointer and lever (to which rod is connected) counterclockwise from its free position until thermostatic coil spring picks up the choke valve lever, then continue to rotate pointer until it lines up with plastic pointer on cover Hold pointer in this position Loosen clampscrew in modifier lever, rotate lever until it points forward (away from fuel inlet) and scribed line on lever is vertical, then tighten clampscrew. Use Bending Tool J-1137 to bend modifier rod at upper angle until rod freely enters hole in primary throttle valve lever with throttle valves seated. Connect rod and install clip.

② - On 1959 cars, set 1 or 2 Pts. Rich when installing improved choke piston to correct stumble or hesitation complaints *See Changes, Cautions, Corrections (above).*

Ch ke Piston L ver Adjustment (Chevrolet 2816S, 17S, 18S; 3059S, 60S, 61S): *Not required on other carburetors wh re automatic choke mounted on air horn and linked dir ctly to choke shaft lever* Remove automatic choke cover and coil assembly, gasket, and baffle plate for access to choke vacuum piston Modify a 028" wire gauge (Tool T109-189) by bending outer 1/8" portion of wire at 90° angle. Block throttle valves approximately half open Open choke valve and insert wire gauge in choke piston cylinder so that bent end is between top of slot in cylinder and bottom of slot in piston, close choke valve by pressing on piston lever until wire gauge is gripped and held in place *(NOTE* - A rubber band can be used to hold choke lever in this position while checking choke valve opening) Choke valve opening or clearance between top edge of valve and air horn wall should be as shown in table below Adjust by bending choke connector rod at lower angle

Chok Pist n Lever Setting

Car & Carb.	Choke Opening	Checking Gauge
Chevrolet 2816S	032"	Ⓒ
Chevrolet 2817S,3060S,3061S	080"	T109-234
Chevrolet 2818S, 3059S	3/32"	T109-125

Ⓒ - Supersedes original specification of 080" (Gauge T109-234) to correct stalling when cold *See Changes, Cautions, Corrections above*

Ch k R d Adjustm nt: *This adjustment is preliminary to checking and adjusting Fast Idle, Unloader, and Secondary Throttle Lockout* Loosen choke lever clampscrew, insert wire gauge of correct size (see table below) between tang on fast idle cam and boss on throttle body casting (hold gauge in place by pressure on choke lever) and take up all slack in linkage Hold choke valve closed and tighten clampscrew

Ⓒ - No clearance (cam lip should lightly contact boss on flange casting)

Fast Idle Setting: This adjustment can be made with carburetor "Off Engine" (on the bench), or with carburetor "On Engine" (with engine operating)

►*CHEVROLET CORVETTE 2614S & 2627S ADJUSTMENT NOTE:* **Tang on throttle lever is used instead of a fast idle adjusting screw Adjustment is made by bending this tang**

►*CHEVROLET NOTE (2816S, 2817S, 2818S, 3059S, 3060S, 3061S)* No fast idle adjustment required on these carburetors Fast idle speed will be correct when hot or slow idle speed correctly set

►*CHRYSLER 2535S, DE SOTO 2636S, DODGE 2535S & 2634S, PLYMOUTH 2632S & 2762S ADJUSTMENT CAUTION On these models, no fast idle adjusting screw is used and fast idle should be adjusted as follows* Insert wire gauge of correct size (see table below) between primary throttle valves and carburetor wall on side opposite idle adjusting screws, move choke valve to fully closed position, bend fast idle tang on throttle lever so that throttle valves have slight drag on gauge with tang resting on high step of fast idle cam

►*OLDSMOBILE NOTE·* Manufacturer recommends that fast idle be set with carburetor on engine (see "On Engine" Adjustment below)

Fast Idle Adjustment "Off Engine"—Hold choke valve tightly closed so that fast idle cam rotated to point where high step of cam is under fast idle screw Turn fast idle screw in or out until primary throttle valve opening is correct (see table below) Measure this opening between edge of valve and carburetor wall on side opposite idle ports

ℂ - No fast idle adjusting screw *See special Adjustment Caution above.*

℗ - Manufacturer recommends that fast idle be set "On Engine" (below)

Fast Idle Adjustment "On Engine"—Engine and Transmission must be at operating temperature, shift lever in neutral, and air cleaner in place (Buick—Disconnect fast idle connector rod from trip lever so that cam may be held in "cold" position while engine running with choke valve fully open) On models listed below rotate fast idle cam so fast idle screw rests on high step of cam Adjust fast idle screw to obtain fast idle speed as indicated in table below

►*CHEVROLET CORVETTE 2614S & 2627S ADJUSTMENT NOTE:* Tang on throttle lever is used instead of a fast idle adjusting screw Adjustment is made by bending this tang

1954-56 Buick

Checking & Adjustment: Place transmission in neutral Remove left oil filler cap (1956). Back off throttle stopscrew and make sure that fast idle cam is in slow idle position and throttle valves are fully closed On Buick Dynaflow cars, make sure dashpot is properly adjusted and is not holding throttle valves open Hold a 6" straightedge against rear face of throttle lever lower arm (1956 Buick), against choke unloader arm (other models), with scale resting on rocker cover or against carburetor body Mark rocker cover or carburetor body at edge of scale Turn on ignition and slowly open throttle until starter begins to operate, then make a second mark on rocker cover or carburetor body at this point Distance between marks should be as indicated in table below Adjust switch by changing timing shims on contact spring *See "Carter Car Starter" in Electrical Section*

Carter Car Starter Switch Setting

Car Model	Arm Travel
Buick (1952-54)	3/4-1 1/16"
Buick (1955)	9/16-15/16"
Buick (1956)	1/2-13/16"

AUXILIARY THROTTLE VALVES

Auxiliary Throttle Valves (Buick 2082S, 2197S, 2358S, 2347S;Chevrolet 2555S, 2505S,SA, 2655S, 2626S, 2627S, 2669S, 2657S, 2656S, 2362S, 2419S, 2613S, 2614S, 2626S, 2627S, 2816S, 2817S, 2818S, 2059S, 3060S, 3061S; Chrysler 2317S, 2444S, 2445S, 2534S, 2525S, 2741S, 2742S; DeSoto 2317S, 2476S, 2445S, 2532S, 2635S, 2636S; Dodge 2253S, 2181S, 2303S,SA,SB, 2474S, 2432S, 2443S,SA, 2476S, 2445S, 2532S, 2622S,SA, 2633S, 2634S, 2535S, 2698S, 2660S; Hudson, Nash & Rambler 2593S,SA; Packard 2394S, 2575S; Plymouth 2253S, 2302S,SA,SB, 2442S, 2530S,SA, 2631S, 2632S, 2725S, 2761S, 2762S; Pontiac 2364S,SA; Studebaker 2394S, 2574S, 2575S, 2829S, 2830S): Velocity type valves located directly above secondary throttle valves On some carburetors, the auxiliary throttle valves are locked out when choke is operating S *"Auxiliary Throttle Valve Adjustment" and "Auxiliary Throttle Valve Lockout Adjustment" below for carburetors in which these adjustments are required.*

Auxiliary Throttle Adjustment (Buick 2082S, 2197S, 2358S, 2347S; Chrysler 2317S, 2444S, 2445S, 2534S, 2535S; DeSoto 2317S, 2476S, 2445S, 2532S, 2635S, 2636S; Dodge 2253S, 2181S, 2303S,SA,SB, 2474S, 2432S, 2443S,SA, 2476S, 2445S, 2532S, 2622S,SA, 2534S, 2535S, 2660S, 2698S; Plymouth 2253S, 2302S, SA,SB, 2442S, 2530S,SA, 2631S, 2632S, 2725S, 2761S, 2762S) - Disconnect secondary throttle operating rod Adjust stop lug on secondary throttle lever using Bending Tool T109-214 until clearance between lower edge of auxiliary throttle valve and bore is 27/64" (Gauge T109-242) with stop lug against stop on flange.

Auxiliary Throttle Valve Lockout Adjustment (Buick 2082S. 2197S, 2358S, 2347S; Chrysler 2317S, 2445S; DeSoto 2317S, 2476S, 2445S, 2532S, 2636S; Dodge 2253S, 2181S, 2303S,SA,SB, 2474S, 2432S, 2443S,SA, 2476S, 2445S, 2532S, 2622S,SA, 2600S, 2698S; Plymouth 2253S, 2302S,SA,SB, 2442S, 2530S,SA, 2632S, 2725S, 2762S) - *NOTE - This adjustment should be made after completing fast idle adjustment.* With choke valve closed, edge of hook on lockout arm should contact auxiliary throttle lever, making maximum contact of

CONTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (C nt.)

locking step on lever. Open choke valve, auxiliary valves should become unlocked a few degrees before choke reaches wide open position. Adjust by bending lockout arm.

Auxiliary Throttl Valve Lockout Adjustment (Chevr let 2816S, 2817S, 2818S, 3059S, 3060S, 3061S; Chrysl r 2535S, 2742S; Dodge 2535S, 2634S) - *NOTE - This adjustm nt should be made after fast idle and secondary thr ttl l ver adjustments have been completed.* Crack throttle valve and hold choke valves tightly closed, then close throttle. Lockout dog on auxiliary throttle shaft should freely engage in notch in lockout arm. To adjust, bend lockout dog on auxiliary throttle shaft.

SECONDARY THROTTLE LEVER & LOCKOUT

Sec ndary Throttl Op rating Lever Adjustment: *CAUTION - Adjustment procedures and settings are diff r nt n various carburetors due to type of linkage d sign used. Adjust as follows:*

Buick 2082S, 2197S, 2358S, 2347S; Chrysler 2317S, 2444S, 2445S; DeSoto 2317S, 2476S, 2445S, 2532S; Dodge 2253S, 2181S, 2303S,SA,SB, 2474S, 2432S, 2443S,SA, 2476S, 2445S, 2532S, 2622S,SA, 2698S; Plymouth 2253S, 2302S,SA,SB, 2442S, 2530S, 2631S, 2632S, 2725S, 2761S, 2762S - Stop lugs on both primary and secondary throttle levers should contact stop bosses on throttle body at the same instant that throttle valves are opened. *NOTE - At this point, secondary throttle valv s will b a few degrees from wide open position.* Adjust by bending secondary throttle operating rod at angle, using Bending Tool T109-213.

Cadillac 2109S, 2110S; Chevrolet 2218S; Chrysler 2041S; Dodge 2191S, 2660S; Oldsmobile 2059S, 2246S; Packard 2142S, 2103S, 2112S; Studebaker 2214S,SA,SB, 2219S,SA,SB - Primary and secondary throttle valves must reach wide open position at the same instant. Adjust by bending secondary throttle operating rod at upper angle, using Tool T109-213.

Chrysler 2126S; D Soto 2210S; Mercury 2361S,SA - Block choke valve in wide open position, back out throttle stopscrew so that primary throttle valves are fully closed. Hold secondary throttle valves slightly open and close primary throttle valves. Secondary throttle valves should close tightly the same instant as primary valves. Hold primary valves closed. It should not be possible to open secondary throttle valves. Adjust by bending throttle operating rod (secondary connector rod) slightly at angle bend.

Chevrol t 2351S, 2366S,SA, 2626S, 2627S, 2362S, 2418S, 2613S, 2614S; Chrysler 2534S, 2535S, 2741S, 2742S; DeS t 2635S, 2636S; Dodge 2534S, 2535S; Packard 2232S, 2284S, 2394S, 2575S; Pontiac 2283S, 2268S, 2364S,SA; Studebaker 2330S, 2394S, 2574S, 2829S, 2830S - Primary and secondary throttle valves must reach wide open position at the same instant. Adjust by bending throttle operating rod at upper angle with Bending Tool T109-213. Close primary and secondary throttle valves tightly, then check clearance between positive closing shoes on primary and secondary throttle levers. This clearance should be .017-.022" (2351S, 2366S,SA, 2626S, 2627S, 2362S, 2419S, 2613S, 2614S, 2232S, 2284S, 2283S, 2268S, 2364S,SA, 2330S, 2829S, 2830S); .008-.013" (2394S); .010-.030" (2534S, 2535S, 2741S, 2742S, 2574S, 2575S); .020" (2635S, 2636S). Adjust by bending shoe on primary lever (all carburetors except following); on secondary lever (2613S, 2614S, 2534S, 2535S, 2741S, 2742S, 2574S, 2575S).

Chevrolet 2555S, 2505S,SA, 2655S, 2669S, 2657S, 2656S, 2816S, 2817S, 2818S, 3059S, 3060S, 3061S; Hudson, Nash & Rambler 2593S,SA - Two adjustments required as follows:

1) Block choke valves wide open and back out throttle lever stopscrew so that throttle valves are fully closed. Open primary valves to a point where secondary valves just start to open. Primary throttle valve opening at this point should be 3/16"(2505S,SA, 2555S, 2656S, 2657S); 11/64" (2669S, 2593S, 2818S, 3059S); 7/32" (2816S, 2817S, 3060S, 3061S). Adjust by bending throttle operating rod. Check wide open position. Secondary valves should be a few degrees from wide open position with primary throttle valves wide open.

2) With primary and secondary throttle valves fully closed, clearance between positive closing shoes on primary and secondary throttle levers should be .017-.022" (2505S, 2555S); .010-.030" (2656S, 2657S, 2669S, 2816S, 2817S, 2818S, 3059S, 3060S, 3061S); .008-.013" (2593S). Adjust by bending shoe on primary lever (2505S,SA, 2555S, 2593S); on secondary lever (All Others).

Lincoln, Continental & Mercury 2404S,SA - Block choke valve wide open and back out throttle lever stopscrew so that primary valves seat in bores. When primary and secondary throttle valves are seated there should be a minimum clearance of .010" between lug on secondary operating lever and stop on primary throttle shaft dog. To adjust, bend lug on secondary operating lever with Tool T109-214. *NOTE - Secondary valves seat at top of bore only.*

Secondary Throttle Lockout Adjustment: *NOTE - This adjustment not required on all carburetors. See adjustment procedures following for various carburetors.*

Cadillac 2109S, 10S, 43S; Chrysler 2041S; Dodge 2191S - 1) Hold choke valve closed so high step of fast idle cam is under fast idle screw, then tighten fast idle adjusting screw until primary throttle valves open .015" (Gauge T109-44), measured between edge of throttle valve and carburetor wall on side opposite idle ports. *NOTE - Valve should have slight drag on gauge.* Lock pawl should be in unlocked position at this point. Adjust by bending tang on lock pawl using Bending Tool T109-105. 2) Hold primary throttle valves halfway open, open choke valve fully, then open primary throttle valves fully. Tang on secondary arm should engage in notch in lockout lever preventing secondary throttle shaft movement. Hold choke valve wide open and close primary throttle valves sufficiently so that lock pawl is unlocked, finally open primary throttle valves fully. Lockout lever should fall free allowing secondary throttle valves to be open before primary throttle valves are fully open. Adjust by bending tang on secondary throttle lever as required to provide clearance for correct operation of lockout lever. Readjust Fast Idle.

Chevrolet 2218S, 2351S, 2366S,SA, 2362S, 2505S, SA, 2555S, 2614S, 2626S, 2627S, 2655S, 2669S, 2656S, 2657S, 2818S, 3060S, 3061S; Chrysler 2126S, 2367S,SA, 2314S, SA, 2589S, 2590S; DeSoto 2210S, 2311S,SA, 2588S; Hudson, Nash & Rambler 2593S,SA; Packard 2232S, 2284S, 2394S, 2575S; Oldsmobile 2059S, 2246S; Studebaker 2214S,SA,SB, 2330S, 2394S, 2574S, 2575S, 2829S, 2830S - This adjustment should be made after completing fast idle and secondary throttle lever adjustment. Crack throttle valves and hold choke valve closed, then close throttle. Tang on secondary throttle lever should engage notch in lockout lever. To adjust, bend tang on secondary throttle lever. *NOTE - With choke open, lockout lever should fall free allowing secondary throttle valves to open before primary valves reach wide open position.*

Packard 2142S, 2103S, 2112S - Close choke valve tightly, open primary throttle valves fully and make certain that tang on secondary throttle lever arm is engaged in notch in lockout lever to prevent secondary throttle valves opening. Hold choke valve wide open and open primary throttle valves fully. Check to make certain that lockout lever falls free allowing secondary throttle valves to open before primary valves are fully open. Adjust as necessary by bending tang on secondary throttle lever to provide clearance for correct operation of lockout lever.

Primary Throttle Shaft Dog Adjustment (Spring Load d Primary Throttle Linkage): Chrysler 2314S,SA, 2367S, SA, 2589S, 2590S; DeSoto 2311S, SA, 2588S - With primary throttle valves wide open, adjust secondary operating rod so there is .054-.064" clearance (Gauge T109-193) between upper edge of secondary throttle valve (next to idle port) and bore of carburetor. Place 1/4" gauge (T109-31) between upper edge of primary throttle valve and bore of carburetor (next to idle port) and adjust long tang on primary throttle shaft dog (use Tool T109-214) so that inner arm of spring just contacts inner lug of secondary operating lever and secondary valves just start to open. With primary and secondary throttle valves tightly closed, there should be .005" clearance (Gauge T109-237) between outer lip on secondary operating lever and stop lug on primary throttle shaft dog. To adjust, bend outer lip on secondary operating lever, using Tool T109-214. *NOTE - Make sure that secondary operating lever operates freely and does not bind in any position.* With primary and secondary valves tightly closed, there should be .040" clearance (Gauge T109-193) between short tang on primary throttle shaft dog and outer arm of spring. Adjust by bending short tang on primary throttle shaft dog with Tool T109-214.

Lincoln & Continental 2404S,SA, Mercury 2404S,SA, 2361S - Place a .030" gauge, T109-29 (2404S,SA), .076" gauge, T109-215 (2361S) between wide open stop tang on primary throttle lever and stop on flange. Adjust upper lug of throttle shaft so that upper arm of spring lightly contacts tang of throttle operating lever. Hold

C NTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (Cont.)

primary and secondary throttle valves in wide open position. Adjust lower lug of throttle shaft dog so lower arm of spring lightly contacts center web of throttle operating lever. Use Bending Tool T109-214 to adjust lugs on throttle shaft dog.

Automatic Secondary Throttle Control (Chrysler 2367S,SA, 2314S,SA, 2589S, 2590S; DeSoto 2311S,SA, 2588S; Lincoln & Continental 2404S,SA; Mercury 2361S,SA, 2404S,SA): This unit requires no adjustment. Bend operating rod as necessary to insure secondary valves closing simultaneously with primary valve. See that linkage is free and that there are no vacuum leaks between carburetor body and unit.

OVERHAUL: *CAUTION - When disassembling carburetor, keep PRIMARY and SECONDARY side parts separate so they will not be interchanged when carburetor assembled. Mark location of primary and secondary throttle connector rods in holes of throttle levers and arms for correct reassembly. Note number of turns secondary throttle return spring is "wound-up" with throttle closed.*

Disassembly: Carburetor consists of three main subassemblies (Air Horn & Bowl Cover, Bowl and Throttle Body) which can be overhauled separately.

Air Horn & Bowl Cover–Remove fuel inlet fitting, gasket, and strainer assembly. Disconnect and remove choke connector rod, accelerating pump rod, secondary throttle return spring. Remove dust cover and gasket. Remove metering rods by rotating rods off pins on vacumeter link and lifting rods out carefully. Remove pump connector link by removing pin spring, sliding upper end of link out of pump lever, and rotating link around lever. Remove vent arm (when used) by taking out vent arm screw. Loosen (do not remove) screw holding pump operating lever on pump countershaft and screw in metering rod arm, slide pump countershaft and lever assembly out, remove pump arm and metering rod arm. Take out all air horn attaching screws (inner screws will be lifted out after air horn removed), make certain that screw located within pump countershaft housing is removed, lift air horn assembly straight up (*CAUTION*–use care not to damage floats). Disassemble remaining parts from air horn as follows: Invert air horn on bench, take out float hinge pins, remove floats with intake needles and clips attached, remove needle seats and gaskets (*CAUTION*–Keep each float assembly, intake needle, and needle seat together, DO NOT mix primary and secondary side parts). Remove vacuum piston by rotating it 90° in either direction and lifting it out. Remove accelerator pump plunger assembly. Remove and discard bowl cover gasket. If automatic choke to be disassembled, proceed as follows: Remove choke lever from choke shaft, remove choke valve (file burrs from staked ends of attaching screws before removing the screws), take out attaching screws and remove thermostatic coil housing, gasket, and baffle plate. (*NOTE* - On cars with "cross-over" type choke, remove screws holding dust plate to choke piston housing and slide plate off shaft). On all carburetors, rotate choke shaft counterclockwise to disengage vacuum piston from cylinder, then withdraw choke shaft and piston assembly. Disconnect piston from link by pushing piston pin out with a piece of wire. Take out attaching screws and remove choke housing and gasket (vacuum passage rubber gasket can be removed from inner side of choke housing by rotating gasket with the blunt end of a thin wire).

►*CADILLAC CHOKE CAUTION:* Choke modifier lever can be removed from pointer shaft but DO NOT remove metal pointer or thermostatic coil from housing.

Carburetor Bowl - Invert bowl to remove pump spring and vacuum piston spring. Take out housing screw and remove pump jet housing, gasket, and pump discharge needle (needle will drop out if bowl inverted). Remove primary and secondary metering jets. *CAUTION - Keep these jets separated.* Remove pump relief valve plug and gasket. Remove pump intake ball retainer from bottom of pump cylinder, invert bowl to remove intake check valve. Remove primary and secondary low speed jets. *NOTE - Low speed jets used on both primary and secondary sides of some carburetors.* Loosen bowl to throttle body attaching screws and remove throttle body from bowl.

Throttle Body – Remove two idle adjusting screws and springs (used on primary side only). Remove four idle port rivet plugs. Remove idle stop screw and spring, and fast idle adjusting screw. On carburetors with vacuum diaphragm assembly remove hairpin clips holding throttle operating link to primary and secondary operating levers. Slide link out and away from levers (don't lose washers). Disengage throttle flex spring from tang on throttle flex dog and slide flex dog off primary shaft. Remove operating lever and flex spring. Disconnect vacuum diaphragm plunger from secondary operating lever by removing hairpin clip. Remove operating lever retaining screw and washer, the slide lever off secondary throttle shaft. Remove screws attaching vacuum diaphragm to throttle body and remove diaphragm and gasket. On all carburetors, take out fast idle mounting screw, remove all fast idle parts (fast idle cam, spring, trip lever, and lockout cam and pawl). Remove primary-to-secondary throttle connector rod, remove secondary throttle lever by loosening clamp screw and sliding lever off shaft, remove primary throttle lever screw from end of shaft, remove all lever parts from shaft. **It is recommended that throttle body not be disassembled further,** however, if it is necessary to remove throttle valves and shaft, proceed as follows: (*NOTE - Mark all throttle valves so they can be reinstalled in the proper position with the correct side of valve upward).* File burrs from staked ends of all throttle valve screws and remove screws and valves from shaft. Remove secondary throttle shaft. Remove primary throttle shaft by using a rawhide hammer to tap shaft through retaining washer. Remove auxiliary throttle valves and shaft when so equipped.

Cleaning & Inspection: Wash all parts in carburetor cleaning solvent except pump plunger assembly, thermostatic coil and housing assembly, and choke housing gasket (clean these parts in clean gasoline). Clean and blow out all passages with compressed air. Remove all gum and carbon deposits. Make certain all calibrated restrictions are clean but DO NOT use drills to clean out these passages. Inspect floats for dents and leaks. Check choke and throttle shafts for excessive wear, inspect pump plunger leather and replace plunger if cracked or creased. See that choke piston operates freely in cylinder (if carbon or dirt present in slots, remove welch plug in bottom of housing to clean slots, install NEW welch plug and make certain that it is air-tight).

Reassembly: Use all NEW gaskets. Install all parts in reverse order of disassembly procedure (above), pay particular attention to the following points.

Valve Installation - Use new screws when installing valves. Install throttle valves as follows: Before tightening screws, shift valves to provide closest possible fit in barrel in closed position (short end of auxiliary valves should have a good bearing on stop bosses), tighten screws securely and stake ends lightly (*CAUTION* - Support shaft on steel block while staking screws). Install retaining washer on end of primary shaft with prongs outward, press washer in on shaft, just far enough to obtain snug fit without endplay in shaft.

① - Port opening above top edge of throttle valve.
② - Bottom of port above top edge of valve.
③ - Top of port above top edge of valve.
④ - With .039-.041" diameter spark port.
⑤ - With 080-.082" diameter spark port.
⑥ - No secondary idle system used.
⑦ - .018-.028" on early 2218S carburetors.
⑧ - None used.
⑨ - Early carburetors.
⑩ - Later carburetors.

① - Carter WCFB carburetor used in early production.
② - Replaces 2650S when used with strainer nut, Carter No. 15-58S.
③ - Used in limited production. Replace with 2805S.
④ - Replaces 2651S when used with strainer nut, Carter No. 15-58S.
⑤ - Synchro-mesh trans. ⑥ - Automatic trans.
⑦ - Golden Commando.

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 BUICK CHOKE VALVE STICKING CORRECTION (Causing Hard Starting):* This condition is caused by air cleaner interference with choke linkage which allows the choke to be held open. Correct by installing a new carburetor-to-air cleaner gasket, Part No. 1458911.

►*1957 BUICK CARBURETOR CHANGES FOR IMPROVED PERFORMANCE:* Make the following changes on carburetors bearing date codes before "B-7". On carburetors with date code "B-7" and later or with date codes having a suffix letter "X", the changes have been made in production. On carburetors having an "X" stamped or scribed adjacent to left front mounting bolt hole, indicates that the changes were made in service. Date codes are stamped on the rear portion of the throttle body flange (brass identification tags are no longer stamped with the date codes)

1) Accelerating Pump Plunger Spring Replacement (To eliminate a lean flat spot on light acceleration) - Install pump plunger and spring assembly, Carter No. 64-209S.

2) Secondary Throttle Operating Lever (To eliminate a lean or sag spot) - This condition may be experienced when engine is at normal operating temperature on one-half to seven-eights throttle acceleration. Correct by installing Secondary Throttle Operating Lever, Carter No. 53A-419, noting the following: When installing lever, secondary throttle return spring should be wound one complete turn clockwise. Make sure that the pick-up lever on primary throttle shaft contacts the loose lever at both points at the same time. If not, bend pick-up lever to obtain proper engagement. Also make sure that primary and secondary throttle valves come to wide open position at the same time. Bend throttle connecting link as necessary.

3) Automatic Choke Vacuum Piston (To eliminate a loading condition on early warm-up) - Install Automatic Choke Piston, Carter No. 160-125.

►*1957 BUICK ENGINE ROUGHNESS & INCORRECT IGNITION TIMING CORRECTION:* On cars having carburetors bearing code dates K-6, L-6, M-6 & A-7 (Stamped on rear portion of throttle body flange), this condition may be caused by distributor vacuum advance operating during engine idle. To check, operate engine at 485 RPM and disconnect vacuum spark line at throttle body. Attach a vacuum gauge to fitting on carburetor and if gauge indicates 5" or more of vacuum, the one throttle valve (primary) which operates vacuum advance unit must be replaced using Throttle Valve, Carter No. 2-208. If for any reason, production throttle valves on the above identified carburetors need replacement, and the vacuum advance operation has been satisfactory, the standard throttle valve, Carter No. 2-186 should be used.

►*1958 CADILLAC EARLY CARBURETOR PRODUCTION CHANGE & REWORK NOTE:* Beginning with Engine No. 057758 (Air.Cond.Cars), No. 058491 (Others), new carburetors (2862S, 2863S) having a new fast idle cam, choke coil, and enlarged restriction entered production. Earlier carburetors (2696S, 2697S, 2802S) can be modified for improved performance as follows:

Fast Idle Cam - To reduce engine idle speed when a warmed-up engine has been restarted after a short cool down period, install a new fast idle cam, Carter No. 181-262.

Choke Coil - A new "softer" choke coil ("AD" Type), Carter No. 170AD-521S should be installed. Set the new coil at "index" instead of 1 notch lean as on previous type coil.

Choke Restriction - Enlarge the choke restriction in bowl casting to .089" (No. 43 drill). This will enable choke to come off sooner.

►*1957 CHRYSLER CARBURETOR FLOODING CORRECTION:* This condition is caused by dirt or foreign matter lodging between fuel inlet needle and seat and can be corrected by installing a new fuel inlet needle and seat assembly, Carter No. 25-343S which has a longer standpipe than previous assemblies. When installing this new assembly, thoroughly clean carburetor and fuel filter. *NOTE* - If Carter No. 25-343S is not available, Carter No. 25-279S can be used by cutting off the standpipe section so the overall length is 1 1/16". Remove all burrs and clean thoroughly before installing.

►*1958 CHRYSLER, DESOTO, DODGE, PLYMOUTH FLOAT ADJUSTMENT CAUTION:* Two different type floats used in these carburetors. Float level specifications are different (see "Adjustment" below).

►*1958 CHRYSLER UNSATISFACTORY WARM-UP PERFORMANCE CORRECTION (Carter AFB 2650S & 2651S Carburetors):* To correct poor warm-up performance or frequent stalling during warm-up, first check and adjust Carburetor Idle Mixture and Speed, Ignition Timing, and operation of Manifold Heat Control. If condition not corrected, and if fully warmed-up engine performance satisfactory, *adjust choke linkage as directed under "Choke Piston Lever Adjustment" below.*

►*1958 CHRYSLER HESITATION & STUMBLE ON ACCELERATION (AFTER ENGINE IS WARMED UP) CORRECTION:* If correct engine tune-up and carburetor adjustment does not eliminate the condition, connect upper end of accelerator pump connector rod to inner hole in pump arm. If condition still exists, replace the power jet rods (step-up rods) using two Carter No. 16-45 rods. Clean fuel filter and filter bowl, then adjust adjust idle mixture and idle speed to specifications.

►*1958 DESOTO FIRESWEEP (2773S & 2642S CARBURETORS) HESITATION & FLAT SPOT CORRECTION:* This condition is more noticeable on acceleration at slower speed (0-40 MPH) and may be corrected by installing two .091" Primary Metering Jets, Carter Part No. 120-155 in place of the original .089" jets, Carter Part No. 120-159. In some instances it may be necessary to set accelerator pump linkage to the long stroke for cold weather operation (make this adjustment only if road test indicates that it is necessary)

►*1958 DESOTO, DODGE & PLYMOUTH V8 STALLING DURING WARM-UP CORRECTION (Cars with Carter AFB 2641S, 2642S or 2644S Carburetors):* Engine stalling after starting and when accelerating during warm-up period may be caused by choke vacuum piston opening choke valve too far and can be corrected by lengthening piston link as follows: With choke valve held tightly closed, remove and discard cotter pin at-

CONTINUED ON NEXT PAGE

1957-58 CARTER AFB 4-BARREL CARBURETORS (C nt.)

taching choke piston link to bracket on choke valve. Use a piece of straight wire .060" in diameter and 1¾" long (1/16" welding rod) to attach link by passing wire through both holes in choke valve bracket (end of wire should protrude 1/8" on other side) and threading long end of wire through hole in choke piston link. Hold wire tight against bracket and wrap end of wire behind the short end and over top of bracket.

►*1958 DODGE SECONDARY THROTTLE VALVE IMPROPER OPERATION CORRECTION:* A new throttle flex spring, Carter Part No. 61-623 is being used in production and may be used on earlier cars to improve secondary throttle valve opening. This spring is fastened on right end of primary shaft and acts as the connector between primary and secondary throttle shafts. If secondary throttle shaft is sticky or slightly bent, the new spring having a heavier action, will improve the operation.

►*1958 DESOTO & DODGE CHOKE HOUSING & SETTING PRODUCTION CHANGE (2773S):* Thermostatic coil, housing and rod assembly, Carter No. 170AX-515S replaced by No. 170AU-515S in later carburetors. Choke setting on early carburetor with 170AX-515S is 2 points rich. On later 170AU-515S, the setting is centered (on index).

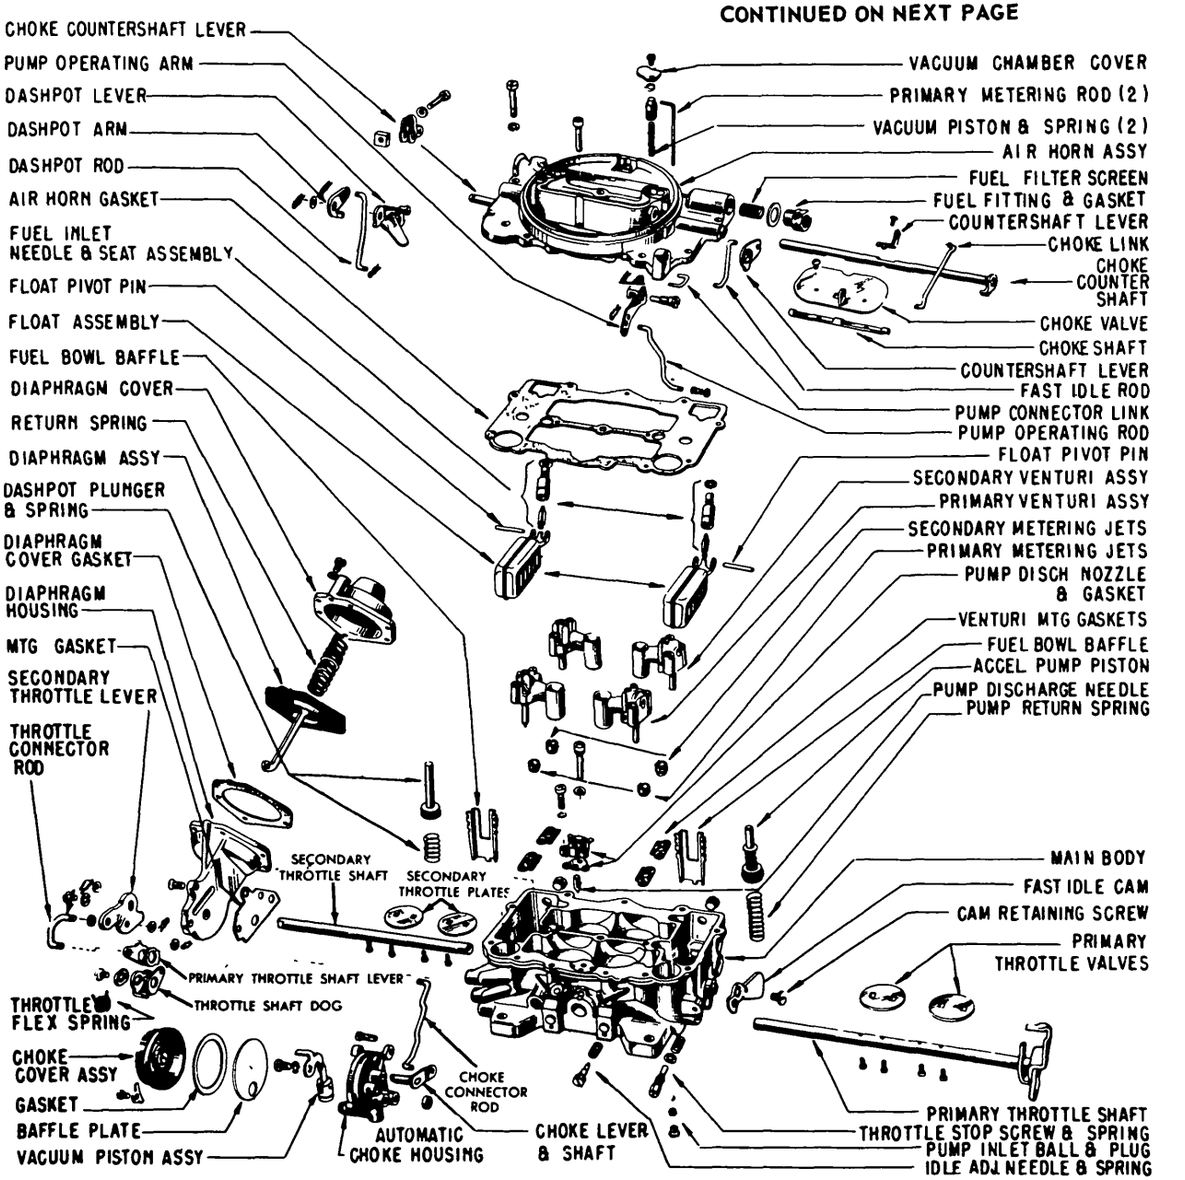
►*1957 FORD & MERCURY SURGE AT 50-60 MPH (DUE TO LEANNESS) CORRFCTION:* Install the following new parts: Primary Venturi Assembly (choke side), Carter No. 58-179S. Primary Venturi Assembly (pump side), Carter No. 58-180S. Vacuum Piston Spring, Carter No. 61-259. Step-Up (Metering) Rod, Carter No. 16-28.

►*1957 FORD & MERCURY SECONDARY JET CHANGE (To correct rich mixture at high altitudes):* When installing 2-step lean step-up rods for high altitude operation (10,000-15,000 ft.), install secondary metering jet, Carter No. 120-186, which supersedes Carter No. 120-176.

►*1957 FORD & MERCURY CHOKE SETTING CHANGE:* Initial choke setting has been changed from 2 points rich to 1 point rich from index.

►*1957 FORD HARD (HOT) STARTING CORRECTION:* Install a new "resinoid" spacer, Part No. B7A-9603-D between carburetor and intake manifold to replace the former aluminum spacer. Heat transfer between manifold and carburetor will be reduced with the later type spacer.

►*1958 FORD POOR GAS MILEAGE AND ROUGH ENGINE IDLE CORRECTION:* If the above condition is caused by improper choke operation, install choke housing, Carter No. 170AD-478S. The correct setting for the new choke assembly is **2 notches lean.** Make sure that manifold heat stove and connecting line do not have a vacuum leak.



►*1958 FORD V8 HARD HOT STARTING CORRECTION (Carter 2640S,SA Carbs.):* On carburetors not vented in lower venturi (provided on early carburetors only), correct above condition by drilling external bowl vents in bowl cover as follows: Remove carburetor bowl cover, remove floats and intake needles (mark for reinstallation), dashpot linkage and gasket. Center punch hole locations on each side of bowl cover as specified below, use 9/64" drill to drill holes through **outer** wall of air horn only *(CAUTION* - Stop drilling as soon as drill breaks through into vent passage). Remove burrs, carefully clean chips from bowl cover, reassemble carburetor.

Left Side Vent Hole - Viewing bowl cover with choke housing to left, hole center should be 5/16" below edge of air cleaner mounting surface and 23/64" to **l ft** of choke countershaft center.

Right Side Vent Hole - Viewing bowl cover with choke housing to right, hole center should be 5/16" below edge of air cleaner mounting surface and 23/64" to **right** of choke countershaft center.

►*1958 PLYMOUTH CARBURETORS 2652S, 2653S, 2641S, 2744S SECONDARY THROTTLE VALVE IMPROPER*

CONTINUED ON NEXT PAGE

TYPICAL CARTER AFB 4-BARREL CARBURETOR (FORD & MERCURY)

1957-58 CARTER AFB 4-BARREL CARBURETORS (C nt.)

OPERATION CORRECTION: A new throttle flex spring, Carter Part No. 61-623, is being used in production and may be used on earlier cars to improve secondary throttle valve opening. This spring is fastened on right end of primary shaft and acts as the connector between primary and secondary throttle shafts. If secondary throttle shaft is sticky or slightly bent, the new spring having a heavier action will improve the operation.

►*1958 PLYMOUTH GOLDEN COMMANDO ENGINE INCORRECT TIMING, POOR PERFORMANCE, HARD STARTING, BACK FIRING CORRECTION (CARTER AFB 2653S CARBURETOR):* These conditions may be caused by an improperly located distributor vacuum port in carburetor. To check if vacuum port is properly located, disconnect vacuum line from carburetor and install a vacuum gauge at carburetor vacuum line fitting. With engine running atslow idle (off fast idle), the gauge should not show a reading over 6" of vacuum. If reading is over 6" of vacuum, it is possible the throttle valve (primary) is not covering the vacuum port. To correct, reposition the throttle valve to properly cover port. In some instances it may be necessary to grind blade lip, at vacuum port location, to a thickness of .030".

►*1958 PONTIAC ROUGH IDLE & STALLING (CAUSED BY BUILD-UP OF GUM IN THROTTLE BORES) CORRECTION:* Remove carburetor. *(NOTE* - Do not remove gum deposits from throttle bores). Invert carburetor and drill a 1/8" diameter hole in each **primary** throttle plate at a point approximately centered in the half of the throttle plate located adjacent to outside edge of throttle body. Remove chips and reinstall carburetor. Adjust hot idle speed to 500 RPM, then adjust throttle rod setting with gauge pin and adjust the idle mixture screws.

►*1958 PONTIAC CARBURETOR PRODUCTION CHANGE & IDLE ADJUSTMENT CAUTION:* Later carburetors, No. 2767S, SA, & 2768S, SA have an air by-pass type idle system. The conventional idle speed screw (throttle stop) has been eliminated and hot idle speed is controlled by the air screw. DO NOT install an idle speed (throttle stop) screw on these carburetors.

►*1958 PONTIAC 2767S CARBURETOR PUMP DISCHARGE PASSAGE PLUG FALLING OUT CORRECTION:* If this plug falls out it may be reinstalled without removing carburetor from engine as follows: Use a drift with a ¼" round end having a slight chamfer. *NOTE - A Carter carburetor pump plunger, with retainer and plunger shaft spring removed, can be used as a drift.* Using the drift, tap ball into passage with a light hammer until ball is 1/32" below surface of casting. Use a punch or nail set with a flat end about 1/8" in diameter and stake casting over ball at two points.

►*1958 PONTIAC PART THROTTLE SURGE CORRECTION:* Step-up rods, Pontiac Part No. 7013366, which are slightly richer, should be used to correct this surge condition if the condition cannot be eliminated by normal adjustment procedures.

►*1958 PONTIAC CARBURETOR PRODUCTION CHANGE:* Carburetors No. 2767SA & 2768SA are now being used in production. The later type carburetors have a redesigned and relocated accelerator pump intake ball check. The new ball check is a one piece assembly and is located in the float bowl instead of on the flange gasket surface of carburetor body. Early and later type ball checks are not interchangeable.

►*1958 PONTIAC AIR CONDITIONED CAR STALLING CAUTION & IDLE ADJUSTMENT NOTE:* If it has not been possible to reach 540-560 RPM (with air conditioning turned off), within the range of the by-pass idle air screw, drill .093" holes in primary throttle valve plates halfway between throttle shaft and the idle ports. *DO NOT install conventional idle speed screw on a by-pass type carburetor.*

DESCRIPTION: This carburetor is a four barrel downdraft type having the float bowl (main body assembly) cast integrally with the throttle body. The primary section contains a low speed (idle) system, high speed system, choke, accelerating pump, dashpot, and vacuumoperated metering rods. The secondary section contains only a high speed system. Two separate float bowls are used, each of which supply fuel to one primary and secondary section.

Fuel System: A single fuel inlet and passages in air horn casting direct fuel to right and left hand float bowls. Floats operate independently of each other and the float bowls are vented to the air cleaner with a connecting passage between the bowls to maintain a uniform air pressure on the fuel.

Idling & Low Speed (Conventional System) - Fuel for idling and early part-throttle operation is metered through the low speed circuit on primary side only (secondary throttle valves remain closed). With primary throttle valves closed or at idle position, fuel enters the idle wells through the main metering jets and is metered in the low speed jets. As the fuel passes the economizer, air enters the by-pass and air bleeds and the mixture is discharged at the idle discharge ports and the idle mixture adjustment screw ports in both primary throats.

Idle & Low Speed (Idle Air By-pass System) - Throttle valves are completely closed at slow idle speed and air is admitted through Idle Air System which consists of an air bypass passage (primary side only) through which air for closed throttle operation is taken from above the throttle valves through a metered (non-adjustable) orifice and an adjustable orifice to each primary bore. An Idle Speed Screw (single screw for both primary bores) controls the adjustable orifice and all idle speed adjustments are made with this screw (throttle stopscrew not used). Throttle valves are completely closed at idle speed.

High Sp d (Primary Side)—As primary throttle valves are opened, manifold vacuum at idle ports drops, diminishing fuel-air flow through idle system. At this point, venturi vacuum is increased causing fuel to flow from the high speed nozzles, with the amount of fuel delivered being governed by throttle valve opening and the position of the main metering rods in main metering jets. The position of the main metering rods (one for each primary barrel) is controlled by manifold vacuum applied to the vacuum piston. The metering rods do not require adjustment. As the vacuum existing in primary venturi draws fuel from primary main metering jet and main well up to the high speed nozzle, the fuel passes through the main well tube and is mixed with air which enters the vent tube through the primary venturi high speed air bleed. The air-fuel mixture is then discharged from high speed nozzle into carburetor venturi. The high speed air bleed also acts as an anti-percolator vent when engine is hot.

High Speed (Secondary Sid)—Fuel for the high speed circuit of the secondary side is metered through secondary metering jets, and with secondary system supplementary at high speeds only, metering rods are not used. When secondary throttle valves are opened, fuel is drawn from secondary metering jets and wells, through the secondary venturi main well, where it is mixed with air from secondary venturi air bleed and discharged out of the secondary high speed nozzles.

►*ADDITIONAL FEATURES NOT FOUND ON ALL CARBURETOR MODELS: Various carbur tors, as indicated under "Adjustment" below, will hav one or more of the following features:*

Automatic Choke (Conventi nal Type): Carter Climatic Control with thermostatic coil.

Automatic Choke ("Cross-Ov r" Typ): Thermostatic coil assembly for this type choke is mounted in a well in the manifold and is linked to choke shaft lever by a rod (plain cover is used on choke housing on air horn and a lever is mounted on end of choke shaft where it extends through cover). Adjustment procedures for this type choke are different than for conventional automatic chokes. *See "Carter & Stromberg (Cross-Over) Automatic Choke".*

Auxiliary Throttle Valves: Velocity type auxiliary secondary throttle valves are located directly over secondary throttle valves in carburetor main body. Auxiliary throttle valve action is controlled by air velocity and by counterweights attached to valve assembly or to shaft.

Automatic Secondary Throttle C ntrol: Vacuum operated diaphragm type control unit opens and closes secondary throttle valves in accordance with air velocity through primary venturi. A mechanical override linkage insures that secondary throttle valves will always close with primary throttle valves.

Anti-Stall Dashpot: The internal anti-stall dashpot is located in carburetor fuel bowl and provides slow closing of throttle valves to idle position.

Spring Loaded Primary Thr ttl Linkag : Consists of a torsion spring on the throttle shaft between the flex dog and throttle spring arm with a stop pin located on the throttle shaft dog. Special throttle linkage adjustment required.

ADJUSTMENTS: *Make all adjustm nts as indicated b low.*

►*1958 IDLE SPEED ADJUSTMENT NOTE (DESOTO, DODGE & PLYMOUTH 2652S, 2653S, PONTIAC 2767S, 2768S):* These carburetors have a single Idle Air Bypass Screw which is used for all idle speed adjustments

CONTINUED ON NEXT PAGE

1957-58 CARTER AFB 4-BARREL CARBURETORS (C nt.)

(there is no throttle stopscrew) Turning the Idle Air Adjustment Screw outward increases engine speed and also leans the mixture supplied to engine which must be compensated for by adjustment of idle mixture screws

Initial Idl Mixtur Setting: If initial adjustment required to allow engine to be started and warmed up, open both idle mixture screws (from fully seated position) as indicated below

Initial Idle Mixture ①

Car & Carb.	Idle Screw Opening
Buick 2507S	¾-1¾ turns
Buick 2676S	1½ turns
Buick 2800S	¼-1¾ turns
Chrysler 2448S, 2650S, 2651S, 2686S	¼-1¾ turns
Chrysler 2805S, 2806S, 2836S	¼-1¾ turns
DeSoto 2642S, 2773S, 2853S	¾-2¼ turns
DeSoto 2652S, 2653S	¼-1½ turns
Dodge 2642S 2773S, 2801S	¾-1¾ turns
Dodge 2652S, 2653S	¼-1½ turns
Ford 2441S, SA	½-1½ turns
Ford 2640S,SA	¼-1¾ turns
Mercury 2441S,SA	½-1½ turns
Plymouth 2641S, 2744S, 2812S, 2813S	¼-1¾ turns
Plymouth 2652S, 2653S	¼-1½ turns
Pontiac 2506S	1-2 turns
Pontiac 2740S,2751S,2767S,SA,2768S,SA	½-2 turns

① - See "Idle Speed & Mixture Adjustment (DeSoto, Dodge & Plymouth with 2 Carbs)" below for initial idle mixture setting

Idl Sp d & Mixtur Adjustment (DeSoto, Dodge & Plym uth with Tw Carbur t rs). Open and close throttle valves several times to make sure valves seat properly, then connect tachometer and vacuum gauge For initial adjustment, adjust large idle bypass screw **one** turn off its seat on front carburetor, **one-half** turn on rear carburetor *NOTE - Th air screw is opened less on rear carburetor becaus of air admitted through the choke* Turn in each of the four idle adjusting screws (two on each carburetor) until they seat, back out ¾ turn To adjust idle speed, start engine and bring it up to normal operating temperature, then adjust idle air screws (one on each carburetor) the same amount to obtain 650 RPM with transmission in "N" (Neutral) Adjust one of the mixture screws on rear carburetor until highest vacuum reading or best engine "feel" and highest engine RPM is obtained Adjust the other mixture screws on front and rear carburetors in a similar manner Readjust idle air screws in both carburetors to set speed at 650 RPM *NOTF - Idl air screws must be turned an qual amount Adjust idl mixture screws again if the idl air scr ws ar mov d* After smooth idle is obtained, turn mixture screws 1/6 to 1/3 clockwise (to lean)

Idl Sp d & Mixture Adjustm nt (Exc pt D S t ,D dg & Plymouth with Tw Carbur t rs): With engine at normal operating temperature, choke fully off and carburetor on "slow idle" (Air Conditioner turned off), proceed as follows Place transmission lever in proper range (see "Idle Speed Setting" below) *NOTE - See "1958 Idle Speed Adjustment Note" above for carburetors having the Idle Air Bypass Adjusting Screw* Adjust engine idle speed to correct RPM using a tachometer (see "Idle Speed Setting" below) Turn one mixture screw until highest engine RPM is reached and highest vacuum is obtained at the same time, then repeat this operation with the other screw Repeat this procedure until turning mixture screws will not increase engine RPM, and the smoothest idle is obtained with the highest vacuum

Idle Speed Setting

Car Model	S.M. Trans.	Auto. Trans.
1957 Buick		① 485 RPM
1958 Buick		①② 485 RPM
1957-58 Chrysler		① 500 RPM

1958 Plymouth (1 Carb)	450-500 RPM	① 450-500 RPM
1958 Plymouth (2 Carbs)	650 RPM	① 650 RPM
1957 Pontiac	⑥ 450-470 RPM	③⑥ 430-450 RPM
1958 Pontiac	450-470 RPM	③⑦ 480-500 RPM

① - Transmission in "N" (Neutral)
② - 550 RPM (Air Cond Cars)
③ - Transmission in "D" (Drive)
④ - 475 RPM (Engines with hydraulic valve lifters), 600 RPM (Engines with solid valve lifters)
⑤ - 450 RPM (Engines with hydraulic valve lifters), 500 RPM (Engines with solid valve lifters)
⑥ - 500-520 RPM with Air Conditioner unit turned OFF
⑦ - 540-560 RPM with Air Conditioner unit turned OFF

Accelerating Pump: Back off idle speed screw (except carburetors with Idle Air System) until throttle valves seat in bores of carburetor (make sure choke is wide open so that fast idle cam does not hold throttle valves open). Place pump operating rod in center hole (except Buick & Pontiac), in single hole (Buick & Pontiac), and measure the distance from top of bowl cover to top of plunger shaft This measurement should be 33/64" (Buick & Pontiac), 15/32" (Ford & Mercury), 7/16" (Chrysler, DeSoto, Dodge & Plymouth) To adjust, bend throttle connector rod

Metering Rods: *No adjustment required. Metering rods are not used on secondary side.*

Float Setting: Align float by sighting down side of float to determine if side of float is parallel to outer edge of horn casting. To adjust, bend float lever by applying pressure to end of float shell with fingers while supporting float lever with the thumb *(CAUTION–Apply only enough pr ssur to bend float l v r).* After aligning float, remove as much clearance as possible between arms of float lever and support lugs on air horn by bending both arms of the lever. Arms should be parallel to inner surfaces of support lugs and float must operate freely without excess clearance on hinge pin.

Fl at L v l: *NOTE - Two diff r nt typ floats ar used on some carburetors and different float settings ar required for each of the two types.* Primary and Secondary floats are set to the same height With air horn inverted, bowl cover gasket in place and needle valve seated, measure the distance between top of float at outer end and air horn gasket with proper gauge (see table below). Adjust by bending float arm.

① - "Cross-Over" type choke

② - See "1958 Ford Poor Gas Mileage & Rough Engine Idle Correction" above

③ - See "1958 DeSoto & Dodge Choke Housing & Setting Production Change (2773S)" above

Choke Piston Lever Adjustment (Buick 2507S, 2676S, 2800S; Chrysler 2448S, 2560S, 2651S, 2686S, 2805S, 2806S, 2836S; DeSoto, Dodge, Plymouth 2653S; Pontiac 2506S, 2740S, 2751S, 2767S,SA, 2768S,SA): Clearance between choke lever and stop in piston housing with choke held closed should be 045" (2507S, 2676S, 2506S, 2740S, 2751S, 2767S,SA, 2768S,SA), 040" (2448S, 2650S, 2651S, 2653S, 2686S, 2805S, 2806S), 067" (2836S), 010" (2800S) To adjust, bend choke connector rod *NOTE - On Ford & Mercury, adjust choke countershaft (see below)*

Choke Piston Lever Adjustment (Chrysler, All Carbs.): The following procedure can be used in place of the above instructions to correct unsatisfactory warm-up performance (as noted above) With automatic choke retainer ring, cover, and thermostatic coil assembly removed, open throttle ¼ (remove throttle return spring), open choke valve fully Use special wire gauge (can be made up from 026" wire with short right angle bend at end) inserted in choke piston slot so that hook on end enters slot in cylinder Rotate choke lever clockwise so that wire gauge will be clamped between piston and cylinder slots with choke linkage free Choke valve opening or clearance between upper edge of choke valve and air horn wall should be 11/64" Adjust by bending choke connector rod at upper angle Reassemble automatic choke and set at one notch rich

CARTER AFB 4-BARREL CARBURETOR THROTTLE BODY (WITH AUXILIARY THROTTLE VALVES)

Choke Countershaft Linkage (Ford & Mercury): 086" (Gauge T109-215) clearance between choke lever and stop in piston housing with choke valve held closed To adjust, loosen countershaft lever clampscrew, then take endplay out of countershaft and hold choke valve tightly closed Remove slack from linkage by pressing countershaft lever towards closed position with gauge in place between choke lever and stop in piston housing

Fast Idl Linkag Adjustm nt (Buick 2507S, Ford & M rcury 2441S,SA, P ntiac 2506S, Carbur t rs with ut ind x mark n fast idl cam): 010" (Gauge T109-200) clearance between lug on outer choke shaft lever and stop on inner choke shaft lever with choke tightly closed and fast idle against stop on casting To adjust, bend fast idle connector rod

Fast Idle Linkage Adjustment (Buick 2800S, 2507S, Ford & Mercury 2441S.SA, Ford 2640S,SA, P ntiac 2506S, Carburetors with index mark n fast idl cam): With slight clearance between lug on fast idle cam and stop on flange casting, and inner choke shaft lever contacting lug on outer choke shaft lever, align mark on fast idle cam with adjusting screw To adjust, bend fast idle connector rod

Fast Idl Linkag Adjustm nt (Chrysl r 2448S, 2650S, 2651S, 2686S, 2805S, 2806S, 2836S; D Sot 2642S, 2653S, 2773S, 2823S; D dg 2642S, 2653S, 2773S,

Unloader· After Choke Rod adjusted (see above), rotate primary throttle valves to wide open position. Use gauge indicated (see table below) to check clearance between upper edge of choke valve and wall of air horn. To adjust, bend unloader lip on primary throttle shaft lever with tool T109-214.

Unloader Setting

Car & Carb.	Checking Gauge Size & No.
Buick (All Carbs)	3/16"T109-28
Chrysler (All Carbs)	¼" T109-31
DeSoto (All Carbs exc 2652S)	¼" T109-31
Dodge (All Carbs exc 2652S)	¼" T109-31
Ford (All Carbs)	067" T109-234
Mercury (All Carbs)	067" T109-234
Plymouth (All Carbs exc 2652S)	¼" T109-31
Pontiac (All Carbs)	1/8" T109-36

Dashpot (Ford & Mercury 2441S,SA, Ford 2640S,SA): With primary throttle valves in wide open position there should be a clearance of 7/16" between top surface of bowl cover and bottom of dashpot arm lever To adjust, bend dashpot inner arm tang with Tool T109-22

Auxiliary Throttle Valves: *NOTE - Used on some carburetors* No adjustment required With carburetor level, auxiliary throttle valves must close from wide open position of their own weight

Secondary Throttle Lever Adjustment (Buick & Pontiac): Bend secondary throttle operating rod so primary and secondary throttle valves reach wide open position at the same time *NOTE - Secondary throttle valves will be a few degrees from wide open position when primary throttle valves are wide open On Buick 2800S carburet ors, upper edge of secondary valves should just contact auxiliary valves when auxiliary valves are wide open, and the wide open stop lug on secondary throttle lever should contact boss on flange to prevent secondary valves from going past wide open position. If necessary, bend stop lug* With primary and secondary throttle valves tightly closed there should be 017- 022", Gauge T109-29 (Buick 2507S, Pontiac 2506S), 010- 030", Gauge T109-29 (Buick 2676S, 2800S, Pontiac 2740S, 2751S, 2767S,SA, 2768S,SA) clearance between positive closing shoes on primary and secondary throttle levers To adjust, bend shoe on secondary lever

Secondary Throttle Lever Adjustment (Except Buick, Pontiac, Ford & Mercury): *NOTE - There is no secondary throttle lever adjustment on Ford & Mercury carburetors* Block choke valves wide open With 19/64" (Chrysler 2448S, 2686S), 23/64" (DeSoto, Dodge, Plymouth 2652S, 2653S), 3/8" (Others) clearance between lower edge of primary throttle valves and bores (side opposite idle ports), secondary valves should just start to open To adjust, bend throttle operating rod *NOTE - At wide open throttle, secondary valves will reach a full vertical position* With primary and secondary valves in tightly closed position, there should be 010- 030" (Gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever

S c ndary Thr ttl L ck ut Adjustm nt (Exc pt F rd & M rcury Carbur t rs): Crack throttle valves and manually open and close choke valve Tang on secondary throttle lever should freely engage in notch of lockout dog To adjust, bend tang on secondary throttle lever On DeSoto Dodge & Plymouth 2653S carburetor, hold lockout dog tightly against stop on flange casting (secondary throttle valves partly open) There should be 020" (Gauge T109-29) clearance between tang on secondary throttle lever and lockout arm To adjust, bend arm at slot on lockout dog *NOTE - On this carburetor, fast idle cam may be removed to aid in gauging and adjusting*

Primary Throttle Shaft Dog (Spring Loaded Primary Throttle Linkage): Ford & Mercury - With primary throttle valves in wide open position there should be a clearance of 015", Gauge T109-44 (2441S,SA), 020", Gauge T 109-29 (2640S,SA) between edge of secondary throttle valves and bore of carburetor adjacent to primary throtvalves To adjust, bend upper tang on primary throttle shaft dog *NOTE - If clearance cannot be obtained, bend throttle operating rod slightly* With primary and secondary throttle valves in tightly closed position, there should be a clearance of 067" (Gauge T109-234) between primary throttle shaft flex spring and lower tang on primary throttle shaft dog To adjust, bend lower tang

Automatic Secondary Throttle Control (Ford & Mercury): This unit requires no adjustment. See that linkage is free and that there are no vacuum leaks between carburetor body and unit.

Buick Vacuum Starter Switch Timing Check (On Car): Back off throttle stop screw and rotate fast idle cam to slow idle position then fully close throttle valve *(CAUTION* - Make sure that dashpot does not prevent full closing of throttle) Measure distance from diaphragm flange of dashpot to near edge of dashpot arm on throttle lever With ignition turned on slowly open throttle while holding scale in position against flange of dashpot When cranking motor is energized note distance from flange of dashpot to near edge of dashpot arm Subtract the two measurements If switch is properly timed, the difference should be 3/8-11/16" (1957 Models), 13/16-1 5/16" (1958 Models) Adjust by changing timing shims located below contact spring in terminal cap

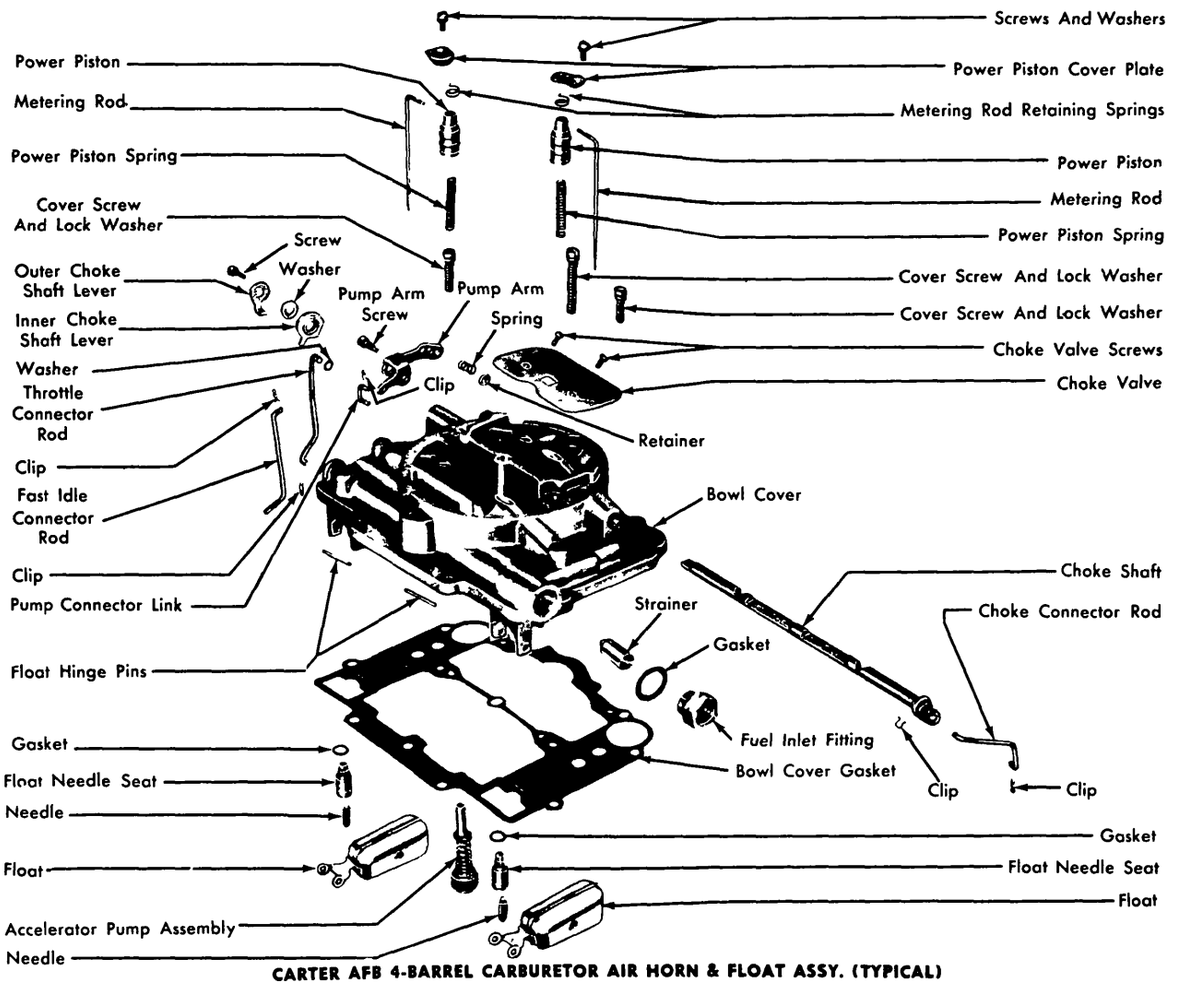
OVERHAUL· *CAUTION - When disassembling carburetor, be sure to keep PRIMARY and SECONDARY side parts separate so they will not be confused or interchang d when carburetor reassembled*

Disassembly: *NOTE - This carburetor consists of two main assemblies (Air Horn & Main Body) which can be overhauled separately Pemove air horn from main body as follows*

All Models (Except Ford & Mercury) - Disconnect choke connector rod at choke shaft lever (except models with "Cross-Over" type choke), then disconnect throttle connector rod at pump arm and fast idle connector rod at choke lever Remove air horn-to-main body attaching screws and lockwashers and remove air horn from main

CONTINUED ON NEXT PAGE

1957-58 CARTER AFB 4-BARREL CARBURETORS (Cont.)



body by lifting air horn assembly straight up.

Ford & Mercury - Remove air cleaner anchor screw, then remove anti-stall dashpot arm, anti-stall dashpot operating lever, and choke countershaft lever from choke side of carburetor. On fuel inlet side, disconnect fast idle connector rod at the inside choke countershaft lever, and disconnect accelerating pump operating rod at pump arm. Remove air horn-to-main body attaching screws and remove air horn from main body.

Air Horn (Except Ford & Mercury) - Remove fuel inlet strainer nut, gasket and screen, then remove power piston cover plates. Remove two metering rods with pistons and remove springs from piston wells. Remove pump arm and link and pump plunger assembly. Remove float hinge pins, floats and float needle assemblies and gaskets. *NOTE - Keep individual float parts grouped so that same needle and seat are reassembled together.* On models with "Cross-Over" type choke, use a prick punch and pierce the welch plug in end of choke piston cylinder and remove plug. Disconnect piston link at choke lever and slide choke piston and link out of cylinder. On all models, remove inner and outer choke shaft lever and washers, then remove choke valve and choke shaft.

Air Horn (Ford & Mercury) - Remove accelerating pump plunger, metering rod and power piston assemblies, floats, fuel inlet and needle assemblies, then remove air horn gasket. Remove fuel inlet fitting, gasket and screen. Remove choke plate connector link, then slide choke plate countershaft out of air horn assembly. Remove choke plate, then slide choke shaft out of air horn.

Main Body - On cars with conventional automatic choke assembly, remove attaching screws and remove coil housing and thermostatic coil. Remove housing gasket and baffle plate. To disassemble choke, remove choke lever attaching screws and retainer washer, then remove choke piston lever and link assembly by rotating piston in bore. On Buick models, remove starter switch terminal cap, return spring guide block assembly, plunger and ball. On all cars, remove pump discharge nozzle assembly and gasket, then remove primary and secondary venturi assemblies. *CAUTION - Venturi assemblies must be marked for reassembly in the same location.* Remove two primary and two secondary metering jets and mark them for reassembly in the same location. On models having auxiliary throttle valves, remove auxiliary throttle valve assembly. On all models, remove pump return spring, idle mixture screws and spring. On Buick carburetors, if starter switch strainer is not visibly damaged or clogged, it will not have to be removed. On models having an air bypass idle system, remove the large idle air adjusting screw and spring. On all models, invert carburetor body and remove pump discharge check needle. With body inverted, remove pump intake screw plug, check ball seat, and check ball. Remove fast idle cam attaching screw and cam, then on all models except Ford & Mercury, remove spacer and lockout lever, throttle operating rod, throttle shaft washer, secondary throttle lever and spring. On Ford & Mercury, remove throttle connector rod, disconnect secondary throttle operating diaphragm lever, then remove secondary throttle operating lever. Remove secondary diaphragm housing cover, return spring and diaphragm, then remove diaphragm housing and gasket from main body. On all models, remove throttle shaft arm, throttle shaft dog and inner throttle shaft arm and flex spring from end of primary throttle shaft on choke side. *NOTE - It is not recommended that throttle body be disassembled further, however, if necessary to remove throttle valves and shafts, proceed as follows:* Mark all throttle valves so they can be reinstalled with correct side of valve upward. File burrs from staked ends of all throttle valve screws and remove screws and valves from shafts. Remove secondary throttle shaft. Remove primary throttle shaft using a rawhide hammer to tap shaft through retainer washer.

CARTER AFB 4-BARREL CARBURETOR AIR HORN & FLOAT ASSY. (TYPICAL)

Cleaning & Inspection: Clean all metal parts in carburetor cleaner and dry with compressed air. *(CAUTION - Do not wash accelerator pump plunger assembly or thermostatic coil and cover assembly in cleaning solvent).* Clean and blow out all passages with air. Remove any gum deposits in carburetor. Clean carbon out of bowl assembly heat passages. Make sure that all calibrated restrictions such as idle ports, air bleeds and vents are clean, but do not pass drills or wires through these passages. Check all shafts and their bearing bores for wear. Check each piston in its cylinder. Check for worn or damaged jets and worn holes in ends of various levers. Check accelerator pump plunger leather and replace as an assembly if leather is creased or cracked. Examine float needles and seats, and if needle is grooved replace needle and seat assembly. Check idle mixture adjusting screws for burrs, ridges, or grooves and replace screws if necessary. Check floats for dents or leaks and check hinge pin bores for burrs or wear and check pins for straightness. Clean fuel inlet screen.

CONTINUED ON NEXT PAGE

1957-58 CARTER AFB 4-BARREL CARBURETORS (Cont.)

Check fast idle cam for excessive wear on steps and replace if necessary. On models with auxiliary throttle valves, check valve assembly to make sure it is free to swing and that weights do not rub on casting. On all models, carefully check body assembly and valve assembly for wear at throttle valves and bores and between shafts and their bores. On Ford & Mercury models, check secondary throttle diaphragm housing for cracks and check dashpot plunger leather for damage or wear. Make sure intake check and discharge restriction is free of lint, gum, or other foreign matter.

Reassembly: Use all new gaskets. Install parts in reverse order of disassembly procedure(above), and note the following:

Valve Installation - Use new screws when installing valves. Install valve shafts, then install valves in their respective bores with "C" in circle toward manifold side of carburetor. Install new screws but do not tighten. Make sure the idle speed adjusting screw is backed out, then hold valves in place with fingers pressing on high side of valve. Tap valves lightly with a screwdriver to seat them in the bores and while holding in this position, tighten the screws securely. Stake screws in place by squeezing with pliers.

THROTTLE VALVE SETTING

④ - Bottom of port above top edge of fully closed throttle valve.
⑤ - .000-.010" (Early with valve No. 2-186). .008-.016" (Late with Valve No. 2-211).

Ford & Mercury Secondary Throttle Operating Diaphragm Installation - Install secondary throttle diaphragm housing with a new gasket and stake the screws into indentations with a prick punch. Install secondary operating lever and attached operating rod, secondary throttle shaft washer and screw. Install secondary diaphragm and gasket in diaphragm housing. Temporarily attach diaphragm rod to secondary throttle lever pin. Install diaphragm return spring and housing cap with vacuum passage in cap indexing with vacuum passage in housing. Install six screws and lockwashers. *NOTE* - Diaphragm must be positioned so it is not under tension as the attaching screws are being tightened finger tight. Disengage diaphragm rod and securely tighten the six screws. Reinstall diaphragm rod and retain with spring retainer.

(1) - Choke side. (2) - Pump side.
(10) - Nozzle installed permanently. **Do not remove.**
(12) - Supersedes 16-59 which superseded 16-58.
(13) - Supersedes 58-270S. (14) - Supersedes 58-271S.
(15) - 1 size lean 16-39, 2 sizes lean 16-40.
(16) - Use 120-155 (with 16-45) to correct leanness, hesitation, flat spot.
(17) - Supersedes 120-226. (18) - Supersedes 16-50.
(19) - Use 16-70 (with 120-159) to correct leanness, hesitation, flat spot.
(20) - 1 size lean 16-35, 2 sizes lean 16-39.
(21) - Supersedes 58-236S.
(22) - Supersedes 58-237S.
(23) - Later production. Early production .028".
(24) - Supersedes 16-14.
(25) - 1 size lean 16-21, 2 sizes lean 16-22.
(26) - Supersedes 58-202S on 2640S.
(27) - Supersedes 58-203S on 2640S.
(28) - 1 size lean 16-61, 2 sizes lean 16-63U (Unitized Pkg. consisting of 2 step-up rods 16-62 and 2 metering jets 120-175).
(29) - Later production. Early production .035".
(30) - Later production. Early production .032".
(31) - 1 size lean 16-60, 2 sizes lean 16-64.

① - Choke side of carburetor
② - Pump side of carburetor.
(10) - Nozzle installed permanently. **Do not remove.**
(20) - 1 size lean 16-35. 2 sizes lean 16-39 Use 16-70 to correct Flat Spot or Surge on Acceleration.
(32) - Supersedes 16-82 (without "X") to correct improper throttle response.
(33) - 1 size lean 16-111 2 sizes lean 16-112
(34) - 1 size lean 16-113 2 sizes lean 16-114
(35) - Use 16-44 to correct Hesitation or Stumble on Acceleration.
(36) - Supersedes No. 120-176 (0635")
(37) - 1 size lean 16-39. 2 sizes lean 16-40
(38) - 1 size lean 16-109. 2 sizes lean 16-81.
(39) - 1 size lean 16-27. 2 sizes lean 16-110.
(40) - 1 size lean 16-25. 2 sizes lean 16-26.
(43) - Supersedes earlier type to correct Leanness at Wide Open Throttle.
(44) - 1 size lean 16-98 2 sizes lean 16-99.

►CHANGES, CAUTIONS, CORRECTIONS

►*1959 BUICK SERIES 4400 EXCESSIVE FAST IDLE SPEED CORRECTION AND CARBURETOR PRODUCTION CHANGE:* On early cars having a fast idle cam stamped "181-260", adjust fast idle speed by positioning cam so fast idle adjusting screw contacts high step of cam (engine at normal operating temperature), then adjust fast idle screw until engine speed is 1300 RPM. Later carburetors will have a fast idle cam stamped "181-271" which will provide the desired fast idle speed when engine speed is adjusted to 1500 RPM with fast idle screw on high step of fast idle cam adjacent to index mark.

►*1959 BUICK SERIES 4600, 4700, 4800 IMPPOPER THROTTLE RESPONSE CORRECTION AND CARBU-*

CONTINUED ON NEXT PAGE

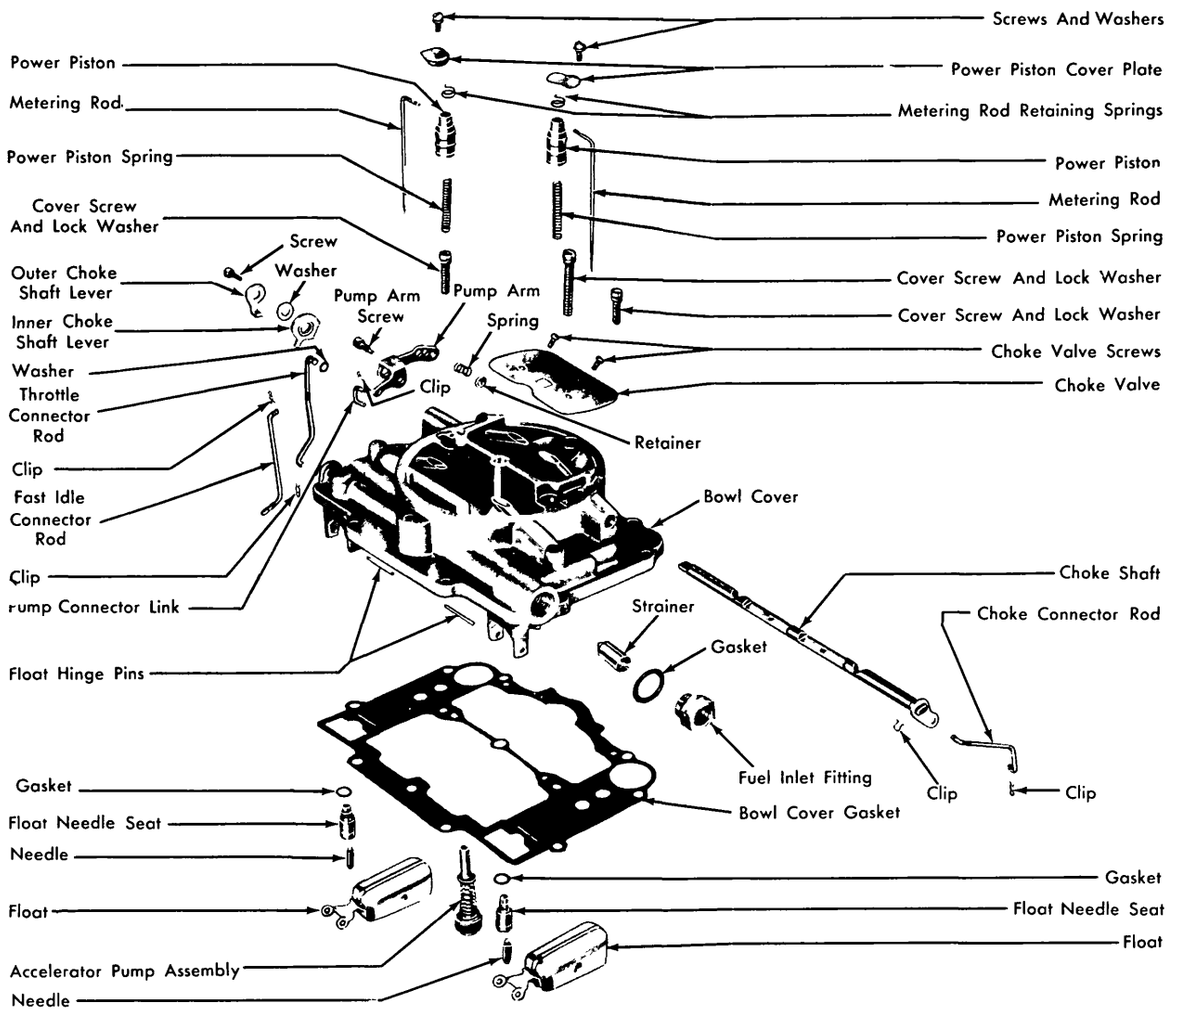
1959-60 CARTER AFB 4-BARREL CARBURETORS (C nt.)

RETOR PRODUCTION CHANGE: Correct by installing new metering rods, Carter No. 16-82X and vacuum piston springs, Carter No. 61-259. Carburetors manufactured after Nov. 1958 (with date code "L8" or later) have the above changes made in production.

►*1959 BUICK 4600, 4700, 4800 ROUGH ENGINE (ON 3/4 THROTTLE ACCELERATION)CORRECTION:* This condition may be caused by insufficient bend of left primary bore baffle on carburetor plate. To correct, install a new carburetor-to-manifold plate, Buick No. 11191308 (before Engine Code No. 4F96981, later cars have the new plate). *For additional correction, see "Carter AFB Carburetor" on Buick Car Model page.*

►*1959 BUICK INOPERATIVE CHOKE MECHANISM:* On early cars, condition may be caused by foreign material or corrosion in choke housing. To correct, remove choke thermostat housing, piston, and baffle and thoroughly clean parts with water (*CAUTION* - Do not leave parts in water longer than necessary) and dry with compressed air. *NOTE* - Later cars have improved fender skirts and baffles to prevent road splash in engine compartment. These parts can be installed on early cars.

►*1960 BUICK CHOKE SETTING CHANGE (FOR IMPROVED STARTING):* Set choke thermostat 2 notches rich (supersedes previous setting of 1 notch rich). *NOTE* - Carburetors with date code "K" and later will be changed in production to the new setting.



►*1960 BUICK ACCELERATOR ROD-TO-CARPET SPACING NOTE:* If unable to obtain enough adjustment for correct accelerator pedal-to-carpet spacing, the improper carburetor throttle rod is installed. Install rod, Part No. 1188324

►*1959 CADILLAC THROTTLE RETURN CHECK RATTLE (Cars before Engine No. 001180): See "Throttle Return Check Rattle Correction" under CARBURETOR on Cadillac Car Model page for installation of restriction in vacuum hose.*

►*1958-59 CHEVROLET AFB CARBURETORS:* Carter AFB carburetor used on 348" Engine with Hi-Lift Camshaft and mechanical Valve Lifters. All specifications for both 1958 and 1959 carburetors are included below.

►*1959 CHRYSLER HESITATION OR STUMBLE ON ACCELERATION WITH ENGINE AT NORMAL OPERATING TEMPERATURE (CARTER AFB 2797S CARBURETOR):* If this condition persists after engine properly tuned, manifold heat control valve and engine cooling thermostat checked for proper operation, accelerating pump connector rod installed in **inner** hole of pump rocker arm fuel filter bowl cleaned and filter element replaced (if necessary); a lean mixture is indicated and should be corrected as follows: Install new Step-up Rods (2 required), Carter No. 16-44, to replace original rods, Carter No. 16-75.

►*1959 CADILLAC LEANNESS AT WIDE OPEN THROTTLE CORRECTION (Early Cars Before Engine No. 002124):* Install Metering Rods, Carter No. 16-106 and Secondary Metering Jets, Carter No. 120-165. Later carburetor having the later metering rods and jets have the letter "A" stamped on throttle body flange beside the part number.

CARTER AFB 4-BARREL CARBURETOR AIR HORN & FLOAT ASSEMBLY (TYPICAL)

►*1959 CHRYSLER ENGINE STALLING AFTER COLD START CORRECTION (CARTER AFB 2797S CARBURETOR):* This condition may be caused by choke piston and link allowing choke valve to open too wide after a cold start. To correct, install new choke piston and link assembly, Carter No. 160-204S. *NOTE - The later type piston has no groove around outer diameter. Early piston has a groove.* Later carburetors having the new choke piston and link assembly are identified by a letter "A" stamped on flange right front corner adjacent to stamped date code and carburetor number or by spot of white paint on left front corner of flange.

►*1958-60 CHRYSLER, DESOTO, DODGE, PLYMOUTH FUEL INLET NEEDLE AND SEAT ASSEMBLY PRODUCTION CHANGE & CARBURETOR FLOODING CORRECTION:* A new needle and seat assembly, Part No. 2196207, is being used in later 1960 carburetors and may be installed on earlier carburetors to correct a flooding condition. The new needle has a "Viton" (resilient synthetic rubber) tip and the needle seat orifice has been enlarged slightly. 1960 carburetors with the new assembly are identified by the letter "B" preceding the carburetor model number.

►*1960 CHRYSLER 300F HUNTING & SURGING CORRECTION: See "Throttle Linkage Adjustment (300F & Cars with Ram Induction)" on Car Model page.*

►*1959 DESOTO FIREFLITE & DODGE CUSTOM ROYAL FLAT SPOT OR SURGE ON ACCELERATION OR AT*

CONTINUED ON NEXT PAGE

1959-60 CARTER AFB 4-BARREL CARBURETORS (C nt.)

CRUISING SPEEDS WITH ENGINE AT NORMAL OPERATING TEMPERATURE (CARTER 2794S & 2787S CARBURETORS) If this condition persists after engine tuned up with special attention to Ignition Timing and Accelerating Pump Setting, correct by installing new Step-up Rods (2 required), Carter No 16-70, to replace original rods, Carter No 16-45

►*1959 FORD, LINCOLN, MERCURY HARD COLD STARTING, STALLING, POOR COLD PERFORMANCE, & SPARK PLUG FOULING* Can be correct by revising the fast idle speed setting (600-650 RPM with fast idle screw on low step of cam) as directed under "Fast Idle Adjustment (On Engine)" Also check choke countershaft linkage for proper choke adjustment as directed under "Choke Countershaft Adjustment" below If above adjustments do not correct engine richness and loading complaints, install new choke piston as follows

Ford, Lincoln, M rcury Choke Piston Change - Install new choke piston, Carter No 160-211, to replace original piston No 160-198 New piston can be identified by brown stain in groove near bottom of piston (no mark on original piston) After installing new piston, make all choke adjustments listed under ADJUSTMENTS below *NOTE* - Carburetors date coded FKL-9BBE or later have this new piston installed in production

►*1959 LINCOLN & MERCURY LEAN CONDITION OR SURGING ON ACCELERATION* May be caused by metering rod piston sticking in bore due to dirt passing air cleaner and entering metering rod piston bore through relief vent Correct by removing metering rod and piston and thoroughly cleaning out the bore Assemble new piston on metering rod and install in carburetor *NOTE* - If one piston found sticking, examine other piston and cylinder for dirt and scuffing Examine and correct air cleaner to prevent recurrence

►*1959 LINCOLN & MERCURY HARD STARTING, ROUGH IDLE, FLOODING & POOR FUEL ECONOMY* Examine carburetor for leaking or missing Main Well Plugs (these plugs located in angle passage in center wall of carburetor to right and left of secondary throttle valves) Replace plugs, using Main Well Repair Kit No B9SZ-9B526-A, as detailed below REPLACE BOTH PLUGS IF ONE PLUG FOUND LEAKING OR MISSING *NOTE* - Carburetors date coded FKL9BBL (June 1959) and later have the new plug assemblies

R moving Main Well Plugs - Coat 1/16" drill with light grease and drill through center of plug *(CAUTION* - Use care not to strike wall inside passage) Insert self-tapping screw in drilled hole and pull plug out with pliers

Installing Main W ll Plugs - Clean counterbore in carburetor and main well passage thoroughly and blow out with air Insert coated fibre gasket into counterbore and press it in place against shoulder Insert steel expansion plug (cupped side in) on top of fibre gasket, use 250- 295" diameter flat end pin punch to flatten expansion plug and seat it in counterbore Replace second plug similarly *CAUTION - Prop r size pin punch must be used to seat plug to prevent driving plug into main well passage*

►*1959 LINCOLN & MERCURY IMPROPER RETURN TO IDLE SPEED NOTE* This condition is due to improperly adjusted carburetor rod *See 'Throttle Linkage Adjustment" on individual car model pages*

►*1959 LINCOLN & MERCURY CARBURETOR ICING OR PERCOLATING NOTE* May be caused by improperly operating air vent intake duct assembly *See "Tune-Up on individual car model pages*

►*1959 MERCURY ACCELERATOR PEDAL STICKING (NOT RETURNING TO IDLE)* May be caused by interference between carburetor control rod and fuel inlet line Correct by carefully bending fuel line out away from carburetor Check for clearance by moving control rod from closed to wide open throttle position Fuel inlet line On later cars has larger (3/4") radius at carburetor end to provide clearance

►*1959 PONTIAC ERRATIC THROTTLE RETURN ACTION* Can be corrected by changing accelerator control return spring into the second or middle hole of the dash mounted bracket to provide more positive action Later cars have the spring connected in this manner

►*1959 PONTIAC FAST IDLE CAM NOT RELEASING FULLY DURING COLD WEATHER OPERATION (Cars before Engine Production No 20345)* Can be corrected by installing new Manifold Heat Control Valve Thermostat See Manifold Heat Control under TUNE-UP in Pontiac Car Model page for details *NOTE* - This thermostat used in production on later cars and earlier engines which have been modified are marked by daub of white paint on right hand cylinder head

►*1960 PONTIAC ACCELERATION FLAT SPOT OR STUMBLE CORRECTION* May be caused by collapsed "S" link (connecting pump lever and plunger) Correct by replacing "S" link or pump plunger *NOTE - Lower end of link must point toward air horn to avoid contact with bowl casting cover*

DESCRIPTION: Four-barrel downdraft type with automatic choke Design is similar to previous Carter AFB carburetors except for the following features *For complete description, see '1957-58 Carter AFB 4-Barrel Carburetors" and note the following*

Idle Air System (Cadillac 2814S, 2815S, 2951S, 2952S; Chrysler 2798S, 2799S, 3084S; DeSoto, Dodge, Plymouth 2790S, 2791S; Dodge 2948S; Chrysler, DeSoto, Dodge & Plymouth 2903S; Plymouth 2975S, 2976S; Pontiac 2819S, 2820S, 2975S, 2976S): Throttle valves are are completely closed at low idle speed and air is admitted through Idle Air System which consists of an air bypass passage (primary side only) through which air for closed throttle operation is taken from above throttle valves through a metered (non-adjustable) orifice and an adjustable orifice to each primary bore An Idle Speed Screw (single screw for both primary bores) controls adjustable orifice and all idle speed adjustments are made with this screw (throttle stop screw not used) *NOTE - Throttl valv s are compl t ly closed at idle speed*

►*CADILLAC CHOKE MODIFIER NOTE This unit is not used on 1959-60 models*

Idl C mpensator Valv (Buick 2840S, 2877S, 2981S, 2982S; Cadillac 2814S, 2815S, 2951S, 2952S; F rd Thund rbird 2992S; P ntiac 2819S, 2975S, 2976S): This assembly is mounted between main venturi on secondary side and consists of a valve, bi-metal strip, holder and mounting bracket This unit is not adjustable and must be replaced if faulty The purpose of the compensator is to admit additional air under hot idling conditions and to prevent stalling With high air temperature in carburetor, the valve opens and allows additional air to be drawn into carburetor bores below the secondary throttle valves to offset the enrichening effect of hot idle *CAUTION - Idle compensator must be held closed while adjusting idle speed*

Cross-Over Type Automatic Choke (Chrysler, DeSot , Dodge & Plymouth Carburetors Except 2790S, 2791S, 2798S, 2799S): This type automatic choke is a separate unit mounted in a well in intake manifold (at exhaust cross-over passage) and linked to choke valve lever by a connector rod Choke vacuum piston is located in a cylinder in carburetor air horn and linked directly to choke valve *See "Carter Cross-Over Typ Automatic Choke" for complete data*

ADJUSTMENTS *Make all adjustments as indicated below*

►*IDLE SPEED ADJUSTMENT NOTE (CARS WITH IDLE AIR BY-PASS SYSTEM)* These carburetors have a single Idle Air By-pass Screw which is used for all idle speed adjustments (there is no throttle stopscrew) Turning the idle air adjustment screw outward increases engine speed but also leans out the mixture supplied to engine which must be compensated for by the adjustment of idle mixture screws

Idle Mixture & Speed Adjustment (Cars with One Carburetor) *CAUTION - On cars with Idle Compensator, the the compensator valve must be held closed while adjusting idle speed (use pencil or other instrument to hold compensator down on its seat) On cars with Idle Air System, adjusting the air adjustment screw (to adjust engine speed) will change the idle mixture setting and this should always be rechecked after an engine speed adjustment has been made* If initial adjustment required to allow engine to be warmed up, turn both idle mixture adjusting screws in until lightly seated, then back screws out the correct number of turns shown in table below Run the engine until it reaches normal operating temperature with choke valve wide open and fast idle inoperative (engine idling at hot or slow idle speed) Then proceed as follows Connect vacuum gauge and tachometer Adjust engine idle speed to correct figure shown in table below with transmission selector lever in proper rangeas indicated Make this adjustment by turning throttle stopscrew (or Idle Air Bypass Adjusting Screw on carburetors with this adjustment) Adjust each idle mixture adjusting screw in or out for smooth idling and highest vacuum reading and engine RPM *(NOTE* - On Buick, set each screw midway between points where engine runs irregularly due to lean and rich mixture) Recheck and if necessary reset idle speed, then recheck idle mixture setting *CAUTION* - On cars with Idle Air Bypass Ad-

CONTINUED ON NEXT PAGE

1959-60 CARTER AFB 4-BARREL CARBURETORS (C nt.)

justing screw, always recheck idle mixture adjustment after changing setting of idle air adjusting screw On cars with automatic transmission, check and adjust Throttle Linkage *See Throttle Linkage Adjustment under CARBURETOR on each car model page*

Idle Mixture & Speed Adjustment (Chrysler, DeSoto, Dodge & Plymouth With Two Carburetors, Except Ram Induction): These carburetors have Idle Air Bypass Screw for idle speed adjustment Before adjusting carburetor, check and adjust carburetor inter-connecting linkage *See "Throttle Linkage Adjustment" under CARBURETOR on Car Model pages* If preliminary adjustment required for engine warm-up, adjust idle mixture screws (see table below), then set idle air bypass screws (one on each carburetor) 1 turn open Connect tachometer, then operate engine until it reaches normal operating temperature (choke valve wide open and fast idle inoperative) Disconnect interconnecting rod at rear carburetor throttle lever Adjust idle speed to correct engine RPM (see table below) by turning idle air bypass screw on each carburetor equally Adjust both idle mixture screws on **front** carburetor for maximum engine RPM, then adjust both idle mixture screws on **rear** carburetor for maximum RPM, finally readjust front carburetor as necessary *CAUTION - If engine RPM increases more than 25 RPM during above adjustment, readjust idle air bypass screws for correct idle speed and repeat idle mixture adjustment Final adjustment should be made with idle mixture adjusting screws* Before connecting the interconnecting rod at rear carburetor, check and adjust transmission throttle linkage *See "Throttle Linkage Adjustment" under CARBURETOR on Car Model pages*

Idle Mixture & Speed Adjustment (Chrysler, DeSoto, Dodge & Plymouth With Ram Induction): These carburetors have Idle Air Bypass Screw for idle speed adjustment Before adjusting carburetors, check and adjust carburetor interconnecting linkage *See "Throttle Linkage Adjustment" under CARBURETOR on Car Model pages* If preliminary adjustment required for engine warm-up, adjust idle mixture screws (see table below), then set idle air bypass screws (one on each carburetor) 1 turn open Connect a tachometer, then operate engine until it reaches normal operating temperature (choke valve wide open and fast idle inoperative). Turn engine off and disconnect each carburetor throttle rod at bellcrank on manifold Start engine and turn idle mixture screws on left carburetor 1/8 turn at a time until smoothest idle is obtained Repeat this procedure on right carburetor, keeping mixture screws within 1/8 turn of each other With transmission in "N" (Neutral), air conditioner compressor ON (if so equipped), adjust idle speed to 725-750 RPM by adjusting idle air bypass screw on each carburetor equally Repeat the idle mixture and speed adjustment until a smooth idle is obtained at 725-750 RPM Connect each carburetor throttle rod at bellcrank

Car & Carb.	Idle Mixture Screw Setting Idle Screw Opening
Buick 2840S, 2877S, 2981S, 2982S	¼-1¾ turns
Cadillac 2814S, 2815S	1¼-2¾ turns
Cadillac 2951S, 2952S	1½-2 turns
Chevrolet 2859S, 2897S	¼-1¾ turns
Chevrolet 3012	½-2 turns
Chrysler 2797S	½-2 turns
Chrysler 2799S, 2927S	1-2 turns
Chrysler 2903S, 3084S	1/8-1½ turns
DeSoto 2787S	¾-2¼ turns

℃ - Throttle Stopscrew or Idle Air Adjusting Screw
② - Air Conditioner turned OFF
③ - Air Conditioner turned ON
⑨ - Transmission in "N" (Neutral) or "P" (Park)
⑤ - Transmission in "D" (Drive)
⑥ - 550 RPM for Air Conditioned cars Transmission in "D" (Drive) or "R" (Reverse) and Air Conditioner turned ON
℃ - Ram Induction Engine
⑧- Front & Rear Carburetors
⑨ - With headlights turned on if car is equipped with alternator

►*1960 CADILLAC SPEED ADJUSTMENT CAUTION:* Due to vacuum released parking brake, it is impossible to set the brake with transmission selector lever in "Dr" position unless vacuum release is disconnected Disconnect diaphragm at neutral safety switch and tape switch opening to prevent any air leakage

Anti-Stall Dashpot (Throttle Return Check) On Ford, Lincoln, Mercury, the dashpot is an integral part of the carburetor and adjustment for this unit is given below On other models, dashpot is a separate unit mounted on the carburetor or elsewhere in the throttle linkage For adjustment on these models, see *Throttle Linkage Adjustment under CARBURETOR on car model pages*

Dashpot Adjustment (Ford, Lincoln, Mercury) - Two adjustments required (1) Distance from top of plunger shaft with primary throttle valves tightly closed should be 1/8" *NOTE - Be sure dashpot lever does not contact bowl cover attaching screw* To adjust, bend flat portion of dashpot lever (2) With primary throttle valves wide open, distance from top of plunger shaft to top of bowl cover should be 7/16" To adjust, bend top lug on flat lever *NOTE Check to be sure plunger shaft does not bind in hole in bowl cover and operates freely*

Idle Speed-Up Control (Cadillac Air Conditioned Cars) This unit increases engine idling speed with air conditioning turned on and transmission selector lever in Neutral For adjustment, see *CARBURETOR on Cadillac car model page*

Metering Rods: No adjustment required. Metering rods not used on secondary side.

Float Setting: *(NOTE - Before adjusting float level and float drop, floats must be aligned as follows).* Align floats by sighting down side of float to determine if side of float is parallel to outer edge of horn casting. To adjust, bend float lever by applying pressure to end of float shell with finger while supporting float lever with thumb (CAUTION - Apply only enough pressure to bend float lever). After aligning float, remove as much clearance as possible between arms of float lever and support lugs on air horn by bending both arms of the lever. Arms should be parallel to inner surfaces of support lugs and float must operate freely without excess clearance on hinge pin.

Float Level - Both floats are set to the same height With air horn inverted, bowl cover gasket in place and needle seated, measure distance from top of float at outer end to air horn gasket with proper gauge (see table below) Adjust by bending float arm

Pontiac 2820S	9/32"	T109-126
Pontiac 3010S	7/32"	T109-106

① - Plus or minus 1/64"

Float Drop - With bowl cover held in upright position so that floats down at lower end of travel, measure from outer (free) end of float to bowl cover gasket This dimension should be 23/32" plus or minus 1/16" for all models Specific car manufacturers recommendations are as follows

Float Drop Setting

Car & Carb	Float Drop
Buick (All)	3/4"
Cadillac (All)	13/16"
Chrysler 1959 (All)	23/32"
Chrysler 1960 (All)	3/4"
DeSoto (All)	3/4"
Dodge (All)	3/4"
Ford, Lincoln, Mercury (All)	23/32"
Plymouth 1959 (All)	23/32"
Plymouth 1960 (All)	3/4"
Pontiac (All)	23/32"

Accelerating Pump Stroke This is a pump stroke adjustment and not a seasonal setting On all models with provision for seasonal setting make certain that connector rod engaged in correct hole in pump arm as listed below Back out throttle stopscrew so that throttle valves fully seated Use scale to measure from top surface of bowl cover to top of pump plunger stem If this distance not correct as shown in table below, adjust by bending connector rod at lower angle using T109-213 bending tool

Pump Stroke Setting

Car Model	Plunger Height	Connector Rod
Buick 2940S, 2877S	33/64"	Non-Adj
Buick 2981S, 2982S	1/2"	Non-Adj
Cadillac (All)	15/32"	Inner Hole
Chrysler (Exc 2903S)	7/16"	Center Hole
Chrysler (2903S)	27/64"	Center Hole
DeSoto (Exc 2903S)	7/16"	Center Hole
DeSoto (2903S)	27/64"	Center Hole
Dodge (Exc 2903S)	7/16"	Center Hole
Dodge (2903S)	27/64"	Center Hole
Ford T-Bird (All)	① 17/32"	Inner Hole
Lincoln, Mercury	17/32"	Inner Hole
Plymouth (Exc 2903S)	7/16"	Center Hole
Plymouth 2903S	27/64"	Center Hole
Pontiac (All)	33/64"	②Non-Adj

① - Or 11/32" with connector rod in center hole
② - Pump connector link (arm-to-plunger) must be installed with offset toward arm

Automatic Choke (Cross-Over Type): This choke assembly is mounted in well in manifold casting. To adjust with unit off engine, loosen mounting post locknut and turn mounting post with screwdriver until index mark on disc positioned opposite correct mark on scale (see table below for proper setting). When choke is installed on engine, lift cover disc and open and close choke manually to make sure connector rod clears sides of hole in housing cover. If rod does not clear, replace unit (bending the rod will affect choke calibration).

Automatic Choke (Integral Type) *Adjust AFTER Choke Piston Lever Adjustment or Choke Countershaft Adjustment has been completed* Settings are shown in table below Adjust by loosening choke cover screws and rotating cover and thermostatic coil assembly

Automatic Choke Setting

Car & Carb	Choke Setting
Buick 2981S, 2982S	2 Points Rich
Cadillac 2814S, 2815S	Centered
Cadillac 2951S, 2952S	1 Point Rich
Chevrolet 28598, 2897S, 3012S	Centered
Chrysler 2797S	① Centered
Chrysler 2799S	1 Point Rich
Chrysler 2927S	①2 Points Rich
Chrysler 2903S	①1 Point Rich

Plymouth 2968S	①2 Points Rich
Pontiac 2819S, 2820S	1 Point Rich
Pontiac 2975S, 2976S, 3010S	Centered

① - "Cross-Over" type Automatic Choke
② - 2 Points Rich (Early 170AX-515S Choke Assy), Centered (Later 170AU-515S Choke Assy)
③ - Centered (With 170AU-516S Choke Assy), 2 Points Rich (With 170AX-516S Choke Assy)

Choke Piston Lever & Countershaft Adjustment: This adjustment requires removal of choke cover and thermostatic coil assembly, gasket and baffle plate for access to choke piston lever *NOTE - On Chrysler, DeSoto, Dodge & Plymouth 2903S & 2948S carburetors, a "Cross-Over" type choke assembly is used and the choke housing located on bowl casting of carburetor contains only a choke piston and lever assembly* Adjust as follows

1959 Buick, 1959-60 Chevrolet & Pontiac - With choke valve held tightly closed by pressure applied to choke piston lever in choke housing, measure clearance between choke piston lever and stop in housing This measurement should be 010" To adjust, bend choke connector rod

1960 Buick - Open throttle so fast idle cam does not contact adjusting screw, then close choke valve by pressing on piston lever in choke housing Top of choke piston should be flush with top of piston cylinder when choke valve is closed To adjust, bend choke connector rod

1959-60 Cadillac (All), Chrysler (2799S, 2903S), DeSoto, Dodge & Plymouth (2791S, 2903S, 2948S), 1960 Ford Thunderbird - Use a 026" wire gauge (T109-189) with 1/8" section at end of gauge bent at a 90° angle Set throttle valves one-quarter open and open choke valve wide Insert wire gauge into choke piston slot so hooked end enters slot in cylinder wall Close choke valve by pressing on choke lever until wire gauge is gripped between piston and cylinder (linkage hanging free) Check choke valve clearance between upper edge of valve and air horn This opening should be 093" (Cadillac), 5/64" (Chrysler 2799S), 1/8" (All others) Adjust by bending choke connector rod at angle

1959 Ford Thunderbird, Lincoln & Mercury - Loosen countershaft lever clampscrew, then close choke valve and hold it in this position Place 086" gauge (T109-215) between choke piston lever and stop in choke housing (take all slack out of linkage by pressing countershaft lever toward closed choke position) Hold linkage in this position and tighten clampscrew

Fast Idle Linkage: *NOTE - This adjustment must be made before checking and adjusting Fast Idle and Unloader Adjust each model as follows*

Buick 2981S, 2982S; Chrysler 2799S, 2927S; DeSoto 2950S; DeSoto, Dodge, Plymouth 2968S, Plymouth 2969S, 2970S - With choke valve closed, index mark on fast idle cam should align with adjusting screw To adjust, bend fast idle connector rod

Cadillac 2814S, 2815S, 2951S, 2952S; Chrysler 2797S; DeSoto & Dodge 2773S, 2787S, 2794S; DeSoto, Dodge, Plymouth 2791S; Dodge 2854S, 2948S, 2991S; Plymouth 2812S, 2813S, 2855S, 2856S, 2925S - With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever, align center of fast idle screw with index mark on cam To adjust, bend choke fast idle connector rod

CONTINUED ON NEXT PAGE

1959-60 CARTER AFB 4-BARREL CARBURETORS (C nt.)

Buick 2840S, 2877S; Chevrolet 2859S, 2897S, 3012S; Ford Thunderbird, Lincoln & Mercury 2853S - With slight clearance between lug on fast idle cam and stop on flange casting, and inner choke shaft lever contacting lug on outer choke shaft lever, align index mark on cam with adjusting screw. To adjust, bend fast idle connector rod.

Chrysler, DeSoto, Dodge, Plymouth 2903S; Pontiac 2819S, 2820S, 2975S, 2976S - With choke valve tightly closed and trip lever and cam arm in alignment, align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

Ford Thunderbird 2992S - With inner countershaft lever contacting lug on outer countershaft lever, align index mark on cam with adjusting screw. To adjust, bend fast idle connector rod.

Fast Idle Setting: *This adjustment can be made with the carburetor on the bench (Off Engine) but setting should be checked after the carburetor installed (On Engine) as follows:*

Fast Idle Adjustment (Off Engine) - Open throttle and close choke valve tightly (this will allow fast idle cam to assume fast idle position). With choke valve closed and index mark on fast idle cam in alignment with fast idle adjusting screw, turn screw in or out until throttle valve opening or clearance between lower edge of valve and carburetor wall is correct as shown in table below.

Fast Idle Setting (Off Engine)

Car & Carb.	Valve Opening	Gauge No.
Buick (All)	.020"	T109-29
Cadillac (All)	.023"	T109-189
Chevrolet 2859S, 2897S	.012"	T109-200
Chevrolet 3012S	.025"	T109-125
Chrysler 2797S	.015"	T109-44
Chrysler 2799S	.013"	
Chrysler 2927S	.020"	T109-29

Plymouth 2925S, 2968S	.020"	T109-29
Plymouth 2969S, 2970S	.020"	T109-29
Pontiac (All)	.026"	T109-189

Fast Idle Adjustment (On Engine - Except Chrysler, D Soto, Dodge & Plymouth With Ram Induction) - With engine at normal operating temperature, rotate fast idle cam so that fast idle adjusting screw is on high step of cam and in alignment with index mark (Exc. Thunderbird, Lincoln, Mercury). On Thunderbird, Lincoln & Mercury, place fast idle adjusting screw on lowest (last) step of cam. On all models, operate engine and adjust fast idle screw for correct engine speed as listed below.

Fast Idle Adjustment (On Engine - Chrysler, DeSoto, Dodge, Plymouth With Ram Induction): *NOTE - Make fast idle adjustment on each carburetor individually.* With engine at normal operating temperature and idling at 725-750 RPM, transmission in "N" (Neutral) with air conditioner compressor "ON" (if so equipped). Turn compressor "OFF" (if so equipped) and remove both air cleaners. Disconnect throttle rods at bellcrank and open throttle valves of left hand carburetor far enough to allow positioning of fast idle cam to fast idle index mark. *NOTE - Right hand carburetor should remain at curb idle position.* Adjust fast idle screw to obtain an idle speed as indicated in table below. *NOTE - The indicated fast idle speed is for* **one** *carburetor with the other carburetor on slow idle speed. There is no specification for engine RPM with both carburetors simultaneously set at fast idle position.* Place left hand carburetor in slow idle position (off fast idle), then repeat the above adjusting procedure on right hand carburetor. *NOTE - It is important that both carburetors have identical idle speeds.*

Fast Idle Setting (On Engine)

Car Model	Engine RPM
1959 Buick 4400	①
1959 Buick 4600, 4700, 4800	1500
1960 Buick (All Models)	1500
1959-60 Cadillac	1700-1750
1959-60 Chevrolet	1600-1800
1959 Chrysler, DeSoto, Dodge	1400
1960 Chrysler (Exc. Ram Induction)	1775-1825
1960 Chrysler (Ram Induction)	② 1375-1425
1960 DeSoto (Exc. Ram Induction)	1775-1825
1960 DeSoto (Ram Induction)	② 1475-1525
1960 Dodge, Auto. Trans. (Exc. Ram Ind.)	1775-1825
1960 Dodge, Synchro-mesh (Exc. Ram Ind.)	1200-1300
1960 Dodge (Ram Induction)	②1475-1525
1959 Ford, Lincoln, Mercury	③ 550
1960 Ford Thunderbird	④ 625
1959 Plymouth	1400
1960 Plymouth, Auto. Trans. (Exc. Ram Ind.)	1775-1825
1960 Plymouth, Synchro-mesh (Exc. Ram Ind.)	1700-1750
1960 Plymouth (Ram Induction)	② 1525-1575
1959-60 Pontiac	2200

① - 1300 RPM (First cars with Fast Idle Cam stamped "181-260"). 1500 RPM (Later cars with Fast Idle Cam stamped "181-271").

② - Fast idle speed with one carburetor on **fast** idle and the other on **slow** idle. There is no specification for engine RPM with both carburetors simultaneously set at fast idle position.

③ - With fast idle screw on low step of cam. Adjust to 600-650 RPM to correct Hard Starting, Stalling, Poor Cold Performance, and Spark Plug Fouling. *See "Changes, Cautions, Corrections" above.*

④ - With fast idle screw on low step of cam.

Unload r: After fast idle linkage adjusted (above), rotate primary throttle valves to wide open position and check choke valve opening or clearance between upper edge of valve and air horn wall using gauge listed in table below. If clearance not correct, adjust by bending unloader lip on primary throttle lever using bending tool T109-214.

►*PONTIAC NOTE:* Manufacturer recommends that throttle valves be opened by depressing accelerator pedal (to simulate actual driving conditions and insure unloader functioning properly in service).

Unloader S tting

Car Model	Chok Op ning	Gaug No.
1959 Buick	3/16"	T109-28
1960 Buick	7/32"	T109-106
1959 Cadillac	9/32"	T109-126
1960 Cadillac	5/16"	T109-107
1959 Chevrolet	3/16"	T109-28
1960 Chevrolet (2897S)	3/16"	T109-28
1960 Chevrolet (3012S)	1/4"	T109-31
1959-60 Chrysler	1/4"	T109-31
1959-60 DeSoto & Dodge	1/4"	T109-31
1959-60 Ford T-Bird	1/8"	T109-36
1959 Lincoln & Mercury	1/8"	T109-36
1959-60 Plymouth	1/4"	T109-31
1959-60 Pontiac	5/32" ①	T109-36

① - Supersedes early 1959 specification of 1/8".

Auxiliary Throttle Valves: Velocity type valves (counterweighted free valves without linkage). No adjustment required. *NOTE - Auxiliary throttl valv s not used on all Chrysler, DeSoto, Dodge & Plymouth carbur tors.*

Secondary Throttle Lever Adjustm nt: *This adjustm nt required to insure correct action of primary and secondary throttle valves. Check and adjust each mod l as follows:*

All Model s (Except Chevrolet & P ntiac) - Block choke valve wide open. Open throttle valves until clearance between lower edge of throttle valve and throttle bore on side opposite idle port is correct as shown in table below. Secondary valves should just start to open at this point. Adjust by bending secondary throttle operating rod using Tool T109-213. Open primary valves fully. On Buick & Cadillac, secondary valves should be a few degrees from wide open with primary valves wide open. On Chrysler, DeSoto, Dodge, Plymouth 2903S, primary valves should be a few degrees past vertical and secondary valves will be a few degrees from vertical. On all other carburetors, both primary and secondary valves should be vertical in wide open position. *NOTE - On Buick carbur tors, upp r edg of secondary valve should just contact auxiliary valv when auxiliary valve is wid open. If n cessary, b nd stop lug on secondary lev r t prev nt s c ndary valves from going past wide p n.* On all models, check and adjust throttle lever closing shoes (see below).

Chevrolet 2859S, 2897S, 3012S & P ntiac 3010S - Primary and secondary valves must reach wide open position at the same time. To adjust, bend secondary operating rod. *NOTE - Secondary valv s will b a f w degrees from wide open when primary valv s ar wid open.* Upper edge of secondary valve should just contact auxiliary valve when auxiliary valve is wide open. *CAUTION - Wide open stop lug on s condary thr ttl l ver sh uld c ntact boss on flang to pr v nt s condary throttle valv fr m g ing past wid p n. If n c ssary, bend st p lug.*

Plymouth 2812S, 2813S, 2855S, 2856S	3/8"
Plymouth 2925S, 2969S, 2970S, 2968S	3/8"
Plymouth 2791S	23/64"
Plymouth 2903S	29/64"

Primary & Secondary Throttle Lever Closing Shoe Adjustment· With primary and secondary throttle valves closed, check clearance between positive closing shoes on throttle levers using Gauge T109-29 (.020") Clearance at closest point should be .010-.030" Adjust by bending shoe on secondary lever

Secondary Throttle Lockout Adjustment· *This adjustment not required on Ford, Lincoln, Mercury 2853S Carburetor* On all other carburetors, open throttle valve slightly to clear fast idle cam, open and close choke valve manually Lockout tang on secondary throttle lever should freely engage in notch of lockout dog Adjust by bending tang on secondary throttle lever On some carburetors, additional adjustment required as follows

Cadillac (All); Chrysler 2799S; DeSoto, Dodge & Plymouth 2791S; Dodge 2948S - Hold lockout dog tight against stop on flange With secondary throttle valves partially open, clearance between tang on secondary throttle lever and lockout arm should be .026" (Cadillac 2951S, 2952S), .020" (All Others) *NOTE - Fast idle cam may be removed to make this adjustment.*

Buick Vacuum Starter Switch Timing Check: Switch timing can be checked with carburetor on engine on Dynaflow cars only On all cars, switch can be timed with carburetor off engine as detailed below

Switch Timing (Off Engine) - Connect battery and test lamp across switch terminals so that lamp will light when switch contact is made See that choke valve is wide open and fast idle cam in hot or slow idle position Close throttle valve against ¼" drill rod inserted between lower edge of valve and carburetor wall at center Lamp should light indicating that switch contacts are closed Repeat test with 7/64" drill rod Lamp should not light If switch does not operate within above limits, adjust by adding or removing square timing shims located under contact spring Shims furnished in thicknesses of .006" and .018"

Switch Timing (On Engine - Dynaflow Cars) - Place transmission selector lever in Park and apply parking brake Back off throttle stopscrew so that throttle valves tightly closed (fast idle cam must be in hot or slow idle position) Place scale against flange on dashpot diaphragm and measure distance to nearest edge of dashpot arm on throttle lever Turn ignition on, open throttle slowly and, at point where starter is energized, again measure distance to nearest edge of dashpot lever The difference between the two measurements should be ½-¾" If switch timing not correct, adjust as for "Off Engine" timing above *NOTE* - Reset engine idle speed as directed under ADJUSTMENTS above

OVERHAUL: *CAUTION - When disassembling carburetor, be sure to keep PRIMARY and SECONDARY side parts separate so they will not be confused or interchanged when carburetor reassembled*

Disassembly: *NOTE - This carburetor consists of two main assemblies (Air Horn & Main Body) which can be overhauled separately Remove air horn from main body as follows*

All Models (Except Ford & Mercury) - Disconnect choke connector rod at choke shaft lever (except models with "Cross-Over" type choke), then disconnect throttle connector rod at pump arm and fast idle connector rod at choke lever Remove air horn-to-main body attaching screws and lockwashers and remove air horn from main body by lifting air horn assembly straight up

Ford & Mercury - Remove air cleaner anchor screw, then remove anti-stall dashpot arm, anti-stall dashpot operating lever, and choke countershaft lever from choke side of carburetor On fuel inlet side, disconnect fast idle connector rod at the inside choke countershaft lever, and disconnect accelerating pump operating rod at pump arm Remove air horn-to-main body attaching screws and remove air horn from main body

Air Horn (Except Ford & Mercury) - Remove fuel inlet strainer nut, gasket and screen, then remove power piston cover plates Remove two metering rods with pistons and remove springs from piston wells Remove pump arm and link and pump plunger assembly Remove float hinge pins, floats and float needle assemblies and gaskets *NOTE - Keep individual float parts grouped so that same needle and seat are reassembled together* On models with "Cross-Over" type choke, use a prick punch and pierce the welch plug in end of choke piston cylinder and remove plug Disconnect piston link at choke lever and slide choke piston and link out of cylinder On all models, remove inner and outer choke shaft lever and washers, then remove choke valve and choke shaft

Air Horn (Ford & Mercury) - Remove accelerating pump plunger, metering rod and power piston assemblies, floats, fuel inlet and needle assemblies, then remove air horn gasket Remove fuel inlet fitting, gasket and screen Remove choke plate connector link, then slide choke plate countershaft out of air horn assembly Remove choke plate, then slide choke shaft out of air horn

Main Body - On cars with conventional automatic choke assembly, remove attaching screws and remove coil housing and thermostatic coil Remove housing gasket and baffle plate To disassemble choke, remove choke lever attaching screws and retainer washer, then remove choke piston lever and link assembly by rotating piston in bore On Buick models, remove starter switch terminal cap, return spring guide block assembly, plunger and ball On all cars, remove pump discharge nozzle assembly and gasket, then remove primary and secondary venturi assemblies *CAUTION - Venturi assemblies must be marked for reassembly in the same location.* Remove two primary and two secondary metering jets and mark them for reassembly in the same location On models having auxiliary throttle valves, remove auxiliary throttle valve assembly On models having an idle compensator valve assembly, remove two self-tapping screws and remove compensator and gasket. On all models, remove pump return spring, idle mixture screws and spring On Buick carburetors, if starter switch strainer is not visibly damaged or clogged, it will not have to be removed On models having an idle air bypass system, remove large idle air adjusting screw and spring On all models, invert carburetor body and remove pump intake screw plug, check valve ball seat and ball Remove fast idle cam attaching screw and cam, spacer and lockout lever, throttle operating rod, throttle shaft washer, secondary throttle lever and spring Remove throttle shaft arm, throttle shaft dog and inner throttle shaft arm and flex spring from end of primary throttle shaft on choke side *NOTE - It is not recommended that throttle body be disassembled further, however, if necessary to remove throttle valves and shafts, proceed as follows* Mark all throttle valves so they can be installed with correct side of valve upward File burrs from staked ends of all throttle valve screws and remove screws and valves from shafts Remove secondary throttle shaft, then remove primary throttle valve shaft using a rawhide hammer to tap shaft through retaining washer

Cleaning & Inspection: Clean all metal parts in carburetor cleaner and dry with compressed air *(CAUTION - Do not wash accelerator pump plunger assembly or thermostatic coil and cover assembly in cleaning solvent)* Clean and blow out all passages with air Remove any gum deposits in carburetor Clean carbon out of bowl assembly heat passages Make sure that all calibrated restrictions such as idle ports, air bleeds and vents are clean, but do not pass drills or wires through these passages Check all shafts and their bearing bores for wear Check each piston in its cylinder Check for worn or damaged jets and worn holes in ends of various levers Check accelerator pump plunger leather and replace as an assembly if leather is creased or cracked Examine float needles and seats and if needle is grooved replace needle and seat assembly Check idle mixture adjusting screws for burrs, ridges or grooves and replace screws if necessary Check floats for dents or leaks and check hinge pin bores for burrs or wear and check pins for straightness Clean fuel inlet screen

CONTINUED ON NEXT PAGE

1959-60 CARTER AFB 4-BARREL CARBURETORS (Cont.)

Check fast idle cam for excessive wear on steps and replace if necessary. On models with auxiliary throttle valves, check valve assembly to make sure it is free to swing and that weights do not rub on casting. On all models, carefully check body assembly and valve assembly for wear at throttle valves and bores and between shafts and bores. On Ford, Lincoln & Mercury models, check dashpot plunger leather for damage or wear. Check to make sure intake check and discharge restriction is free of lint, gum or other foreign matter.

Reassembly: Use all new gaskets. Install parts in reverse order of disassembly procedure and note the following:

Valve Installation - Use new screws when installing valves. Install valve shafts, then install valves in their respective bores with "C" in circle toward manifold side of carburetor. Install new screws but do not tighten. Make sure idle speed adjusting screw is backed out, then hold valves in place with fingers pressing on high side of valve. Tap valves lightly with a screwdriver to seat them in the bores and while holding in this position, tighten the screws securely. Stake screws in place by squeezing with pliers.

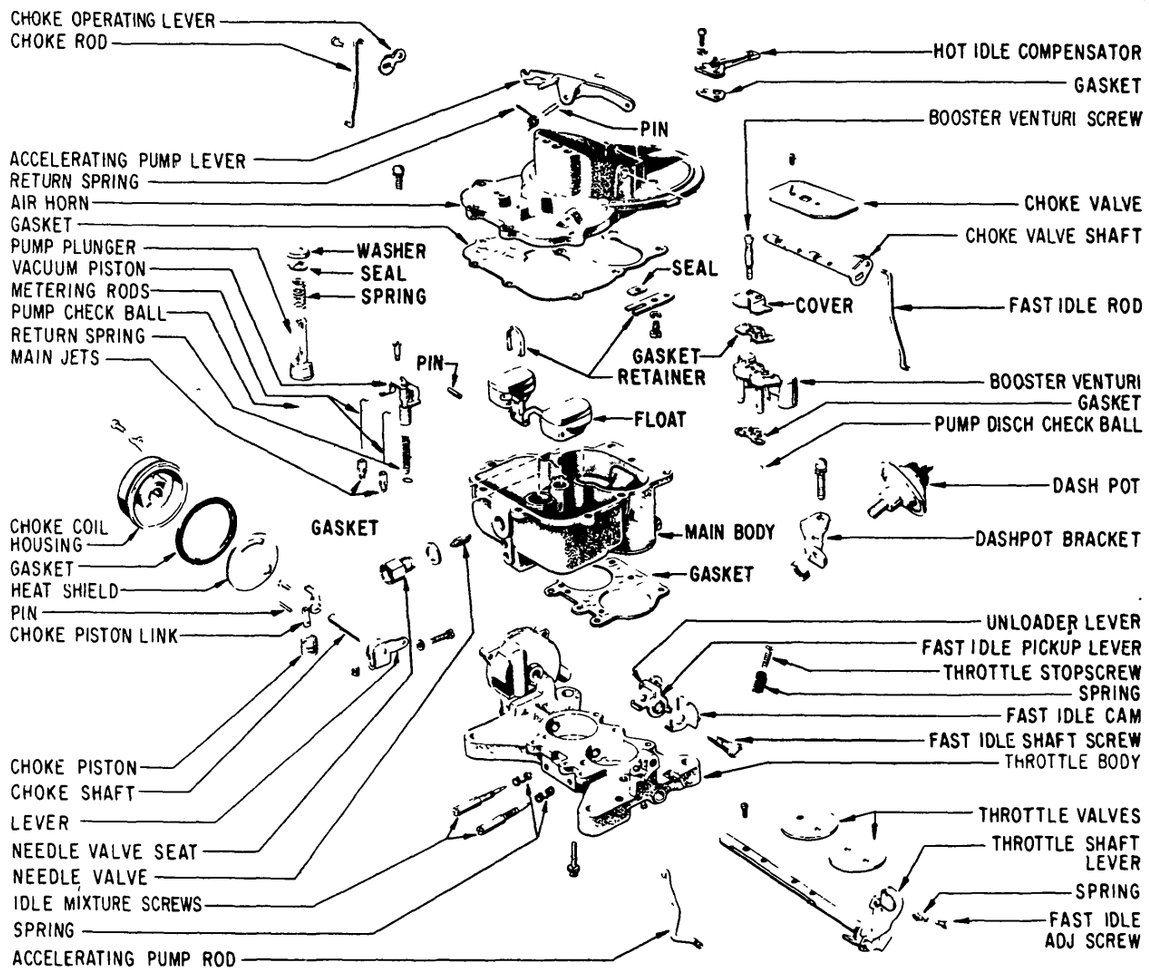
►CHANGES, CAUTIONS, CORRECTIONS



►*1960 LINCOLN & MERCURY HARD HOT STARTING CORRECTION (EARLY CARS):* This condition may be caused by poor seating of fuel inlet valve needle in needle seat and can be corrected as follows: Remove needle and seat assembly from carburetor and support seat on a hard clean surface, then use a light hammer and tap needle into its seat with ONE tap of hammer. *CAUTION - Repeated tapping or a heavy blow will ruin the seat.* Install needle and seat assembly and tighten the seat to 24-84 inch pounds. If the above procedure does not correct the condition, replace needle and seat assembly.

►*1960 LINCOLN & MERCURY SLUGGISH PERFORMANCE AND ACCELERATION CORRECTION:* If normal adjustment and tune-up procedures do not correct the condition, check for proper alignment of carburetor booster venturi within the main venturi and for foreign material or burrs in accelerator pump discharge nozzles. To check booster venturi position, measure the distance between each booster venturi and main venturi at the most rearward point (opposite side of carburetor from fuel bowl). This distance should be .255" minimum (use a ¼" drill and a .005" feeler gauge inserted between booster and main venturi). If clearance is less than .225", remove booster venturi assembly from main body and remove all parting line flash present at front vertical wall of booster casting. *CAUTION - Do not remove more metal than required to conform to contour of wall.* Install venturi assembly and position it as far forward as possible before tightening attaching screws. Recheck clearance between booster and main venturi. *NOTE - Burrs and foreign material in pump discharge nozzles may be cleaned by passing a No. 70 drill (.028") through the openings. DO NOT use a drill larger than .028".*

►*1960 LINCOLN & MERCURY ENGINE STALLING & LOADING (AFTER ONE OR TWO MILES OF OPERATION) OR FAILURE OF CHOKE VALVE TO CLOSE AT LOW TEMPERATURE CORRECTION:* May be caused by incorrect thermostatic coil spring in automatic choke assembly. To check, remove thermostatic coil housing and check spring identification letters which are stamped on outside face of square tang-end. The correct spring is identified by the letters "RA". If not correct, replace thermostatic coil housing assembly with Part No. 9848-A.

►*1960 LINCOLN & MERCURY HARD HOT STARTING CORRECTION:* If the condition exists after carburetor, choke, and linkage are properly adjusted, install Carburetor Booster Venturi Support Assembly Kit, No. COLY-9A523-A (Carter No. 58-530U), and lower float level as detailed below. Remove carburetor air horn, inlet needle and seat assembly, float assembly, float shaft retainer, booster venturi support cover, gasket, and the booster venturi support assembly and gasket. Install the new support assembly gasket, booster venturi support assembly, support cover gasket, booster support cover, and secure with two screws. *NOTE - See "Lincoln & Mercury Sluggish Performance & Acceleration Correction" above for proper alignment of booster venturi assembly in main body. Clearance between booster venturi and main venturi must not be less than .255" and equal on all sides.* Install float and float shaft assembly, then install the new needle and seat assembly. Install new float shaft retainer and baffle assembly. Lower the float level so there is ¼" clearance from top of each float (measured at center of float) to top of machined surface of main body. *NOTE - Use Tool 9550-DA to measure this distance. With float level set at ¼" (at center of float), the clearance at end furthest from pin must be 9/32".* Install carburetor air horn. Carburetor assemblies with the above revisions were used in production after April 15, 1960 and are identified by Part No. COLE-9510-G (Carter No. 2965SA).

►*2965S CARBURETOR ACCELERATING PUMP CHECK BALL PRODUCTION CHANGE & SERVICE REPLACEMENT CAUTION:* The accelerating pump inlet check ball has been changed from steel to aluminum in production. When servicing a carburetor with an aluminum check ball, do not stake it in place as required for steel ball. The accelerating pump outlet check ball is steel and is approximately the same size as the aluminum inlet check ball. To identify, use a magnet to determine material used.

CARTER ABD 2-BARREL CARBURETOR ASSEMBLY

DESCRIPTION: 2-Barrel downdraft type of new design. Air horn, main body, and throttle body are aluminum castings with the choke housing cast integrally with the throttle body. A hot idle compensator located on the air horn, is calibrated to open under high temperature conditions, with engine idling, preventing engine stalling or a decrease in idle speed.

ADJUSTMENTS: *NOTE - All adjustments, except float setting and fast idle throttle clearance can be mad with the carburetor installed on the engine.*

Idle Setting: 1-1½ turns open from a lightly seated position (initial setting). Final setting should be made with engine at operating temperature. Adjust mixture screws

CONTINUED ON NEXT PAGE

1960 CARTER ABD 2-BARREL CARBURETORS (Cont.)

to obtain highest vacuum reading, then turn screws out 1/8 turn.

Idl Speed: 450-475 RPM with transmission selector lever in "D" (Drive).

Fast Idle Speed: With engine at normal operating temperature, transmission selector lever in "D" (Drive) and fast idle screw on lowest (slowest) step of cam, adjust fast idle screw to obtain 600-650 RPM.

Dashpot: .060-.090" clearance between dashpot plunger and throttle operating lever with dashpot plunger held in to limit of travel and throttle valves closed. To adjust, loosen locknut and rotate dashpot in bracket.

Ch ke Setting: 1 notch lean.

Accelerating Pump: 7/16" from top of accelerator pump plunger to top of bowl cover with pump operating rod in lower hole of throttle lever. To adjust, bend operating rod at lower angle with Tool T109-213.

Ch ke Valve & Piston Lever Linkage: Bend 1/8" of end of Tool T109-189 (.026" wire gauge) at a 90° angle, then insert bent end of gauge into choke housing piston bore so that it is between bottom of slot in choke piston and top edge of vacuum slot in choke housing. Close choke valve by pressing on piston lever until it stops, then check clearance between upper edge of choke valve and air horn which should be 5/32" (Tool T109-154). To adjust, use parallel jaw pli ers and bend choke operating lever at the reduced area to obtain proper adjustment.

Unl ader: 1/8" clearance between upper edge of choke valve and wall of air horn with throttle valves wide open. To adjust, use 1/8" gauge, Tool T109-36 or a 1/8" drill to check clearance. Bend tang on choke unloader lever as required.

Fast Idle Cam: With choke valve closed, fast idle adjusting screw should rest at index mark on high step of fast idle cam. To adjust, bend fast idle cam pickup lug on choke unloader lever as required.

Throttle Valve Clearance (Fast Idle): With choke valve closed, turn fast idle screw until there is .020" clearance between throttle valve and bore on side opposite idle port. Use Tool T109-29 to check clearance,

Fl at Level: 9/32" measured at free end of float. *NOTE - This setting supersedes previous setting of ¼".* Press down on float shaft retainer and hold float and lever assembly in uppermost position against fuel inlet needle. Distance between top of float (end furthest from hinge pin) and top machined surface of main body should be 9/32" (Tool T109-239). Bend float lever arms as required to obtain proper alignment (parallel). Bend inlet needle tab as required for proper float level.

OVERHAUL: Air Horn Disassembly - Disconnect choke rod from choke housing lever, then remove accelerator pump operating rod retainer at throttle lever and unhook rod at pump operating lever. Remove fast idle cam operating rod retainers at each end and disconnect rod from fast idle cam. Remove air horn attaching screws, then remove air horn from main body. Remove fast idle cam operating rod from bottom side of air horn by slipping it through seal washer. Disconnect choke operating lever from choke valve shaft and from choke operating rod. Remove operating rod by slipping it through seal washer from bottom side of air horn. Remove accelerating pump plunger by compressing spring and slipping plunger off pump operating lever. Remove choke valve and choke shaft. Remove hot idle compensator attaching screws, compensator assembly and gasket. *NOTE - If it is necessary to replace accelerator pump operating l v r, remove retainer and return spring, then pry out tapered retainer pin with a pair of side cutters and remove lever.*

Main Body Disassembly: Remove fuel inlet fitting and needle seat with inlet needle and gasket. Remove float shaft retainer, float and lever assembly, and float shaft. Remove accelerator pump inlet check ball (invert main body and catch ball). Remove vacuum piston retainer screw and remove vacuum piston and metering rods as an assembly. Remove metering rods from vacuum piston assembly. Remove vacuum piston spring and gasket. Remove main metering jets, then remove booster venturi assembly and gasket. Remove accelerator pump discharge check ball (invert main body and catch ball).

Throttle Body Disassembly: Remove throttle body attaching screws, then separate throttle body from main body. Remove throttle body to main body gasket. Remove dashpot and bracket, then remove fast idle cam screw, cam, washer and pickup lever. Remove idle mixture adjusting screws, then remove automatic choke thermostatic coil housing, gasket and heat shield. Remove piston, lever and link assembly attaching screw and remove piston, lever and link assembly by rotating assembly 90° counterclockwise and slipping piston out of bore. Remove choke housing lever and shaft assembly. *NOTE - If necessary to remove throttle valves, mark valves in a suitable manner and scribe a line across throttle plate next to throttle shaft to insure plate alignment and installation in correct position. File off staked ends of throttle valve screws, then remove screws, throttle valves and throttle shaft.*

Throttle Body Reassembly: *NOTE - If throttle valves removed, insert throttle shaft into body and place throttle valves in their respective positions in bores and on throttle shaft, using reference marks made at disassembly for proper positioning and alignment. Install throttle valve screws but do not tighten. Back off idle adjusting screw and allow throttle valves to seat in bores. Tap plates lightly to position and at the same time hold throttle shaft in the closed position and tighten throttle valve screws. Stake screws securely, then turn idle adjusting screw back to its original position.* Install fast idle cam, washer and pickup lever, then install shaft screw. *NOTE - Pickup lever should be positioned with hole for operating rod toward the throttle bore.* Install choke housing lever and shaft assembly in choke housing, then install piston, lever and link assembly. Attach piston lever to choke shaft. *NOTE - Lever on choke housing shaft should be toward right when viewing throttle body from choke housing end.* Install idle mixture adjusting screws and turn them in until they seat lightly, then back them off 1-1½ turns for initial adjustment. Install dashpot and bracket assembly. Install throttle body and gasket on main body.

► *CARBURETOR REASSEMBLY NOTE (BOOSTER VENTURI ASSEMBLY INSTALLATION):* Booster venturi assembly must be properly positioned in bores of carburetor body and the bores in throttle body (body flange assembly) must be properly centered as follows: Loosen attaching screws holding body flange assembly to main body and position body flange assembly away from fuel bowl section of main body casting as far as possible, then tighten attaching screws. Clearance between each booster venturi and the main venturi when measured at side opposite fuel bowl should be a minimum of .255" (measured with a ¼" drill and a .005" feeler gauge). If unable to obtain clearance, remove booster venturi assembly and remove all parting line "flash" from cluster that may be present on side which is positioned next to fuel bowl.

Main Body Reassembly: Install accelerator pump discharge check ball and stake the ball lightly. *CAUTION - Check ball is steel and should not be interchanged with the aluminum inlet check ball. See "Check Ball Production Change & Service Replacem nt Caution" above.* Install booster venturi assembly and gasket, then install main metering jets. Install metering rods on vacuum piston assembly, t hen insert vacuum piston spring and gasket in piston bore and install vacuum piston assembly. *CAUTION - Make sure met r ing rods enter metering rod jets.* Tighten piston retaining screw securely. Install float shaft in float lever and install float, lever and shaft assembly. Install fuel inlet needle and seat assembly and tighten securely, then adjust float setting. Install float shaft retainer. Install accelerator inlet check ball (steel ball used on early cars and an aluminum ball used on later cars). *See "Check Ball Production Chang & Service Replacement Caution" above.*

Air Horn Reassembly: *NOTE - If accelerator pump operating lever was removed, install lever using a new retaining pin, then install lever r turn spring.* Install hot idle compensator assembly and gasket and tighten screws securely. Install accelerator pump plunger on operating lever, then install seal washer and retainer on each side of the air horn. Insert choke shaft through air horn and install choke valve. Stake choke valve screws securely. *NOTE - Install choke shaft in air horn so integral lever on shaft is on same side of air horn as accelerator pump operating lever.* Insert choke operating rod through seal washer with dogged end toward top of air horn, then insert operating rod through choke shaft lever so end of rod is toward air horn and choke lever parallels choke shaft fast idle lever. Insert fast idle cam operating lever through seal washer with the straightest length through seal and the end of the rod toward air horn. Install rod retainer. Install air horn gasket on main body, then install air horn, tightening screws evenly and securely. *CAUTION - Do not damage accelerating pump plunger when installing air horn.* Insert choke operating rod into choke shaft lever and install retainer. Insert fast idle cam operating rod into fast idle cam trip lever and install retainer. Adjust choke valve and piston lever linkage, unloader, and fast idle cam *(see "Adjustment" above).* Loop accelerator pump operating rod through pump operating lever, then insert other end of rod through bottom hole of throttle shaft lever and install retainer. Adjust accelerator pump and throttle valve clearance (fast idle). *See "Adjustment" above.* Install thermostatic choke coil heat shield, gasket and thermostatic coil housing. *NOTE - Be sure thermostatic coil engages slot in choke piston.* Install retainers and screws loosely, then rotate coil housing so index mark is at 1 notch lean. Adjust dashpot. *See "Adjustment" above.*

►CHANGES, CAUTIONS, CORRECTIONS

►***1954 BUICK SERIES 40 & 50 SYNCHRO-MESH CARS LOADING UP ON ACCELERATION WITH COLD ENGINE CAUSING A STUMBLE OR BUCK (Cars with first 2081S Carburetor):*** Can be corrected by making following changes. *NOTE*—All required parts are furnished in Carter Unitized Pkg No. 170-353U

(1) Choke Coil & Cover Assembly—Remove and discard original assembly, Carter No. 170AJ73S (stamped on cover). Install NEW assembly, Carter No. 170U73S, using a new gasket and set choke for Centered (At Index) setting

(2) Chok Warm Air Passage Bushing—Remove air horn assembly and gasket. Install special Reducer Bushing (I.D. #42 Drill or 0935") in choke warm air passage which is hole in top edge of bowl cover under choke mounting location (this passage has #38 drill or .1015" metering orifice at bottom). Use a square end tool to drive bushing in flush with upper surface of bowl cover. Re-install air horn assembly using a new gasket

(3) Metering Rod—Make certain carburetor has later type No. 75-1107 Metering Rods. See Metering Rod Production Change following.

(4) Install new Identification Tag stamped 2081SA. ***NOTE—Later 2081SA carburetors do not require the above change.***

►***1954 BUICK SERIES 40 & 50 METERING ROD PRODUCTION CHANGE (Early No. 2081S Carburetors):*** First type Metering Rods, Carter No 75-994, changed to No. 75-1107 which will improve performance and correct low-speed buck (see Correction immediately above). *NOTE*—All 2081SA carburetors have this later metering rod

►***1955 BUICK 40 ROUGH IDLE ON SYNCHRO-MESH CARS (Bucking or Missing)*** · May be caused by flash in cylinder head exhaust crossover passages resulting in uneven manifold heat Remove head, examine passages and make certain that openings are at least 5/8" diameter Correct by knocking out flash with a punch and blow passages out thoroughly

►***1954-55 BUICK 40 WARM-UP PERFORMANCE IMPROVEMENT (SYNCHRO-MESH CARS) Check and correct the following*** ·

1) Check cylnder head for obstructed exhaust crossover passages (see Rough Idle Correction above)
2) Make certain that correct Carter carburetor installed On 1954 cars with first 2081S carburetor, make certain that carburetor brought up to later 2081SA specifications and that later type No 75-1107 Metering Rod installed
3) Adjust carburetor (Fuel Level, Pump Stroke, Metering Rod Setting, Idle Adjustment) ***Idle setting must not be too lean.***
4) Set Automatic Choke at 2 Points Lean (original setting was CENTERED) Choke setting may be varied on individual engines but must not exceed 3 Points Lean

►*1957-EARLY 1958 RAMBLER SERIES 10 CARBURETOR INSTALLATION & INSPECTION CAUTION (TO CORRECT FLASH-O-MATIC TRANSMISSION 1-2 SLIPPAGE OR 2-3 PILE-UP IN D1 RANGE)* Vacuum for transmission solenoid & vacuum control is supplied from carburetor passage which terminates in two ports in carburetor as follows *NOTE - Late 1958 models were changed to take the vacuum directly from intake manifold and the vacuum line connection on carburetor was plugged* 1) Vacuum port at throttle edge 2) In carburetor mounting flange at choke vacuum supply passage In correcting above transmission complaints, inspect carburetor and note the following

1) Carburetor Vacuum Ports - Check port at throttle edge for correct size (0465") and make certain passages are not restricted With throttle valves tightly closed **top** edge of this port should be flush with **bottom** edge of valve

2) Carburetor Mounting Flange & Gasket - Inspect mating surfaces of carburetor flange and manifold for unevenness burrs or chipped areas These surfaces can be cleaned up by using crocus cloth on a surface plate Inspect gasket for swelling at the vacuum port and channel area

►*1958 RAMBLER LIGHT THROTTLE ACCELERATION STUMBLE CORRECTION (At speeds below 25 MPH)* Install two metering rods, Carter Part No 75-1431 These new rods are furnished in a replacement kit Rambler Part No 3201205 Adjust new metering rods to same specifications as for previous rods See *"Adjustment" below*

DESCRIPTION: 2-barrel downdraft with automatic choke, concentric float bowl and double floats, permanently assembled main nozzles, high pressure type spring operated accelerating pump, and built-in Carter Car Starter (Buick Models only) 1957 & early 1958 Rambler carburetor, used with automatic transmission has an additional vacuum port at throttle edge for transmission control On later carburetors, the vacuum line opening is either plugged or eliminated and the vacuum line for transmission control is taken directly from intake manifold

ADJUSTMENT: With engine at normal operating temperature, choke valve open and fast idle inoperative, proceed as follows

Idle Mixtur : Adjust each mixture screw until highest vacuum is obtained with smooth engine operation at indicated idle speed

Idle Mixture Screw Setting

Car & Carb.	Idle Screw Opening
Buick 2081S, SA, 2179S	1¼-1¾ turns
Chrysler	½-1 turns
Nash 2061S, 2350S	½-1½ turns
Pontiac	1¼ turns
Pontiac 719SA, 720SA, 2122S	¾-1¾ turns
Rambler 2350S, 2386S	½-1½ turns
Rambler 2887S, 2887SA	½-2 turns
Willys 2204S	1-2 turns

Idle Speed Setting

Car Model	Synchro-mesh	Auto. Trans.
Buick	450 RPM	450 RPM
Chrysler	475-500 RPM	450-500 RPM
Nash (1955)	500-550 RPM	①450 RPM
Nash (1956)	550 RPM	①②475 RPM
Pontiac Six	520-540 RPM	① 365-385 RPM
Pontiac Eight	450-475 RPM	①③ 365-385 RPM
Rambler	550 RPM	①②475 RPM
Willys	500 RPM	

① - With selector lever in "N" (Neutral)
② - 500 RPM on air conditioned cars (air conditioner ON)
③ - 460-480 RPM on air conditioned cars

Accelerating Pump: *NOTE - Two different type accelerating pumps used as follows Type "B" used on Buick, Chrysler, Pontiac Eight, and Willys. Type "C" used on all others Adjustments are different as indicated below*

Type 'B" Accelerating Pump: Pump is high pressure delayed action type with positive throttle lever connection Pump plunger is loose on plunger stem and is positioned by spring above plunger to provide uniform pump action (compression and expansion of spring provides uniform plunger movement and pump discharge) Check and adjust as follows

►*CAUTION:* When measuring pump stroke, proceed exactly as follows (gauge reading indicates plunger shaft position rather than actual movement.

Pump Stroke Checking & Adjustment—Install pump connector link in hole of pump arm which provides correct stroke for checking (see table), back out throttle lever stopscrew so that throttle valves are tightly closed (CAUTION—See that fast idle cam does not hold throttle valves open).

►*CAUTION· Check pump stroke by either of the two following methods:*

(1) Gauge T109-117S Method—Invert gauge on edge of dust cover boss of bowl cover at pump plunger shaft (CAUTION—hold gauge vertical to insure correct reading). Turn knurled nut on gauge until gauge finger just touches upper end of plunger shaft. Number indicated on gauge should agree with "Gauge" figure in table below. Adjust by bending throttle connector rod at upper angle.

(2) Scale Method—Use a scale to measure distance from top of pump plunger shaft to top of dust cover boss on bowl cover This distance should agree with

CONTINUED ON NEXT PAGE

CARTER "WCD" (C nt.)

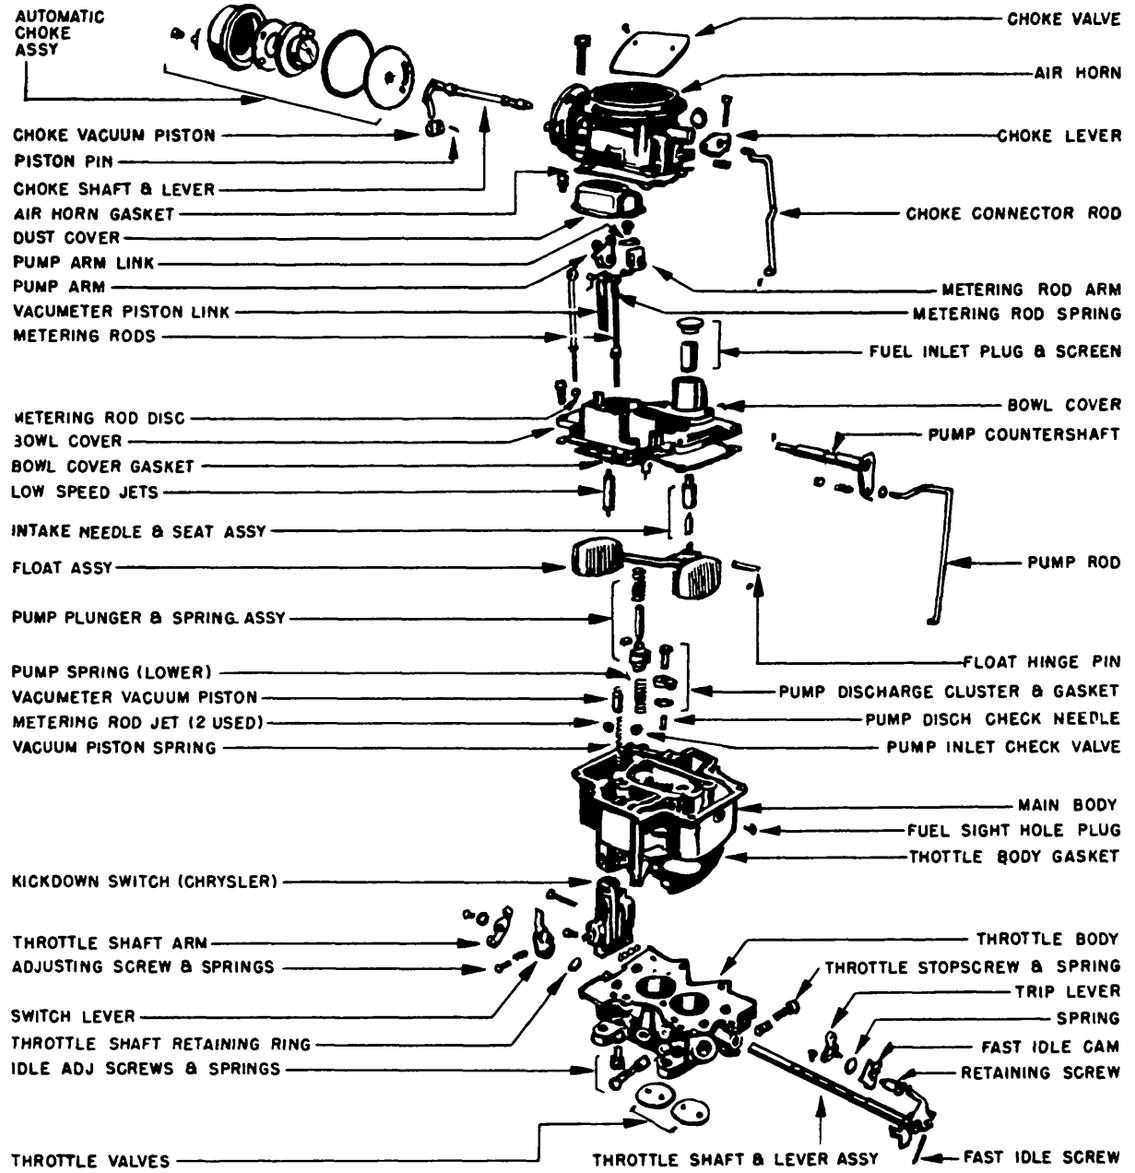
"Scale" figure in table. Adjust by bending throttle connector rod at upper angle.

Car & Carb.	Type "B" Pump Setting Reading Gauge	Scale	Pump Stroke
Buick (All)	29	17/64"	Long
Chrysler	29	17/64"	Long
Pontiac Eight (All)	32	20/64"	Short
Willys	33	22/64"	Long

Pump Jet Aim—Pump jets must be properly aimed so that pump discharge stream strikes venturi at correct angle To check (with air horn removed), operate pump by opening throttle with short quick stroke and note direction of pump jet stream Stream should miss outer wall of primary venturi and strike lower part of inner wall of secondary venturi To adjust, bend pump jet slightly Check both pump jets similarly.

►*CAUTION· Use extreme care not to distort jets when making adjustments.*

Type "C" Accelerating Pump: Pump is high pressure delayed action type (same as Type "B" above) but pump stroke is checked and adjusted differently as follows



Pump Stroke Adjustment—Back out throttle stopscrew so that throttle valves seated (CAUTION—make certain fast idle screw does not hold throttle valves off seat). Remove dust cover over pump countershaft. Place straightedge across top of dust cover boss at pump arm. Flat op top of pump arm should be parallel to straightedge. Adjust by bending throttle connector rod at upper angle using bending tool T109-213.

Metering Rod: *NOTE - Special gauge T109-163 (2.940") is required to check metering rod setting on Nash 2061S & Pontiac Eight 719SA, 720SA, 2122S carburetors. Gauge not required on other carburetors. Check each type as follows*

Metering Rod Check (With Gauge)—Use special metering rod gauge (see table below). Install gauge in place of either metering rod seating gauge in metering rod jet Back out throttle lever stopscrew so that throttle valves tightly closed. Press down lightly on vacuum piston link until lug of piston link contacts lip of metering rod arm In this position, clearance between metering rod bearing and shoulder in notch or gauge should be less than 005" Adjust by bending lip of metering rod arm using bending tool T109-105 Remove gauge and reinstall metering rod

Metering Rod Check (No Gauge Required)—Check and adjust the rods as follows: Back off throttle lever stopscrew so that throttle valves tightly closed, loosen metering rod arm clampscrew (on countershaft under dust cover on bowl cover), press down on vacumeter link until both metering rods just bottom in carburetor casting, rotate metering rod arm until finger on arm contacts lip on vacumeter link, tighten clampscrew (*CAUTION*—do not disturb arm position)

Fl at L v l: *NOTE - On Nash, Rambl r & Pontiac Six, float ass mbly consists of two fl ats and auxiliary l v r. A singl float is us d on all oth r carbur tors On carburetors with two fl ats, mak sur both floats ar s t to uniform h ight.*

CARTER "WCD" DUAL CARBURETOR

Float Level Setting - With bowl cover and float assembly removed from carburetor, invert assembly, remove cover gasket, install correct gauge (see table below) on cover directly below floats with notched portions of gauge fitted over edge of cover casting. Make vertical and lateral adjustments on each float

V rtical Adjustm nt - Top of each float should just clear horizontal portion of gauge Adjust by bending float arms *CAUTION* - Adjust both floats evenly.

Lateral Adjustment - Sides of floats should barely touch vertical uprights of float gauge (necessary to prevent floats hanging up in bowl). Adjust by bending float arms

Fast Idle: *CAUTION - Two s ttings (1) and (2) r quir d.* **(1) Fast Idl Cam Cl arance** - Loosen choke lever clampscrew on choke valve shaft, insert correct gauge (see Checking Gauge (1) in table below) between lip

CONTINUED ON NEXT PAGE

CARTER "WCD" (C nt.)

on fast idle cam and boss on flange casting. Hold choke valve tightly closed and remove all slack from linkage by pressing choke lever toward closed position, tighten choke lever clampscrew.

(2) Fast Idle Screw Setting - With choke valve tightly closed, tighten fast idle adjusting screw against high step of fast idle cam until throttle valve opening or clearance between edge of valve and carburetor bore on side opposite idle ports is correct (see Checking Gauge (2) in table below).

Float Level Setting

Car & Carb.	Float Level	Gauge No.
Buick 2081S, SA	5/32"	T109-196
Buick 2179S	3/16"	T109-162
Chrysler 2039SA	11/64"	T109-205
Nash 2061S, 2350S	5/32"	T109-196
Pontiac Six 2010S	5/32"	T109-196
Pontiac Eight (All)	3/16"	T109-162
Rambler (All)	5/32"	T109-196
Willys 2204S	3/16"	T109-162

Fast Idle Setting

Car & Carb.	Settings & Gauge Nos. Setting No. 2	Setting No. 1
Buick 2081S, SA	.010" T109-29	.028" T109-189
Buick 2179S	.010" T109-29	.025" T109-189
Chrysler (All)	.040" T109-193	.017-.021" T109-44
Nash 2061S	.005" T109-237	.026" T109-189
Nash 2350S	.010" T109-200	.020" T109-29
Pontiac (All)	.040" T109-193	.026" T109-189
Rambler (All)	.010" T109-200	.020" T109-29
Willys (All)	.040" T109-193	.016"

Unl ad r Setting: Hold throttle valve wide open and check choke valve opening or clearance between edge of valve and air horn (see table below). Adjust by bending unloader lip on throttle lever with Tool T109-41.

Unl ad r Setting

Car & Carb.	Choke Opening	Gauge No.
Buick 2081S, SA	3/16"	T109-28
Buick 2179S	1/4"	T109-31
Chrysler 2039SA	7/32"	T109-106
Nash 2061S	11/64"	T109-166
Nash 2350S	3/16"	T109-28
Pontiac 2010S	9/64"	T109-34
Pontiac 719S,SA,720S,SA	1/8"	T109-36
Rambler (All)	3/16"	T109-28
Willys 2204S	1/8"	T109-36

Thr ttle Valv S tting: Check when overhauling carburetor.

Throttl Valve Setting

Car & Carb	Idl Valve Opening	Vacuum Spark Port
Buick (All)	②.057-.063"	①.010-.014"
Chrysler (All)	②.136-.140"	②.035-.041"
Nash (All)	②.117-.123"	②.033-.038"
Pontiac (All)	②.122-.128"	②.052-.058"
Rambler 2350S,2586S	②.117-.123"	②.033-.038"
Rambler 2887S, SA	②.095-.101"	②.028-.038"
Willys	②.125-.131"	②.027-.037"

① - Bottom of port above top edge of valve.
② - Top of port above top edge of valve.

Car Starter Setting: (Buick 1954) - With transmission in neutral, apply parking brake and make sure throttle linkage and dashpot correctly adjusted. Back off throttle stopscrew, disconnect throttle connector rod and rotate fast idle cam to slow idle position, then close throttle valves. Place a scale against choke unloader arm on throttle lever and make a mark on carburetor body at the 1" point on scale. Turn on ignition and open throttle slowly while holding end of scale against unloader arm. Note point at which starter drive pinion just engages flywheel. Scale should read between 1 15/16" and 2 5/16" at reference mark on carburetor (15/16" to 1 5/16" travel of arm). If switch timing too early, remove shims. If switch timing too late, add shims. *NOTE - Shims are added or removed on guide block under contact spring. Do not use less than one .018" shim or more than three .018" shims plus two .006" shims.*

Buick (1955)—Place transmission selector lever in neutral and apply parking brake. Back off throttle stop screw, rotate fast idle cam to slow idle position, fully close throttle valve. *(NOTE (Dynaflow Cars)*—Dashpot must not interfere with full closing of throttle.) Place scale against rear face of lower arm of throttle lever which contacts dashpot, with scale resting on rocker arm cover. Mark rocker arm cover at front edge of scale (throttle valve fully closed). Turn "IGN" switch ON, slowly open throttle, mark cover again at point where cranking motor is energized. Timing is correct if distance between marks on rocker arm cover is 29/32—1 7/16". Adjust by changing number of shims. Reset idle speed to 450 RPM (engine hot) and recheck adjustment of throttle linkage and dashpot.

OVERHAUL: ***NOTE—On carburetors equipped with Car Starter or Dashpot, remove these units as follows:***

Car Starter Removal (Buick Carburetors)—Disconnect and tape leads on switch terminals. Take out switch terminal cap attaching screw, hold-down clip, switch cap. Withdraw return spring, guide block and contact spring assembly, switch plunger, and ball.

Dashpot Assembly—Take out attaching screws and lift dashpot assembly off carburetor.

Disassembly: Disconnect and remove throttle connector rod, disconnect fast idle rod from choke lever. Take out screws fastening air horn, lift off air horn assembly (see Air Horn disassembly below). Take out two attaching screws in dust cover, remove dust cover and gasket. Remove fuel inlet strainer cover nut and remove strainer. Take out bowl cover attaching screws and remove bowl cover assembly *(CAUTION*—lift bowl cover straight up to avoid damaging parts on underside of cover). See Bowl Cover disassembly below. Remove spring from accelerating pump cylinder. On Chrysler carburetors, lift out vacuum piston, spring, and gasket from vacuum piston cylinder. On all other carburetors, remove the vacuum piston spring (piston pulls out with cover assembly). Unscrew and remove metering rod jets (use Tool T109-58 or wide bladed screwdriver which will engage both slots in jet). Take out attaching screw in pump discharge jet cluster, remove cluster and gasket. Remove pump relief valve plug assembly and gasket. Remove intake check valve retainer in bottom of pump cylinder, invert carburetor body and catch pump discharge check needle and intake ball as they drop out. Remove pump intake strainer (if used). Take out four screws attaching throttle body, lift off throttle body and gasket. See Throttle Body disassembly below. ***CAUTION—DO NOT attempt to remove main Discharge Nozzles (nozzles are permanently installed in body).***

Throttle Body—On Buick carburetors, see Car Starter data (above) for removal of these parts. Remove both idle adjusting screws and springs. Remove both idle port rivet plugs (use Rivet Extractor Tool T109-43). DO NOT remove throttle valves and shafts unless replacement of parts required. To remove these parts, first mark both valves (to insure re-installation in same carburetor barrel), take out attaching screws and remove valves. Take out screw on end of throttle shaft, remove lever and washer. Remove shaft retainer ring or use rawhide mallet to tap shaft out through retainer, remove shaft and lever assembly. Remove fast idle cam and trip lever mechanism.

Bowl Cover—Unhook and remove both metering rods *(CAUTION*—use care not to bend or otherwise damage the rods), do not lose metering rod discs (when used). Unhook vacuum piston from link (on Chrysler carburetors, piston is not attached to link but it will be necessary to compress link spring and retainer, remove brass pin from end of link, then remove retainer and link spring). Lift vacuum piston link out. Push float fulcrum pin out, remove float assembly, remove intake needle from float lever (types where needle clipped to float lever). Remove fuel intake needle seat and gasket. Unscrew both low speed jets (use T109-76 wrench). Remove cover gasket. Remove hairpin clip from pump connector link, remove link, remove pump plunger assembly. If pump arm countershaft requires removal (for parts replacement), loosen screws in metering rod and pump arms, take out pin spring in end of countershaft, pull countershaft and lever assembly out and at the same time lift out the metering rod arm and pump arm.

Air Horn—Remove retainer screws and retainers, remove choke housing and coil assembly, gasket, and baffle plate. Remove lever from end of choke shaft. Take out attaching screws and remove choke valve. Rotate shaft to disengage vacuum piston from cylinder, withdraw shaft and piston assembly.

►***CHRYSLER THERMOSTATIC COIL HOUSING CAUTION:*** Thermostatic coil, heat retainer plate, and housing are serviced as an assembly. Coil and heat retainer plate can be removed from housing for cleaning by hitting assembly sharply against palm of hand with coil side down.

Cleaning & Inspection: Wash all parts except thermostatic coil and housing assembly in suitable cleaning solvent. Blow out all passages and dry with air. Make certain that all gum and carbon deposits removed, particularly from carburetor barrels at throttle valves and idle ports. Inspect all parts for wear or damage.

Reassembly: Use all NEW gaskets. Install parts in reverse order of disassembly procedure and note the following important instructions:

CONTINUED ON NEXT PAGE

CARTER "WCD" (C nt.)

Throttle Valve Installation—Insert throttle shaft in throttle body, install shaft retaining ring on end of shaft with prongs outward, press ring on shaft so that it is snug fit against body without endplay in shaft. Install throttle valves with trademark ("c" in circle) on idle port side and facing downward toward manifold side, insert throttle valve screws loosely. Close throttle fully, center both valves in carburetor barrels, hold valves firmly in place while supporting screw heads on a steel block.

Pump Jet Assemblies—Use loader tool T109-122U to install pump intake check ball and retainer in pump cylinder (place ball and new retainer in small end of tool sleeve, tap sleeve to seat retainer in pump cylinder recess). Place pump discharge check needle with tapered end down in passage in main body, install pump discharge cluster with new gasket, tighten screw securely. Install pump relief valve plug and gasket.

Accelerating Pump, Metering Rod & Vacuum Piston Assembly—Install vacuum piston link in bowl cover with lip at center opening pointing toward outer side of cover *(CAUTION*—use care not to distort metering rod spring). Install piston on lower end of link on all carburetors except Chrysler (NOTE—On Chrysler, install link spring and retainer on link, compress spring and install brass pin in end of link, install vacuum piston in main body). Coat pump operating countershaft with light graphite grease and insert it through hole in bowl cover and through metering rod arm and pump arm (hold metering rod arm so that it engages opening in piston link and pump arm so that it extends over pump plunger), install pin spring in groove in end of countershaft. Center pump arm over pump plunger rod and tighten setscrew temporarily, install pump link in plunger rod and pump arm with ends of link pointing toward countershaft arm and secure with pin spring. After bowl cover installed and pump connector rod installed, adjust pump stroke (see ADJUSTMENTS). Install metering rods, inserting end of each rod through hooked end of metering rod spring and entering metering rod in metering rod jet, rotate rod eye over pin on piston link, adjust metering rods (see ADJUSTMENTS).

Automatic Choke Assembly—Install choke shaft, link, and piston assembly in air horn, rotate shaft to enter piston in cylinder. Install choke valve on shaft with trademark on valve ("c" in circle) upward, install new screws loosely, then close choke valve and tap it gently to center the valve, tighten screws securely. Check for uniform clearance at edges of valve and for free operation (valve should open of own weight from closed position). Stake screws lightly while supporting screw heads on a steel block. Install baffle plate and coil housing with a new gasket, place indicator mark on cover downward and install retainers and screws loosely, then rotate housing counter-clockwise until correct setting secured (see ADJUSTMENTS), tighten retainer screws securely.

Service Parts

Gasket Sets - Carter No. 189 (719SA, 720SA, 2122SA), No. 195A (2081S,SA) No. 231 (2010S); No. 237 (2039SA), No. 256 (2179S), No. 258 (2204S), No. 268 (2061S), No. 285 (2350S, 2586S, 2887S, SA).

►CHANGES & CORRECTIONS

►*1957 BUICK PERFORMANCE IMPROVEMENTS (Synchro-mesh Cars with Carter 2529S Carburetor)* Parts listed below are used in later carburetors and can be installed in earlier carburetors to improve performance and correct complaints as indicated

1) Lean Part Throttle Condition at 30-40 MPH - Install parts furnished in Unitized Kit, Carter No. 75-1383U (Buick No. 1180737) as listed below. This pump spring is included in new Pump Plunger, Rod, Spring, & Retainer Assy., Carter No. 64-208S (Buick No. 1180623). This Pump Plunger Assembly will be included in revised Repair Pkgs. and supersedes previous type assembly No. 64-200S.

Carter Unitized Pkg. No. 75-1383U

Part	New No.	Superseded No.
Metering Rods	75-1371	② 75-1348
Pump Plunger Spring Ⓒ	61-601	

Ⓒ - Part of Pump Plunger Assy. No. 64-208S.
② - This rod now 1 Size Lean.

2) Loading During Warm-up Condition - Replace original Vacuum Piston in automatic choke housing with new type, Carter No. 160-122 (Buick No. 1179336), and change Automatic Choke Setting to 1 Point Lean (was 1 Point Rich). Also set Fast Idle Speed (on engine) to 1800 RPM (was 1500 RPM) as directed below. *NOTE* - Previous type Choke Vacuum Piston, Carter No. 160-157, is continued on 2536S carburetors.

►*1958 BUICK SERIES 40 (AIR COND CARS) LAG IN THROTTLE RESPONSE CORRECTION*· This condition may exist on some cars and is apparent after deceleration with closed throttle at road speeds To improve this condition, install a deflector 2½" x 3½" which should be located with its centerline on centerline of the air cleaner snorkel, and attached to fan shroud with two self tapping screws When the above change is made, also install one step lean metering rods, Carter No 75-1368, in carburetor

►*1960 BUICK EXCESS IDLE SPEED DURING WARM-UP CORRECTION:* May be caused by incorrect fast idle cam. Check to see if fast idle cam is "brass" colored. If not, install fast idle cam, Buick Part No. 1199208, synchro-mesh cars (Carter No. 181-288), Buick Part No. 1199209, automatic transmission cars (Carter No. 181-289). Carburetors date coded L-9 or later have the correct cam.

►*1960 BUICK (2979S & 2980S) CARBURETOR CHANGES FOR IMPROVED HOT WEATHER OPERATION:* Install Unitized Package, Carter No. 118-185U which consists of a new higher metering rod cover, fuel inlet needle and seat assembly, gaskets, and plugs for the external and accelerator pump vent holes. *NOTE - The installation of this kit converts carburetors 2979S & 2980S to 2979SA & 2980SA.*

►*1956 HUDSON & NASH POOR WARM-UP PRODUCTION CHANGE & CORRECTION* The following items were

CONTINUED ON NEXT PAGE

CARTER DUAL TYPE WGD (C nt.)

changed in production and are incorporated in Unitized package Carter No. 75-1271-U, Hudson-Nash No. 311-9897 for installation in earlier carburetors.

Vacuum Pist n Spring (2231S, SA before Code date M-5)- Heavier Vacuum Piston Spring No. 61-332 replaced Vacuum Piston Spring No. 61-226 to improve choke operation, on later carburetors.

M tering R ds (2231S Carbs.)- Metering Rods with .003" smaller power step used starting with Engine Serial Number P-24900.

NOTE - Before installing these parts in earlier carburetors, they should be checked for the following items

1) Choke valve must have minimum of .005" clearance between valve and air horn from full open to full closed position.

2) Choke valve shaft must be free of gum deposits, and operate freely in air horn.

3) Unloader arm must not bind on fast idle link (bend unloader arm to obtain clearance).

4) Baffle must be installed correctly with no bind and choke shaft arm must extend through small circular hole in outer revolving baffle.

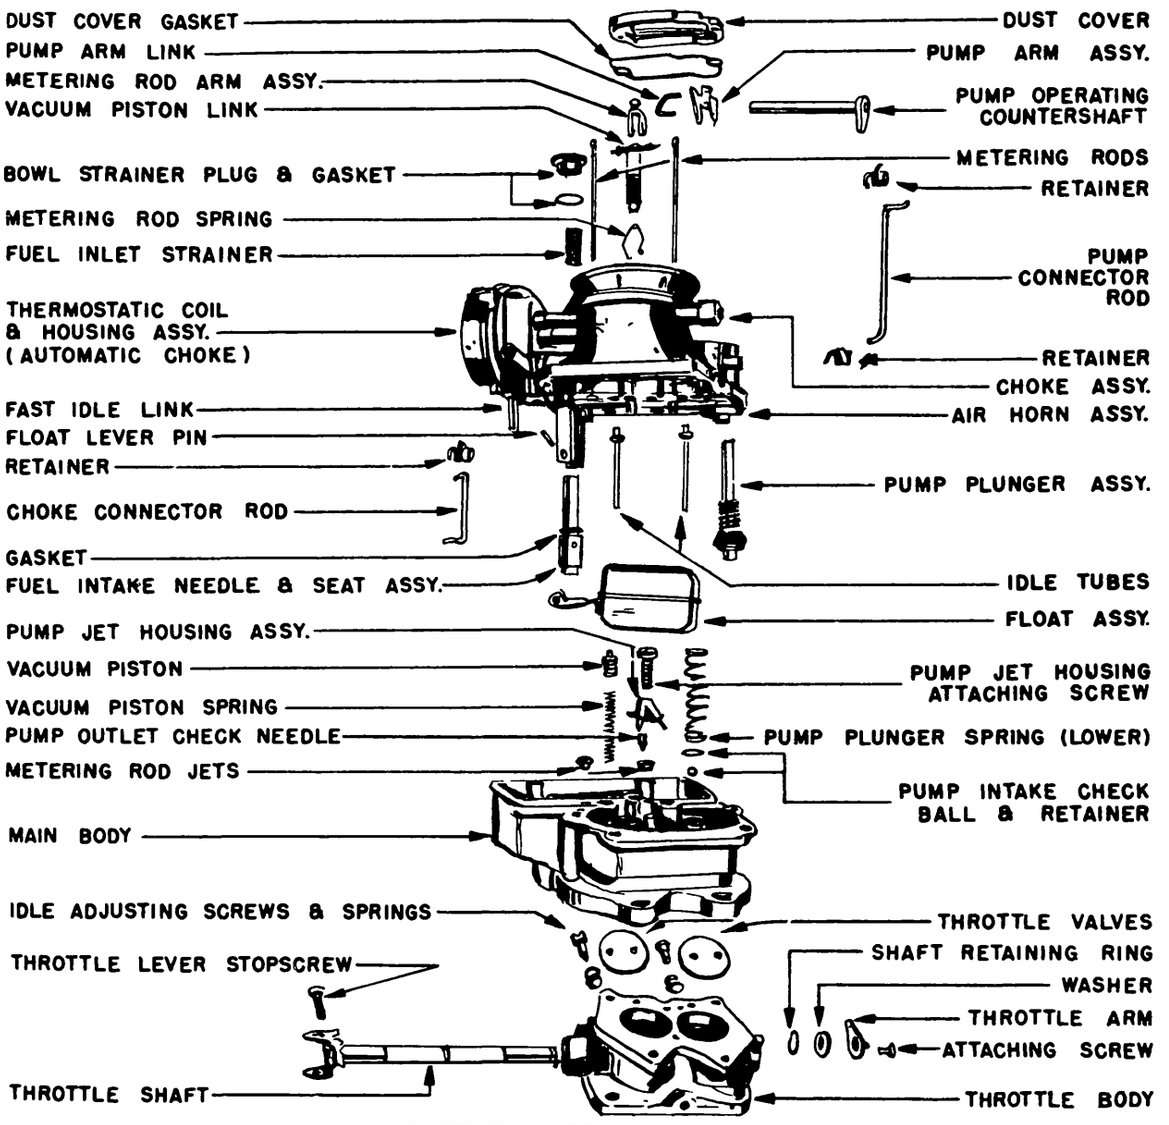
5) Choke piston must be free in bore.

6) Choke heat tube must be free of any obstruction.

7) Automatic Choke must be set to specifications, plus or minus one notch.

►***WILLYS 4-WHL. DRIVE UTILITY ROUGH ROAD FLOODING & STALLING CORRECTION (Carter 2052S Carburetors):*** On Utility vehicles only (Truck & Station Wagon), this condition can be corrected by installing special SPRING-LOADED Intake Needle & Seat assembly as listed below and using special **Float Level Setting** (see Float Level). On all other models, regular SOLID Intake Needle and Seat are used.

Intake Needle & Seat Assembly



Type	Part No.	Float Level Setting
Solid (Reg. Prod)	25-196S	9/32"
Spring-loaded (spec.)	25-173S	7/32"

DESCRIPTION

DESCRIPTION: Dual downdraft type with vacuum control of metering rods (vacumeter), spring loaded piston type accelerating pump operated by throttle lever, well type non-adjustable anti-percolator, and Automatic Choke and Fast Idle

Fuel System: Consists of Idle (Low Speed) Fuel System, Main (High Speed) Fuel System, and Accelerating Fuel System which operate as follows (Idle & Main Fuel Systems duplicated for each barrel):

Idle Fuel System—Fuel for idling is taken from main nozzle well up through the Idle Tube which meters the fuel and is then mixed with air admitted through idle air bleed opening in air horn. Fuel mixture passes through restricted horizontal passage and additional air is admitted through idle passage bleed opening in air horn. Fuel mixture then flows down through passage to idle discharge ports at throttle edge. For closed throttle idling, all fuel is discharged through lower port below throttle and is controlled by the Idle Adjusting Screw (upper port serves as additional air bleed). As soon as the throttle is cracked open, additional fuel is discharged through upper port also. At higher car speeds idle system drops out and all fuel is discharged by main fuel system.

CARTER TYPE WGD CARBURETORS

Main Fuel System—Fuel enters main well through metering jet and is metered by the metering rod in this jet. Fuel then flows up through main well and is discharged through Main Discharge Nozzle located in throat of primary venturi. Anti-percolator well acts as an air bleed for the main nozzle and this air bleed action is controlled by the size and location of the anti-percolator well vents so that at high speeds practically all back bleeding of air into the system is eliminated.

Anti-Percolator Well Vents—Well is vented through pocket formed by flat on nozzle in high speed passage at inner wall of primary venturi and by restricted opening in air horn at top of well.

ADJUSTMENT & OVERHAUL

IDLING ADJUSTMENT: Adjust only with engine warmed up so that choke valve wide open and engine idling at hot or slow idle speed (Automatic Choke and Fast Idle inoperative). Set throttle stopscrew for correct idle speed, adjust both idle adjusting screws (one for each barrel) so that engine idles smoothly. Screws control fuel mixture and should be turned in for leaner mixture, out for richer mixture. See car model page for complete tune-up data.

1954 Willys	550	425-450

① - Transmission selector lever in "N" (Neutral)
② - Compressor running on air conditioned cars
③ - 550 RPM on air conditioned cars with Air Conditioner Compressor not operating
⑨ - Transmission selector lever in "DR" (Drive)
⑤ - 575 RPM on Overdrive cars
⑥ - 450 RPM with Air Conditioner Compressor operating
⑦ - Transmission selector lever in "H"
⑧ - 500 RPM with Air Conditioner Compressor operating

DASHPOT ADJUSTMENT (Buick Dynaflow): See *Throttle Linkage Adjustment" on car model pages for dashpot adjustment*

ACCELERATING PUMP: Pump stroke should be checked and adjusted before checking metering rods *NOTE - Pump adjustment is different for various models as follows*

Adjustment (Buick, All Models; Hudson 2252S, 2231S, SA, 2352S; Nash 2231S, SA, 2352S; Oldsmobile 2058S; Packard 2393S; Pontiac 2207S, SB, 2182S, SA, SB, 2359S; Rambler 2352S, SA): Remove dust cover over pump countershaft On Buick (all carbs) and Pontiac 2359S, make certain that pump link is connected in outer (long stroke) hole of pump arm Back off throttle stopscrew so that throttle valves fully closed, then place straightedge across dust cover boss in line with pump arm Top surface of pump arm should be parallel to straightedge Adjust by bending pump rod at upper angle with Tool T109-213

Adjustment (Other Carburetors): Back off throttle lever stopscrew until throttle valves seat in bore Place universal pump gauge, T109-117S inverted on edge of dust cover boss on bowl cover. Turn knurled nut of gauge until finger on gauge touches top of plunger shaft The distance from dust cover boss to top of plunger shaft should be ½", "43" on gauge (except 767S), 15/64", "42" on gauge (767S) Adjust by bending throttle connector rod at upper angle

Metering Rods: *CAUTION - Metering rods should be adjusted after Pump Stroke Adjustment completed No gauge required* Remove dust cover, back off throttle stopscrew so that throttle valves fully closed Loosen clampscrew on metering rod arm on pump countershaft, press down on vacuum piston link until metering rods just bottom in carburetor casting Hold link and rods in this position, revolve metering rod arm until tongue on arm just contacts lip on vacuum piston link, tighten clampscrew

Float Level: Remove bowl cover and float assembly and invert assembly so that float hangs freely with needle valve closed Measure distance from face of bowl cover to top of float at center using gauge listed below Adjust by bending float arm Make certain that float operates freely and that hinge pin clearance is not excessive

Float Alignment - Make certain that side of float is parallel to edge of cover casting and that there is minimum clearance between float lever and air horn lugs Float must operate freely without binding

Float Level

Packard 2393S	3/16"	T109-28
Pontiac 2207S,SB, 2182S,SA,SB	7/32"	T109-106
Pontiac 2359S	15/64"	T109-32
Rambler 2352S,SA	7/32"	T109-106
Willys 2052S,SA	①	②

① - 7/32" with Spring Loaded Intake Needle & Seat Assembly, Carter No 25-173S 9/32" with regular solid Needle & Seat Assembly, Carter No 25-196S
② - Use Gauge No T109-106 (7/32") T109-126 (9/32")

FAST IDLE: *NOTE - Fast idle adjustment is different on Buick carburetors than on other carburetors as follows*

Fast Idle Linkage Adjustment (Choke Shaft Lever Clearance): Buick (All Carbs.) - On early carburetors (without index mark on fast idle cam) there should be 020" (Gauge T109-29) clearance between lug on outer choke shaft lever and stop on inner choke shaft lever On later carburetors (with index mark on fast idle cam), a slight clearance should exist between tang on fast idle cam and stop on flange casting, and with inner choke shaft lever contacting lug on outer choke shaft lever, align index mark on fast idle cam with adjusting screw To adjust, bend lug on outer choke shaft lever

Pontiac (2359S) - *NOTE - There is no Fast Idle Throttle Valve Clearance adjustment on this carburetor* With choke valve tightly closed and inner choke shaft lever in contact with outer choke shaft lever, center of fast idle screw (throttle stopscrew) must align with index mark on fast idle cam *NOTE - There should be a slight clearance between tang on fast idle cam and stop on flange casting* To adjust, bend lug on outer choke shaft lever with Tool T109-214

Adjustment (Buick): With fast idle screw on high step of fast idle cam, clearance between lower edge of throttle valve and bore of carburetor should be as indicated in table below Adjust by turning fast idle screw

Adjustment (Except Buick): With thermostatic coil housing, gasket and baffle plate removed, crack throttle valve and hold choke valve closed, then close throttle Clearance between throttle valve and bore of carburetor (on side opposite idle ports) should be as indicated in in table below To adjust, loosen locknut on connector rod sleeve and adjust sleeve (Oldsmobile 851S,SA, 2015S), bend choke connector rod at lower angle (all others)

Fast Idle Setting

Car & Carb.	Gauge Size & No.
Buick 2292S, 2378S, 2400S	015" T109-44
Buick 2529S, 2536S, 2674S, 2675S, 2845S	.026" T109-189
Buick 2837S, 2838S, 2979S,SA, 2980S,SA	026" T109-189
Nash 2231S,SA, 2252S	.030" T109-29
Nash 2352S	023" T109-189
Oldsmobile 2059S	.020" T109-29
Packard 986S, 2102S	023" T109-189
Packard 2393S	024" T109-189
Pontiac 2182S,SA,SB, 2207S,SB	026" T109-189
Rambler 2352S,SA	023" T109-189
Willys 2052S,SA	018-023" T109-189

UNLOADER: Adjustment procedures are different as indicated below

Adjustment (Buick, All Carbs. & Pontiac 2359S): Hold choke valve lightly closed, then fully open throttle valves which will open choke valve slightly Measure choke valve opening or clearance between upper edge of valve and air horn wall (see table below)

Adjustment (Exc. Buick Carburetors & Pontiac 2359S): With thermostatic coil housing, gasket and baffle plate removed, hold throttle valves wide open and close choke valve as far as possible without forcing Clearance between top edge of choke valve and inner wall of air horn should be as indicated in table below To adjust, bend arm on choke trip lever (773S, 776S, 2115S, 999S,

CONTINUED ON NEXT PAGE

⊥ - Above top edge of valve with valve tightly closed
⊘ - Bottom of port above upper edge of valve with valve tightly closed
⊙ - Top of port above top edge of valve

CARBURETOR OVERHAUL: With carburetor removed from engine, disassemble, clean, and inspect all parts as follows:

Disassembly: Remove dust cover on bowl cover by taking out two attaching screws, disconnect fast idle connector rod and pump connector rod at both ends. Take out eight bowl cover and air horn attaching screws, lift air horn straight up and remove from main body casting (CAUTION—use extreme care not to damage float and jets installed in cover). Disassemble these parts as follows:

Air Horn & Bowl Cover—Remove float by taking out float hinge pin and unhooking intake needle pull clip, remove intake needle seat. Loosen setscrews on metering rod arm and pump arm, slide countershaft out of housing. Lift out metering rod arm, pump arm, pump plunger assembly, vacumeter piston and link, and metering rods, remove cover gasket Unscrew low speed jets (Idle Tubes). Loosen clampscrew and remove choke shaft lever, take out attaching screws and remove choke valve. Take out three attaching screws, remove automatic choke cover and thermostatic coil assembly (rotate cover counterclockwise to free coil hook), remove gasket and baffle plate. Revolve choke shaft until piston clears vacuum cylinder, remove shaft and piston assembly. Take out three self-tapping screws and remove piston housing assembly from air horn casting, lift out piston housing gasket.

Main Body Casting—Take out attaching screw and remove pump jet cluster and gasket. Invert casting and catch vacumeter spring, pump discharge needle, and lower pump spring. Remove metering jets, pump relief valve assembly, and pump intake strainer. Use tool T109-56 to remove retainer ring from bottom of pump cylinder, remove pump intake check ball (under retainer ring). Take out attaching screws and remove throttle flange assembly.

►***CAUTION—Do not attempt to remove main nozzles from body casting (permanently installed in casting).***

Throttle Flange Casting—Take out attaching screw and remove pump lever from throttle shaft, remove throttle shaft retaining ring, take out attaching screws and remove throttle valves. Slide throttle shaft and lever assembly out Remove fast idle cam assembly. Remove idle adjusting screws and springs, and idle port plugs.

Cleaning & Inspection: Wash all parts in solvent or approved carburetor cleaner, dry with air, blow out all channels and passages with compressed air Remove carbon from flange casting bore with sandpaper (CAUTION—do not use emery cloth). Examine vacuum cylinder in automatic choke housing for dirt and carbon accumulation (if necessary, remove welch plug from base of vacuum cylinder by drilling small hole in plug and using nozzle puller T109-178 to remove plug, install new plug after cleaning cylinder). Replace all worn or damaged parts. Use all new gaskets when reassembling carburetor.

Reassembly: Reassemble carburetor by reversing disassembly directions and note the following important instructions:

Throttle Valve Installation—Back off throttle lever stopscrew, install throttle valves with trademark (small "C") toward idle ports when viewed from manifold side of casting, insert screws loosely, hold valves firmly in place with fingers and tap valves lightly to centralize them in bores, hold lever end of shaft against flange casting boss, tighten valve screws securely. Then install new retaining ring on shaft.

Pump Jet Assembly—Install pump discharge needle first (insert with point downward), use new gasket under pump jet cluster, tighten retaining screw securely. Install pump relief valve assembly. Drop pump intake ball into recess in pump cylinder, use tool T109-122U to install retainer ring.

Pump Plunger & Arm Assembly—Assemble pump link on pump countershaft arm and install pin spring retainer. Insert pump plunger stem in place in bowl cover, slide lower end of link through hole in upper end of plunger stem and revolve ½ turn. When installing bowl cover and air horn, see that lower spring installed in pump cylinder, insert pump plunger, hold pump arm in place while inserting countershaft.

Float Assembly—Make certain that intake needle is attached to float arm with pull clip when installing float. Check float level before installing bowl cover and air horn on main body casting.

Metering Rod Jets—Do not use a gasket under these jets.

Metering Rod & Vacumeter Assembly—Install metering rod spring in vacuum piston link and install vacuum piston spring in cylinder in main body

CONTINUED ON NEXT PAGE

CARTER DUAL TYPE WGD (C nt.)

casting. Install vacuum piston link through slot in bowl cover with lip on link pointing toward air horn. Install vacumeter piston on link with pin extending toward air horn. When installing bowl cover and air horn on body casting guide vacumeter piston into vacuum cylinder in body casting. Hold pump arm in position and slide countershaft in through arm and support in casting, then hold metering arm in position with lip on arm extending through slot in vacumeter link and slide countershaft through arm. Install throttle connector rod and retainers. Install both metering rods (CAUTION—see that rods enter metering jets), connect metering rod spring. Check assembly for free movement by pressing down on vacumeter link.

Choke Assembly—Make certain that new gasket installed in hot air passage in air horn, install piston housing assembly (CAUTION—attaching screws are self-tapping type and must be pulled down securely but with care not to strip threads). Install choke valve shaft and piston, rotating shaft to enter piston in cylinder. See that tapered edges of choke valve seat in air horn, hold valve with fingers and tap with screwdriver to centralize valve before tightening attaching screws. Check valve for free movement (valve should open freely of own weight). When assembling automatic choke mechanism, install flat baffle plate first (with choke lever prong extending through slot in plate), then install extruded baffle plate, gasket, cover and thermostatic coil assembly.

Starter Switch (not used on all Carburetors)—Install switch strainer in recess in throttle body, install switch ball, switch plunger (notch up), guide block, and "W" shaped switch contact spring (CAUTION re-install adjusting shims under contact spring). Install switch return spring, terminal cap assembly, hold-down clip and attaching screw.

Car Starter Switch Adjustment (Carburetor Off Engine):
Buick 1955 - Connect a test lamp across switch terminals so lamp will light when switch makes contact. Block choke valve open so fast idle cam is at slow idle position, then back off throttle stopscrew to fully close throttle valve. While holding throttle valve fully closed, hold a scale against choke unloader arm of throttle lever and make a pencil mark on fuel bowl at opposite side of scale. Slowly open throttle valve while holding scale in position against unloader arm. At point where test lamp lights, make a second mark on bowl. Distance between marks on float bowl should be 15/16" to 1 5/16" if switch is correctly timed. Adjust by adding or removing shims.

Buick 1956-60 - Connect a test lamp across switch terminals so lamp will light when switch makes contact. Block choke valve open so fast idle cam is in slow idle position, then back off throttle stopscrew to fully close throttle valve. While holding carburetor in normal upright position, insert a ¼" drill between wall of throttle body and lower edge of one throttle valve at center. With valve closed against drill, the switch should make contact and light the test lamp. Remove drill and insert a 7/64" drill in same position. With valve closed against drill, switch should open so test lamp goes out. Adjust switch timing by adding or removing shims.

Car Starter Switch Adjustment (Carburetor On Engine):
Buick 1955-56 S.M. & Auto. Trans. Cars - Back off throttle stopscrew and rotate fast idle cam to slow idle position, then fully close throttle valve. *NOTE - On Dynaflow cars, make sure that dashpot will not prevent full closing of throttle valve.* Hold a scale or straightedge against rear face of lower arm of throttle lever that contacts dashpot, so scale rests on rocker arm cover. With throttle valve fully closed, make a pencil mark on rocker arm cover at front edge of scale. With ignition switch turned on, slowly open throttle while holding scale in position against throttle lever. At point where cranking motor is energized, hold throttle lever and make a second mark on rocker arm cover at front of scale. If vacuum switch is correctly timed, then distance between pencil marks on rocker arm cover will be 29/32" to 1 7/16" (1955); 3/4" to 1 1/8" (1956). Adjust switch timing by adding or removing shims under contact spring.

Buick 1957-60 Automatic Transmissi n Cars - *NOTE - On synchro-mesh cars it is n cessary to remove carburetor from engine to check start r switch timing.* Place transmission selector lever in Park and apply parking brake. Back off throttle stopscrew so that throttle valves tightly closed (fast idle cam must be in hot or slow idle position). Place a scale against flange on dashpot diaphragm and measure distance to nearest edge of dashpot arm on throttle lever. Turn ignition on and open throttle slowly. At point where starter is energized, again measure distance to nearest edge of dashpot lever. The difference between the two measurements should be 5/8" to 15/16" (1957); 1 1/16" to 1 5/8" (1958); 9/16" to 7/8" (1959-60). Adjust switch timing by adding or removing shims under contact spring.

Service Parts

Gasket Sets: Carter No. 196 (986S, 2052S,SA, 2102S, 2115S); No. 249 (2058S, 2231S,SA, 2252S, 2393S); No. 254 (2182S,SA,SB, 2207S,SB); No. 274 (2292S, 2400S, 3378S); No. 289 (2352S); No. 305 (2529S, 2536S, 2674S, 2675S, 2837S, 2838S, 2845S); No. 314 (2359S), No. 339 (2979S, SA, 2980S, SA).

Re-Carburetion Kits: Carter No. 1755N (2058S); No. 1759N (2052S,SA); No. 1765N (2102S); No. 1777N (2182S,SA,SB); No. 1778N (2207S,SA); No. 1802N (2231S,SA); No. 1823 (2292S, 2378S); No. 1824N (2400S); No. 1831N (2393S); No. 1843N (2352S,SA); No. 1867N (2529S); No. 1868N (2536S); No. 1939N (2674S); No. 1940N (2675S, 2845S); No. 1966N (2837S); No. 1967N (2838S); No. 5006N (2979S,SA); No. 5007N (2980S,SA).

Zip-Kits: Carter No. 900-7 (2292S, 2378S, 2400S); No. 900-8 (2529S); No. 900-28 (2182S,SA,SB, 2207S,SB); No. 900-37 (2536S); No. 900-41 (2231S,SA); No. 900-56 (2058S, 2674S, 2675S, 2845S); No. 900-63 (2837S, 2838S); No. 900-85 (2115S); No. 900-86 (986S, 2102S); No. 900-87 (2052S,SA); No. 900-109 (2979S,SA, 2980S,SA).

①—Before Serial No. 1099741.
②—Beginning Serial No. 1099741.

DESCRIPTION: Single barrel downdraft type with Carter Climatic Control (Automatic choke), Fast Idle, Anti-percolator, and throttle lever operated Accelerating Pump.

Model 2108S - Idle system has various changes (Key-hole slot idle port, reduced size economizer, air bleed, and by-pass; shorter idle tube with larger diameter metering hole). Accelerating pump plunger is longer (not interchangeable with previous type) and stroke occurs lower in cylinder which prevents entrance of air.

Model 2190S - Same design as 2108S except that different Metering Rod used. See Jet Specifications.

Thr ttl B dy H ating—Holes provided in throttle body and intake manifold by which exhaust gases are transmitted from the exhaust manifold to the heating passages in the throttle body when the manifold heat valve is closed. This prevents possiblility of ice forming at the throttle valve during the engine warm-up period. Heating action in throttle body diminishes as the manifold heat control valve opens.

ADJUSTMENT: *S t thes carburetors to the following specifications:*

IDLING ADJUSTMENT

Idle Scr w Setting - ½-1½ turns open. Turn screw out for richer mixture. Adjust only with air cleaner in place and with engine at normal operating temperature (choke valve open, fast idle inoperative).

Idl Sp ed Setting

Car Mod l	Idle Speed
Studebaker (All Synchro-mesh)	550-600 RPM
Studebaker (All Auto. Trans.)	①550 RPM

① - Transmission selector lever in "N" or "P".

ACCELERATING PUMP SETTING

Pump Str ke S tting - Check pump travel after carburetor has been reassembled. Back off throttle stop-screw so that throttle valve tightly closed, remove dust cover. Install Pump Gauge T109-117S on bowl cover with lip of gauge extending over plunger shaft and gauge held vertically, turn nut on gauge until lip contacts top of plunger shaft, note gauge reading. Open throttle wide and again note gauge reading. Difference in two readings should be 14/64". Adjust by bending throttle connector rod at lower angle using T109-213 bending tool.

METERING ROD SETTING

Checking & Adjustment - Remove metering rod and install Metering Rod Gauge No. T109-102 (2.468") in place of the rod making certain that gauge seated in metering rod jet. With throttle stopscrew backed off so that throttle valve tightly closed, press down lightly on metering rod arm so that upper lip of arm contacts pin in pump arm. At this point, clearance between metering rod pin and shoulder of notch in gauge should be less than .005"and gauge should not contact pin Adjust by bending upper lip of metering rod arm using bending tool T109-105. *Then check and adjust lower (economy) lip as follows:-* Remove gauge,press down on metering rod arm until upper lip contacts pump arm pin. Clearance between pin and upper surface of lower lip should be 3/16" (Float Level Gauge T109-28 can be used). Adjust by bending the lower lip.

ANTI-PERCOLATOR SETTING

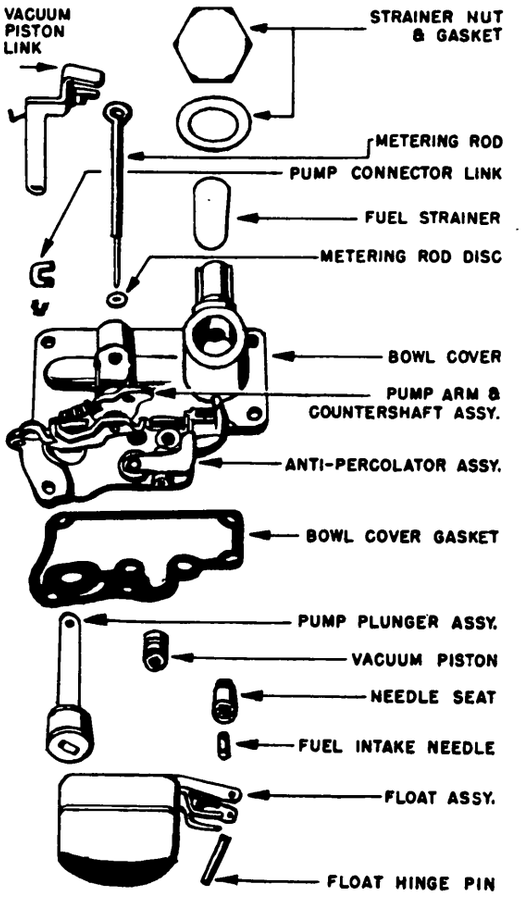
Checking & Adjustment - Crack throttle valve open .030" by placing large end of Gauge T109-29 between edge of valve and carburetor wall on side opposite idle port. Clearance between rocker arm lip and pump arm should be .025" (Gauge T109-189 can be used to check this clearance). Adjust by bending rocker arm using bending tool T109-105.

FLOAT LEVEL

Checking & Adjustment - Remove and invert bowl cover assembly so that float in closed position. Measure dis-distance from top of projection on bowl cover to top edge of soldered seam on float using gauge T109-80 (3/8"). Adjust by bending lip on float lever which contacts intake needle.

THROTTLE VALVE SETTING

Idle Port Opening - Top of lower idle port should be .112-.116" above upper edge of throttle valve.



Vacuum Spark Port - Top of port should be .060-.070" above upper edge of throttle valve.

FAST IDLE SETTING

Checking & Adjustment - With thermostatic coil housing, gasket, and baffle plate removed, crack throttle valve to allow choke valve to close, close choke valve, move throttle valve toward closed position as far as possible. Check remaining throttle valve opening which should be .046" (.045" end of gauge T109-158 may be used). If opening not correct, adjust by bending choke connector rod at lower angle using bending tool T109-213. Then adjust Unloader.

UNLOADER SETTING

Ch cking & Adjustm nt - After fast idle adjustment completed, open throttle valve fully, close choke valve as far as possible without forcing. Check remaining choke valve opening using gauge T109-28 (3/16"). If opening not correct, bend arm on choke trip lever (within choke housing) using bending tool T109-214.

"WE" BOWL COVER ASSEMBLY

AUTOMATIC CHOKE SETTING

Setting (All Carburetors) ..... 1 Point Lean

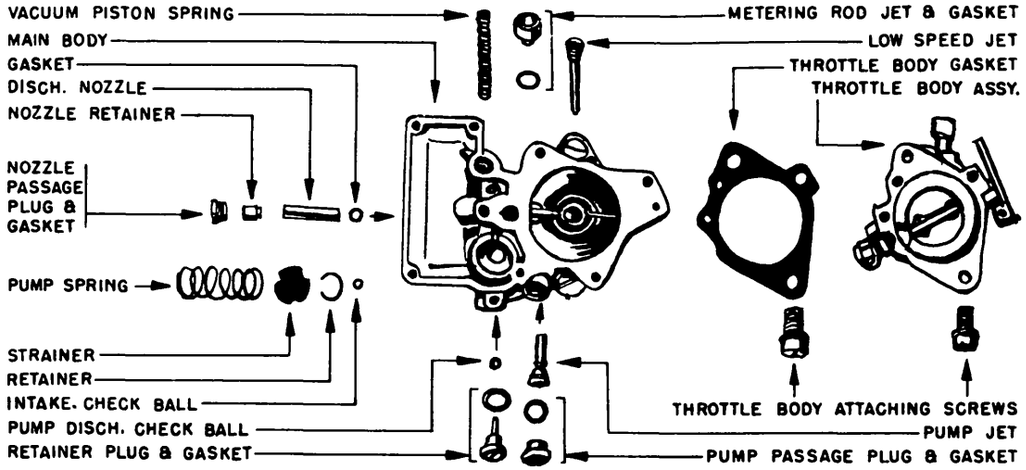
Adjustment - Loosen retainer screws around rim of cover, rotate cover and thermostatic coil assembly clockwise (for leaner setting) or counter-clockwise (for richer setting).

OVERHAUL: Disassembly - Take out attaching screw and remove dust cover from bowl cover. Disconnect choke connector rod from fast idle link and throttle lever and remove rod. Take out air horn attaching screws and lift off air horn assembly, remove gasket. Disconnect throttle connector rod at throttle lever and pump operating lever, remove rod. Remove idle passage

CONTINUED ON NEXT PAGE

CARTER "WE" (C nt.)

plug and gasket from bowl cover, take out bowl cover attaching screws, lift bowl cover assembly straight up to remove it from the bowl.



Air Horn Disassembly - Take out retainer screws, remove thermostatic coil housing and gasket. Remove baffle plate (retained by one screw), trip lever, fast idle link. Take out choke valve screws and remove choke valve. Unhook fast idle cam spring from lip on choke shaft, rotate shaft counter-clockwise until choke piston clears cylinder, withdraw shaft and lever assembly, lift fast idle cam off hub on body. Choke piston can be removed from shaft lever link by pushing out piston pin.

Bowl Cover Disassembly - Disconnect and remove pump connector link, slide pump plunger and rod assembly out, remove bowl cover gasket. Unhook vacuum piston from piston link by turning it 90°, then withdraw link and metering rod assembly from cover (*CAUTION* - do not lose metering rod disc). Unhook metering rod spring and remove metering rod from link. Remove plug and gasket at fuel inlet boss, lift out fuel strainer. Remove float lever pin, lift off float assembly and intake needle, remove needle seat and gasket using tool T109-57.

Main Body Disassembly - Lift vacuum piston spring and pump spring out. Remove pump strainer, intake check ball retainer (use tool T109-56), and check ball retainer (use tool T109-56), and check ball from pump cylinder (invert casting to drop ball out). Remove low speed jet, pump discharge passage plug and gasket, pump discharge jet, pump discharge check ball retainer plug and gasket, and discharge check ball (tilt casting to drop ball out). Remove metering rod jet and gasket using tool T109-57. Take out throttle body attaching screws, lift off throttle body and gasket. Remove main discharge nozzle passage plug (tool T109-57), nozzle retainer plug (tool T109-58) and nozzle (use Extractor tool T109-55). *CAUTION*–Make certain that nozzle gasket removed from recess in body.

Throttle Body Disassembly - Take out idle adjusting screws and spring. Do not disturb throttle valve and shaft assembly.

Cl aning & Inspection: Clean all castings and metal parts thoroughly with suitable carburetor cleaner, rinse in solvent, blow out all passages and dry with air. Make certain that all carbon and gum deposits removed. Remove all carbon deposits from heater holes in throttle body (heater holes in manifold should also be thoroughly cleaned). Inspect all parts for wear or damage.

"WE" MAIN BODY & THROTTLE BODY ASSEMBLY

Reassembly: Use all NEW gaskets. Install all parts in reverse order of disassembly procedure above and note following important points:

Main Discharge Nozzle Installation - Use new copper gasket on nozzle and make certain that flat on nozzle is upward. Tighten nozzle retainer plug and passage plug securely.

Throttle Valve Installation–If valve has been removed, use new screws when re-installing. Install valve with trademark up and on idle port side, install screws loosely, then close throttle fully and tap valve lightly to centralize it in bore, then tighten attaching screws securely. Check throttle valve location (see Throttle Valve Setting).

Idle Tube Installation–See that idle tube seats firmly against shoulder in casti ng. When installing air horn gasket, see that idle air bleed hole in gasket is aligned with passage in body casting and air horn (air bleed extends up into air horn to point above choke valve).

Accelerating Pump Assembly–Make certain that pump intake strainer is clean, install intake ball check, retainer, and strainer in pump cylinder (use Tool T109-122U to install retainer), see that pump plunger is not worn or damaged, use loading tool to install plunger in cylinder.

Pump Operating Countershaft Lubrication - Lubricate shaft with No. 3 graphite grease before assembling bowl cover parts.

Choke Valve Installation - After shaft and piston assembly installed in air horn, lock fast idle cam spring around lip of choke lever shaft. Install choke valve with trademark (small "c" in circle) upward, install new screws loosely, center valve by tapping it lightly in closed position before tightening attaching screws. Check for free operation (valve should fall open of own weight).

Thermostatic Coil & Housing Installati n - After fast idle and unloader adjustment completed, install coil housing with indicator mark approximately one-quarter turn clockwise from reference mark on body, then rotate housing counter-clockwise for correct choke setting. *CAUTION* - If housing not installed as above thermostat spring may hook up on hot air tube.

Carburetor Installation–Make certain that special slotted type flange gasket is used when installing carburetor or manifold. *CAUTION*–Metering rod vacuum piston passage terminates in hole on face of mounting flange and passage hole must not be covered by gasket.

Carburetor Adjustments - Make all adjustments listed under ADJUSTMENT above.

SERVICE PARTS

Gasket Set - Carter No. 235 (989S,SA, 2108S, 2190S, 2417S).
Repair Pkg. (With Std. Met ring R d) - Carter No. 1729 (989S,SA); No. 1746 (2108S); No. 1837 (2417S).

►CHANGES & CORRECTIONS

►*1956 CARBURETOR FLOAT PRODUCTION CHANGE.* Carburetors with date code B-6 (on brass tag) or later have split type floats See "Float Level" for adjustment of split type float carburetors.

►*1956 CARBURETOR FLOODING (Date Code Before B-6) CORRECTION·* If flooding is eliminated on early carburetors by loosening needle seat (gas line to carburetor fitting), it indicates a bind or interference between float hinge and inner end of float needle seat To correct, install needle and seat assembly, Carter No 25-313S, included in Repair Kit 1816S

►*1957 CARBURETOR INSPECTION & INSTALLATION CAUTION (TO CORRECT FLASH-O-MATIC TRANSMISSION 1-2 SLIPPAGE OR 2-3 PILE-UP IN D1 RANGE).* Vacuum for Transmission Solenoid & Vacuum Control is supplied from carburetor passage which terminates in two ports in carburetor as follows· 1) Vacuum port at throttle edge. 2) In carburetor mounting flange at choke vacuum supply passage. In correcting above transmission complaints, inspect carburetor and observe mounting cautions as follows·

1) Carbur t r Vacuum Ports - Check port at throttle edge for correct size (.0465") and make certain this passage not restricted. With throttle valve tightly closed, t p of this port should be flush with **bottom** edge of throttle valve.

2) Carbur t r M unting Flange & Gasket - Inspect mating surfaces of carburetor flange and manifold for unevenness, burrs, or chipped areas. These surfaces can be cleaned up using crocus cloth on a surface plate. Inspect gasket for swelling at the vacuum port and channel area. See installation below.

3) Carbur t r Installati n - Use new type corbestos gasket, Rambler No. 3153999. *NOTE* - If this gasket not available, No. 3108576 ro 3143932 can be used. Gasket No. 3108576 has four 3/16" holes but these holes will not affect operation.

►*1957 ENGINE SURGE AT STEADY THROTTLE (Early Cars with Carter 2580S Carburetor):* On cars with carburetors code-dated "J-6" or earlier, this condition can be corrected by installing new Metering Rod, Carter No. 75-1366S to replace original rod No. 75-1332S. This new metering rod used in production in later 2580S & 2564S carburetors. *NOTE - Metering rod setting is important and should be check d and adjusted.*

►*1957-58 CARBURETOR REPLACEMENT NOTE:* Only carburetors with transmission vacuum control port will be furnished for service. When used on Synchro-mesh, Overdrive, or later 1958 models with transmission vacuum line connected directly to intake manifold, this port will not be used. Production carburetors used with Synchro-mesh or Overdrive do not have this port.

►*1958 RAMBLER HOT HARD STARTING CORRECTION:* This condition usually occurs after 10 to 30 minutes of engine shut down. If correct carburetor adjustment does not correct the condition, install a 3/16" thick gasket, Part No. 3147641 between the carburetor gasket and manifold cover. *NOTE* - The standard corebestos gasket must be used at carburetor flange side on automatic transmission cars with vacuum control ports in base of carburetor. The new gasket will serve as a heat insulator and prevent heat being transferred to carburetor.

►*1958 RAMBLER AUTOMATIC CHOKE PRODUCTION CHANGE:* To improve choke operation, a new choke thermostatic coil and choke piston is being used in production beginning with Engine No. B-194969 (Std. & O.D. Trans.), No. B-195381 (Auto. Trans.). Carburetors having these changes may be identified by Date Code D-8 or later, stamped on the identification tag. The new choke coil, Carter No. 170AE-61S should be set on index.

►*1959 STUDEBAKER 2876S CARBURETOR PRODUCTION CHANGES FOR IMPROVED PERFORMANCE:* Carburetors identified by green colored tag incorporate the changes listed below (except Choke Vacuum Piston Change). These changes improve performance as indicated.

1) Automatic Choke Thermostatic Coil & Housing Assembly - First type, Carter No. 170AS-61S, replaced by new type, Carter No. 170AN-OOS. Choke setting is unchanged (Centered). New thermostatic coil allows choke valve to open more quickly during warmup and will improve performance.

2) Accelerating Pump Link Revision - New pump link with hardened lower end (to prevent wear at pivot pin hole) and zinc-plated, dichromated finish (to prevent scuffing and sticking) replaced former type plain link. New link may be identified by yellow-green color.

3) Idle System Change - Slotted idle port has been lengthened to improve idle air bleed action.

4) Choke Vacuum Piston - New choke piston, Carter No. 160-138, prevents stalling after cold start by retarding choke valve opening and prolonging fast idle operation during warmup. New piston has one narrow and one wide groove in side (previous type has two equal width grooves) and will be furnished for service.

►*1959 STUDEBAKER IMPROVED WARMUP PERFORMANCE: See data on new Automatic Choke Thermostatic Coil & Housing Assembly listed under Production Changes above.*

►*1959 STUDEBAKER STALLING AFTER COLD START CORRECTION:* On cars with first type carburetor, install new Automatic Choke Thermostatic Coil & Housing Assembly, and also new Choke Vacuum Piston as listed under Production Changes above.

►*1959 STUDEBAKER IMPROVED HOT ENGINE STARTING:* Excessive engine cranking time under conditions of warm engine and high temperatures may be caused by gasoline percolation through pump discharge nozzle while engine is stopped (resulting in flooded engine). Correct by installing new Accelerating Pump Plunger and new Metering Rod as listed below. Pump plunger is vented by ball check to prevent fuel percolation and metering rod has modified end to assist in venting vapor into the bowl. *Check and correct all carburetor adjustments when installing these parts.*

Engine Starting Caution - When starting a warm engine, it is recommended that the accelerator pedal be depressed one-third and held in this position while cranking the engine.

Carter 2876S Parts Change

Part	Studebaker Part N .
Accelerating Pump Plunger	1549786
Metering Rod (Std.)	1549787
Metering Rod (1 Size Lean)	1549796
Metering Rod (2 Sizes Lean)	1549797
Metering Rod (3 Sizes Lean)	1549798

►*1960 STUDEBAKER (2934S CARB.) STUMBLE ON ACCELERATION & ENGINE STOPPING AFTER COLD START CORRECTION:* Install Accelerating Improvement Kit, Studebaker Part No. 1550997 (Carter No. 64-236U) according to instructions furnished with kit. To correct stopping on cold start, install Choke Improvement Kit, Studebaker No. 1550998 (Carter No. 170-673U) according to instructions furnished with kit. *NOTE* - Installation of the above kits will convert carburetor 2934S to 2934SA.

►*1960 STUDEBAKER CARBURETOR 2934S FLAT SPOT (DURING LIGHT TO MEDIUM THROTTLE OPENING)CORRECTION:* Adjust float level to proper specifications and adjust accelerating pump jet so fuel will hit the venturi at its vertical center line at a point 1/8" below top of venturi. Make sure the accelerating pump discharge ball check is seated properly as follows: Remove ball check retainer, then place a small brass rod on top of ball check, and seat ball by striking rod sharply with a light hammer. Check accelerating pump piston spring. If spring is silver colored, replace spring with Part No. 518820 (copper color).

DESCRIPTION: Single barrel downdraft type with automatic choke and fast idle. Fuel for idle and early part throttle operation is supplied through low speed circuit. Fuel for part throttle and full throttle operation is supplied through high speed circuit. 1957 & Early 1958 Rambler carburetors used on cars with automatic transmission have additional vacuum port at throttle edge for transmission control. On later Rambler models, the vacuum line for transmission control is taken directly from intake manifold.

Low Speed Circuit - Gasoline enters idle well through metering rod and step up jets. Low speed jet measures amount of fuel for idle and early part throttle operation. Air by-pass, economizer, and idle air bleed are calibrated and break up liquid fuel mixing it with air prior to its reaching idle and idle adjusting screw ports.

CONTINUED ON NEXT PAGE

CARTER "AS" DOWNDRAFT (C nt.)

High Sp d Circuit - Position of metering rod in metering rod jet, and step up rod in step up jet, controls amount of fuel admitted to high speed nozzle *NOTE* - Metering rod is larger in diameter at its lower end As throttle is opened, metering rod moves downward and more fuel will flow through metering rod jet. Vacuum at vacuum piston controls position of step up rod Step up rod is held in down position by manifold vacuum overcoming step up piston spring tension, metering fuel around large diameter of step up rod in step up rod jet When vacuum drops, spring tension moves rod out of jet into power position. *NOTE* - There is no adjustment for step up rod. Permanently installed anti-percolating plugs or bushings and passages prevent vapor bubbles in nozzle passage and low speed well by venting vapors and relieving pressure so fuel is not pushed out nozzle

ADJUSTMENTS: Set these carburetors to the following specifications:

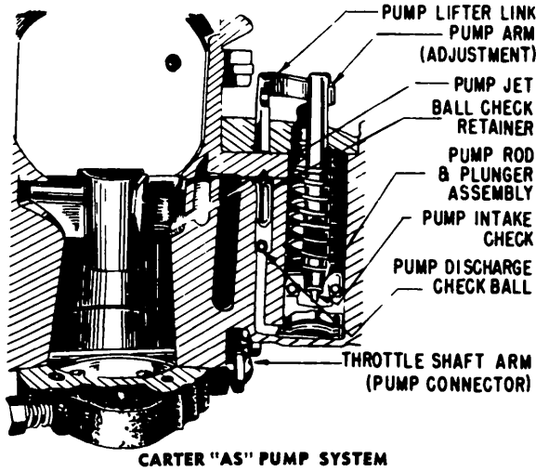
Idling Adjustment: Warm up engine thoroughly, so that choke valve is wide open and fast idle inoperative. See table for idle screw setting. Turn screw out for richer mixture. See car model pages for complete tune-up data.

Idle Mixture Setting

Car & Carb.	Idle Screw Setting
Checker 2858S	½-1¾ turns
Rambler 2349S	¼-1½ turns
Rambler (Others)	¼-1¼ turns
Studebaker (All)	¼-1¾ turns

Idle Speed Setting

Car & Carb.	Synchro-mesh	Auto. Trans.
Checker (All)	400 RPM.	①400 RPM
Rambler (All)	550 RPM	①②475 RPM
Studebaker (1959)	550 RPM	①550 RPM
Studebaker (1960)	550 RPM	①575-590 RPM



① - Automatic transmission in "N" or "P" position
② - Air conditioned cars 500 RPM with air conditioner ON

Float Level *NOTE - Split type floats used on all carburetors after 1956 code date B-6 (see Production Change above)* Remove bowl cover, gasket, and float pin retainer Check each float separately while holding lip of float arm against seated needle *CAUTION - Float pin must be at bottom of guide slots* Place gauge squarely on top of bowl edge at free end of float Ridge on top of float should just contact step on gauge Adjust by bending lip on float arm Make certain that floats clear sides of bowl Adjust by bending float arms as necessary Install float pin retainer, invert carburetor so that both floats rest against seated needle Clearance between overlapping tangs on float levers should be .010-.015" Adjust by bending long tang on left hand float Recheck float level

Float Setting

Car & Carb.	Checking Gauge	Float Setting
All Models	T109-282	1/4"

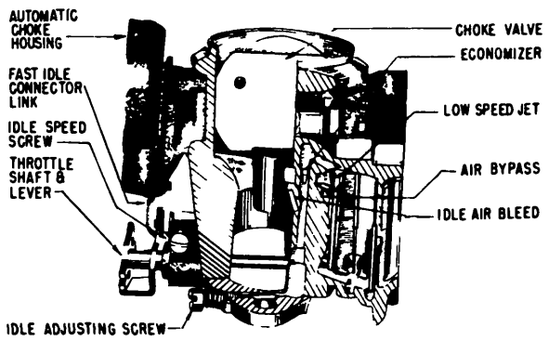
Pump Adjustment: Top of pump arm that engages slot in pump shaft must be parallel to top surface of bowl cover with throttle in wide open position Adjust by bending pump arm up or down as necessary.

CARTER "AS" PUMP SYSTEM

Metering Rod Adjustment: With throttle wide open, metering rod should just bottom in carburetor casting. To adjust bend metering rod arm. When metering rod is properly adjusted, some movement can be noted around eye of metering rod retainer clip when throttle is moved slightly from wide open position. If rod is too low, it will tend to push metering rod retainer clip up. If rod is too high, it will be possible to push rod down.

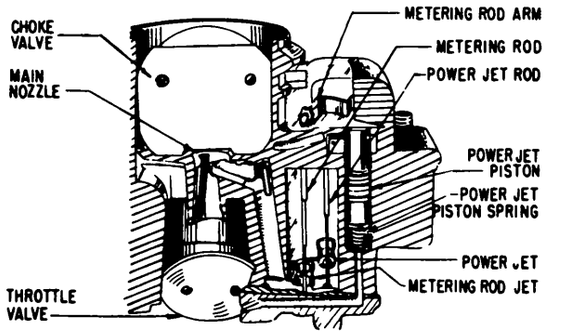
Fast Idle Adjustment: Remove thermostat coil housing, gasket and baffle plate. Crack throttle valve and hold choke valve closed to rotate fast idle cam to fast idle position. Close throttle. Measure clearance between throttle valve and bore of carburetor (side opposite idle port) using gauge listed in table below Adjust by bending choke connector rod at lower angle using bending tool T109-213

Fast Idle Speed - With correct fast idle adjustment, fast idle speed should be 1600-1800 RPM (Hot)



Fast Idle Setting

Car & Carb.	Checking Gauge	Throttle Opening
Checker 2858S	T109-29	.030"
Rambler 2349S	T109-158	.043"
Rambler (Others)	T109-29	.030"
Studebaker 2934S, SA	T109-234	.065"
Studebaker 2876S	T109-158	.045"



Unloader Adjustment: Hold throttle valve wide open and close choke valve without forcing it Measure clearance between upper edge of choke valve and inner wall of carburetor air horn See table below. To adjust, bend choke shaft unloader arm

Unloader Setting

Car & Carb.	Checking Gauge	Choke Opening
Checker 2858S	T109-34	9/64"
Rambler 2564S, 2580S	T109-34	9/64"

① - Top of port above top edge of valve unless otherwise noted.
② - Carburetors with Date Code before D-8.
③ - Carburetors with Date Code D-8 and later.
④ - Below lower edge of throttle valve with throttle valve tightly closed.

OVERHAUL: With carburetor removed from engine, proceed as follows:

Disassembly: Take out two dust cover retaining screws, remove dust cover and gasket. Remove step-up jet piston, rod and spring from bowl cover. Disconnect spring clip from actuating link and remove metering rod and spring clip retainer. Take out throttle shaft arm screw, remove throttle shaft arm and pin assembly. Remove choke piston link-to-throttle valve arm lever connector rod retainer and remove rod. Take out cover retaining screws and remove bowl cover and gasket. Push accelerating pump plunger toward cover and disconnect it from actuating link, remove plunger and actuating link. Remove spring from pump plunger. Take out choke cover retaining screws, remove choke cover and coil assembly, gasket, and baffle. Slip fast idle link out of housing. Remove staking from ends of choke valve screws, remove screws, lift choke valve out. Disconnect fast idle cam spring from choke shaft lever, rotate choke shaft to withdraw choke piston from cylinder, remove choke shaft, lever, and piston assembly from housing. Disconnect piston by pushing out piston pin. Remove fast idle cam and spring assembly from choke housing. Remove float lever pin retainer, remove needle valve and seat assembly, remove float and pin assembly. Separate floats by taking out the retaining pin. Remove metering rod jet, step-up jet, and low speed jet. Remove pump discharge ball retainer and check ball. Remove idle mixture adjusting screw and spring, and idle speed screw and spring,

Inspection: Thoroughly clean and inspect all carburetor parts. *CAUTION* - Take care not to damage percolator tube which extends above top surface of carburetor bowl. Replace all worn or damaged parts.

Reassembly: Use all new gaskets. Reassemble all parts in reverse order to disassembly procedure and note the following points:

Accelerating Pump Jet Aim (Studebaker) - Check pump discharge jet by filling bowl with clean gasoline and operating pump plunger with several quick full strokes. Pump jet should be parallel to choke shaft and stream should strike side of small venturi about 1/8" down from top edge. Adjust by bending pump jet tube. *CAUTION - Use care not to damage metering end of tub .*

Ass mbling Air H rn t B dy - Install body gasket on air horn. Install metering rod retainer on pump lifter link but **do not install metering rod**, insert pump lifter link through operating slot in air horn, place pump spring over pump plunger and install plunger in air horn, install fast idle link in choke piston housing. Hold pump plunger, lifter link, and gasket in position and lower air horn and bowl cover onto carburetor body.

Metering Rod Installation - Place metering rod retainer in position on actuating link. Lower metering rod into place until end of rod enters hole in retainer, push metering rod and retainer down into operating position, push retainer toward rod until retainer ears engage slot in arm on lifter link.

Carburetor Adjustments - Make all adjustments as listed above in ADJUSTMENT section.

SERVICE PARTS: Gasket Sets - Carter No. 276S (2349S, 2580S, 2664S, 2665S, 2564S, 2748S, 2749S); No. 330 (2876S); No. 330A (2934S); No. 350 (2934SA).

Re-Carburetion Kits: Carter No. 1816N (2349S); No. 1936P (2580S, 2664S, 2665S, 2564S, 2748S, 2749S); No. 1981P (2876S); No. 5005P (2934S); No. 5021N (2934SA).

Zip-Kits: Carter No. 900-30 (2349S, 2580S, 2664S, 2665S, 2564S, 2748S, 2749S); No. 900-75A (2876S); No. 900-111 (2934SA); No. 900-108A (2934S).

CARTER WA1

HUDSON	Carter Carburetor No.

1956 Wasp (Twin H-Power)	Two 2013S
1956 Hornet 6 (Twin H-Power)	Two 2113S

① - *See CARBURETOR on car model pages for idling adjustment procedures.*

DESCRIPTION: Single barrel, downdraft type. Primary and secondary venturis are mounted in main body casting (not air horn) by two streamlined struts with nozzle directly above one strut on center-line of venturis and float bowl. Float bowl has been designed to eliminate clearance between sides of bowl and float.

ADJUSTMENT: Adjust carburetor to following specifications.

Idl Mixture: Single Carburetors - *NOTE - See CARBURETOR on car model pages for idling adjustment of "Twin Carburetors".* With engine at normal operating temperature, choke valve wide open and fast idle inoperative, set throttle stopscrew for correct idle speed, then adjust idle mixture screw for smooth idle (turn screw out for richer mixture). Recheck idle speed after adjusting mixture screw. *See "Idle Mixture Table" below for initial idle mixture screw adjustment.*

Idle Mixture

Carburetor	Idle Screw Setting
749S, 2009SA	½-1½ turns
2113S	1¼-2¼ turns
2114S, 2013S	¾-1¾ turns

Idle Speed: 550 RPM (Synchro-mesh); 575 RPM (Overdrive); 500 RPM (Hydra-Matic).

ACCELERATING PUMP: Accelerating pumps are low pressure type and are actuated by throttle lever through arm and countershaft assembly on bowl cover. Countershaft arm has three holes for pump linkage engagement to provide varied pump stroke for seasonal requirements (Hudson), single hole (Willys).

Pump Stroke Adjustment: To check the pump plunger travel, back off throttle lever stopscrew so that throttle valve closes tightly, adjust pump connector link for correct pump stroke as shown in "Pump Setting" column of table below (see Pump Adjustment above for this connector link adjustment). Install Universal Pump Stroke Gauge T109-117S on ridged portion of bowl cover so that projecting portion of gauge rests on top surface on connector link at pump shaft. Hold gauge vertical and note reading, then open throttle wide and again note reading. Difference between these two readings is pump stroke (in sixty-fourths of an inch) and should agree with 'Pump Stroke' figure in table below. To adjust, bend throttle connector rod at lower angle near throttle lever. *CAUTION*—Check metering rod adjustment (disturbed by this adjustment).

Accelerating Pump Stroke Setting

Car & Carb.	Pump Stroke	Pump Setting
Hudson (All Carbs.)	16/64"	Medium

Pump Seasonal Adjustment: Three holes are provided in pump arm on countershaft for pump link connection. Inner hole provides minimum pump stroke, lower hole medium stroke, outer hole maximum stroke (adjustment accessible by removing dust cover). See tune-up data on car model pages for settings and seasonal changes.

METERING ROD (ECONOMIZER): Metering rod and jet assembly meters all fuel for main nozzle (stepped and tapered rod is lifted out of jet as throttle is opened and provides greater fuel flow through jet to nozzle). Metering rods can be changed for special conditions. See Carter Jet Specification Table.

Vacumeter Type Note—On these types, metering rod is linked to vacuum piston stem so that rod is controlled by vacuum piston within limits determined by throttle valve opening (lug on pump arm serves as stop for lip

CONTINUED ON NEXT PAGE

CARTER WA1 (C nt.)

on piston link to prevent vacuum piston pulling metering rod down in jet beyond correct point for the particular throttle opening). These models adjusted in special manner (see below).

Metering Rod Setting

Carb.	Metering Gauge & Length
2009S	T109-102 (2.468")
2009SA	T109-241 (2.548")
All other Carbs.	T109-102 (2.468")

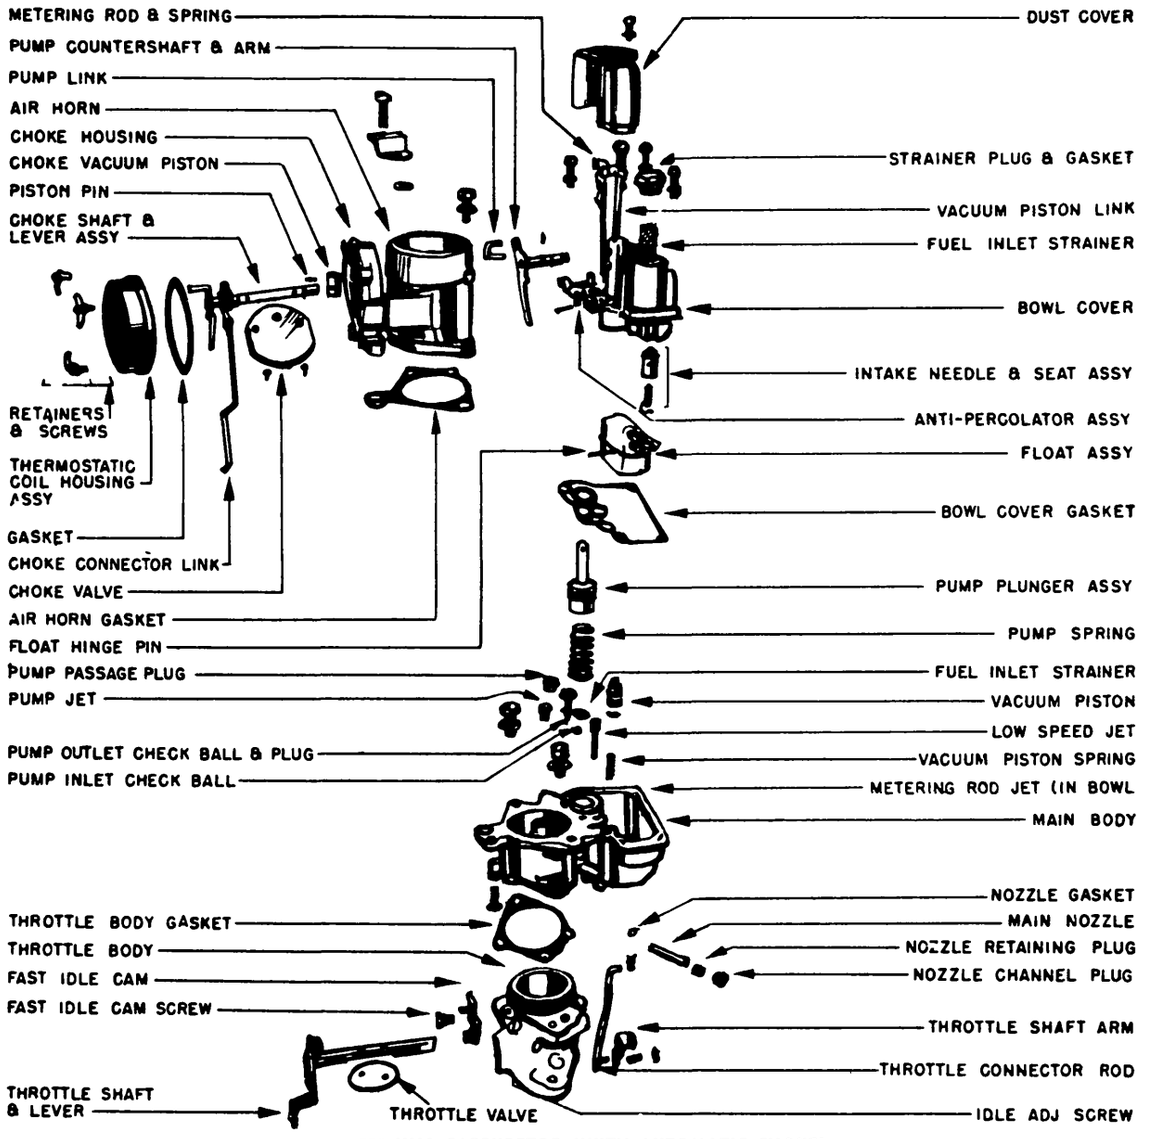
Metering Rod Adjustment (Vacumeter Type)—Remove metering rod (hung on pin on upper end of vacuum piston link) being careful not to lose metering rod disc Install gauge No. T109-102 (2.468") in place of metering rod making certain that gauge seats in metering rod jet and is held vertical Back off throttle stopscrew so that throttle valve tightly closed. Press down lightly on vacuum piston link at point directly over piston Clearance between pin on piston link and shoulder of notch in gauge should be less than .005" and gauge should not drag on pin Adjust by bending lip on piston link so that it contacts lug on pump arm (use special tool T109-105). Remove gauge, install metering rod and disc, connect metering rod spring

ANTI-PERCOLATOR: Saxophone Key Type. Consists of a main nozzle vent in bowl cover controlled by a leather-faced, felt-backed metal cap which opens the vent when the throttle is closed to prevent any percolating discharge from the nozzle The cap must be seated to close the vent when the throttle is opened.

Adjustment—Crack throttle open by inserting special gauge (see table below for gauge for each model) between edge of valve and carburetor wall on side opposite idle port. Bend anti-percolator rocker arm (use special tool T109-105) so clearance between rocker arm lip and pump arm .005-.015" (use feeler gauge)

Anti-Percolator Setting

Car & Carb.	Gauge No. & Throttle Opening	
Hudson (749S, 2114S)	T109-29	.020"
Hudson (2009SA)	T109-29	030"
Hudson (2013S, 2113S)	T109-44	.016"



FLOAT LEVEL: To check float level, remove float bowl cover, invert cover, measure from top edge of machined projection on cover at free end of float to top of soldered seam (see table below) Adjust by bending lip of float lever.

►*CAUTION:* On cars with spring-loaded pin in intake needle, use care not to compress the spring when checking float level (invert cover assembly and allow float to rest on intake needle of own weight. Compressing spring will cause false reading and result in incorrect float setting)

Float Level Setting

Car & Carb.	Float Level
Hudson (749S, 2113S, 2114S)	1/2"
Hudson (2013S)	1/4"
Hudson (2009SA)	7/16"

Ⓓ—Change to 7/16" (Gauge T109-81) to correct hesitation or cutting out on sharp turns (see Changes & Corrections above) Set to 7/16" when carburetor converted to 2009SA.

CARTER WA1 CARBURETOR (WITH AUTOMATIC CHOKE)

Float Travel—Should be ½" (all models) To check travel, hold float bowl cover in normal position, note drop or free travel of float at free end. To adjust travel, bend the two small float stop lips at the hinge end of the float.

Float Needle Valve & Seat—Furnished only in matched sets as follows:

Car & Carb.	Fl at Inl t Valve Part N .	Intake Hol Siz No.
Hudson (749S)	25-75S	46
Hudson (2009SA, 2113S, 2114S)	25-75S	46
Hudson (2013S)	25-162S	42

THROTTLE VALVE SETTING: When installing valves, see that trademark is up and on idle port side, install screws loosely, tap valve lightly to centralize it in bore, tighten screws securely. See that throttle valve stopscrew is backed off so that valve closes tightly, check throttle valve setting as shown in table below Shims furnished .002" (2-93), 005" thick (2-94) to correct valve position

CONTINUED ON NEXT PAGE

CARTER WA1 (Cont.)

Throttle Valve Setting

Car & Carb.	Idle Port Opening	Vacuum Port Hgt.
Hudson (749S)	.136-.140"	.020"
Hudson (2113S)	.178-.182"	①.049"
Hudson (2114S)	.120-.124"	①.040"
Hudson (2009SA)	.120-.124"	.005-.015"
Hudson (2013S)	.103-.107"	①.010-.020"

① - Top of port above throttle valve (bottom of port, others).

FAST IDLE: Consists of fast idle cam pivoted directly above the throttle lever so as to serve as stop for throttle stopscrew and is linked to the choke valve. Refer to Climatic Control article in Carburetion Equipment Section for Data.

Adjustment—To check, turn fast idle cam to normal or slow idle speed position, tighten throttle lever stopscrew until it just seats against cam, rotate cam until stopscrew is against first step of cam (screw must not be on step) check clearance between lower edge of choke valve and air horn wall (use gauge). If clearance is not 1/2", Gauge T109-83 (Hudson 2013S, 2114S); 5/8", Gauge T109-85 (All others), adjust by bending fast idle link at offset using Tool T109-41.

CHOKE SETTING: Loosen housing screws and rotate housing so index mark is aligned with proper mark on casting: "Centered" at index (749S); "1 Point Lean" (Others).

UNLOADER: Consists of a cam on the throttle lever which opens the choke valve (through fast idle linkage) when throttle is held wide open to correct flooding. To check, hold throttle wide open, check clearance between lower edge of choke valve and air horn wall. See table below for correct clearance and checking gauge on each model. To adjust, bend cam on throttle lever (use Tool T109-41).

Unloader Setting

Car & Carb.	Gauge No. & Choke Valve Clearance
Hudson (749S)	T109-80 .....7/16"
Hudson (2113S, 2114S)	T109-84 .....9/16"
Hudson (2009SA, 2013S)	T109-84 .....9/16"

CARBURETOR OVERHAUL: *CAUTION—When disassembling carburetor for overhaul, note the following points:*

Disassembly: Remove dust cover attaching screw and lockwasher, remove the dust cover. Remove fast idle cam screw and fast idle cam. Take out air horn attaching screws (two screws on top, one beneath Climatic Control housing), remove air horn and gasket. Take out retainer screws, remove thermostatic coil and housing assembly, piston housing strainer. Take out choke valve screws and remove choke valve. Loosen screw on choke lever and link assembly 4 full turns, pry lip on lever away from shaft with screwdriver. Revolve choke shaft counter-clockwise to free piston from cylinder and remove assembly (*CAUTION*— Do not remove pin holding piston housing and air horn casting together—these parts line-reamed at factory and must be kept in alignment). Remove pin spring, spring retainer, and spring from throttle connector rod and remove rod. Remove pin spring and connector link from pump arm. Remove low speed passage plug and gasket assembly (located next to anti-percolator cap), Take out bowl cover screws and remove bowl cover assembly intact. Remove vacuum piston spring from cylinder in casting, disconnect piston from link by turning piston ¼ turn, remove piston link and rod from bowl cover and disassemble rod and link using care not to lose metering rod disc or damage spring. Remove float, needle and seat assembly, strainer nut and gasket, and strainer. Take out pin and remove anti-percolator cap and rocker arm assembly and spring. Remove pump plunger and rod assembly, take out strainer and check ball in lower end of pump cylinder. Remove low speed jet assembly, nozzle passage plug, nozzle retainer plug and nozzle (use Tool T109-55). *CAUTION - Make certain that small nozzle gasket removed from nozzle passage.* Remove metering rod jet and gasket assembly. Remove pump jet passage plug and pump jet. Remove pump discharge ball retainer and check ball. Remove body flange (lower casting) gaskets and insulator, idle adjusting screw and spring, and idle port rivet plug. Remove throttle shaft arm and shaft assembly, take out throttle valve screws and remove valve, shaft and lever assembly.

Servicing—Wash all parts in clean gasoline (except thermostatic coil and housing assembly and cork parts), blow out all passages with compressed air, examine metering rods and jets, replace all worn parts.

Reassembly: Use all new gaskets (see Parts List below), group all the low speed circuit, high speed circuit, float, pump, and choke circuit parts together to insure correct re-installation. Install parts in reverse order of disassembly directions given above and note following special instructions and cautions: When installing throttle valve, use new attaching screws, install valve with trademark up and on idle port side of bore, install screws loosely, tap valve lightly to centralize it in bore and then tighten attaching screws. Centralize choke valve in same manner and check operation by making certain that choke valve falls open freely of own weight. When installing nozzle, make certain that new gasket used, install nozzle with flat side up. See that low speed jet seats firmly in casting at shoulder. Check and adjust metering rod, anti-percolator setting, pump stroke, float level, fast idle and choke setting, throttle valve setting as directed above. Pack dust cover attaching screw hole in bowl cover with graphite grease before installing dust cover and attaching screw (oil or grease must not be used at any other point). Adjust carburetor when re-installed.

SERVICE PARTS: Gasket Sets - Carter No. 139S (2009SA, 2013S, 2114S); No. 198 (749S, 2113S).
Re-Carburetion Kit - Carter No. 1535 (749S); No. 1736 (2009SA); No. 1737 (2013S).

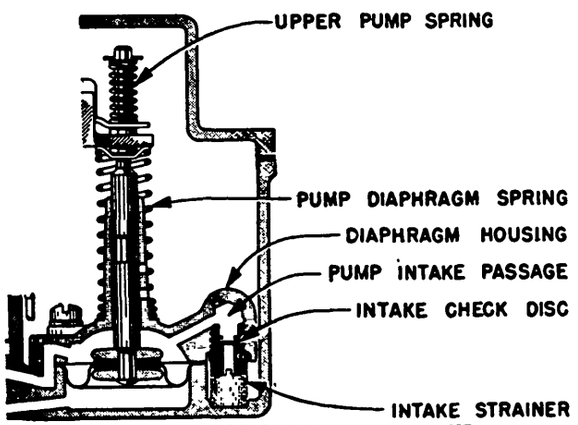
►CHANGES & CORRECTIONS

►*NASH STATESMAN CARBURETOR ADJUSTMENT CAUTION:* Both carburetors must be synchronized for correct operation. See special Idle Adjustment procedure below.

►*NASH STATESMAN CARBURETOR FLOODING RECOMMENDED CORRECTION & PRODUCTION CHANGES:* Following changes were made in production and can be incorporated in earlier cars to eliminate flooding caused by (1) Vibration of Needle Valve, and (2) Dirt under Needle Valve.

(1) Carter 2098S, 2137S, & First 2137SA Carburetors—Flooding caused by vibration can be eliminated by installing Spring-loaded Needle Valve & Seat Assy. No. 25-239S and Float Assembly No. 21-122S, and setting float level to new specification (see Float Level below). *NOTE—Carburetor 2137SA tagdated "M3" and later have the above changes made in production.*

(2) Cars before Serial No. K-624096—Flooding caused by dirt under intake needle can be eliminated by installing Fuel Filter (Service Replacement No. 3117218) at rear carburetor (use Tee No. 3140204 and attach fuel pump line to inlet side of filter using Elbow EL-204). Cars after above serial number have filter installed in production.



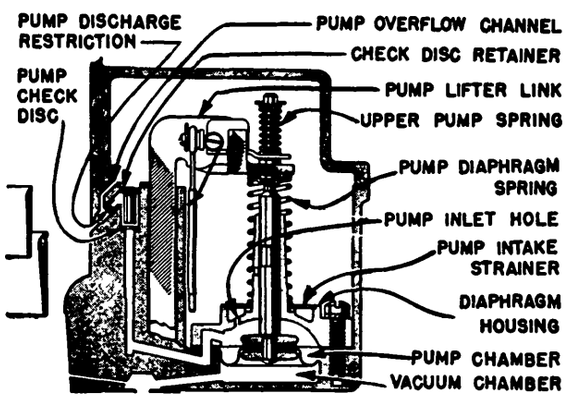
►*WILLYS CARBURETOR PRODUCTION CHANGE (YF-951S and 938SC superseded by YF-951SA and YF-938SD): Carter YF-938SD and YF-951SA have all modifications recommended for "Flat Spot & Stumble Correction" below.*

►*1960 WILLYS FLAT SPOT OR STUMBLE CORRECTION (All vehicles with Carter YF 938S, SA, SC; 951S Carburetors):* Before modifying carburetor, thoroughly tune up engine, check carburetor metering rod and float level settings, adjust engine idle speed, and make certain that cooling system thermostat is operating correctly. If flat spot or stumble persists, modify carburetor as follows:

Carter YF 938S, SA, SC; 951S Modification - Some carburetors have a .025" size accelerator pump discharge jet. When installing field fix kit in a carburetor, check size of discharge jet. If carburetor being converted has .025" jet, open to .031" by running a No. 68 drill through jet. Install parts in Carter Unitized Package No. 75-1504U (Willys No. 924161). Consists of pump discharge check needle (No. 17-18), metering rod jet (No. 120-166), and metering rod (No. 75-1500). *Upon completing conversion, mark or tag carburetor to indicate that it is either a YF 938SD or YF 951SA.*

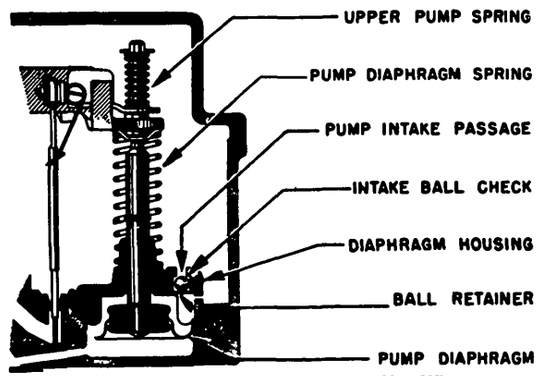
DESCRIPTION

DESCRIPTION: Single barrel, downdraft type with diaphragm operated metering rod (vacuum and mechanically controlled), diaphragm type accelerating pump, Anti-Percolator, Fast Idle, and manually or automatically controlled choke (Climatic Control). Carburetors used on early 1958 Rambler models with automatic transmission have an additional vacuum port at throttle edge for transmission control. On later carburetors, the vacuum line opening in the side of carburetor is plugged and the vacuum line for transmission control is taken directly from intake manifold.



"DISC" TYPE PUMP INTAKE VALVE

ADJUSTMENT & OVERHAUL



Idling Adjustment: Warm up engine thoroughly so that choke valve wide open and fast idle inoperative. Adjust throttle stopscrew for correct engine idle speed, then adjust idle mixture screw for smoothest running and highest RPM. Turn screw out for richer mixture. Recheck idle speed after adjusting mixture. *See "Idle Mixture Table" below for initial idle mixture screw adjustment.*

Car & Carb.	Idle Mixture Idle Screw Opening
Nash (All)	½-1¾ turns
Rambler (All)	½-1½ turns
Willys 938S,SA,SC,SD, 951S,SA	¾-1¾ turns
Willys 2392S	½-2 turns
Willys 2467S	1-2½turns

►*1954-55 NASH STATESMAN IDLING ADJUSTMENT (Two Carburetors): See CARBURETOR on Car Model pag s.*

Accel rating Pump: Diaphragm type pump on all models, with ball check discharge valve (except 2467S), discharge needle (2467S). *CAUTION - On 2467S only, check pump adjustm nt wh nev r carburetor disassembled or pump linkag disturb d BEFORE checking and adjusting M t ring Rod.*

Pump Adjustm nt (2467S) - With idle screw backed out so that throttle valves are fully seated, press down on upper end of diaphragm shaft until it is bottomed in diaphragm housing (Tool T109-212 may be used to hold diaphragm shaft down in this position). In this position, metering rod arm should contact lifter link at outer end nearest the springs. Adjust by bending pump connector link at lower angle using bending Tool T109-213. *CAUTION - B nding link at any other point may cause binding of pump lifter link.*

M t ring R d Adjustm nt: With throttle valve seated in bore of carburetor, press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber. Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod. Metering rod should contact bottom of metering rod well and metering rod arm should contact lifter link at outer end nearest the springs and at supporting lug. Adjust by bending lip of metering rod arm to which metering rod is attached.

Float S tting Adjustment: Invert air horn and float cover assembly allowing float to hang freely, then measure from top of float at free end to bowl cover (gasket removed). Adjust by bending lip which contacts intake needle (do not bend float arm).

►*CAUTION: On models with spring loaded intake n edle, do not compress this spring when checking float level (will result in false reading and incorrect float setting).*

① - With original solid type Intake Needle & Seat No. 25-189S (or 25-257S on 2098S), & Float No. 21-1117S.
② - With special spring loaded Intake Needle & Seat No. 25-239S & Float No. 21-122S to correct flooding (see Changes & Corrections above).
③ - With production type spring loaded Needle & Seat No. 25-239S & Float No. 21-122S.

Automatic Choke: Used on Nash & Rambler. Willys carburetors have a manual choke control. Adjust by loosening cover screws and rotating cover and thermostatic coil assembly.

Automatic Choke Setting

Car Model	Choke Setting
Nash Statesman (All)	2 Pts. Lean
Rambler & Rambler American	1 Pt. Lean

Fast Idle Adjustment (Manual Choke Control): With choke valve in wide open position, check to see that lip on fast idle arm is in contact with boss on carburetor body casting. To adjust, bend fast idle arm rod at lower offset.

Fast Idle Adjustment (Automatic Choke Control): Remove thermostatic coil housing, gasket and baffle plate. Crack throttle and hold choke valve fully closed, then close throttle. With fast idle cam revolved to fast idle position, hold choke valve and throttle valve closed as far as possible. Clearance between throttle valve and bore of carburetor (side opposite idle ports should be .024", Gauge T109-189 (Nash); .054" (Rambler & Rambler American). Adjust by bending connector link at lower angle.

Unloader Adjustment (Automatic Choke Control Carbs.): *NOTE - This adjustment must be made after fast idle adjustment.* Hold throttle valve in wide open position and close choke valve as far as possible without forcing. Clearance between lower edge of choke valve and inner wall of air horn should be 29/64", Gauge T109-81 (Nash); 9/32", Gauge T109-126 (Rambler & Rambler American). Adjust by bending choke trip lever.

THROTTLE VALVE SETTING: Check when overhauling carburetor.

Throttle Valve Setting

Car & Carb.	①Idle Port	Vacuum Spark Port
Nash (2098S)	142-.146"	②.001-.009"

① - Top edge of port above top edge of throttle valve.
② - Bottom of port above top edge of throttle valve with valve tightly closed.

DISASSEMBLY: With carburetor removed from engine, proceed as follows:

1) Remove pin springs and fast idle connector rod springs, remove fast idle connector rod. Take out air horn and bowl cover attaching screws, remove choke tube clamp, lift off air horn and gasket.

2) Take out pump disc check valve retainer ring (when used), lift out retainer and pump check valve disc or pump discharge needle. Then remove throttle shaft arm assembly from end of throttle shaft (pump connector link, shaft seal spring, dust seal washer, felt dust seal). Unscrew four pump diaphragm housing attaching screws, lift out entire pump and metering rod assembly.

3) Disassemble pump by removing attaching screws, pin spring, metering rod, upper pump spring retainer, upper pump spring, metering rod arm, pump lifter link, diaphragm spring retainer, diaphragm spring, and diaphragm housing. Remove intake strainer from housing (use knife tip to lift flat type strainer out of housing recess). On carburetors with disc type intake check valve, remove valve plug assembly. On Nash carburetors, take out plug on upper side of diaphragm housing and remove discharge check valve spring and ball.

►***PUMP DIAPHRAGM CAUTION*—If old diaphragm is to be re-used, store the diaphragm in gasoline. Diaphragm will shrink and stiffen if allowed to dry out for more than one hour.**

4) Remove metering rod jet from body casting. Remove Low Speed Jet assembly.

►***CAUTION—Do not attempt to remove pressed-in parts such as Nozzle, Pump Jet and Anti-percolator Air Bleed.***

5) Take out three body flange (throttle body) attaching screws, remove throttle body from main body casting.

6) Remove idle adjustment screw and spring, idle port rivet plug, throttle lever assembly and washer, fast idle arm. Take out throttle valve attaching screws, lift valve out, remove throttle shaft, remove shaft seal by prying out seal retainer.

►***CAUTION—Do not attempt to remove vacuum passage orifice restriction which is pressed in.***

7) Remove float pin, lift out float, remove needle and seat assembly from air horn casting.

8) On carburetors with manual type choke control, take out choke valve screws, lift choke valve out, unhook choke spring, slide choke shaft out of housing. If necessary to replace choke lever assembly, pry off choke lever retainer ring (in end of shaft), remove lever assembly from shaft.

►***CAUTION—Do not attempt to remove balance vent tub .***

CLEANING & INSPECTION: Wash all parts in carburetor cleaning solution (CAUTION—do not immerse diaphragm assembly, pump check disc, or seals in the solution). Inspect all parts for wear or damage, replace if necessary. Blow out all passages with compressed air.

C NTINUED N NEXT PAGE

CARTER TYPE "YF" (C nt.)

REASSEMBLY: Use all new gaskets. Assemble by reversing the disassembly order as given above and note the following important points:

Throttle Valve Installation—Install valve with trademark (c) toward idle port when viewed from manifold side of flange. Install screws loosely, tap valve and then hold with fingers to insure it being centralized in bore, tighten screws securely.

Metering Rod Jet Installation—NO gasket used

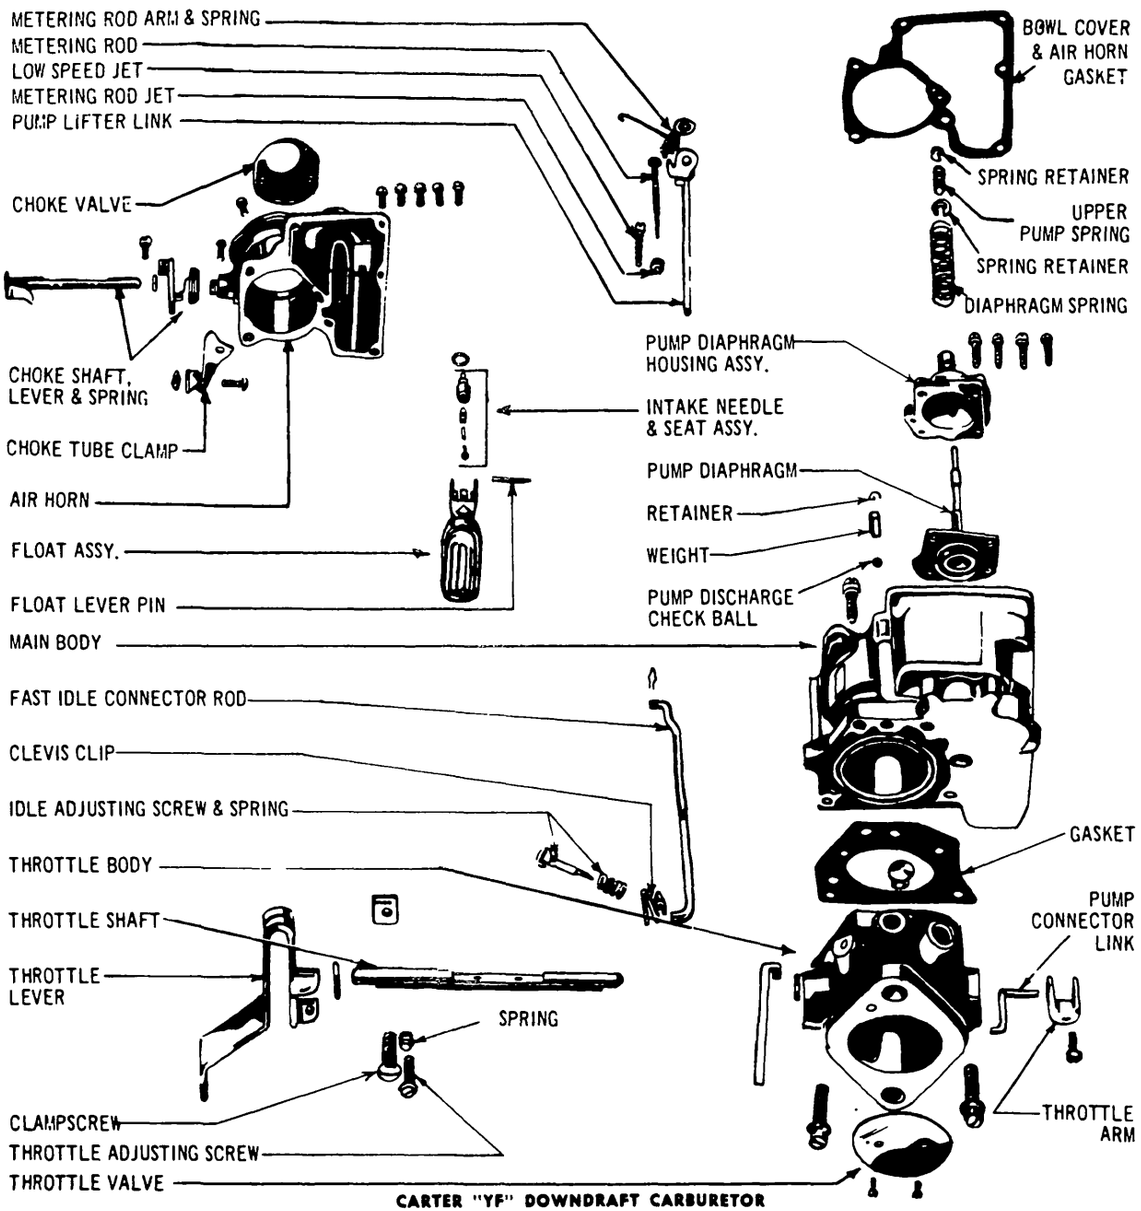
Pump Diaphragm Assembly Installation—Before tightening attaching screws, make certain that diaphragm is flat and edges are not wrinkled, then tighten screws evenly.

Pump Linkage—Check pump linkage to make certain that it does not bind in any position. If binding noted, loosen throttle arm clampscrew and adjust throttle arm, retighten clampscrew.

Float Intake Needle & Seat Assembly—Soak new gasket in 90 proof alcohol for 15 minutes, install and let dry on needle seat before installing this part. When installing float, make certain that shoulder on float pin is on side away from carburetor bore.

Choke Valve Installation—Install the attaching screws loosely, center valve by tapping on valve lightly and hold in this position with fingers while tightening screws securely.

Fast Idle Linkage (Manual Choke Carburetors): Install connector rod with offset end upward, and with pin spring on outside.



Fast Idle Linkage (Automatic Choke Carburetors): Install connector rod with angle end down toward throttle lever and open ends of rod in toward carburetor body.

►*CARBURETOR INSTALLATION CAUTION*—Special slotted type flange gasket must be used to install carburetor on engine. Diaphragm type metering rod and accelerating pump control will not function if this gasket not used.

REPAIR PARTS: Gasket Sets - Carter No. 200 (2392S); No. 206A (938SA,SC,SD, 951S,SA, 2071S); No 216 (2014S, 2098S, 2137S,SA, 2163S, 2258S, 2757S).

Re-Carburetion Kits: Carter No. 1546P (2392S); No. 1590N (2014S, 2757S); No. 1715N (2071S); No. 1760N (2163S); No. 1764S (938SA,SC,SD, 951S,SA); No. 1849P(2467S).

Zip-Kits: Carter No. 900-31A (938SA,SC,SD, 951S,SA, 2071S); No. 900-38 (2014S, 2757S); No. 900-77A (2392S); No. 900-78A (2467S).

CARTER "YF" DOWNDRAFT CARBURETOR

CARTER "YH" HORIZONTAL

	Carter Model No.
CHEVROLET	
1954 Corvette 6	Three 2066S or 2066SA
1955 Corvette 6	Three 2066SA
NASH	
1954-55 Amb. 6 Jetfire	895SA
1954-55 Amb. 6 Dual Jetfire	(Front) 973S (Rear) 974S
1956 Amb.6 Super Jetfire	2368S
1956 Amb.6 Lemans Dual Jetfire	Two 2369S
NASH-HEALEY	
1954 Models Ⓒ	973 (Front), 974S (Rear)

①—Beginning 1953 Serial No. NH-2310 (102" WB), NH-3024 (108" WB).

►CHANGES, CAUTIONS, CORRECTIONS

►*CHEVROLET CORVETTE CAUTION:* THREE carburetors used per engine with interconnected linkage. CARBURETORS MUST BE ADJUSTED AS SHOWN BELOW.

►*NASH DUAL JETFIRE & NASH-HEALY CAUTION:* TWO carburetors used per engine with interconnected throttle linkage. CARBURETORS MUST BE ADJUSTED AS SHOWN BELOW.

►*NASH DUAL JETFIRE & NASH-HEALEY 973S & 974S THERMOSTATIC COIL ASSY. & SETTING CHANGES FOR IMPROVED HOT STARTING PERFORMANCE:*

Thermostatic Coil Assy. Change: First "N" type No. 170N-250S Assy. superseded by later "P" type No. 170P-250S with DIFFERENT CHOKE SETTING. *See Choke Setting data below.*

Fast Idle & Unloader Setting Changes: *See Fast Idle & Unloader Setting data below.*

►*NASH AMBASSADOR HARD STARTING OR PERCOLATION CORRECTION (Jetfire & Dual Jetfire Models):* Following production changes were made to improve carburetor operation when hot and can be installed on earlier cars as detailed below.

Heat Deflector—Nash No. 3141499 (Jetfire starting Eng. No. A-262326), No. 3141496 (Dual Jetfire starting Serial No. R-736465) heat deflector used in production beginning with above numbers. **Installation**—Remove and discard battery heat shield. Install deflector on upper exhaust pipe clamp studs on top of present stud nuts, use check nuts No. NU-819 to retain deflector. See that deflector does not contact exhaust pipe clamps. On Overdrive Cars, mount Kick-down Switch on deflector (holes provided for attaching screws).

Insulated Fuel Line—Nash No. 3142006 Used in production beginning Engine No 262585. **Installation**—Interchange elbow fitting on front carburetor and Tee fitting on rear carburetor. Connect fuel line between fuel pump and front carburetor.

Carburetor Drain Tube & Hole—Drain tube installed in carburetor air horn drain hole beginning with Serial No R-734366 & RC-22771. Package No. 3117368 is furnished for installation on earlier cars.

Installation—Carburetor need not be removed from engine. Remove air cleaner, boot, tee, and adapter. Remove pipe plug from drain hole in bottom of air horn. Enlarge existing drain hole to 5/16" diameter (drill from below, using small ¼" electric drill), remove all metal particles from inside of air horn. Install drain tube, nut, and connection (furnished in package).

DESCRIPTION: "YH" type horizontal carburetors are similar to "YF" models with modifications as required for horizontal operation.

ADJUSTMENT: ***Make all adjustments exactly as follows:***

►***IDLING ADJUSTMENT CAUTION—Models with TWO carburetors (Nash Dual Jetfire & Nash-Healey) or THREE carburetors (Chevrolet) must be adjusted exactly as detailed below for proper synchronization and correct performance.***

Idle Setting: If initial adjustment required to start and warm up engine, set idle mixture adjusting screw (see table below). When engine at normal operating temperature so that choke valve wide open and fast idle inoperative, set throttle stop-screw for correct idling speed (see table below), adjust idle mixture screw so that engine runs smoothly (turn screw out for richer mixture, in for leaner mixture), recheck idle speed.

Idle Mixture Setting

Car & Carb.	Idle Screw Opening
Chevrolet Corvette 2066S, SA	½-1½ turns
Nash Amb. 895S, SA	½-1½ turns
Nash & Nash-Healey 973S, 74S	¾-1¾ turns
Nash 2368S, 2369S	¼-1¾ turns

Idle Speed Setting

Car Model	Engine RPM S.M. Trans.	Auto. Trans.
1954-55 Corvette		Ⓒ 475
1954 Nash Amb 6	① 550	②③ 475
1955 Nash Amb. 6	①500-550	②③ 450
1956 Nash Amb. 6	500	②③ 475
1952-54 Nash Dual Jetfire	550-650	② 550-650
1955 Nash Dual Jetfire	500-550	②③ 450
1956 Nash Dual Jetfire	500	②③ 475
1952-54 Nash-Healey	550-650	

①—With selector lever in "D" position
②—With selector lever in "N" position
③—No Air Conditioning. 500 RPM Air Conditioner operating. (All Trans. in Neutral)

►*NASH DUAL JETFIRE, NASH-HEALEY & CHEVROLET CORVETTE IDLE ADJUSTMENT & THROTTLE VALVE SYNCHRONIZATION:* See *"CARBURETOR" on individual car model pages.*

Accelerating Pump: No seasonal adjustment provided and pump stroke does not require adjustment.

METERING ROD SETTING

Car Model	Checking Gauge & Length
Chevrolet Corvette	T109-104 (2.312")
Nash (All Models)	T109-104 (2.312")

Metering Rod Setting: ***CAUTION—Gauge required for this setting.*** Back off throttle stopscrew so that throttle valve fully seated, remove bowl cover assembly, unhook metering rod spring from rod and **remove metering rod,** insert correct gauge in place of rod and make certain tapered end is seated in metering rod jet (hold gauge vertical to insure correct seating in jet). Press down on diaphragm shaft until metering rod arm contacts lifter link at diaphragm stem. At this point, metering rod pin should rest lightly on metering rod gauge. Adjust by bending metering rod arm at undercut point using bending tool T109-22. Make certain that metering rod arm contacts lifter **at diaphragm shaft and at outer end of lifter link.** Remove gauge and re-install metering rod. Reset idle speed.

FLOAT SETTING

Car & Carb.	Float Setting	Gauge No.
Chevrolet 2066S,SA	3/8"	T109-80
Nash 895S,SA	3/8"	T109-80
Nash 973S, 974S	7/16"	T109-81
Nash 2369S	7/16"	T109-81
Nash 2368S	5/16"	T109-107

Float Level: Remove bowl cover and float assembly and remove cover gasket. Invert cover so that float hangs freely. Check float height at highest point on float by inserting gauge between float and cover. Adjust by bending float lever.
CAUTION—Do not compress spring in intake needle which would cause incorrect setting.

Float Drop—Check by holding bowl cover assembly in upright position so that float drops to limit of travel. Distance from float seam at free end of float to underside of bowl cover should be 2". Adjust by bending stop tab on float arm.

FAST IDLE SETTING

Car & Carb.	Throttle Opening	Gauge No.
Chevrolet 2066S,SA	.020"	T109-29
Nash 895S,SA, 2368S	Ⓒ.030"	T109-29
Nash 973S, 974S	② .015"	T109-44
Nash 2369S	.018"	T109-44

Ⓒ - Supersedes .033" setting on 895S,SA.
② - Supersedes .030" setting.

Fast Idle Setting: *NOTE—Chevrolet carburetor has manual choke and fast idle adjusted differently.*

Chevrolet—Hold choke valve tightly closed, measure throttle valve opening or clearance between edge of valve and air horn wall on side opposite idle port If opening not correct (see table below), adjust by bending offset portion of choke connector link using bending tool T109-213.

Nash—Remove thermostatic coil housing gasket, and baffle plate (for access to fast idle cam located within choke housing). Open throttle valve partially (to free fast idle linkage), close choke valve fully, close throttle valve. Hold choke valve tightly closed, apply slight tension to throttle lever to remove play from linkage, check throttle valve opening (clearance between edge of valve and carburetor bore on side opposite idle port). If clearance not correct, adjust by bending throttle connector link at lower angle using tool T109-213. Check Unloader.

CONTINUED ON NEXT PAGE

CARTER "YH" (C nt.)

UNLOADER SETTING

NOTE—No Unloader used on Chevrolet 2066S, SA.

Car & Carb.	Choke Opening	Gauge No.
Nash 895S,SA, 2368S	① 1/2"	T109-83
Nash 973S, 974S, 2369S	② 5/8"	T109-85

① - Supersedes 3/16" & 1/4" settings on 895S,SA

② - Supersedes 1/2" setting on 973S, 974S

Unloader: After making fast idle adjustment (above), hold throttle valve in wide open position and close choke valve as far as possible *(CAUTION—do not* force valve beyond point where it is held open by unloader arm). Check choke valve opening (clearance between lower edge of wall and air horn wall). If clearance not correct, adjust by bending choke shaft unloader arm using tool T109-105.

CHOKE SETTING

NOTE—Choke on Chevrolet 2066S, SA is manual type.

Car & Carb.	Choke Setting
Nash 895S (Early) ①	1 Point Lean
Nash 895SA (Later) ②	1 Point Rich
Nash 973S, 974S (Early) ③	1 Point Lean
Nash 973S, 974S (Later) ④	2 Points Lean
Nash 2368S	1 Point Rich
Nash 2369S	2 Points Lean

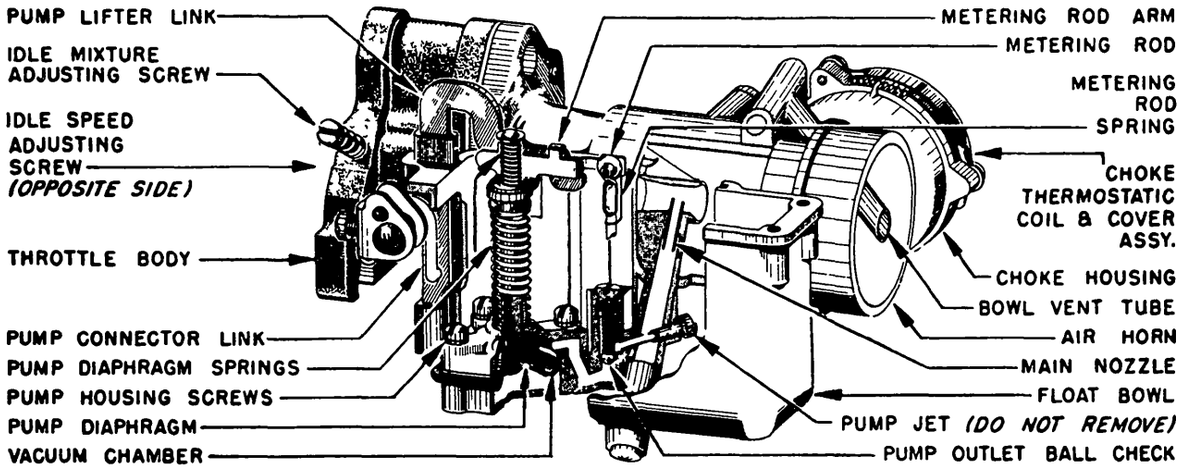
① - With One-Piece Choke Piston, Carter No 160-35

② - With Two-Piece Choke Piston, Carter No 160-116S

③ - "N" Coil No 170N-250S See *Production Change above*

④ - "P" Coil No 170P-250S See *Production Change above*

THROTTLE VALVE SETTING: ***See OVERHAUL data for throttle valve installation.*** With valve correctly installed, Idle Port Height (top of port above top edge of valve) and Vacuum Spark Port (bottom of horizontal port above top edge of valve) with throttle valve tightly closed should be:



THROTTLE VALVE SETTING

Car & Carb.	⑪Idle Port	Vacuum Spark Port
Chevrolet 2066S, SA	124- 128"	⑫ 026-.036"
Chevrolet 2066SA⑬	.124- 128"	⑪.016- 026"
Nash (All)	124- 128"	⑫ 026- 036"

⑪—Top of port above top edge of valve
⑫—Bottom of port above top edge of valve
⑬—Late production carburetors.

OVERHAUL (With Carburetor removed from engine):

Disassembly: Remove bowl strainer nut and gasket, take out inlet screen. Remove bowl cover assembly (bowl cover, float, intake needle and seat). Remove choke connector rod, throttle shaft arm assembly,

CARTER "YH" HORIZONTAL CARBURETOR

and pump connector link. Take out throttle valve screws, remove valve, remove throttle shaft by carefully tapping it through shaft retaining ring. Take out attaching screws and remove body flange assembly (throttle body) and gasket Unscrew idle mixture adjusting screw and spring. Use tool T109-210 to remove idle passage rivet plug. Take out four diaphragm housing attaching screws, lift out entire diaphragm and metering rod assembly, disassemble this unit. Remove pump intake passage plug and ball check from diaphragm housing. Remove metering rod jet, pump discharge check plug, spring, ball, and low speed jet. Take out attaching screws and remove climatic control and housing assembly, remove gasket, baffle plate, and fast idle link. Take out choke valve attaching screws, remove choke valve, revolve choke shaft counter-clockwise until piston clears cylinder, remove choke shaft, fast idle cam, and piston as an assembly. Take out attaching screw and remove choke piston housing assembly and gasket. Remove all passage plugs.

►***CAUTION—DO NOT remove Nozzle, Bowl Vent, Tube, Economizer, Passage Bushings, or Pump Jet.***

Cleaning & Inspection: Wash all parts except climatic control coil and housing assembly in cleaning solution. Remove all carbon from flange bore, blow out all passages with compressed air. If choke piston is not free in cylinder, remove welch plug from bottom of housing and clean out all carbon and dirt from cylinder walls and grooves. Install NEW welch plug **air tight.** Inspect all parts for wear or damage.

Reassembly: Use all NEW gaskets. Reassemble parts by reversing order of disassembly procedure (above) and note the following points:

Throttle Valve & Shaft Installation—After throttle valve shaft installed in body, back off throttle stopscrew, install throttle valve with trademark (c in circle) toward idle port when viewed from manifold side of body, insert screws loosely, tap valve lightly to center it in bore before tightening screws. ***See Throttle Valve Setting (above).*** Install throttle centering washer (prongs outward) while pressing on shaft at lever end, press washer tight against casting (use drive end of 3/8" drive 1/2" socket to press washer in place). Check throttle shaft for free operation after centering washer installed.

Pump Diaphragm Installation—Make certain that discharge hole in diaphragm is aligned with passage in diaphragm housing, install the four attaching screws through housing holes and diaphragm so that it is held smoothly against housing. After baffle plate installed in fuel bowl, install diaphragm assembly in the bowl and tighten the attaching screws evenly. Check for free operation.

Climatic Control Installation—After choke piston housing and gasket installed on body, install choke shaft, fast idle cam, and piston assembly in air horn and check for free operation (if shaft binds loosen housing attaching screws and align housing). Install choke valve so that trademark (c in circle) is visible when valve closed, use new attaching screws, tap valve lightly before tightening screws.

SERVICE PARTS: Gasket Set - Carter No 223 or 227 (895S,SA 973S, 974S), No 248 (3066S,SA), No 284 (2368S), No 284A (2369S)

Recarburetion Kits (Repair Packag) - Carter No 1713 or 1719 (895S,SA), No 1754 (973S, 974S), No 1771 (2066S,SA), No 1830 (2368S)

(1) Supersedes 75-994 used on first 2081S carburetors
(2) 1 Size Rich No 75-1122
(10) Nozzle Installed Permanently - DO NOT REMOVE.
(11) Nozzle Assembly, Inner Nozzle No. 31 (.120"), Outer Slip Nozzle .110".
(14) Supersedes No. 75-1111
(15) Supersedes No. 120-155 (091")
(16) Supersedes No. 75-845
(17) Three Sizes Lean No. 75-906.
(19) With 232" Engine (No. 2115S with 262" Engine).
(20) Twin H-Power Cars (Two Carburetors).
(21) First Cars (Two Carburetors of Same Type).
(22) Later Cars (Two Carburetors of Same Type).
(23) Latest Cars (Two Carbs.) can be used to replace 2098S or 2137S, SA.
(24) Dual Jet Fire Engine (Two Carbs. 973S Front, 974S Rear).
(31) Was No 69 Part No 11-269S
(32) – Three Sizes Lean No. 75-922.
(34) Three Sizes Lean No. 75-976.
(41) Supersedes No. 11-163S.
(51) – Supersedes No. 48-236 (#72).
(52) – Supersedes No. 75-1265.
(60) - Supersedes 75-1348 (now 1 size lean).

(10) Nozzle Installed Permanently - DO NOT REMOVE
(20) Supersedes No 75-873
(24) Dual Jet Fire Engine (Two Carbs 973S Front, 974S Rear)
(25) Used on first Synchro-mesh Trans. Cars
(26) Used on later Synchro-mesh Trans Cars, and some Hydra-Matic Cars
(27) Used on Hydra-Matic Cars (Except 720SA on some cars)
(38) Super Powerflyte (Two Carburetors)
(39) Synchro-mesh Trans Cars
(40) Supersedes No 75-831 (used on first 895S Carburetors)
(52) – Supersedes No. 75-1265.
(53) – Three Sizes Lean No. 75-1292.
(54) – Ambassador Dual Jet Fire (2 Carburetors).
(55) – Supersedes No. 75-1215S
(56) – One Size Lean Pkg. 75-1308U (Metering Rod 75-1304S & Power Jet Rod 16-13).
(57) – Two Sizes Lean Pkg. 75-1309U (Metering Rod 75-1305S & Power Jet Rod 16-13).
(58) – Metering Rod Jet 120-163 (.098"), & Power Jet 230-10(.076") used with Power Jet Rod 16-12
(61) - Supersedes 75-1332S. (62) - Supersedes 75-1265.
(63) - Supersedes 75-1388S. (70) - Supersedes No 48-247S
(64) - Kit consists of 1 Power Jet Rod 16-33 and 1 Metering Rod Assembly 75-1390S

CARTER BBR1 CARBURETORS

STUDEBAKER	Cart r Carbur t r N .
1957 Champion Scotsman	BBR1 2724S
1958 Scotsman	2764S, ① 2724S
1958 Econ-O-Miler (Taxicab), Early	2724S
1958 Econ-O-Miler (Taxicab), Late	2808S

① - Optional

DESCRIPTION: Single barrel downdraft carburetor with manual choke control. Same design as other Carter (B&B) Downdraft carburetors with vacuum controlled step-up jet or power orifice.

ADJUSTMENTS: *Set carburetor to the following specifications.*

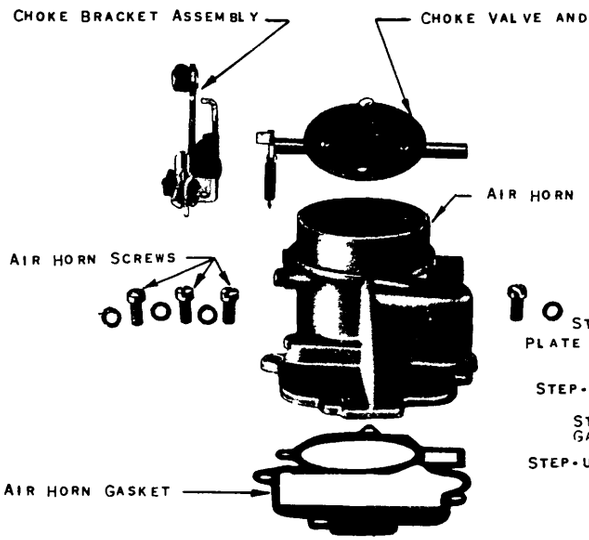
Idle Setting: Adjust only with engine at normal operating temperature (choke valve wide open).

Idle Mixture - ½-1½ turns open. Turn screw out for richer mixture.

Idle Speed: 550-600 RPM (Synchro-mesh, 550 RPM (Flightomatic), with selector lever in "N" or "P" position.

Accelerating Pump: Check pump stroke setting after carburetor overhaul, adjust pump for seasonal requirements as indicated.

Seasonal Setting - Three holes provided in throttle lever for pump lifter link engagement as follows



Center Hole - Normal operation (medium stroke). **Outer Hole** - Cold weather operation (long stroke). **Inner Hole** - Hot weather operation (short stroke).

Pump Stroke Setting - To check stroke, remove air horn assembly, make certain pump link is connected in center hole of throttle lever (2724S, 2764S), inner hole (2808), then back off throttle stopscrew so that throttle valve is fully closed Place pump travel gauge, T109-117S, on upper edge of body casting at pump cylinder, turn gauge until projecting finger contacts top of pump plunger shaft and note gauge reading Open throttle wide with pump plunger pressed to bottom of pump cylinder, then take second gauge reading. Difference between the two readings is pump stroke and should be "32" (32/64") for 2724S & 2764S carbs , "14" (14/64") for 2808S carb To adjust stroke, bend horizontal portion of pump link arm

Float Level: 5/64" (2724S, 2764S), 1/8" (2808S) from top of float bowl to top of float with needle valve seated To adjust, bend lip on float arm

Step-up (Power) Valve: No adjustment provided. Vacuum piston should operate freely and clearance between step-up rod and top of piston plate should be .010" minimum with piston pushed all the way down *(CAUTION* - This clearance necessary to permit spring to fully close step-up jet). Adjust clearance by bending plate slightly.

Fast Idle: No adjustment required Consists of a fast idle cam serving as a stop for the throttle lever stopscrew Fast idle cam is linked to choke valve and is rotated to fast idle position when choke valve is closed for cold starting

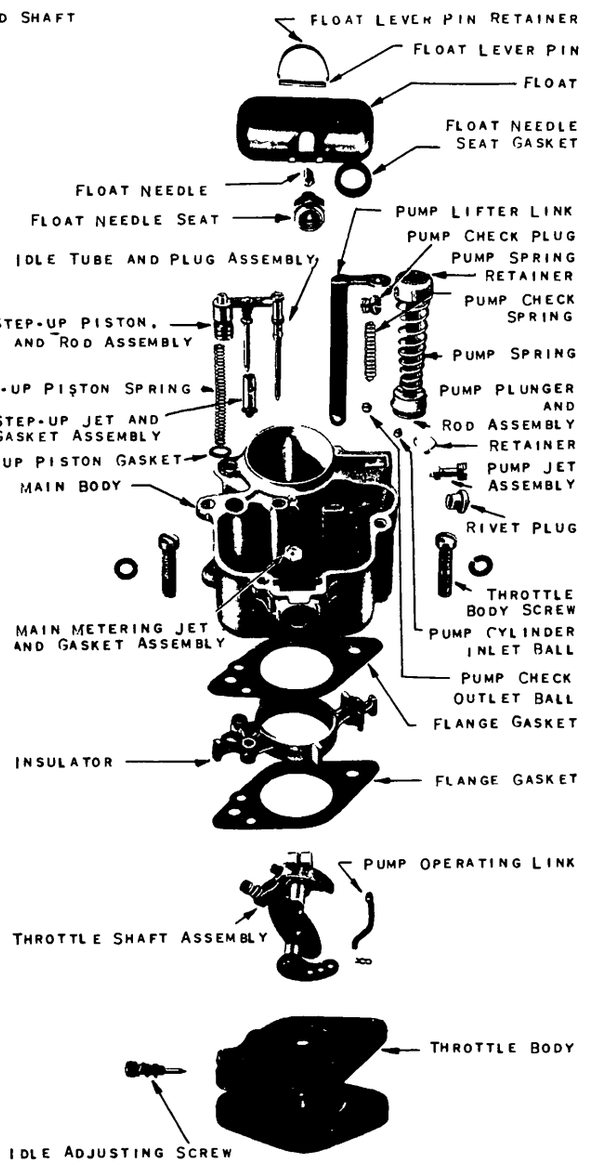
CARTER BBR1 CARBURETOR

Choke: Manual type Choke valve has poppet type relief valve

Throttle Valve Setting: When installing throttle valve, insert attaching screws loosely, then close valve completely and tap it lightly to centralize it in bore, tighten attaching screws securely. Check throttle valve position.

Throttle Valve Setting

Carb.	① Idle Port	Vacuum Spark Port
2724S, 2764S	133- 137"	② 007- 013"
2808S	096- 100"	③ 011- 021"



① - Top of port above top edge of valve with valve tightly closed
② - Top of port below lower edge of valve
③ - Bottom of port above top edge of valve

JET SPECIFICATIONS

Part	Size	Part No.
Main Jet (2724S, 2764S)①	②	159-59S
Main Jet (2808S) ③	⑪	159-70S
Main Vent (2724S, 2764S)	0315"	145-72
Main Vent (2808S)	0315"	145-39
Step-up Jet (2724S, 2764S)	.037"	149-43S
Step-up Jet (2808S)	026"	149-50S
Idle Tube (2724S, 2764S)	0276"	123-31S

►CHANGES, CAUTIONS, CORRECTIONS

►**Carburetor Mounting Flange Gasket Caution (For all Models):** Step-up jet vacuum piston vacuum passage terminates at carburetor mounting flange and special slotted type gasket must be used when mounting carburetor on manifold CAUTION—Use of plain or solid type gasket will shut off vacuum passage and cause excessive fuel consumption complaints.

►**Engine Stalling while Idling Correction**—Check idle setting (see below). Check slow-closing throttle adjustment (first type only) as directed in article on Chrysler Slow-closing Throttle in Carburetion Equipment Section. Remove Idle Orifice Tube and Plug Assembly and clean tube and passages with compressed air. Remove idle adjusting screw and blow out idle ports with air.

►**Carburetor Loading Up Complaints**—Check and adjust float level.

►**Engine Stalling or Stumbling when Throttle Opened**—May be caused by accelerating pump leakage (worn or wrinkled pump leather, inlet or outlet ball check valves not seating). To check pump for leakage, remove bowl cover, float, pump outlet ball check valve plug, and pump assembly. Fill pump cylinder with gasoline and re-install pump plunger, taking care not to wrinkle or damage pump leather. Hold outlet ball check valve firmly on seat (use brass rod inserted through valve plug hole), press down on pump plunger. Leakage will be evidenced by gasoline at inlet or outlet ball check valves or above pump plunger. If pump plunger can be pushed all the way down and all gasoline discharged from the cylinder, replace pump plunger or reseat ball check valves by tapping on ball with a brass rod. Install new ball (original ball will be flattened by reseating operation) and repeat check. Repeat reseating operation if necessary. remove pump jet and clean with compressed air or install new jet.
CAUTION—Ball check valves are relatively soft (inlet ball Monel, outlet ball Stainless Steel) and any ball used in reseating operation should be replaced for service.

►**Poor Gasoline Mileage (Economy) Complaints**—Check float level. See that the main metering jet is correct type and not worn (special lean metering jets available for special service such as high altitudes or high test fuel). See that step-up jet tight on seat and not leaking, make certain that step-up valve rod and piston clean and not binding or sticking, check step-up piston spring (replace spring if weak or damaged). Check for clogged main vent tube (will cause excessive richness and poor gasoline mileage at speeds above 50 MPH.).

DESCRIPTION

DESCRIPTION: Plain tube, downdraft type with balanced bowl vent (bowl vented through tube cast in air horn), throttle operated accelerating pump, and vacuum controlled step-up jet or power orifice. Some models have special features:

Throttle Restrictor (D6N1, D6N2, E7V1, E7W1)—Restrictor consists of a hemispherical casting bolted on top and bottom of throttle valve (special studs used instead of regular throttle valve mounting screws) to provide control similar to a governor action. *See Throttle Valve Setting (below).*

Automatic Choke (E9A1, B1, C, C1)—Carter Climatic Control assembled on carburetor air horn (has integral fast idle mechanism and unloader). *See adjustment data below.*

Fuel System (Idling):—Fuel taken from main nozzle well up through Idle Orifice tube (metered by restriction in tube) to cross-channel in which it is mixed with air admitted through idle air bleed opening in carburetor wall above venturi. From this point fuel mixture is taken down through channel to discharge ports at throttle edge.

Driving Range—Fuel for main nozzle metered by main metering jet in float bowl. Main nozzle air bled by main vent tube in upper end of nozzle which connects with air vent leading to bowl vent. Lower end of nozzle closed by rivet.

High Speed & Wide Open Throttle Operation—Vacuum piston, which is normally at lower end of stroke with piston spring compressed, will be forced up by spring when manifold vacuum falls off, raising the step-up rod or needle and opening the valve, permitting additional fuel to flow through the power orifice (step-up jet) to the main nozzle.

ADJUSTMENT & OVERHAUL

THROTTLE KICK-DOWN SWITCH: *TWO DIFFERENT TYPES used as follows:*
Automatic Transmission Control Kick-down Switch (All Cars with Automatic Transmission)—This switch is built-in the carburetor and does not require attention in service. No adjustment is provided.

Overdrive Control Kick-down Switch (E9N1, D6U1, D6V1): Switch is separate unit mounted on the carburetor and actuated by a lever on the throttle valve shaft. Adjust as directed below. NOTE—On other Overdrive Cars, Kick-down switch is mounted separately and is not part of the carburetor assembly.

Adjustment—Adjust switch position on bracket (loosen one mounting nut on switch stem, tighten opposite nut) for clearance of 1/64-3/64" with throttle valve in wide open position. *CAUTION—Throttle lever must have sufficient overtravel to operate switch.*

VACUUM STEP-UP (ECONOMIZER): No adjustment required but setting should be checked when carburetor reassembled after servicing to insure step-up valve closing. To check, push vacuum piston down in cylinder to end of stroke, check clearance between piston plate and head of step-up valve needle stem. Clearance should be 1/64-1/32". To adjust, bend piston plate slightly.

IDLING ADJUSTMENT: Idle adjusting screw controls fuel discharge through lower idle port and should be turned in for leaner mixture, out for richer mixture. Approximate idle screw settings given in table below. Adjust only with engine warmed up so that choke valve is wide open and fast idle inoperative. Idle speed controlled by throttle lever stopscrew. See tune-up data on car model pages for complete tune-up data on each car model.

IDLE SETTING

Car Model	Carburetor	Idle Setting	Idle Speed
Chrysler 6①	E9C. E9C1	½-1½ turns open	6 MPH.
Chrysler 6④	E9B1. E9A1	½-1½ turns open	475-500 RPM.
De Soto⑤	E7V1. E7W1	½-1½ turns open	6 MPH.
DeSoto①	E9C. E9C1	½-1½ turns open	6 MPH.
DeSoto④	E9B1, E9A1	½-1½ turns open	475-500 RPM.
Dodge①	D6H2, J1, P1, P2, U1, V1	½-1½ turns open	6 MPH.
Dodge④	D6M-1	½-1½ turns open	475-500 RPM.
Dodge①	E9N1, E9T1	½-1½ turns open	6 MPH.
Dodge④	E9U1, E9V1	½-1½ turns open	475-500 RPM.
Plymouth	D6H1, H2, N1, N2, R1, U1	½-1½ turns open	6 MPH.
Plymouth⑥	D6P1, D6P2	½-1½ turns open	450-500 RPM.

①—Cars with Standard Transmission.
④—Cars with Hydraulically Controlled Transmission & Fluid Drive.
⑤—Special City Traffic. ⑥—Hy-Drive Transmission Cars.

FLOAT LEVEL: To check float level, remove air horn (integral with float bowl cover), use special gauge (see Note), placing gauge on top edge of bowl with lugs extending down toward float on either side of soldered seam. Press lip of float lever against needle valve, float should contact both lugs on gauge. Adjust by bending float lever lip slightly at point where it contacts valve needle (do not bend float arm. If gauge not used, measure from top edge of bowl to top of float (not soldered seam). This measurement should be 5/64" for all models except those listed in table below. Float level figures are plus or minus 1/64".

CONTINUED N NEXT PA E

CARTER (B&B) DOWNDRAFT TYPE (C nt.)

FLOAT LEVEL SETTING

Car Model	Carburetor	Float Level	Checking Gauge
Dodge	E9U1	1/16"	T109-49
ALL OTHERS		5/64"	T109-50

►**D6U1, V1, E9B1, N1, U1, V1 FLOAT SETTING CAUTION:** Remove the float pin retainer, hold lip of float arm against seated intake needle and **make certain float pin is at the bottom of its guide slots.**

Float Needle Valve and Seat—Triangular type. Furnished only in matched sets as follows:

FLOAT INLET VALVE

Car Model	Carburetor	Part No.	Intake Hole Size
DeSoto City Traffic	E7V1, E7W1	25-102S	#44
ALL OTHERS		25-82S	#44

ACCELERATING PUMP: Delayed action type (spring operated pump plunger). **Seasonal Adjustment**—Three holes provided in throttle lever for connector link engagement. Inner hole provides minimum stroke, center hole medium stroke, outer hole max. stroke. See car model pages for recommended settings.

Pump Stroke Adjustment—To check, remove air horn and float bowl cover assembly, back off throttle stopscrew so that throttle valve closes tightly, connect pump connector link in correct hole of throttle lever (see table below), install Universal Pump Stroke Gauge T109-117S on bowl so that indicator lip on gauge rests on top of pump plunger shaft. Note gauge reading, then open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should agree with table below To adjust, bend horizontal portion of pump connector link

►***EX3, EX3R, E7L3, E7L4, E7W1 (some), E9A1, E9C, E9C1 NOTE***—No pump stroke adjustment required on these models. Make certain that horizontal portion of pump lifter link is at right angles to pump lifter link shaft (bend arm if necessary) using bending tool T109-41.

ACCELERATING PUMP SETTING

Car Model	Carburetor	Pump Stroke	Pump Setting
Chrysler 6 ('51-54)	E9A1, E9C, E9C1, E9B1		See Note (above)
DeSoto ('51-54)	E9A1, E9B1, E9C, E9C1		See Note (above)
Dodge	D6H2, M1, P1, P2, U1, V1	22/64"	Medium Stroke
Dodge	E9N1, E9T1, E9U1, E9V1		See Note (above)
Plymouth	D6H1, H2, D6N1, N2	22/64"	Medium Stroke
Plymouth	D6P1, P2, R1, U1	22/64"	Medium Stroke

THROTTLE VALVE SETTING: When installing valves, insert attaching screws loosely, back throttle stopscrew off, tap valves lightly to centralize in bore, then fasten screws securely.

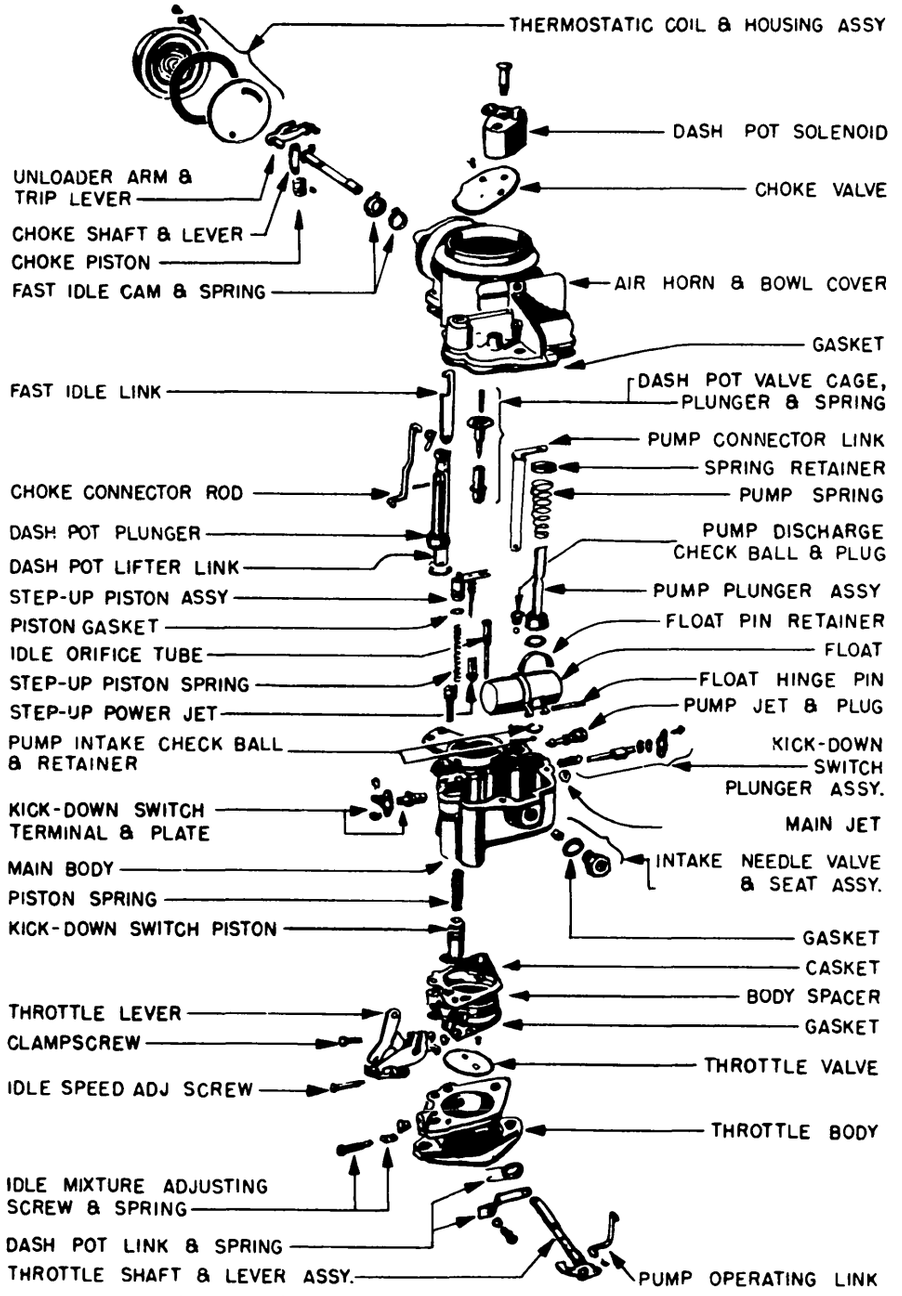
►***D6N1, D6N2, E7V1, E7W1 CAUTION***—These models have hemispherical throttle restrictors bolted on upper and lower faces of throttle valve. First install valve in usual manner using No. 101-286 Throttle Restrictor Screws (studs) **instead** of usual valve attaching screws, then install restrictors on studs and use special No. 105A-45 Throttle Restrictor Nuts to retain the restrictors.

Setting—With throttle stopscrew backed off so that valve tightly closed, distance from top edge of valve to top of upper idle port should agree with 'Idle Port' figure in table below, and distance from top of valve to top of vacuum spark port should agree with 'Vacuum Spark Port' figure (except as noted).

THROTTLE VALVE SETTING

Car Model	Carburetor	Idle Port Height	Vacuum Spark Port
Chrysler 6	E9A1, E9C, E9C1	.118-.122"	①.012-.018"
DeSoto	E7W1	.118-.122"	①.052-.058"
DeSoto	E9A1, E9C, E9C1	.118-.122"	①.012-.018"
DeSoto Repl. Carb.	E6P5	.088-.092"	①.052-.058"
Dodge	D6H2, M1, P1, P2, U1, V1	.118-.122"	②.021-.027"
Dodge	E9N1, E9T1, E9U1, E9V1	.118-.122"	
Plymouth	D6H1, H2, D6N1, N2	.118-.122"	②.021-.027"
Plymouth	D6P1, P2, R1, U1	.118-.122"	②.021-.027"

①—Top of port above top of valve. ②—Bottom of port above top of valve.



CHOKE (EXCEPT E9A1, B1, C, C1): Offset type with poppet type relief valve. Control on Plymouth models (without Automatic Choke) is semi-automatic (spring-loaded). Sisson Automatic Choke is standard on all models.

CHOKE MODELS E9A1, B1, C, C1): Carter Climatic Control on carburetor air horn.

CHOKE SETTING

Car Model	Carbur tor	Choke Setting
Chrysler 6 & DeSoto	E9A1, E9B1, E9C, E9C1	Centered (At Index)

CONTINUED ON NEXT PAGE

CARTER (B&B) CARBURETOR (WITH AUTOMATIC CHOKE)

Form 40 A

CARTER (B&B) DOWNDRAFT TYPE (C nt.)

►*THERMOSTATIC COIL & HOUSING REMOVAL & INSTALLATION CAUTION*—When servicing carburetor or air cleaner, observe the following precautions to avoid breaking or otherwise damaging the coil housing:
1) Use two wrenches when removing or replacing the heat tube on the housing cover (hold fitting on cover with one wrench while turning coupling nut). Align heat tube with cover fitting to prevent strain on cover.
2) Make certain that gasket installed between air cleaner and carburetor air horn to insure proper clearance.
3) Install air cleaner with indention on underside in line with automatic choke heat tube to provide adequate clearance at this point.

►*THERMOSTATIC COIL ASSY. CAUTION*—Thermostatic coil is mounted on "Delayer Plate" within housing (delayer plate provides longer choke operation during warm-up and prevents choke closing too rapidly after engine stopped). It should not be necessary to remove the coil assembly from the housing for choke servicing, and **coil must not be removed from delayer plate.**

FAST IDLE (EXCEPT E9A1, B1, C, C1): Consists of throttle shaft dog pivoted below the throttle shaft and linked to the choke valve lever so that throttle opened to fast idle position when choke valve closed for starting (dog acts as stop for throttle lever idle speed screw).
No adjustment required.

FAST IDLE (MODELS E9A1, B1, C, C1): Consists of throttle shaft dog pivoted assembly mounted on the choke valve shaft within the Climatic Control housing and linked to the throttle valve lever.

►***CAUTION—Thermostatic Coil Housing, Gasket, and Baffle Plate must be removed to check or adjust the fast idle and unloader.***

Adjustment—To check fast idle setting with thermostatic coil housing, gasket, and baffle plate removed, back out throttle stopscrew so that throttle valve tightly closed. Crack throttle valve, close choke valve completely, then close throttle valve (this will allow fast idle cam to assume fast idle position). Check throttle valve opening or clearance between edge of valve and carburetor wall on side opposite idle port (see table). Adjust by bending choke connector rod at lower angle near throttle lever using tool T109-41. ***Check and adjust Unloader before reassembling choke.***

FAST IDLE SETTING

Car Model	Carburetor	Checking Gauge	Throttle Opening
Chrysler 6 & DeSoto ..	E9A1, E9B1, E9C, E9C1	....T109-44①	.....015-.019"

①—Double-ended gauge (.015" and .018").

UNLOADER (MODELS E9A1, E9C, E9C1): Consists of an arm on choke trip lever in the choke housing which engages a lug on the choke lever and opens the choke valve when the throttle valve is held wide open.

Adjustment—To check unloader with thermostatic coil housing, gasket, and baffle plate removed, hold throttle valve wide open, close choke valve as far as possible (CAUTION—do not force valve closed), measure choke valve opening or clearance between upper edge of valve and air horn wall (see table). Adjust by bending arm on choke trip lever using bending tool T109-187.

UNLOADER SETTING

Car Model	Carburetor	Checking Gauge	Choke Valve Opening
Chrysler 6 & DeSoto	E9A1, E9B1, E9C, E9C1	.T109-154.....	5/32"

OVERHAUL: ***DISASSEMBLY CAUTION—Automatic Choke, slow-closing throttle dashpot, and kick-down switch not used on all carburetors. Disregard data on these units when overhauling carburetors on which they are not used.***

Disassembly: 1) Remove dashpot magnet from air horn by taking out attaching screw (carburetors with magnetic dashpot only).
2) On carburetors with automatic choke, disengage fast idle rod from throttle lever, remove choke thermostatic coil housing (take out screws and remove retainer ring on housing), remove gasket and baffle plate. Remove choke trip lever, slide fast idle link out. Remove choke valve ***(CAUTION***—screws are staked, remove carefully to avoid stripping threads or breaking screws). Rotate shaft counter-clockwise and push in on fast idle cam to disengage choke piston from cylinder, withdraw shaft, lever, and piston ***(CAUTION***—do not loose piston pin).

►***THERMOSTATIC COIL HOUSING CAUTION***—Thermostatic coil, heat retainer plate, and housing are serviced as an assembly. Coil and heat retainer plate can be removed from housing for cleaning by hitting assembly sharply against palm of hand with coil side down. ***DO NOT ATTEMPT TO SEPARATE COIL FROM HEAT RETAINER PLATE.***

3) Take out five air horn screws (one screw underneath choke housing), lift off air horn assembly, remove air horn gasket. Remove fulcrum pin retainer, remove fulcrum pin, lift off float assembly. Remove fuel inlet needle and needle seat assembly. Remove pump operating link after freeing hairpin clip, lift out pump lifter, plunger, and spring assembly.
4) Take out dashpot connector link screw, lift out dashpot lifter and plunger assembly, dashpot valve cage plunger and spring, and dashpot valve cage.
5) Unscrew idle orifice tube, remove tube with step-up piston, plate, and rod assembly. Remove step-up piston spring and gasket, unscrew step-up jet.
6) Unscrew main metering jet, remove pump jet plug, unscrew pump discharge jet ***(CAUTION***—use narrow blade screwdriver). Unscrew pump discharge check ball plug, remove ball check by inverting carburetor.
7) Take out three screws attaching main body to throttle body and separate these parts. If kick-down switch used, remove screws and retainer plates, pull out plunger and spring, carefully pull out terminal assembly to release kick-down limit piston and spring. Unscrew idle mixture adjusting screw and spring. Do not disturb throttle valve assembly.

Cleaning & Inspection: Wash parts in suitable cleaning solvent, blow out all passages with compressed air and dry parts with air. Remove all carbon deposits paying particular attention to throttle bore in vicinity of throttle valve and idle ports. Thoroughly clean choke piston cylinder and slots and grooves in choke piston. Inspect all parts for wear or damage.

►***THROTTLE SHAFT REPLACEMENT CAUTION***—It is recommended that throttle body assembly be replaced if throttle shaft or bearing points in body are worn.

Reassembly: Use all NEW gaskets. Install all parts in reverse order of disassembly procedure and note the following special instructions:

Step-up Piston Assembly—Make certain that step-up rod enters step-up jet, tighten idle orifice tube snugly. Check assembly by pressing the step-up piston down onto its seat. In this position clearance between head of rod and plate should be .010" minimum. Adjust by bending plate slightly.

Accelerating Pump & Dashpot Plungers—Plunger leather must be in good condition (replace if shrunk or hard). Carefully roll leather back, return it to original position (to flare the leather), work leather between thumb and forefinger until soft and pliable. ***NOTE***—Treat new plungers similarly.

Pump Ball Check Valves (Testing)—After pump assembly, test check valves for good seating as follows: Fill bowl to depth of ¼" with clean gasoline, operate pump several times to expel air, then operate pump while holding discharge ball check down with small brass rod. There should be no fuel discharge through either the inlet ball check or discharge ball check valves. If leakage noted, remove parts and clean thoroughly.

Automatic Choke Assembly—Insert choke shaft and piston assembly in air horn, rotate shaft until it is possible to insert piston in cylinder, turn shaft clockwise to enter the piston. Make certain that fast idle cam is centered on boss on air horn. After installing choke valve (below), check assembly for free operation (valve should open freely of own weight from closed position). Make fast idle and unloader adjustment before installing baffle, gasket, and coil assembly (see ADJUSTMENT). Make certain that baffle plate engages locating pin in housing, install new gasket, then install coil housing assembly with indicator mark on rim **downward**, install retainer ring and screws loosely, then rotate coil housing counter-clockwise until indicator mark lines up with center graduation on air horn, tighten retainer screws securely.

Chok Valve Installation—Use new screws and turn screws in loosely, then hold valve in closed position and tap valve gently to center it in bore, tighten screws securely, stake screws by squeezing with pliers.

Form 40 B

CARTER BB UPDRAFT

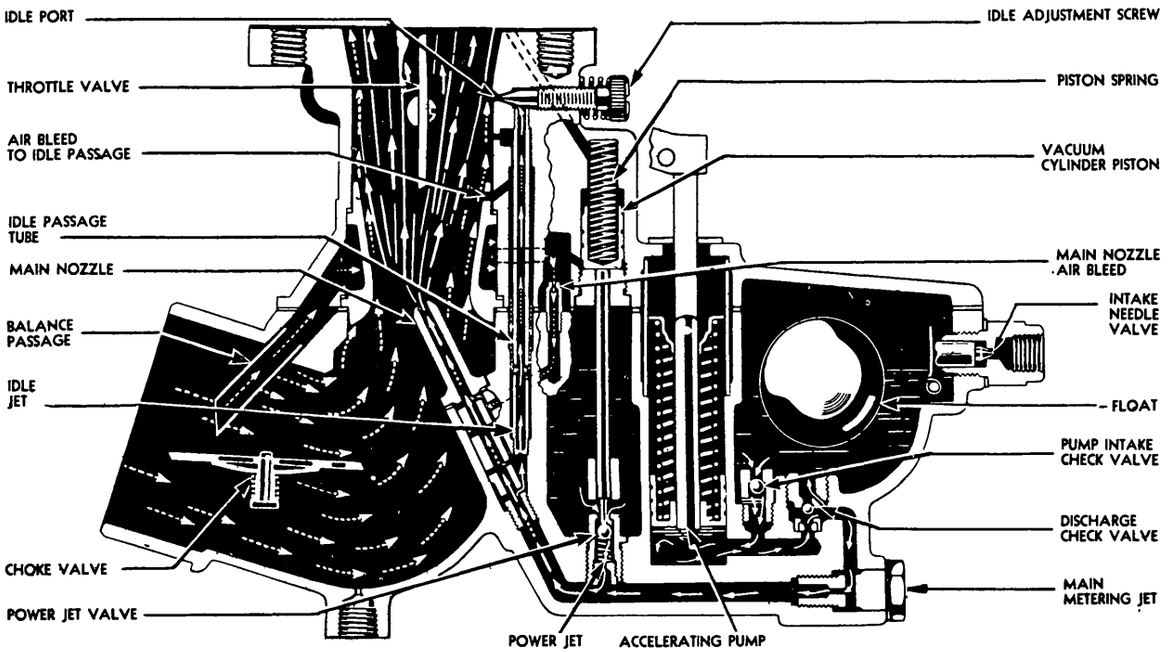
CHEVROLET TRUCK — **Carter Carburetor No.**

1954-55 6 Cyl. Cab-Over-Engine 2075S
1954-56 6 Cyl. Forward Control Models 871SB
1957-60 6 Cyl. Forward Control Models 871SC

►*ACCESS TO CARBURETOR (For Adjustment or Removal):* Remove toe-pan attaching screws, disconnect wires at stop light switch, disconnect accelerator pedal rod from throttle control rod and remove toe-pan.

DESCRIPTION: Plain tube, updraft type with an accelerating pump, vacuum controlled power jet, and a spring mounted auxiliary air valve located in choke valve.

ADJUSTMENT: Idle Mixture - ½-1½ turns open from a lightly seated position (turn screw out for richer mixture).



Idle Speed: 1954-58 Models - 450-500 RPM (Synchro-mesh), 400-450 RPM (Auto. Trans.). **1959-60 Models** - 475 RPM (Synchro-mesh), 450 RPM (Auto. Trans.).

Fl at Level: 0-1/32" (Carter Gauge T109-49 or Chevrolet Gauge J-818-13A) from top of float to top edge of bowl with needle valve seated. *NOTE - Use 1/32" side of gauge (other side used for 1/16" settings).*

Accelerating Pump (Seasonal Setting): Summer (Short Stroke), Winter (Long Stroke).

Pump Stroke - 9/16" (short stroke) with connecting screw in holes in throttle lever and pump link assembly nearest throttle shaft. 1" (long stroke) with screw in holes furthest from shaft.

OVERHAUL: Disassembly - Remove upper-to-lower body attaching screws, then remove upper body (with accelerating pump parts attached) from lower body. Compress pump piston spring and remove connector pin, then remove spring retainer, spring, piston and fibre washer from pump rod and plate assembly. Remove pump packing retainer, then disconnect pump shaft from throttle arm and remove shaft and packing. Remove plug from vacuum power cylinder (use Tool J-816-4) and remove piston and spring. Remove idle passage tube, idle adjusting screw and idle hole plug from upper body. Remove accelerator pump sleeve, power jet push rod, float lever hinge pin, float and needle valve from lower body. Remove accelerator pump intake check valve, discharge check valve and power jet (use Tool J-816-7). Remove main nozzle air bleed, idle jet, main nozzle and main metering jet from lower body (use Tool J-816-1).

CARTER BB UPDRAFT CARBURETOR ASSEMBLY

Cleaning & Inspection: Wash all parts in cleaning solvent and blow out all drilled passages with compressed air. Remove all carbon deposits and make sure power jet piston is free in cylinder. Disassemble and clean power jet (use Tool J-816-2). *CAUTION - Do not lose jet spring or ball.* Replace all damaged or worn parts.

Reassembly: Reverse disassembly procedure and note the following:

Choke Valve - If choke valve was removed, reassemble so flutter valve is on opposite side of valve from inlet and small bleed hole is toward balance vent when valve is closed.

Throttle Valve - If throttle valve removed, reassemble with notch on valve lined up with port for vacuum line in body.

►*INSTALLATION NOTE: Install special gasket on carburetor making sure port for vacuum cylinder is open, then install carburetor on manifold.*

SERVICE PARTS: Gasket Set - Carter No. 202.
Repair Package (With Metering Jet): Carter No. 1539A.

CARTER (BB) UPDRAFT CARBURETOR JET SPECIFICATIONS

►CHANGES, CAUTIONS, CORRECTIONS

►*1954-56 PLYMOUTH 6 TAXICAB CARBURETOR IMPROVED ECONOMY (Carter BBS 2062S,SA; 2063S,SA carburetors):* Improved gasoline economy can be secured by installing all parts furnished in Unitized Pkg. Carter No. 195-67U as listed below. Spark plug gap should be set at .040" when this modification made. *CAUTION* - If this change made on cars operated in normal highway use, high speed performance may be affected.

CARTER "BBS" SINGLE CARBURETOR

Part	Unitized Pkg. 195-67U	Part No.
Main Metering Jet		120-215S
Step-up Rod		75-1125
Idle Tube & Plug Assy.		123-65S
Body Gasket		121-225

►*PLYMOUTH REPLACEMENT CARBURETOR NOTE:* When installing 2604S as a replacement, additional parts are required for Overdrive and PowerFlite cars as follows: **Ov rdriv Cars (2568S)** - Use Unitized Pkg.

CONTINUED ON NEXT PAGE

CARTER "BBS" (C nt.)

No. 192-33U, Kickdown Switch Assembly. **P w rFlit Cars (2569S)** - Use Unitized Pkg. No.202-80U, Dashpot, Bracket & Locknut.

►*1960 CARTER BBS 2986S CARBURETOR PRODUCTION CHANGE & SERVICE RECOMMENDATION:* When servicing this carburetor, install Step-Up Wire No. 75-1519 (.035") to replace original Step-Up Wire No. 75-1507 (.33") and add letter "A" to model number. *NOTE - 2986SA production carburetors have this chang .*

►*CARTER 2985SB & 2986SB CARBURETOR NOTE:* These carburetors which are used in later production on Dodge & Plymouth models have a revised fast idle mechanism which requires an additional fast idle adjustment operation (fast idle speed on earlier carburetors was automatically adjusted when hot or slow idle speed was correctly set).

►*1960 POOR ENGINE IDLE PERFORMANCE (In cong st d traffic in hot w ather, or after continuous highway driving at 60-70 MPH): See CARBURETOR on Car Mod l pag s.*

►*1960 HARD COLD START & WARM-UP CORRECTION (ALL MODELS):* May be caused by choke rod or choke shaft arm striking carburetor air cleaner. To correct, remove air cleaner and install air cleaner mounting gaskets as required for sufficient clearance.

DESCRIPTION: Single barrel downdraft type with integral automatic choke (1954-59 Models); "Cross-Over" type choke (1960 Models). Metering jet and step-up mechanism is vacuum controlled and is not adjustable. Fast idle mechanism is different on some models as follows:

Fast Idl Mechanism (2985SB & 2986SB Carburetors Only): The following parts on these carburetors have been changed to accommodate the later type fast idle mechanism: Throttle Body, Throttle Shaft & Lever, Fast Idle Adjusting Screw and Fast Idle Cam.

Idle Adjustment: Make preliminary setting of idle adjusting screw by turning screw in until it is lightly seated and then turn screw out exactly 1 turn. Warm up engine to normal operating temperature so that choke valve is wide open and fast idle inoperative. Set engine idle speed to correct figure, then adjust idle mixture as follows:

Idle Mixtur S tting - With engine at normal operating temperature, adjust idle mixture screw for highest RPM, then turn mixture screw in until speed starts to drop. Turn screw out just enough to recover engine speed that was lost. Readjust idle speed screw for correct engine idle speed.

Idl Mixture Setting

Carb. No.	Idle Screw Setting
920S, 993S, 994S, 2062S,SA, 2063S, SA	½-1½ turns
2116S, SA, 2215S, 2248S, 2249S, 2203S	½-1½ turns
2293S, 2294S, 2295S, 2380S, 2403S	½-1¾ turns
2567S, 2568S, 2569S, 2604S	½-1¾ turns
2410S, 2771S	1-2 turns
2567S, 2568S, 2569S, 2304S, 2604S	½-1¾ turns
2410S, 2771S, 3053S,SA	1-2 turns
2985S,SA,SB, 2986S,SA,SB	1/8-1½ turns
2900S, 2901S	¼-1½ turns

Idl Speed (1954-55 Mod ls) - 450-500 RPM

Idle Speed (1956-59 Models) - 450-500 RPM (Synchro-mesh), 475-500 RPM (Auto. Trans.), with transmission in "N" (Neutral).

Idl Speed (1960 Models) - 550 RPM (Synchro-mesh), 500 RPM (Auto. Trans. with selector lever in "N").

►*IDLE SPEED SETTING NOTE (ALTERNATOR EQUIPPED CARS):* To compensate for alternator load and provide a more accurate idle speed adjustment, turn headlights on during adjustment.

Accelerating Pump: Three holes provided in throttle lever for pump connector rod engagement to provide seasonal pump setting as listed below.

Pump Stroke Adjustment - Back off throttle stopscrew so that throttle valve fully closed. Make certain that connector rod engaged in center hole of throttle lever. Use scale to measure distance from top surface of bowl cover to top of pump plunger shaft. This distance should be as indicated in table below. If height not correct, adjust by bending connector rod at lower angle with Tool T109-213.

Pump Seasonal Setting - Std. setting is with pump connector rod engaged in hole of throttle lever as indicated below. Outer hole in lever will provide maximum stroke (greater discharge), center and inner holes provide less discharge.

Pump Stroke Setting

Car & Carb.	Plunger Height	Seasonal Setting
All (Exc. Below)	54/64"	Center Hole
Plymouth 2203S	51/64"	Inner Hole
Plymouth 2215S	49/64"	Inner Hole

Float Level: To check float level, remove air horn and bowl cover assembly, and gasket. Place gauge (see table below) squarely on top edge of bowl at center of floats. Remove float pin retainer, hold float arm lip firmly against seated needle valve with float pin at bottom of the guide slots. Ridge or crown on each float should just touch step on gauge. Adjust by bending float lip (*NOTE* - If one float lower than the other, first equalize floats by bending float arm, then adjust both floats by bending the lip). Reinstall float pin retainer.

Float Level Setting

Carb. No.	℄ Float Level
920S, 993S, 994S, 2062S,SA, 2063S,SA	7/32"
2116S,SA, 2203S, 2215S, 2248S, 2249S	7/32"
2293S, 2294S, 2295S, 2380S	7/32"
2403S, 2410S, 2567S, 2568S	9/32"
2569S, 2604S, 2771S	9/32"
2985S,SA,SB, 2986S,SA,SB, 2900S, 2901S	7/32"
3053S, SA	9/32"

℄ - Use Gauge T109-239 for 7/32" & 9/32" settings.

Fast Idle: Different procedures required for various carburetors as follows:

Off Engine (2900S, 2901S, 2985S,SA,SB, 2986S,SA,SB, 3053S,SA,SB) - With choke valve tightly closed and choke connector rod in upper end of slot in cam, align center of throttle stop screw (Exc. 2985SB, 2986SB, 3053SB); center of fast idle screw (2985SB, 2986SB, 3053SB) with index mark on fast idle cam. To adjust, bend choke connector rod at upper angle. *NOTE - Fast idle speed will be correct when engine idle speed properly adjusted (xc. 2985SB, 2986SB, 3053SB). Additi nal "On Engine" fast idle sp ed adjustment required n 2985SB, 2986SB, 3053SB carburetors. See b l w.*

Off Engine (Exc pt 2900S, 2901S, 2985S, SA,SB, 2986S, SA,SB, 3053S,SA,SB) - Remove choke coil housing assembly, gasket, and baffle plate, then back out throttle stopscrew to close throttle valve. Open throttle partially, then close throttle valve, allowing fast idle cam to revolve to fast idle position. Clearance between throttle valve and bore of carburetor on side opposite idle ports should be as indicated in table below. To adjust, bend choke connector rod at lower angle. *CAUTION - Be sure cam trip lever is all the way in piston housing with lub contacting cam.*

Fast Idle Setting

Carb. No.	℄ Throttle Opening
920S,SA, 993S,SA, 994S,SA, 2203S, 2215S, 2248S	.019-.023"
2062S,SA, 2063S,SA, 2116S,SA, 2249S	.022-.026"
2567S, 2568S, 2569S, 2604S	.028-.032"
All Others	.016-.020"

℄ - Use Gauge T109-29 (.022-.026", .019-.023" & .028-.032"), T109-44 (.016-.020").

On Engine (2985SB, 2986SB, 3053SB) - *NOTE - Fast idle adjustment (On Engine) for other carburetors will be correct when slow idle speed properly adjusted.* With fast idle screw on index mark of fast idle cam, adjust engine speed to 1200-1400 RPM by turning fast idle screw.

Fast Idle Throttle Valve Clearance (2985SB, 2986SB, 3053SB) - Clearance between lower edge of throttle valve and carburetor bore with fast idle screw on index mark of cam should be .030".

Unloader (Except 2900S, 2901S, 2985S,SA,SB,2986S,SA, SB, 3053S,SA,SB): After completing fast idle adjustment (above), hold throttle valve in wide open position and close choke valve as far as possible without forcing. Measure choke valve opening between upper edge of valve and air horn with Gauge T109-34 (9/64"). Adjust by bending arm on choke trip lever which actuates choke lever. Reassemble and adjust automatic choke.

Unloader (2900S, 2901S, 2985S,SA,SB, 2986S,SA,SB, 3053S,SA,SB): With throttle valve wide open, clearance between top edge of choke valve and inner wall of air horn should be 11/64" (Gauge T109-166). To adjust, bend unloader arm on throttle valve lever.

Automatic Choke (Integral Type): *CAUTION - When disconnecting hot air tube at choke housing fitting (for removal or adjustment of choke), hold fitting on housing with open end wrench while loosening tube nut to prevent distorting or breaking housing.* To adjust choke, disconnect heat tube and loosen retaining ring screws. Rotate choke housing until index mark on housing is aligned with center line on scale located on air horn. This is correct "Centered" setting for all models.

Automatic Choke (Cross-Over Type): Centered on index. See *"Carter (Cross-Over) Automatic Choke.*

Kickdown Switch (Overdrive Cars): *See CARBURETOR on Car Model pages.*

Slow-Closing Throttle Dashpot (Automatic Trans. Cars): *See CARBURETOR on Car Model pages.*

Throttle Valve Setting: When installing throttle valve it should be positioned as indicated. "Idle Port Opening" is port opening above upper edge of tightly closed valve. "Vacuum Spark Port" is height of top of port above tightly closed valve.

CONTINUED ON NEXT PAGE

CARTER "BBS" (C nt.)

Carb.	Throttl Valv Setting Idl P rt Opening	Vacuum Spark Port
920S,SA,993S,SA,994S,SA	.110-.114"	.044-.050"
2248S, 2203S, 2215S	.110-.114"	.044-.050"
2900S, 2901S, 3053S,SA	.138-.142"	.044-.050"
2985SB, 2986SB	140-.144"	.034-.040"
3053SB	.138-.142"	.034-.040"
All Others	.140-.144"	.044-.050"

OVERHAUL: *CAUTION* - Carburetor main castings (air horn, main body, and throttle body) are assembled with long screws (inserted through air horn and threaded in throttle body) so that all three assemblies will be loose when screws removed. Use care not to damage throttle body when removing air horn or main body.

Disassembly (Carbs. With Integral Type Choke): Remove choke connector rod and accelerating pump rod, then take out long screws in air horn flange and lift air horn and bowl cover assembly up and off main body (discard gasket). Remove pump plunger by pressing it up and sliding it off pump arm. Take out step-up piston retaining screw and remove piston, step-up rod, spring and gasket from cylinder. Invert main body to drop out pump discharge ball from pump passage. *NOTE - Inlet check ball is located under retainer in bottom of pump plunger.* Remove main metering jet, gasket, and idle orifice tube. Remove pump jet by first removing plug in side of main body and then removing jet through this hole. *NOTE - Do not remove main vent tube unless replacement required.* Remove idle mixture screw and spring from throttle body. Do not remove throttle valve or shaft unless wear or damage requires replacement (see "Reassembly" for r eplacement data).

Disassembly (Carbs. With "Cross-Over" Type Choke): Disengage pump operating rod from throttle lever, then remove fast idle cam link retaining pin. Remove air horn retaining screws and tilt air horn toward throttle lever far enough to disengage fast idle cam link from fast idle cam, then remove air horn from main body. Disengage accelerator pump shaft by pushing up on bottom of plunger and sliding plunger shaft off hook on rocker arm. Slide plunger out of air horn and remove bowl vent valve, spring seat and spring. *NOTE - If Id plunger is to be reused, or a new plunger is to be installed, soak plunger leather in clean gasoline.* Lift out float fulcrum pin retainer, then lift out floats and fulcrum pin. Remove fuel inlet needle valve, seat and gasket from main body. Remove step-up piston retaining screw and slide step-up piston and rod out of well. Remove piston spring and gasket. Remove main metering jet and gasket, then unscrew and remove idle orifice tube. Use Tool T109-43 and remove accelerator pump jet plug, then remove pump jet with Tool T109-59T. Remove idle mixture adjusting screw and spring. *NOTE - It is not advisabl to remove throttle shaft or valve from throttle body unless it is necessary to install new parts (see "Reassembly" for replacement data).*

Automatic Choke (Integral Type) Disassembly - Remove choke coil housing assembly, gasket & baffle plate. slide out unloader arm and trip lever. Remove staked portion of choke valve screws, then remove screws and valves. Rotate choke shaft until vacuum piston is clear of cylinder, withdraw shaft and piston assembly, then slide fast idle cam and spring off shaft. Choke thermostatic coil and heat retainer plate can be removed from housing assembly by rapping assembly hard against palm of hand. *CAUTION - Do not attempt to remove coil from heat retainer plate.*

Automatic Choke (Cross-Over) Type - *See "Carter (Cross-Over) Automatic Choke".*

Cleaning & Inspection: Clean all parts in cleaning solvent and dry with air. Blow out all passages with air. Do not use wire or drill's to clean jets. Clean main vent tube by removing plug at end of vent passage, soak in solvent, and blow out with air applied at high speed air bleed hole at top of nozzle bar. Clean all parts of choke mechanism thoroughly, make certain that slots in cylinder and air passages are clean. Clean heat tube, remove heat tube shield at manifold and clean shield and tube in manifold. Inspect tube for dents (obstructing hot air flow) and leaks (*NOTE* -Heavy black carbon deposits on choke parts may indicate exhaust leaks in heat tube) Check all parts for wear or damage and replace as required.

Reassembly: Use all new gaskets. Reassemble carburetor by reversing disassembly procedure and note the following:

Throttle Valve Installation - *NOTE* - If throttle valve shaft or throttle body worn, it is recommended that new throttle body assembly be used. Install throttle valve in same relative position as old valve, install new screws loosely, then close throttle and centralize valve by tapping lightly, tighten screws securely and stake by squeezing with pliers. Check throttle valve position (see specifications above).

Choke Valve Installation - With fast idle cam and spring assembled on choke shaft, slide shaft and piston assembly into air horn, rotate shaft to enter vacuum piston in cylinder. Install choke valve, install new screws loosely, close valve and tap lightly to centralize valve in bore, then tighten screws securely and stake by squeezing with pliers. Check for free operation by closing valve with air horn upright. Choke should open of own weight.

Automatic Ch k (Int gral Type) Reassembly - Install unloader arm and trip lever in air horn. See that retaining spring in heat retainer plate clears notch in plate, then align notch with lug in housing and seat plate in housing. Install baffle plate and gasket on air horn, then install choke housing (index mark downward), retainer ring and tighten screws loosely. Rotate housing counterclockwise until index mark on housing is aligned with center line of scale on air horn, then tighten retainer screws.

Accelerating Pump Assembly - If old pump plunger being reinstalled, flare plunger leather by rolling it back and then reshaping it between thumb and forefinger *(NOTE* - Plunger leather must be soft and pliable). Install plunger in cylinder. Install discharge check ball in discharge passage. Check pump operation as follows: Pour clean gasoline in carburetor bowl (½" deep), operate pump plunger several times to fill cylinder and remove air from discharge passage. Use small brass rod to hold discharge ball down on its seat, press pump plunger down. No fuel should be emitted at either discharge or intake passages. If fuel discharge noted, remove check balls and inspect for damage, clean passages thoroughly. Reseat ball by using small brass rod to tap ball lightly to form new ball seat *(CAUTION* - install new check ball after using ball in reseating operation).

Step-up Piston and Rod Ass mbly - Make certain that step-up rod is free on piston plate (must return freely to vertical position when released) and that piston is free in cylinder. See that step-up rod enters metering jet when assembly installed in carburetor.

SERVICE PARTS: Gasket Sets - Carter No. 247A (920S,SA, 993S,SA, 994S,SA, 2203S, 2215S); No. 252 (2062S,SA, 2063S,SA, 2116S,SA, 2249S, 2293S, 2294S, 2295S, 2380S, 2403S, 2410S, 2567S, 2568S, 2569S, 2604S, 2771S); No. 340 (2900S, 2901S; 3053S,SA,SB); No.341 (2985S,SA,SB, 2986S,SA,SB).

Re-Carburetion Kits: Carter No. 1753N (920S); No. 1766N (2062S,SA, 2063S,SA, 2116S,SA, 2249S); No. 1817N (2293S, 2294S, 2295S, 2380S, 2567S, 2568S, 2569S, 2604S); No. 1838N (2403S, 2410S, 2771S); No. 1942N (920SA, 993S,SA, 994S,SA, 2248S); No. 5010N (2900S); No. 5011N (2901S); No. 5013N (2985S,SA,SB, 2986S, SA,SB).

Zip-Kits: Carter No. 900-1 (2062S,SA, 2063S,S A, 2116S,SA, 2203S, 2249S, 2293S, 2294S, 2295S, 2380S, 2403S,2410S, 2567S, 2568S, 2569S, 2604S, 2771S); No. 900-35 (920S); No. 900-96 (920SA, 993S,SA, 994S,SA); No. 900-105 (2900S, 2901S); No. 900-107(2985S,SA,SB, 2986S,SA,SB).

1954-55 CARTER "BBD" DUAL DOWNDRAFT CARBURETOR (TYPICAL)

►CHANGES & CORRECTIONS

REWORKING CARBURETOR (Nos. 2067S, 2068S, 2070S): On 1954 DeSoto V8 before Engine No. S19-18341, if stumbling, stalling, or loading up is experienced, rework carburetors in same manner as earlier models listed above **EXCEPT** do not install new pump operating lever on air horn and do not install new pump connector rod

►***CHRYSLER WINDSOR HESITATION OR LAG ON LIGHT ACCELERATION (PowerFlite Cars with First 2162S Carburetor):*** This condition occurs at 10-20 MPH during warm-up in cold weather Correct by installing all parts furnished in Unitized Pkg Carter No 195-59U as follows Step-up Spring No 61-549, Step-up Rods No 75-1140, Pump Plunger No 64-184S Venturi Cover & Tube Assy No 118-117S.

►***CHRYSLER WINDSOR CARBURETOR PRODUCTION CHANGE (Carter 2162SA, SB, 2180SA, SB):*** These carburetors have later type parts as listed above for "Hesitation or Lag on Light Acceleration" correction installed in production

►***CHRYSLER WINDSOR CARBURETOR CHANGE FOR IMPROVED GASOLINE ECONOMY (All Carburetors)·*** Carburetors may be modified for slightly leaner mixture by installation of parts furnished in Unitized Pkg Carter No 195-66U (BBD 2162S & 2180S), or No 195-65U (BBD 2162SA, SB; 2180SA, SB) as listed below ***CAUTION—This change should only be made to correct gasoline mileage complaints. If installed in carburetors which are on lean limit, some surge or leanness may be experienced.***

Installation Note—Choke Restriction Bushing should be installed in upper end of choke suction passage in main body Install brass tag OVER original tag on carburetor ***NOTE***—Car should be carefully tuned up to secure best results from this change

CONTINUED ON NEXT PAGE

1954-58 CARTER BBD DUAL (C nt.)

Unitized Pkg. 195-65U & 195-66U

Part	Part No.
Main Metering Jet (2 used)	120-213S
Step-up Jet Rod (2 used)	75-990
Choke Restriction Bushing	158-76
Venturi Cluster Screw①	101-413
Venturi Housing Gasket①	121-252
Venturi Cover Gasket①	121-253
Body Gasket	121-254
Brass Tag	107-48

①—Not furnished in Pkg 195-66U (use original Venturi Cluster Screw)

►*PLYMOUTH 167 HP ENGINE CARBURETOR PRODUCTION CHANGES)*· Several changes have been made in carburetors in production as listed below *See also "Plymouth 167 HP Engine Carburetor Improved Gasoline Mileage Change" below.*

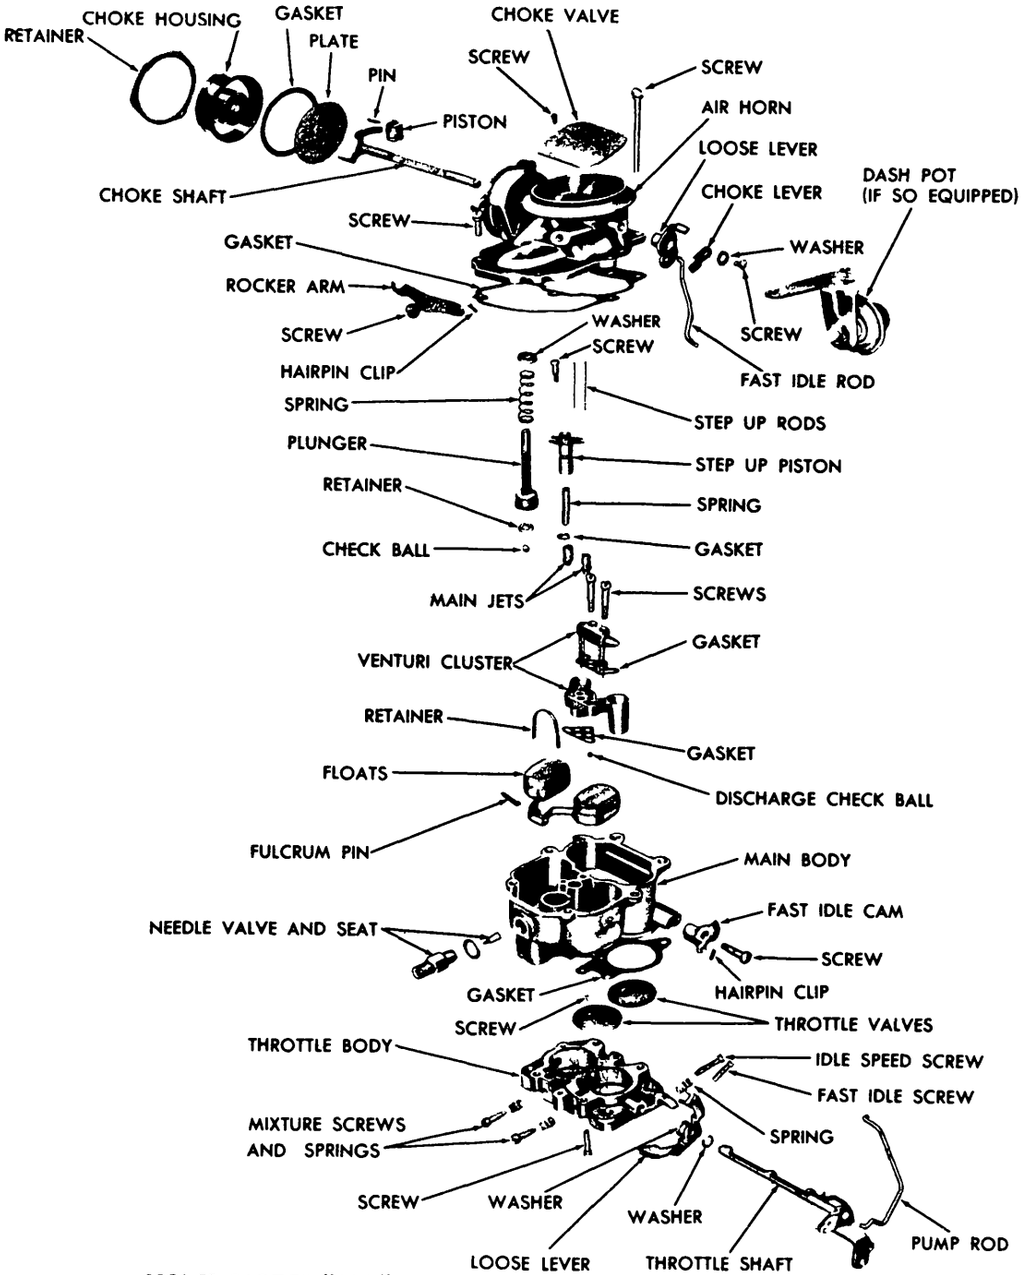
1) Carter 2259SA, 2260SA, 2261SA Carburetors—These carburetors have "2nd Type" parts and specifications as listed below to improve Cold Starting, Part Throttle Loading, and Road Load Economy *When making this change on earlier 2259S, 2260S, 2261S carburetors (with "1st. Type" parts), refer also to Improved Gasoline Mileage change below.*

Carter "S" & "SA" Carburetor Parts Changes

Part	Part No. & Setting 1st. Type	2nd. Type
Step-up Rod (2 used)	75-1168①	②75-1182
Venturi Cluster Screws (2)	101-401	③101-404
Choke Piston & Lever Assy	14-503S	④14-515S
Automatic Choke Setting	2 Pts Lean	Centered

①— 018" diameter ②— 019" diameter
③—Has different Air Bleed Hole calibration
④—Has different vacuum piston

2) Carter 2259SB, 2260SB, 2261SB, 2274SA Carburetors—*These carburetors have all parts listed under "Plymouth 167 HP Engine Carburetor Improved Gasoline Mileage Change" (below) installed in production.*



►*PLYMOUTH 167 HP ENGINE CARBURETOR IMPROVED GASOLINE MILEAGE CHANGE (Carter Carburetors 2259S, SA; 2260S, SA; 2261S, SA; 2274S)* Carburetors can be modified for slightly leaner mixture by installation of all parts furnished in Carter Unitized Pkg 195-62U as listed below and by modifying Distributor Vacuum Unit for increased vacuum advance *CAUTION—This change should only be made to correct gasoline mileage complaints If installed in carburetors which are already on lean limit, some surge or leanness may be experienced*

Carter Unitized Pkg. 195-62U

Part	Part No.
Main Metering Jet (2 used)	120-212S
Step-up Rod (2 used)	75-1168
Venturi Cluster Screw (2 used)	101-364
Venturi Housing Gasket	121-252
Venturi Cover Gasket	121-253
Body Gasket	⑤121-274
Brass Tag⑥	107-48

⑤—Supersedes No 121-254 furnished in first kits
⑥—Install over original tag

Distributor Vacuum Unit Change—Replace original Vacuum Diaphragm Assembly with new part, Plymouth No 1439671 or Auto-Lite No IAZ-2023RA, transferring the spring calibration washers, sealing washer, and nut from the original diaphragm assembly to the new part This change will increase maximum vacuum advance to 25° (engine) at 17" of vacuum (was 23°) *NOTE*—Spark plug gap should be changed to 040" (was 035")

1956-58 CARTER "BBD" DUAL DOWNDRAFT CARBURETOR (TYPICAL)

►*1957 CHRYSLER, DESOTO, PLYMOUTH CARBURETOR JET CALIBRATION CHANGES FOR IMPROVED PERFORMANCE*· See *"Carter BBD Carburetor Jet Specifications" for production changes and latest type jets used in these carburetors.*

►*DE SOTO FLAT SPOT OR HESITATION CORRECTION (2522S Carburetors)* If this trouble not corrected by

CONTINUED ON NEXT PAGE

1954-58 CARTER BBD DUAL (C nt.)

complete tune-up procedure (including Ignition Timing, Manifold Heat Control operation check, and Carburetor adjustment including Float Level and Pump Stroke check), check pump valves and make changes in carburetor as detailed below. *NOTE* - These new parts installed in 2522SA carburetors in production.

Acc l rating Pump Check Valves - Check for leakage by holding discharge check ball at bottom of pump discharge cluster hole while operating pump (Discharge Cluster removed). If leakage noted at discharge ball check or at intake ball check reseat balls Use brass rod to tap ball down if new balls not available

V nturi Cluster Screws (Main Idle Air Bleed) - Install new screws, No. 101-434 (supersedes 101-433)

Step-up R ds - Install new rods, No. 75-1145 (supersedes 75-1177).

►*1957 PLYMOUTH HESITATION OR STUMBLE CORRECTION (301" ENG.)*· First check ignition timing and set to specified setting check Manifold Heat Control Valve for free operation and correct positioning on shaft check Carburetor Float Level and set to specified setting (see below) If above steps do not correct complaint install new parts as listed below *CAUTION* - These parts provide richer-than-standard mixture and should only be used in cases of extreme necessity

Plym uth Parts Changes

Part & Usag	Part No
Step-Up Rod (All Cars)	75-1217
Venturi Cluster Screw (Auto Trans)	101-433

►*1957 PLYMOUTH CHOKE PISTON CHANGE FOR INCREASED ECONOMY DURING WARM-UP & SHORT TRIP OPERATION*· New Choke Piston & Linkage Assembly, Carter No 160-165S, used during production on all "SB" and later carburetors. Supersedes previous type, No. 160-142S on earlier carburetors

►*1957 PLYMOUTH CARBURETOR REPLACEMENT NOTE* Carburetor 2512SC used as replacement for all models When installing this carburetor on Overdrive Cars, use Unitized Pkg No 192-36U also.

►*1958 CHRYSLER HESITATION & STUMBLE ON ACCELERATION (AFTER ENGINE IS WARMED UP) CORRECTION* If correct engine tune-up and carburetor adjustment does not eliminate the condition, connect upper end of accelerator pump connector rod to inner hole in pump arm If condition still exists, replace the two step-up rods using two Carter No 75-1370 rods Clean fuel filter bowl and filter, then adjust idle mixture and idle speed to specifications

►*1958 DESOTO WITH AUTOMATIC TRANSMISSION (2637S CARB) HESITATION & FLAT SPOT CORRECTION* This condition is more noticeable on acceleration at slower speeds (0-40 MPH) and may be corrected by installing two 027" step-up rods, Carter No 75-998 in place of the original 029" step-up rods, Carter No 75-999 In addition, set the accelerator pump linkage to the long stroke for cold weather operation

►*1958 DESOTO (2637S, 2772S, 2822S) CARBURETOR BOWL VENT ADJUSTMENT NOTE: S e "B wl Vapor V nt Adjustm nt" below.*

►*1958 PLYMOUTH HESITATION DURING LOW SPEED ACCELERATION CORRECTION & CARBURETOR PRODUCTION CHANGE* To correct this condition, install a new step-up piston spring, Carter No 61-549 (identified by its pink color) Carburetors Date Coded "M7" or later have the later type spring

►*1958 PLYMOUTH PART THROTTLE IMPROVEMENT NOTE (CARS WITH 2644S & 2645S CARBURETORS)* Replace the original 022" step-up rods, Carter No 75-1140 with 020" step-up rods, Carter No 75-1217

DESCRIPTION: Double-barrel downdraft type with "integral" automatic choke (1955-58 Chrysler, 1954-57 DeSoto, 1955-56 Plymouth), "Cross-Over" type automatic choke (1958 DeSoto & 1956-58 Plymouth). The Venturi Cluster (Main Nozzle Assembly) consists of secondary venturi, main nozzles, main vent tubes, and idle tubes which are mounted as a unit in main body (attaching screws are hollow with calibrated restriction at upper end and serve as Idle Air Bleeds) Metering jets are fixed type located in bottom of bowl Each jet has a metering wire (step-up rod) in the jet which is controlled by the vacuum step-up piston 1954 DeSoto carburetors have a "Water-Jacketed" throttle body

ADJUSTMENTS: *Make all adjustments exactly as detailed below*

Idle Adjustment: Make preliminary setting of both idle mixture screws by turning each screw in until it is lightly seated and then backing screw out exactly 1 turn. Warm up engine to normal operating temperature so that choke valve is wide open and fast idle inoperative. Set engine idle speed to correct figure, then adjust idle mixture as follows

Idle Mixture - With engine warmed up and idling at correct idling speed, turn both idle mixture adjusting screws in 1/8 turn for leaner mixture. If engine speed increases and engine runs smoother, lean mixture further by turning both screws in an additional 1/8 turn. If this results in improved performance, reset idle speed, then make a final adjustment of each mixture screw by turning screw in (leaner) or out (richer) for best performance position of the screw. If any step of above procedure causes engine speed to drop off or engine to run roughly, turn both screws out 1/8 turn for richer mixture and then make final adjustment of each screw. *NOTE* - Best idle performance will normally be found with adjusting screws ¼-1½ turns open from inner seated position Both screws should be set alike within 1/8 turn

Idle Speed (1954-55 Models) - 450 RPM

Idle Speed (1956-58 Models) - 450-500 RPM (Synchromesh Trans), 475-500 RPM (Auto Trans), with selector lever in "N" (Neutral)

Accelerating Pump: Three holes provided in throttle lever and two holes provided in pump arm (or in plunger on some models) for connector rod engagement to provide seasonal pump setting as listed below

Pump Str k Adjustm nt - *NOTE - Connector rod must b install d in proper hol s of pump arm and throttl l v r as indicated in tabl wh n s tting pump strok adjustm nt* Back off throttle stopscrew so throttle valves are fully closed Make certain that connector rod is in proper holes of pump arm and throttle lever Use a scale to measure distance from top surface of bowl cover to top of pump plunger shaft If height not correct as indicated in table below, adjust by bending connector rod

Pump Stroke Setting

Carb.	Plunger Height
2067S, 2068S, 2070S, 2129S, 2130S, 2131S	③ 57/64"
2141S, 2154S, 2155S, 2262S	④ 58/64"
2162S, SA, SB, 2180S, SA, SB	⑤ 54/64"
2176S,SA, 2177S,SA, 2178S,SA	⑤ 1"
2216S, 2250S, 2274S,SA	⑤ 1"
2259S,SA,SB, 2260S,SA,SB, 2261S,SA,SB	⑤ 1"
2299S, 2300S, 2301S, 2308S, 2309S, 2310S	⑥ 1 1/32"
2312S, 2313S	⑥ 31/32"
2407S, 2408S, 2409S,SA	⑥ 1 1/32"
2422S, 2423S, 2424S	⑤ 1"
2512S,SA,SB,SC, 2513S,SA,SB,SC	⑥ 1 1/32"
2514S,SA,SB,SC, 2522S,SA,SB, 2527S	⑥ 1 1/32"
2637S, 2772S, 2822S	⑦ 1"
2644S, 2645S, 2646S, 2685S, 2733S	⑥ 1 1/32"

③ - Connector rod installed in **outer** hole of throttle lever and in top hole of pump plunger.
④ - Connector rod installed in **outer** hole of throttle lever and **outer** hole of pump arm.
⑤ - Connector rod installed in outer hole of throttle lever and **inner** hole of pump arm.
⑥ - Connector rod installed in **center** hole of throttle lever and **inner** hole of pump arm
⑦ - Connector rod installed in **center** hole of throttle lever (single hole only in pump arm).

Pump Seasonal Setting - Standard setting is with connector rod installed in holes of throttle lever and pump arm as indicated in table above. Outer hole in throttle lever and inner hole in pump arm will provide maximum discharge. Inner hole in throttle lever and outer hole in pump arm will provide minimum discharge.

Bowl Vapor Vent Adjustment (1958 DeSoto 2737S, 2772S, 2822S Carburetors): With throttle valves fully closed, vapor vent opening or clearance between heel of rubber grommet on vent arm and seat on bowl cover should be .062- 093" (Gauge T109-234) Adjust by bending lip on vapor vent arm *CAUTION - Setting should be checked whenever pump stroke setting changed*

Float Level: To check float level, remove air horn and bowl cover assembly and gasket Place gauge (see table below) squarely on top edge of bowl at center of floats Hold float arm lip firmly against seated needle valve Ridge or crown on each float should just touch step on gauge Adjust by bending float lip *(NOTE* - If one float lower than the other, first equalize floats by bending float arm, then adjust both floats by bending lip).

CONTINUED ON NEXT PAGE

1954-58 CARTER BBD DUAL (C nt.)

Float Level Setting

Carburetor	① Float Level ②
2067S, 2068S, 2070S, 2129S, 2130S, 2131S	
2141S, 2154S, 2155S, 2162S, SA, SB	7/32"
2176S,SA, 2177S,SA, 2178S,SA	7/32"
2180S,SA,SB, 2216S, 2250S, 2262S	7/32"
2259S,SA,SB, 2260S,SA,SB, 2261S,SA,SB	③ 1/4"
2274S,SA, 2299S, 2300S, 2301S	③ 1/4"
2308S, 2309S, 2310S, 2312S, 2313S	③ 1/4"
2407S, 2408S, 2409S,SA	1/4"
2422S, 2423S, 2424S	③ 1/4"
2512S,SA,SB,SC, 2513S,SA,SB,SC	9/32"
2514S,SA,SB,SC, 2522S,SA,SB, 2527S	9/32"
2637S, 2772S, 2822S	5/16"
2644S, 2645S, 2646S, 2685S, 2733S	9/32"

① - Use Carter Gauge T109-239 (9/32" & 7/32"), T109-280 (5/16"), T109-282 (1/4")

② - 9/32" (Gauge T109-239) floats with flat top 7/32" (Gauge T109-239) floats with curved top

③ - Supersedes previous specification of 7/32"

Fast Idle (Off Car): *NOTE - On later carburetors with fast idle adjusting screw and fast idle cam adjacent to throttle shaft lever (not in choke assembly housing), the fast idle cam clearance must be adjusted in addition to adjustment of throttle valve opening*

Fast Idle Cam Clearance (Carburetors with Fast Idle Cam Adjacent to Throttle Shaft Lever) - On early carburetors (without index mark on fast idle cam), there should be .020" clearance between lip of fast idle cam and boss on casting with choke valve closed and lip on inner choke shaft lever contacting lug on outer lever On later carburetors (with index mark on fast idle cam), align fast idle screw with mark on cam To adjust, bend lip on choke shaft lever

Fast Idle Throttle Valve Opening (Carburetors with Fast Idle Cam in Choke Housing Assembly) - With thermostatic coil housing assembly removed and throttle adjusting screw backed out, place fast idle cam in fast idle position Clearance between valve and bore of carburetor (on side opposite idle ports) should be as indicated in table below To adjust, bend choke connector rod at lower angle

Fast Idle Setting

Carburetor	① Throttle Opening
2067S, 2068S	.015-.019"
2070S, 2129S, 2130S, 2131S	.015-.019"
2141S, 2154S, 2155S, 2262S	.009-.013"
2162S,SA,SB, 2176S,SA, 2177S,SA	.015-.019"
2178S,SA, 2180S,SA,SB, 2216S, 2250S	.015-.019"
2259S,SA,SB, 2260S,SA,SB, 2261S,SA,SB	.015-.019"
2274S,SA, 2422S, 2423S, 2424S	.015-.019"
2299S, 2300S, 2301S, 2308S, 2309S, 2310S	.015"
2312S, 2313S, 2407S, 2408S, 2409S,SA	.015"
2512S,SA,SB,SC, 2513S,SA,SB,SC, 2514S, SA, SB, SC	.020"
2522S,SA,SB, 2637S, 2772S, 2822S	.020"
2527S, 2644S, 2645S, 2646S, 2685S, 2733S	.015"

① - Use Carter Gauge T109-29 (.020"), T109-44 (.015" & .015-.019"), T109-200 (.009-.013") to measure clearance

Fast Idl Thr ttl Valv Op ning (Carbur t rs with Fast Idl Cam Adjac nt t Thr ttl Shaft L v r) - With fast idle adjusting screw on high step of fast idle cam, clearance between lower edge of valve and bore of carburetor should be as indicated in table below

Fast Idle (On Car): On later cars with fast idle adjusting screw, adjust engine speed to 1400 RPM, with fast idle screw on high step of fast idle cam.

Unloader (Carburetors with Fast Idle Cam in Choke Housing Assembly): With choke housing assembly removed, hold throttle valve wide open and close choke valve as far as possible without forcing it. Clearance between upper edge of choke valve and inner wall of air horn should be 9/64" (901S, 905S, 906S, 908S, 909S, 910S), ¼" (All Others). To adjust, bend arm on choke trip lever.

Unloader (Carburetors with Fast Idle Adjusting Screw & Fast Idle Cam Adjacent to Throttle Valve Lever)· With throttle valves wide open and choke valve closed as far as possible without forcing, clearance between top edge of choke valve and inner wall of air horn should be 15/64" (2637S, 2772S, 2822S), ¼" (2512S,SA,SB,SC, 2513S,SA,SB,SC, 2514S, SA,SB,SC, 2522S,SA,SB, 2644S, 2645S, 2646S, 2685S, 2733S), 3/16" (All Others) To adjust (Except 2637S, 2772S, 2822S), bend unloader arm on throttle lever On 2637S, 2772S, 2822S, bend unloader finger on fast idle arm

Automatic Choke: Different type choke assemblies used

All Models (Except 1958 DeSoto & 1956-58 Plymouth) - Integral type mounted on air horn with thermostatic coil linked directly to lever on choke valve shaft To adjust choke setting, loosen three screws in retainer ring and rotate choke housing. *NOTE* - Centered setting is secured with the index line on choke housing aligned with center long line of the scale on rim.

1958 DeSoto & 1956-58 Plymouth - Automatic choke is separate "Cross-Over" type mounted in well in intake manifold (at exhaust crossover passage) and linked to choke valve lever by a connector rod *See "Carter Cross-Over Type Automatic Choke" for complete data.*

OVERHAUL: With carburetor off engine proceed as detailed below *NOTE* - It is recommended that carburetor be mounted on stand, Tool C-3225 to protect throttle valves from damage while carburetor is on the bench

Disassembly: Disconnect and remove fast idle and pump connector rods Remove air horn and bowl cover as an assembly (with integral automatic choke), discard air horn gasket Remove pump plunger and spring by pressing up on plunger and cocking it to one side to disengage plunger stem from pump arm Remove fuel inlet needle valve seat, gasket, and needle valve Take out float pin retainer, remove fulcrum pin and floats Remove vacuum step-up piston retaining screw lift out piston and step-up rods, remove piston spring from cylinder Remove main metering jets and gaskets Loosen venturi cluster screws, lift venturi cluster assembly straight up and remove, separate cover and cluster and discard gaskets (*CAUTION* - Do not attempt to remove idle orifice or main vent tubes from cluster - these parts not furnished separately) Invert carburetor to drop out pump discharge check ball from channel under cluster

CONTINUED ON NEXT PAGE

1954-58 CARTER BBD DUAL (C nt.)

mounting. Remove idle mixture adjusting screws and springs. Invert carburetor, remove throttle body attaching screws, lift off throttle body, discard gasket. Do not remove throttle valves or shaft unless wear or damage requires installation of new parts (see Reassembly for installation data).

Aut matic Choke Disass mbly (Integral Type) - Remove choke housing retainer, heat tube cap and gasket, choke housing and thermostatic coil assembly, baffle plate and gasket. On early carburetors with fast idle cam assembly in choke housing, slide unloader arm and trip lever out and away from fast idle link, then slide link down and remove from below. On all carburetors, remove staked portion of choke valve screws (use file or other tool), remove screws, slide choke valve out. On later carburetors with fast idle cam adjacent to throttle valve lever, remove screw in end of choke shaft retaining choke shaft lever (opposite end from automatic choke housing), slide lever, loose lever, and washer off end of shaft. On all carburetors, rotate choke shaft clockwise until vacuum piston clears cylinder in choke housing. Withdraw shaft, lever, and piston assembly from air horn.

Cleaning & Inspecti n: Clean all parts in denatured alcohol, Metalclene, or equivalent cleaner. Clean and blow out all passages in carburetor castings, venturi cluster, and jets *(CAUTION* - Do not use wire or drills to clean jets). Choke thermostatic coil and heat retainer plate can be removed from housing for cleaning by rapping assembly hard against palm of hand *(CAUTION* - Do not attempt to remove coil from heat retainer plate). If heavy black carbon deposits noted on choke parts, check heat tube in exhaust manifold for leaks. Check all parts for wear or damage and replace as required.

Reassembly: Use all new gaskets. Reassemble carburetor by reversing disassembly procedure and note the following:

Throttle Valve Installation - *NOTE* - If throttle valve shaft or throttle body worn, it is recommended that new throttle body assembly (with shaft) be used. Install throttle valves with mark ("C" in circle) downward and on idle port side install new screws loosely, close throttle valves tightly and centralize valves by tapping them lightly, tighten screws securely and stake screws by squeezing with pliers. Check throttle valve position (see specifications above).

Idle Mixture Screws - Replace screws if tapered portion grooved or ridged. Turn screws in by hand until lightly seated, then back each screw out 1 full turn for approximate idle setting.

Choke Valve Installation - Slide choke shaft and piston assembly into air horn, rotate shaft counterclockwise to enter vacuum piston in cylinder. Install choke valve shaft, install new screws loosely, close valve and tap lightly to centralize valve in bore, then tighten screws securely and stake by squeezing with pliers Check for free operation by closing valve with air horn upright. Choke should open of own weight.

Automatic Choke Reassembly (Integral Type) - Reverse disassembly procedure and adjust choke setting.

Accelerating Pump Assembly - If old pump plunger being reinstalled, flare plunger leather by rolling it back several times, install plunger in cylinder. Install discharge check ball in discharge passage. Check pump operation as follows: Pour clean gasoline in float bowl (½" deep). Operate pump plunger several times to fill cylinder and remove all air from discharge passage. Use small brass rod to hold discharge ball down on its seat, press pump plunger down. No fuel should be emitted at either the discharge or intake passages. If fuel discharge noted, remove check balls and inspect for damage, clean passages thoroughly. Reseat ball by using small brass rod on ball and tapping lightly to form new ball seat *(CAUTION* - install new check ball after using ball in reseating operation). When installing plunger, make certain plunger leather enters cylinder evenly.

Step up Piston & Rod Assembly - Make certain that step-up rods are free on piston plate (must return to vertical position when released), and that piston is free in cylinder. See that step-up rods enter metering jets when installing assembly in carburetor.

Carburetor Adjustment - Make all adjustments listed in Adjustment section above.

SERVICE PARTS: Gasket Set - Carter No. 225 (901S, 905S, 906S, 908S, 909S, 910S, 911S, 912S, 913S); No. 243 (2067S, 2068S, 2070S, 2129S, 2130S, 2131S); No. 255 (2141S, 2154S, 2155S, 2262S); No. 265 (2162S,SA,SB, 2176S,SA, 2177S, SA, 2178S,SA, 2180S,SA,SB, 2216S, 2250S, 2274S,SA, 2422S, 2423S, 2424S); No. 278 (2299S, 2300S, 2301S, 2308S, 2309S, 2310S, 2312S, 2313S, 2407S, 2408S, 2409S); No. 298 (2522S,SA,SB, 2527S, 2685S,2733S); No. 300 (2512S,SA,SB,SC, 2513S,SA,SB, SC, 2514S,SA,SB,SC , 2644S, 2645S, 2646S). No. 325 (2637S, 2772S, 2822S).

Repair Package (With Std. Metering Jet) - Carter No. 1717 (901S, 905S, 906S); No. 1728 (911S, 912S, 913S); No. 1757 (2067, 2068S, 2070S); No. 1758 (2129S, 2130S, 2131S); No. 1779 (2141S, 2154S, 2155S, 2262S); No. 1791 (2176S,SA); No. 1793A (2162S,SA,SB, 2180S,SA, SB); No. 1795 (2259S,SA,SB, 2269S,SA,SB, 2261S,SA, SB, 2274S,SA, 2422S, 2423S, 2424S). No. 1820 (2312S, 2313S); No. 1825 (2299S, 2300S, 2301S); No. 1825A (2407S, 2408S, 2409S,SA); No. 1826 (2308S, 2309S, 2310S); No. 1858 (2527S); No. 1860A (2512S,SA,SB,SC, 2513S,SA,SB,SC, 2514S,SA,SB,SC); No. 1863 (2522S,SA, SB); No. 1917N (2733S); No. 1918N (2685S); No. 1919N (2644S, 2645S, 2646S); No. 1925N (2637S, 2772S); No. 1949N (2822S).

ℂ - Use Carter 2871S for replacement.

►CHANGES, CAUTIONS, CORRECTIONS

►*1959 CHRYSLER, DESOTO, PLYMOUTH CARBURETOR PRODUCTION CHANGE:* First carburetors as listed above have different Body Flange Assembly and Throttle Shaft & Lever Assembly than second carburetors listed for the same models.

►*1959 PLYMOUTH CARBURETOR REPLACEMENT CAUTION:* When installing Carter 2896S to replace original carburetors on Overdrive Cars, use Unitized Pkg. Carter No. 192-36U also.

►*1959 CHRYSLER STUMBLE OR HESITATION ON ACCELERATION (WITH ENGINE AT NORMAL OPERATING TEMPERATURE):* If this condition persists after engine properly tuned, manifold heat control valve and engine cooling thermostat checked for proper operation, accelerating pump connector rod installed in **outer** hole of throttle lever, fuel filter bowl cleaned, and filtering element replaced (if necessary); a lean mixture is indicated and should be corrected as follows: Install new Step-up Rods (2 required), Carter No. 75-997 or 75-999 (as available), to replace original rods, Carter No. 75-1441.

►*1959-60 HARD COLD STARTING CORRECTION (Cars With "Cross-Over" Type Choke):* This condition may be caused by choke piston sticking and can be corrected by squirting carburetor cleaner, lacquer thinner or alcohol through piston link opening in air horn. Operate valve back and forth to flush out gum formation.

►*1959 DESOTO FIREDOME ENGINE FLAT SPOT OR SURGING ON ACCELERATION OR AT LOW SPEEDS (WITH ENGINE AT NORMAL OPERATING TEMPERATURE):* On cars with Carter 2871S carburetor, if this condition persists after engine properly tuned up with special attention to Ignition Timing and Accelerating Pump Setting, make the following corrections:

Step-up Rod Change - Install new Step-up Rods, Carter No. 75-999 (2 required), to replace original rods, Carter No. 75-1426.

Venturi Cluster Screw Air Bleed Size Change - Remove venturi cluster from carburetor and enlarge inner diameter of the two cluster screws using a No. 54 (.054") drill. DO NOT USE A POWER DRILL. Hold cluster screw and drill firmly and drill out hole carefully to avoid reaming hole oversize. Check gasket surfaces of venturi cluster and carburetor and, if necessary, polish surfaces to insure they are clean and free from burrs for satisfactory sealing of the gaskets. Make certain pump discharge check ball is in discharge passage when reinstalling cluster.

DESCRIPTION: Dual (2-Barrel) downdraft type similar to design used on previous models (except for Bowl Vapor Vent and Fast Idle mechanism described below). A "Cross-Over" type automatic choke is used on all models.

Bowl Vapor Vent (1959-60 Chrysler & DeSoto, 1959 Dodge): Consists of an atmospheric vent in bowl cover flange closed by a rubber grommet on a spring arm. A loose lever on pump countershaft opens the vent when throttle valve is closed. *NOTE - Bowl vapor vent adjustment should be checked whenever accelerating pump stroke setting is changed.*

Bowl Vapor Vent (1960 Dodge & Plymouth): *NOTE - This is a new feature on these carburetors.* Consists of an atmospheric vent in bowl cover flange at slot for accelerating pump shaft. Vent valve is installed over accelerating pump shaft and is operated by a special clip (adjustable) on pump shaft that opens vent valve when throttle valves are closed. *NOTE - If pump rod is installed in either the long or short stroke hole in throttle lever, it will be necessary to move the clip (located under vent valve) either up or down to compensate for change in pump stroke.*

Fast Idle Mechanism (Chrysler & DeSoto): Fast idle cam is located directly on end of choke shaft. Fast idle lever is pivoted on side of main body and is linked to throttle lever by a fast idle connector rod. The fast idle adjustment screw is located on upper end of fast idle lever and contacts the fast idle cam. *See "Fast Idle Adjustment" below.*

Fast Idle Mechanism (Dodge & Plymouth): Fast idle cam is located on carburetor main body adjacent to throttle lever and is linked to choke valve shaft lever by a connecting rod. The fast idle lever is pivoted on throttle valve shaft and contacts the fast idle cam. The fast idle adjusting screw is on fast idle lever. *See "Fast Idle Adjustment" below.*

"Cross-Over" Type Automatic Choke (All Models): This type automatic choke is a separate unit located in well in intake manifold (in exhaust cross-over passage) and is linked to choke valve lever by a connector rod. Choke vacuum piston is located in a cylinder in air horn and is linked directly to choke valve. *See "Carter Cross-Over Type Automatic Choke".*

ADJUSTMENTS: *Make all adjustments exactly as detailed below.*

Idle Adjustment: Make preliminary setting of both idle mixture screws by turning each screw in until it is lightly seated and then backing screw out exactly 1 turn. Warm up engine to normal operating temperature so that choke valve is wide open and fast idle inoperative. Set engine idle speed to correct figure, then adjust idle mixture as follows:

Idle Mixture - With engine at normal operating temperature and idling at correct idle speed, adjust idle mixture screws until engine operates smoothly. Recheck engine idle speed and adjust for correct engine RPM.

Idle Mixture Setting

Carb.	Idle Screw Opening
2793S, 2870, 2871S	¼-1¼ turns
2795S, 2895S	¾-2¼ turns
2923S, 2924S	1/8-1½ turns
All Others	¼-1½ turns

Idle Speed Setting

Car	Synchro-mesh	ℂ Auto. Trans.
1959-60 Chrysler		② 500 RPM
1959-60 DeSoto	500 RPM	② 500 RPM
1959 Dodge	450-500 RPM	475-500 RPM
1959 Plymouth	450-500 RPM	475-500 RPM
1960 Dodge	500 RPM	② 500 RPM
1960 Plymouth	500 RPM	③ 500 RPM

ℂ - Automatic transmission in "N" (Neutral).
② - 575 RPM on Air Conditioned Cars.
③ - 550 RPM on Air Conditioned Cars.

Accelerating Pump (1959-60 Chrysler & DeSoto, 1959 Dodge): Three holes provided in throttle lever for pump connector rod engagement to provide seasonal pump setting as listed below. *CAUTION - Bowl Vapor Vent Adjustment must be checked when ever pump setting changed.*

Pump Stroke Adjustment - Back off throttle stopscrew so that throttle valves fully closed. Make certain that pump connector rod engaged in center hole (medium stroke) of throttle lever. Use scale to measure distance from top surface of bowl cover to top of pump plunger shaft (within air horn - remove air cleaner for access). This distance should be 1"±1/64" (all models). Adjust by bending connector rod at lower angle.

Pump Seasonal Setting - Standard setting is with connector rod engaged in center hole of throttle lever (medium stroke). Outer hole will provide maximum stroke (greater discharge), and inner hole minimum stroke (less discharge).

Accelerating Pump (1960 Dodge, 1959-60 Plymouth): Three holes in throttle lever and two holes provided in pump arm for connector rod engagement to provide seasonal setting as indicated below. *CAUTION - Bowl Vapor Vent Adjustment must be checked whenever pump setting is changed.*

Fast Idle (On Car): All Models - With engine at normal operating temperature, adjust idle speed to 1400 RPM (1959); 1375-1425 RPM (1960) with fast idle screw on index mark of cam.

Fast Idle (Off Car): *NOTE - Two adjustments required as follows:*

Fast Idle Linkage Adjustment (1959-60 Chrysler & DeSoto, 1959 Dodge) - With choke valve tightly closed and lug on fast idle cam contacting lip on choke shaft lever, index mark on fast idle cam should be aligned with center of fast idle adjusting screw. To adjust, bend lip on choke shaft lever.

Fast Idle Linkage Adjustment (1959-60 Plymouth, 1960 Dodge) - With choke valve tightly closed and lip on inner choke shaft lever contacting lip on outer lever,

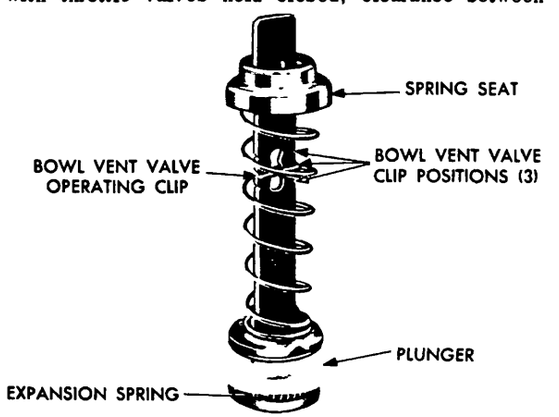
CONTINUED ON NEXT PAGE

1959-60 CARTER BBD DUAL (C nt.)

align index mark on fast idle cam with adjusting screw. To adjust, bend lip on inner choke shaft lever.

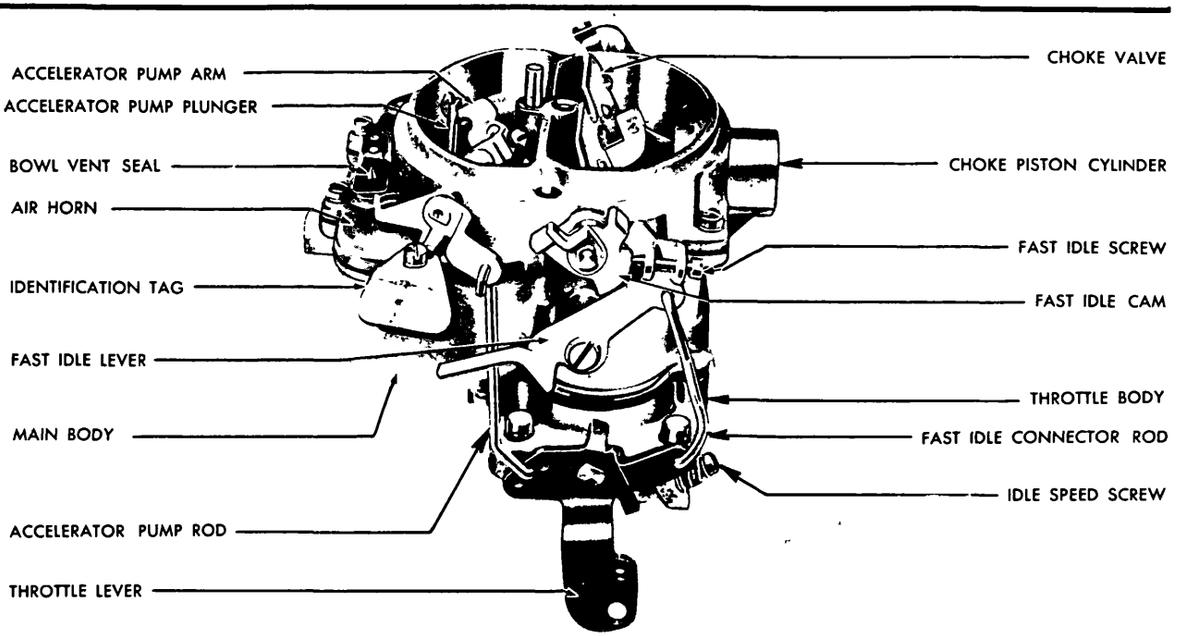
Pump Stroke Adjustment - Back off throttle stopscrew so that throttle valves fully closed. Make certain that connector rod engaged in center hole of throttle lever and inner hole of pump arm. Use scale to measure the distance from top surface of bowl cover to top of pump plunger shaft. This distance should be 1 1/8" (All models). Adjust by bending connector rod at lower angle.

Pump S asonal Setting - Std. setting is with connector rod engaged in center hole of throttle lever and inner hole of pump arm (Medium Stroke). Outer hole in throttle lever will provide maximum stroke (greater discharge), and inner hole minimum stroke (less discharge).



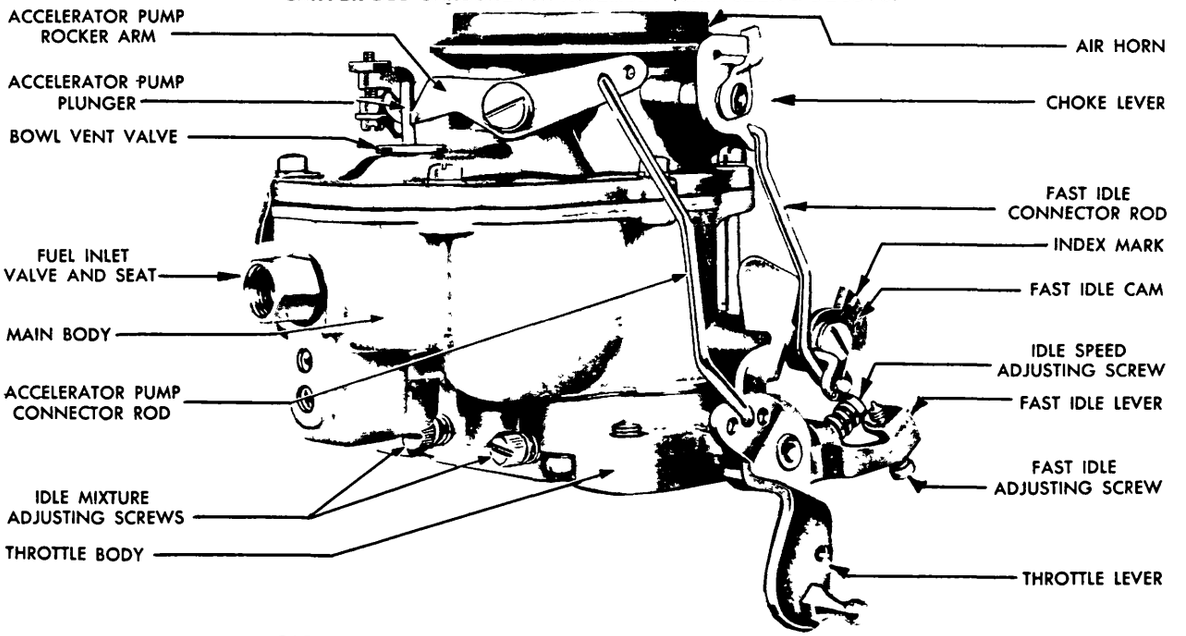
Float L v l: To check float level, remove air horn and bowl cover assembly, and gasket. Place gauge (see table below) squarely on edge of bowl at free end of floats. Hold float arm lip firmly against seated needle valve. Ridge or crown on each float should just touch step on gauge. Adjust by bending float lip (*NOTE* - If one float lower than the other, first equalize floats by bending float arm, then adjust both floats by bending lip).

Float Level Setting



Car	Checking Gauge	Float Level
1959-60 Chrysler	T109-280	5/16"
1959-60 DeSoto	T109-280	5/16"
1959 Dodge	T109-280	5/16"
1960 Dodge	T109-239	9/32"
1959-60 Plymouth	T109-239	9/32"

B wl Vap r V nt Adjustment (1959-60 Chrysler & DeSoto, 1959 Dodge): With throttle valves fully closed, vapor vent opening or clearance between heel of grommet on vent arm and seat on bowl cover should be .062-.093" (Gauge T109-234). Adjust by bending lip on vapor vent arm. *CAUTION - S tting should be checked whenev r pump str k s tting is changed.*



B wl Vap r Vent Adjustment (1960 Dodge & Plymouth): *NOTE - B wl Vap r V nt not used on 1959 Plymouth.* With throttle valves held closed, clearance between bowl vent valve and air horn should be .060" (use a .060" drill shank). To adjust, bend accelerator pump rod at lower angle. *CAUTION - If pump rod is installed in ith r the l ng or sh rt strok h l (cent r hol is normal s tting), it will b n c ssary to mov th hairpin clip l cat d dir ctly und r bowl v nt valv , ither up r down to c mpensat f r change in pump strok and t maintain prop r adjustment.*

1960 DODGE & PLYMOUTH ACCELERATING PUMP PLUNGER ASSEMBLY

CARTER BBD CARBURETOR ASSEMBLY (CHRYSLER & DESOTO)

CARTER BBD CARBURETOR ASSEMBLY (DODGE & PLYMOUTH)

CONTINUED ON NEXT PAGE

1959-60 CARTER BBD DUAL (C nt.)

Fast Idle Throttle Valve Opening (All Models) - Back out idle speed adjusting screw, close choke valve tightly. Fast idle screw should be in line with index mark on fast idle cam (highest step of cam). Turn fast idle screw in or out until correct throttle valve opening is secured (see table below). Check by inserting gauge between lower edge of throttle valve and carburetor wall on side opposite idle ports.

Fast Idle Setting

Car	Checking Gauge	Throttle Opening
1959-60 Chrysler	T109-44	.018"
1959-60 DeSoto	T109-44	.018"
1959 Dodge	T109-44	.018"
1960 Dodge	T109-44	.015"
1959-60 Plymouth	T109-44	.015"

Unloader: To check, close choke valve lightly, open throttle valves to wide open position which will open choke valve slightly. Check choke valve opening or clearance by inserting gauge (see table below) between upper edge of valve and air horn wall. Adjust by bending unloader finger on fast idle arm.

Unloader Setting

Car	Checking Gauge	Choke Setting
1959-60 Chrysler	T109-32	15/64"
1959-60 DeSoto	T109-32	15/64"
1959 Dodge	T109-32	15/64"
1960 Dodge	T109-31	1/4"
1959-60 Plymouth	T109-31	1/4"

Automatic Choke: The automatic choke is a separate "Cross-Over" type mounted in well in intake manifold (at exhaust crossover passage) and linked to choke valve lever by a connector rod. Choke vacuum piston is located in a cylinder in carburetor air horn and linked directly to choke valve. *See "Carter Cross-Over Type Automatic Choke" for complete data.*

Automatic Choke Setting

All Models	Centered (At Index)

Overdrive Kickdown Switch (Plymouth): With throttle valves wide open, clearance between kickdown lever and switch stem guide should be 1'64-3/64". Adjust by loosening switch mounting nuts and changing position of switch in bracket.

Throttle Valve Setting: When installing valves, they should be positioned as indicated. "Idle Port Opening" is the port opening above upper edge of tightly closed throttle valve. "Vacuum Spark Port" is height of top of port above upper edge of tightly closed throttle valve.

Thr ttl Valv S tting

Car	Idle Port	Vacuum Spark Port
1959-60 Chrysler	.140-.144"	.015-.025"
1959-60 DeSoto	.140-.144"	.015-.025"
1959 Dodge	.140-.144"	.015-.025"
1960 Dodge	.144-.148"	.025-.035"
1959-60 Plymouth	.144-.148"	.025-.035"

OVERHAUL: With carburetor off engine, proceed as detailed below. It is recommended that elevating legs (T109-287S and T109-288S) be used for carburetor mounting on the bench to protect the throttle valves and throttle lever from damage.

Disassembly: Disconnect and remove fast idle and pump connector rods. Take out air horn-to-main body attaching screws (two screws located within air horn), remove air horn and bowl cover assembly. Remove pump plunger by pushing it up at an angle to disengage plunger stem from pump arm. Remove inlet needle and seat assembly. Take out float lever pin retainer, remove float and lever assembly. Take out step-up piston plate guide screw and remove step-up piston and rod assembly, remove spring and gasket from cylinder. Remove main metering jets. Take out venturi cluster screws and remove venturi cluster *(CAUTION* - Do not attempt to remove tubes from cluster). Invert carburetor and catch pump discharge check ball as it falls out. Remove idle adjusting screws and springs. Take out throttle body attaching screws and remove throttle body. Do not remove throttle valves unless replacement required (see Reassembly for installation data). Do not remove throttle valve shaft (replace throttle body if shaft worn). If choke shaft does not operate freely, disconnect vacuum piston link and check piston for free movement in cylinder. If necessary to remove piston and link, remove welch plug at outer end of cylinder and slide piston and link out.

Cleaning & Inspection: Clean all parts with mineral spirits or suitable cleaner. Blow out all passages in castings and venturi cluster with compressed air *(CAUTION* - Do not use wire or drills to clean jets). Check all parts for wear or damage and replace as required.

Reassembly: Use all new gaskets. Reassemble carburetor by reversing disassembly procedure and note the following:

Throttle Valve Installation - *NOTE* - If throttle valve shaft or throttle body worn, it is recommended that new throttle body assembly (with shaft) be used. Install throttle valves with mark ("C" in circle) downward and on idle port side, install new screws loosely, close throttle valves tightly and centralize valves by tapping them lightly, tighten screws securely and stake screws by squeezing with pliers. Check throttle valve position (see specifications above).

Idle Mixture Screws - Replace screws if tapered portion grooved or ridged. Turn screws in by hand until lightly seated, then back each screw out 1 full turn for approximate idle setting.

Choke Valve Installation - Slide choke shaft and piston assembly into air horn, rotate shaft counterclockwise to enter vacuum piston in cylinder. Install choke valve shaft, install new screws loosely, close valve and tap lightly to centralize valve in bore, then tighten screws securely and stake by squeezing with pliers Check for free operation by closing valve with air horn upright. Choke should open of own weight.

Accelerating Pump Assembly - If old pump plunger being reinstalled, flare plunger leather by rolling it back several times, install plunger in cylinder. Install discharge check ball in discharge passage. Check pump operation as follows: Pour clean gasoline in float bowl (½" deep). Operate pump plunger several times to fill cylinder and remove all air from discharge passage. Use small brass rod to hold discharge ball down on its seat, press pump plunger down. No fuel should be emitted at either the discharge or intake passages. If fuel discharge noted, remove check balls and inspect for damage, clean passages thoroughly. Reseat ball by using small brass rod on ball and tapping lightly to form new ball seat *(CAUTION* - install new check ball after using ball in reseating operation). When installing plunger, make certain plunger leather enters cylinder evenly.

Step up Piston & Rod Assembly - Make certain that step-up rods are free on piston plate (must return to vertical position when released), and that piston is free in cylinder. See that step-up rods enter metering jets when installing assembly in carburetor.

Carburetor Adjustment - Make all adjustments listed in Adjustment section above.

SERVICE PARTS: Gasket Sets - Carter No. 300 (2775S, 2776S, 2777S, 2864S, 2865S, 2866S, 2896S); No. 325 (2793S, 2795S, 2870S, 2871S, 2872S); No. 335 (2923S, 2924S).

Re-Carburetion Kits: Carter No. 1949N (2793S, 2795S, 2871S, 2872S); No. 1951N (2864S, 2865S, 2866S); No. 1976N (2870S); No. 1988N (2921S, 2922S); No. 1993N (2923S); No. 5015N (2924S).

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 FORD 2-BARREL & 4-BARREL CARBURETOR POWER VALVE (ECONOMIZER) BOTTOMING CORRECTION:* On carburetors that appear to have a leaking power valve, check to determine if power valve is bottoming before the gasket is sufficiently compressed To check, remove power valve and gasket, then install power valve (finger tight) without gasket Using the removed gasket as a gauge try and insert gasket between valve and carburetor body If gasket can be inserted, the power valve has insufficient thread length To correct, install original gasket and one additional gasket, Part No B5A-9909-A on power valve assembly Install valve and check for proper sealing of the two gaskets

►*1957 FORD 2-BARREL CARBURETOR (B7A-9510-L) MAIN JET PRODUCTION CHANGE* Main jets have been increased in size as follows No 62 (0-5000 ft), No 60 (5000-10,000 ft), No 58 (10 000-15,000 ft) replacing the former sizes of Nos 53, 51, 49

►*1957 FORD 2-BARREL & 4-BARREL CARBURETOR-TO-INTAKE MANIFOLD GASKET-AND SPACER NOTE* Proper gaskets and spacers must be used as follows 2-Barrel (Two gaskets Part No B7A-9447-A and one spacer Part No B7A-9603-C), 4-Barrel except on 312" Engine (Two gaskets Part No B7A-9447-B and one spacer Part No B7A 9603-B), 4-Barrel 312" Engine (Two gaskets Part No B7A-9447-B and one spacer Part No B7A-9603-D)

►*1957 FORD 312" ENGINE HARD STARTING CORRECTION* Replace the early aluminum carburetor-to-intake manifold spacer, Part No B7A-9603-B, with the later "resinoid" spacer, Part No B7A-9603-D This later spacer prevents excessive heat transfer between intake manifold and carburetor

►*1957 FORD 2-BARREL CARBURETOR WHISTLE CORRECTION* This whistling noise is caused by the 90° corner located at bottom of throttle bore and can be corrected by using a file to remove the sharp edge at junction of throttle bores and intake manifold flanges *Care must be taken so that not more than 1/16" of stock is removed The removal of additional stock would cause a vacuum leak at this point*

►*1957 FORD 2-BARREL CARBURETOR SURGE CORRECTION:* This surge may be encountered in the 40-50 MPH range and is caused by air leaking into booster venturi assembly through the plugs on top of the "tower-like" projections in carburetor throat Eliminate this air leakage by replacing the defective booster assembly or by sealing the plugs with sealing compound, Part No 8A-19554-B *CAUTION - Do not cover any of the bleed holes on booster assembly*

►*1957 FORD "HIGH ENGINE SPEED" CORRECTION (Cars with Ford 4-Barrel Carburetors):* This condition results from the secondary valves not closing completely due to rough edge at flat portion of valve diameter, or to a slight bend in the secondary throttle shaft. Correct by removing secondary throttle valves and shaft and polish the valves (where flat portion of diameter joins), and the throttle shaft at the three points where shaft contacts carburetor body Remove any burrs on secondary throttle shaft bores *CAUTION - Do not remove any more stock than is necessary or carburetor calibration will be affected*

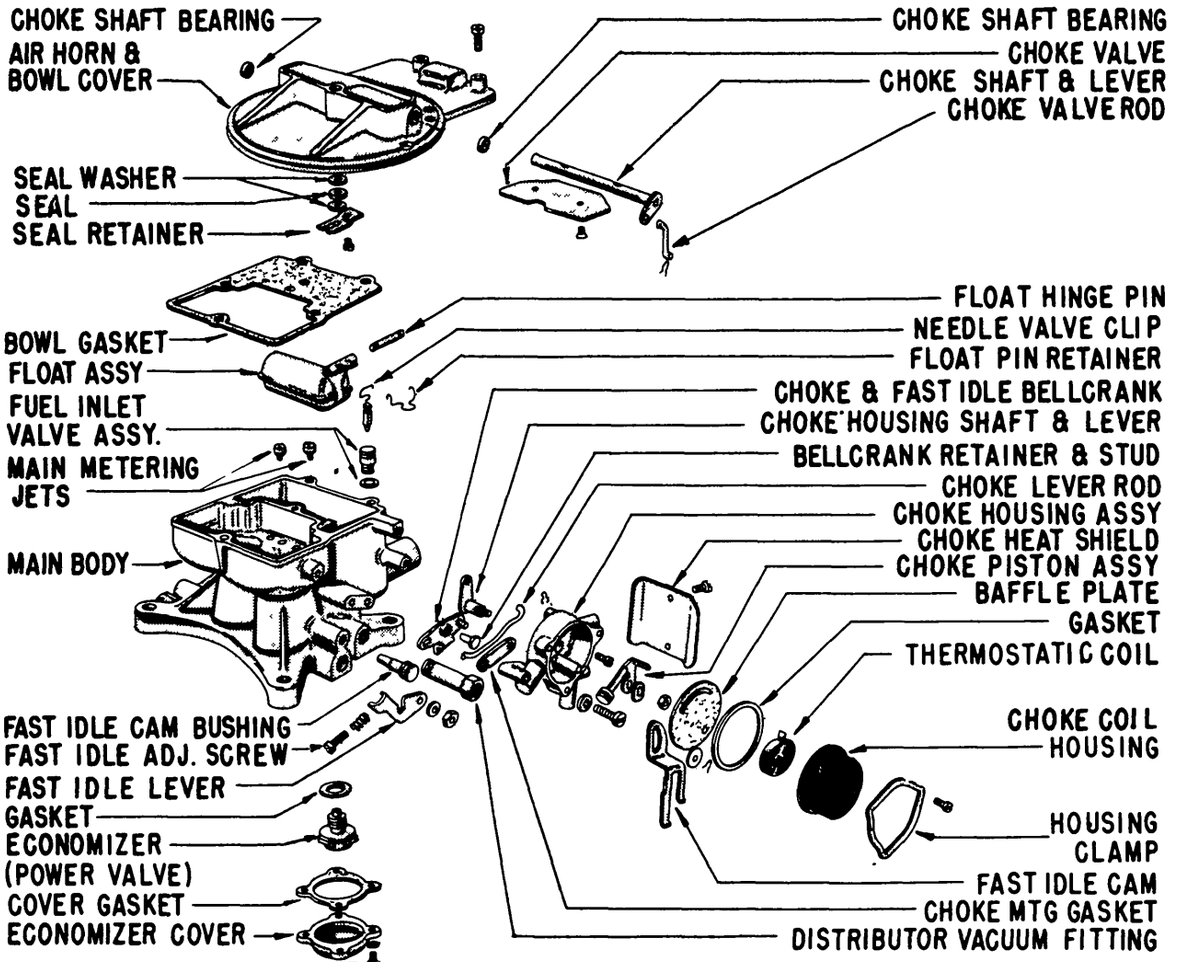
►*1958 FORD 2 & 4 BARREL CARBURETOR ACCELERATOR PUMP SETTING NOTE (TO OBTAIN BEST PERFORMANCE):* For the best economy and acceleration performance, a winter and summer accelerator pump adjustment is necessary, as follows **2-Bbl. Carb.** (292" & 332" Engines, all transmissions)install pump rod in hole No 3 for summer and winter operation **4-Bbl. Carb.** (332" & 352" Engines, all transmissions) install pump rod in hole No 3 (Winter), No 2 (Summer)

CONTINUED ON NEXT PAGE

FORD 2 & 4-BARREL CARBURETORS (C nt.)

►*1958 FORD 2 & 4 BARREL AND MERCURY 4-BARREL SECONDARY MAIN METERING JET CHANGE FOR IMPROVED PERFORMANCE AT HIGHER ALTITUDES:* *S condary main m t ring j ts have been revised. See " Ford 2 & 4 Barr l Carburetor JetSpecifications".*

►*1958 MERCURY & EDSEL SLOW OPENING CHOKE CORRECTION:* If choke will not fully open or if engine remains on fast idle too long, check for freeness of choke assembly and linkage and free any binding condition. Check thermostatic choke heat tube to make sure asbestos insulator is installed, then check and make sure fast idle cam is operating freely. If the condition exists after the above checks, and the choke operates freely, inspect heat stove cover for warping. If cover is warped, replace with the new cover, Part No. 5751311, and gasket, Part No. 5751312. Inspect cover plate mating surface for high spots, and if found, remove with a file to permit proper sealing.



►*1958 MERCURY (WITH FORD 4-BARREL CARB.) FLOODING CORRECTION:* If a chronic flooding condition is encountered, check fuel inlet needle to float lever connector for damage. If connector is deformed, reshape it to correspond to illustration.

►*1958 FORD INTERCEPTOR ENGINE AUTOMATIC CHOKE FAILUTE TO COMPLETELY OPEN CORRECTION:* If choke valves do not open completely or "come off" quickly enough, it may be due to improper sealing of choke stove to manifold. Correct by cementing gasket to manifold and the choke stove cover to gasket with asbestos furnace cement.

►*1958 FORD V8 HARD HOT STARTING CORRECTION (Ford 2 & 4-Bbl. Carb.)* Correct by venting accelerating pump bowl to float bowl which will prevent pump flooding while engine is stopped and hot. Remove carburetor from engine, remove pump cover and internal parts including intake check ball and retaining screw and ball. Center punch vent hole location in top center of pump chamber wall (midway between intake check valve boss and upper edge of pump chamber). Use No. 80 drill in hand operated chuck to drill hole through wall into pump chamber. Clean out all chips and reassemble carburetor. *CAUTION* - DO NOT use power drill and use extreme caution not to damage float. DO NOT use larger drill than No. 80 (.011") or pump action will be affected.

►*1958 EDSEL CHOKE COIL HOUSING CHANGE & ADJUSTMENT NOTE:* A new choke coil housing assembly, Part No. PB8M-9848-A, identified by the letters "TD" embossed in center of bakelite housing is available for service replacement of the previous cover, Part No. EDC-9848-A. Initial adjustment of the new choke coil housing is at "Index" mark.

►*1958 FORD V8 HARD HOT STARTING CORRECTION (Ford Carburetors):* Correct by venting accelerating pump bowl to float bowl which will prevent pump flooding while engine is stopped and hot. Remove carburetor from engine, remove pump cover and internal parts including intake check ball retaining screw and ball. Center punch vent hole location at top center of pump chamber wall (midway between intake check valve boss and upper edge of pump chamber). Use No. 80 drill in hand chuck to drill hole through wall into pump chamber. Clean out all chips and reassemble carburetor. *CAUTION - DO NOT use power drill and use extreme caution not to damage float. DO NOT use larger drill than No. 80 (.011") or pump action will be affected.*

1957 FORD 2-BARREL CARBURETOR BOWL COVER & MAIN BODY ASSEMBLY (TYPICAL)

►*1959 MERCURY CARBURETOR ICING OR PERCOLATING NOTE:* May be caused by improperly operating air vent intake duct assembly. *See "Tune-Up" on Mercury car page.*

►*1959 EDSEL, FORD, MERCURY HARD STARTING, STALLING, POOR COLD DRIVEAWAY & SPARK PLUG FOULING CORRECTION:* Revise carburetor and adjustments as indicated below:

Chok (Eds l 292" Eng.) - Adjust choke coil housing to 2 notches Rich.

Ch k (Eds l 332" & 361" Engs. with 2 r 4-Bbl. Carb.) - Install new Choke Housing, Part No. B9AE-9849-A (colored Red) and adjust choke coil housing to 3 notches lean from index). *NOTE - The above change made in production at Engine Code Date 3-91-M*

Choke (Ford 332" & 352" Engs. with 2 or 4-Bbl. Carb.) - Adjust choke coil housing to 3 notches lean from index.

Choke (Mercury 383" Eng. with 2 or 4-Bbl. Carb.) - Install new Choke Housing, Part No. B9AE-9849-A (colored Red) and adjust choke coil housing to **"Centered (at Index)"** (2-Bbl. Carb,); to **2 notches lean from index** (4-Bbl. Carb.). *NOTE - The above change made in production at Engine Code Date 4-91M.*

Fast Idle (All Models) - With fast idle adjusting screw on starting step of fast idle cam (starting step identified by letter "O"). Adjust engine fast idle speed to 2000 RPM (hot engine).

Acc l rat r Pump Operating Rod (Edsel & Ford) -

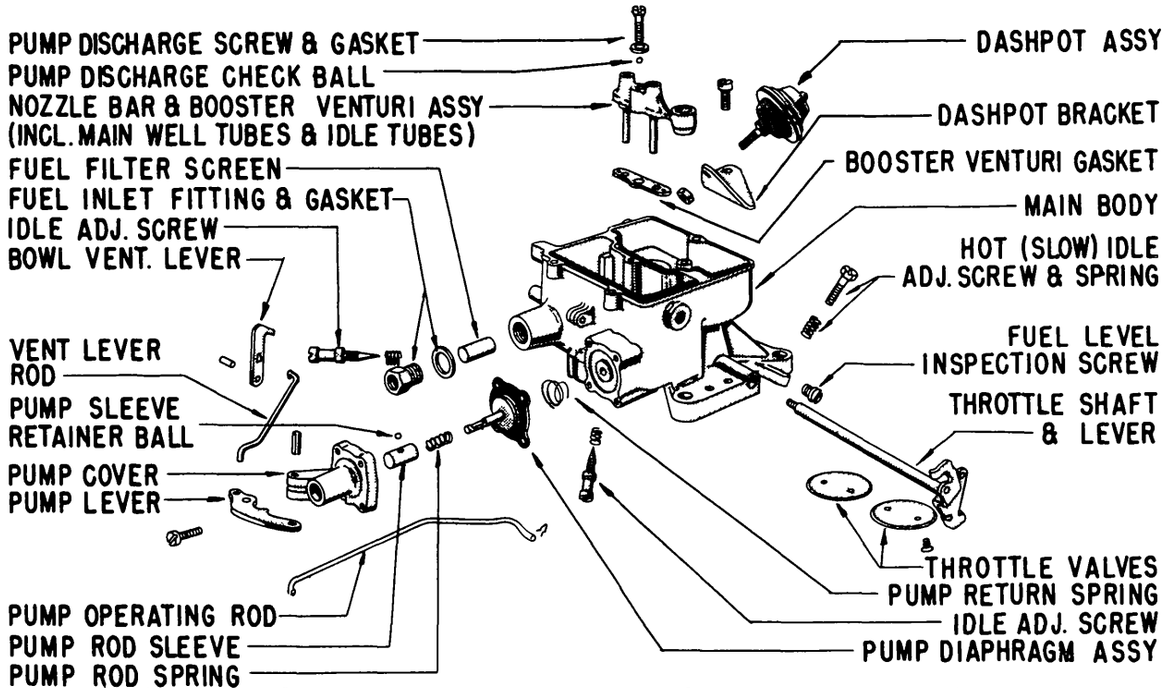
CONTINUED ON NEXT PAGE

FORD 2 & 4-BARREL CARBURETORS (C nt.)

Install accelerator rod in No. 4 hole (farthest from throttle shaft) position of overtravel lever. *NOTE - On Ford models, install rod in No. 3 hole to improve economy and acceleration in hot weather.*

►*1959 EDSEL & MERCURY IMPROPER RETURN TO IDLE SPEED NOTE:* This condition is due to improperly adjusted carburetor throttle rod. *See "Throttle Linkage Adjustment" on car model pages.*

►*1959 EDSEL, FORD & MERCURY ROUGH IDLE & RICH FUEL CONDITION CORRECTION:* If this condition continues after all other corrective steps have been taken, check the economizer (power) valve for leakage of fuel into vacuum passage. If leakage is indicated, install new type gasket, Part No. B9AE-9A588-A. The new gasket is made of harder material and will not allow power valve to become loose when gasket takes a set.



►*1959 CHOKE OPERATING ROD SEAL RETAINER SERVICE REPLACEMENT NOTE:* When necessary to remove choke plate, shaft, operating rod, or rod seal on carburetors having the seal retainer attached with a No. 6 drive screw, drive out old drive screw with a punch, then use a No. 28 drill to enlarge screw hole. Tap the hole with a No. 8-32 tap and install a new retainer, Part No. B8A-9682-A, using a No. 8-32 x ¼" screw. Be sure seal is positioned between air horn casting and retainer so it does not bind the linkage.

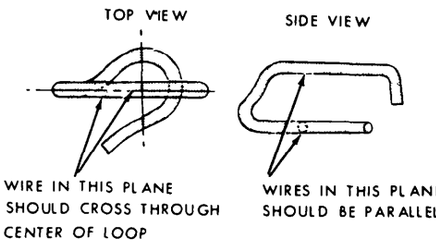
►*1959 EDSEL, FORD, MERCURY ACCELERATOR PUMP LINK & OPERATING ROD PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE:* A new link, Part No. COAE-9529-A, and rod, Part No. COAE-9B542-A are available for service. The new link and rod must be used together and must not be intermixed with previous rod and link. When installing rod in link, position end of rod in **outer** hole in link (do not use inner hole).

►***1959 MERCURY 383" ENGINE STALLING OR ROUGH IDLE CORRECTION:* If this condition exists with high under hood temperatures and cannot be corrected by carburetor adjustment or engine timing, install Part No. B8LE-9B532, air bleed valve (trade name "Carb-Airator"), in intake manifold as close as possible to vacuum take-off port. This valve is temperature operated and opens under high temperature conditions to allow fresh air to bypass the carburetor and enter directly into intake manifold.**

►*1960 2 & 4-BARREL CARBURETOR FLOODING CORRECTION & FLOAT PRODUCTION CHANGE:* To correct a flooding condition, install a new Fuel Inlet Valve & Needle Assembly, Part No. COAE-9564-B, and Carburetor Float & Lever Assembly, Part No. COAE-9550-A. Later carburetors have these parts.

►*1960 2-BARREL CARBURETOR ROUGH IDLE & STUMBLE (ON DRIVEAWAY) CORRECTION:* This condition may be caused by improperly installed vacuum transfer (balance) tubes which are located in main venturi of carburetor main body. If these tubes are assembled too high they will interfere with the booster venturi assembly and cock it in a manner to prevent proper sealing of booster venturi gasket mounting surface. To check, remove air cleaner and disconnect choke plate operating rod at lever, then remove air horn retaining screws, air horn assembly, and

1957-60 FORD 2-BARREL CARBURETOR THROTTLE & MAIN BODY ASSEMBLY (TYPICAL)



gasket. Remove accelerator pump discharge screw and check clearance between vacuum booster venturi assembly and balance tubes by rocking venturi back and forth to see if it is cocked and sealing improperly. If it is not sealing properly, remove booster venturi assembly (do not lose accelerator pump check ball and weight) and discard venturi gasket and ¼" fibre washer gasket. Clean all gasket mounting surfaces, then carefully drive each balance tube downward with a flat end punch and light hammer to obtain an assembled clearance of .010-.035" between end of tube and booster venturi assembly. Reassemble carburetor using new gaskets and tighten accelerating pump discharge screw to 35-40 inch lbs.

►*1960 FORD 292" ENGINE (AUTO. TRANS.) CHOKE COIL HOUSING CHANGE TO IMPROVE PERFORMANCE WHEN CHOKE IS IN OPERATION:* Replace choke coil housing, Part No. COAE-9848-B (identified by letters "TK" on housing) with Part No. COAE-9848-C (identified by letters "TL" on housing).

►*HARD COLD STARTING CORRECTION (ALL MODELS):* Choke plate may be sticking in open position because of misalignment in air horn. Check choke operation and if necessary, realign choke plate.

DESCRIPTION: 2-Barrel Carburetor - Downdraft type with automatic choke. Throttle body and main body are integral, and the air horn also serves as main body cover. The automatic choke is mounted on main body and is connected to choke valve shaft by linkage. A diaphragm type accelerating pump is also mounted on main body and connected to throttle valve by linkage. A bowl vent is actuated by accelerating pump linkage.

4-Barrel Carburetor - Downdraft type with automatic choke. This carburetor is similar in design to the 2-barrel carburetor (see above). The primary side consists of an idle fuel system, accelerating pump system, main fuel system, power system and choke system. The secondary side has only an idle system and a main fuel system. Secondary throttle valves are operated by a vacuum diaphragm and are connected through linkage to the primary throttle to insure positive closing.

MERCURY FLOAT LEVER CONNECTOR

►*1957-60 CARBURETOR COMPONENT DIFFERENCES: Components on various carburetor models are different as follows:*

Automatic Choke Assembly - 1957 Carburetors - Conventional type having a vacuum piston and a thermostatic coil spring linked to the choke shaft.

1958-59 Carburetors - Heated air is drawn into choke housing by manifold vacuum and is directed onto thermostatic coil spring by a baffle plate that controls speed of temperature rise in coil spring housing. The baffle plate rotates with the choke shaft and directs hot air

CONTINUED ON NEXT PAGE

FORD 2 & 4-BARREL CARBURETORS (C nt.)

either through a circuitous route to coil spring for engine warm-up or directly to coil spring for hot engine operation When choke valve is closed (cold engine), small holes in baffle plate pass heated air directly onto coil spring As temperature rises and choke plate opens, baffle plate moves and heated air is directed onto thermostatic coil spring by an alternate longer route When choke valve is fully open, heated air is directed through housing by a shorter route causing coil spring to remain heated and hold choke valve fully open A spring loaded "butterfly" valve in carburetor choke valve plate allows enough air to be drawn through carburetor when engine is first started to enable engine to run and to prevent flooding

1960 Carburetors - Similar to 1958-59 carburetors except that rotating baffle plate in choke housing and butterfly valve in choke valve plate have been eliminated Heated air, controlled by restricted passages in carburetor passes directly through choke housing to heat thermostatic coil spring A new thermostatic coil spring lever, connected to choke housing shaft by a torsion spring allows choke valve to open when manifold vacuum decreases (engine reaches stall point due lean mixture) A series of holes in choke valve plate replaces the "butterfly" valve previously used

Fast Idle Assembly - 1957 Carburetors - Fast idle cam assembly is lifted by a sliding action to engage carburetor throttle lever for fast idle operation

1958-60 Carburetors - Conventional fast idle cam assembly which rotates to engage a fast idle adjusting screw on throttle lever assembly *NOTE - On 1960 carburetors, position of cam, when properly located under fast idle screw, is indicated by a "V" stamped in side of fast idle cam at highest step*

Fuel Bowl Vent - 1957 Carburetors - A saxaphone type key operated by a link from accelerating pump lever vents the fuel bowl

1958-60 Carburetors - Fuel bowl is vented externally at all times

Accelerating Pump Linkage - 1957 Carburetors - Two holes in pump operating lever provide a seasonal adjustment for summer and winter operation

1958-60 Carburetors - Accelerating pump lever is linked to a lever and spring assembly on throttle shaft (primary shaft 4-barrel carburetors) which has four holes in it for pump stroke adjustment **There is no seasonal adjustment on these carburetors.** Rod position on lever is dependent on engine on which carburetor is used

Hot Idle Compensator - 1960 Mercury (With Air Conditioning) Carburetors - This unit is a bi-metal spring that actuates a plunger within the throttle stopscrew to open throttle valves when high underhood temperatures cause loss of engine speed at idle, thus maintaining proper idle speed *NOTE - Not used on other car models*

ADJUSTMENTS: Adjustments are the same for 2—Barrel and 4—Barrel carburetors except as noted below

Idle Mixture Setting: Initial adjustment is 1—1½ turns open from a lightly seated position (to warm up engine) For final adjustment, with engine at normal operating temperature, proceed as follows. On Ford models, turn both idle mixture screws in until engine runs rough from lean mixture, then turn screws out until engine rolls from rich mixture Finally turn screws in just enough for smooth idling and highest vacuum reading On Mercury and Edsel models, install a vacuum gauge and a tachometer, then adjust idle mixture screws until highest vacuum reading is attained at specified hot idle speed Turn idle mixture screws out 1/8 turn Recheck idle speed.

Idle Speed Setting (Hot Engine): With engine at normal operating temperature, choke valve wide open and fast idle screw backed off so it is not contacting fast idle cam, adjust throttle stopscrew on left side of carburetor so engine operates at speed indicated in table below.

Idle Speed Setting

Car Model	Engine RPM S.M. Trans.	Auto. Trans.
1958 Edsel 361" Eng	475-500	①450-475

③ - Standard engine
④ - Modified engine

►*ACCELERATING PUMP ADJUSTMENT NOTE* After installing a new rod or bending the old rod check operation by slowly moving throttle lever to fully opened position If accelerator link strikes pump cover casting file a notch in link as necessary for clearance

Bowl Vent (1957 Carbs.): With engine operating at correct idle speed, place a 100" feeler between idle adjusting screw and screw stop Bowl vent valve should just close To adjust, bend operating rod on vent

Bowl Vent (1958-60 Carbs.): Bowl is vented externally at all times No adjustment

Economizer (Power Valve): *NOTE - On 4-Barrel carburetors, the power valve is located on the primary side only* Diaphragm type located under cover on bottom of fuel bowl surface on main body Power valve opens when manifold vacuum falls to 9½-10" and by-passes fuel through the valve directly to main well No adjustment provided *CAUTION - Power valve forms vacuum chamber and must be tight*

Float Level: To check float level, remove air horn and bowl cover, then hold float in upper position with needle valve closed Distance from gasket surface on main body to top of float should be as indicated in table below *NOTE - If cardboard gauge found in repair kits is used, float must touch low point of gauge and not touch high point of gauge On Edsel & Mercury, Gauge No 9550-MF (see "Modification Note" below) can be used to check float level* To adjust, bend tab on float arm as necessary to obtain correct float level

►*MERCURY CARBURETOR FLOAT GAUGE REWORK FOR USE ON 1960 AIR CONDITIONED CAR CARBURETORS* The dry float setting on carburetors used on air conditioned cars is 500" If Gauge 9550-MF is used, notch out corners of gauge (opposite to present 450" notches) to provide a dimension of 500" Later type Gauge 9550-MFA has the additional notches

Float Level

Car Model	Carburetor	Setting
1957 Ford	2-Bbl	325- 355"
1957 Ford	4-Bbl	540- 570"
1958-60 Ford	2 & 4-Bbl.	435- 465"
1958-60 Mercury & Edsel	2 & 4-Bbl ① 450"	(435- 465")

① - 485- 515" 1960 Mercury with Air Conditioning

CONTINUED ON NEXT PAGE

FORD 2 & 4-BARREL CARBURETORS (C nt.)

Fuel Level: With correct float setting, fuel level should be 1"±1/32" (1957 2-Bbl. Carb.); .970-1.03" (1957-4-Bbl. Carb.); .880-.940" (1958-60 2 & 4-Bbl. Carbs.) below machined surface of main body. *NOTE - Fuel level is same for secondary float on 4-Bbl. carburetors.*

Fast Idle: 1957-59 Models - With slow (hot) idle speed properly adjusted, engine at normal operating temperature, and throttle valves in closed position turn fast idle screw in until it touches low step of fast idle cam. On 1958-59 models, back fast idle screw off ¼-½ turn from above setting. *NOTE* - If setting is considered too high for operating conditions, fast idle speed may be reduced by backing screw off not more than one turn from standard setting.

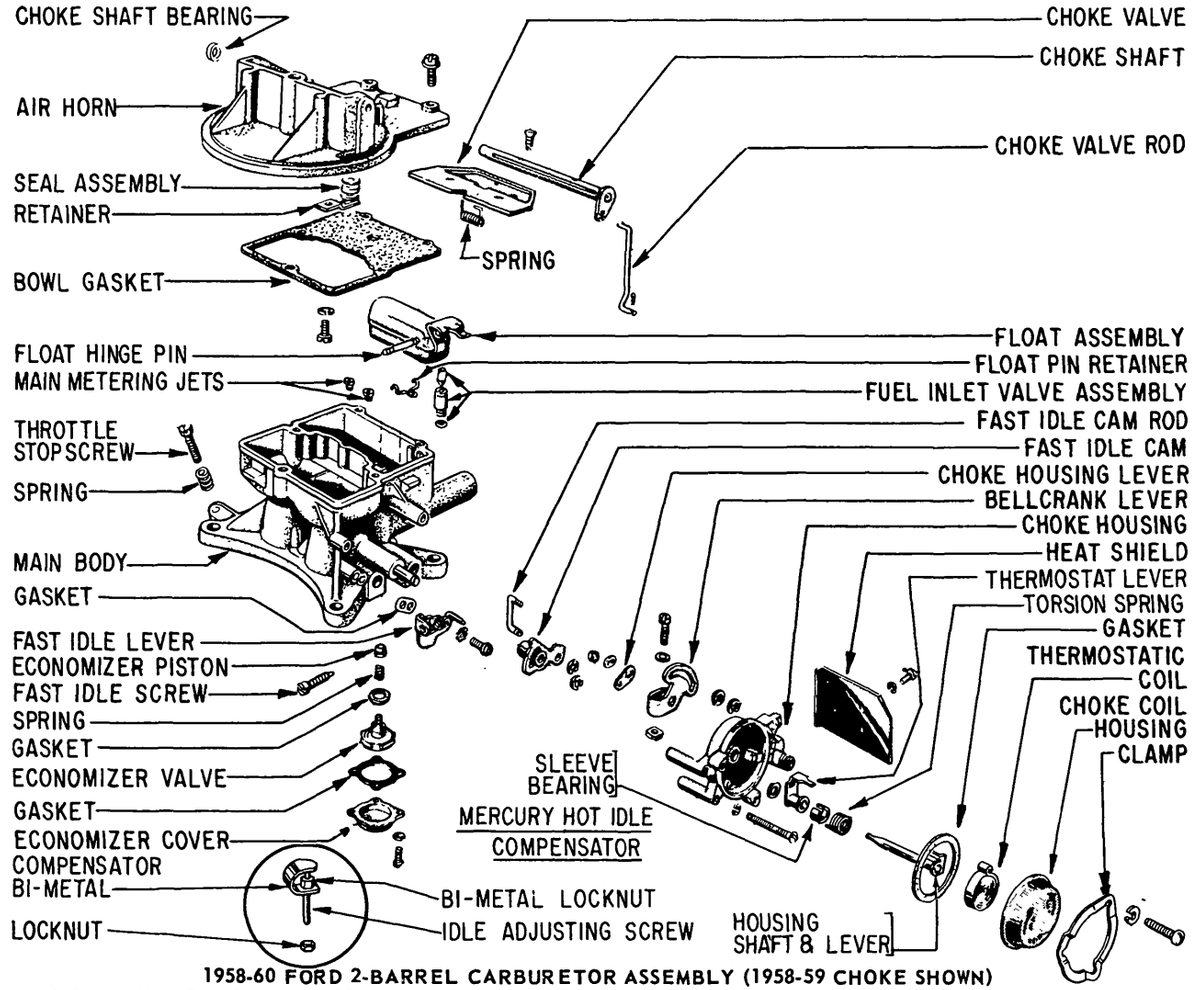
1960 Models - With slow (hot) idle speed properly adjusted, engine at normal operating temperature, and throttle valves in closed position, align top step of fast idle cam (identified by letter "V") with fast idle screw. Adjust fast idle screw to obtain an idle speed of 1500 RPM (292" Eng. with Synchro-mesh Transmission); 1600 RPM (292" Eng. with Auto. Trans.); 1800 RPM (All others). To initially set fast idle speed (carburetor on bench), place fast idle screw on index mark on fast idle cam, then turn fast idle screw until there is .036" clearance between throttle plate and throttle bore, measured at side opposite idle transfer holes. Use a No. 64 drill to measure clearance.

Automatic Choke Setting

Car Model	Choke Setting
1958 Edsel	Centered
1959 Edsel 292" Eng.	① 2 Pts. Rich
1959 Edsel 332" & 361" Engs. (Early)	② Centered
1959 Edsel 332" & 352" Engs. (Late)	③ 3 Pts. Lean
1960 Edsel 292" Eng.	2 Pts. Rich
1960 Edsel 352" Eng.	3 Pts. Lean
1957-58 Ford	Centered
1959 Ford	② Centered
1960 Ford 292" Eng.	2 Pts. Rich
1960 Ford 352" Eng.	3 Pts. Lean
1958 Mercury	④ 2 Pts. Rich
1959 Mercury 2-Bbl. Carb.	②⑤ Centered
1959 Mercury 2-Bbl. Carb.	③⑥ Centered
1959 Mercury 4-Bbl. Carb.	②⑤ Centered
1959 Mercury 4-Bbl. Carb.	③⑥ 2 Pts. Lean
1960 Mercury	Centered

① - Supersedes previous setting of "Centered".

② - See "Edsel, Ford, Mercury Hard Starting, Stalling Poor Cold Driveaway & Spark Plug Fouling Correction" above.



③ - With Red colored choke housing, Part No. B9AE-9849-A.

④ - "Centered" on carburetors with choke housing identified by letters "TD". See "1958 Mercury Choke Setting Change" above.

⑤ - Early cars before Engine Code Date 4-91M.

⑥ - Later cars after Engine Code Date 4-91M.

►*1958 MERCURY CHOKE COIL HOUSING PRODUCTION CHANGE & CHOKE SETTING CHANGE NOTE:* Choke coil housing assemblies identified by letters "TD" embossed in center of bakelite cover are being used in production and for service replacement. The choke setting for this assembly is at INDEX. Choke setting for previous assembly is 2 pts. lean.

1958-60 FORD 2-BARREL CARBURETOR ASSEMBLY (1958-59 CHOKE SHOWN)

Automatic Choke Setting: Loosen choke thermostatic coil spring housing clamp retaining screws and rotate housing to align index mark on housing with proper mark on choke housing as indicated in table below.

►*AUTOMATIC CHOKE ADJUSTMENT NOTE:* For maximum fuel economy, the cover may be rotated in the **lean** direction, dependent on ambient temperatures in the local area. If hard, cold starting is experienced, the cover should be rotated in **rich** direction. *CAUTION - Do not adjust choke in excess of 2 points in either direction from recommended setting.*

Fast Idle Cam & Bellcrank Lever Adjustment (1960 Carbs): With choke plate held in closed position by turning choke housing shaft counterclockwise (as viewed with thermostatic coil housing removed), and throttle plate approximately half-way open, there should be .030" clearance between top side of fast idle cam and the cast stop on back of choke housing. To adjust, loosen clampscrew on bellcrank lever and turn lever on choke housing shaft until proper clearance is obtained.

Choke Plate-to-Choke Housing Shaft Adjustment (1960 Carbs.): Remove thermostatic coil housing, then with .040" clearance between thermostatic coil lever and stop in choke housing, press choke plate open lightly until choke housing lever is against stop in choke housing. There should be 5/32" clearance between front edge of choke plate and air horn (use Gauge T109-154 or Ford Tool 9550-D). To adjust, hold thermostatic coil lever firmly against stop in choke housing and press choke plate open with enough force to bend the tang, then recheck clearance.

OVERHAUL

1957 MODELS

Air Horn Disassembly (2 & 4-Bbl. Carbs.): Remove air cleaner anchor screw and lockwasher. On 2-barrel carburetors, invert carburetor and remove throttle body-

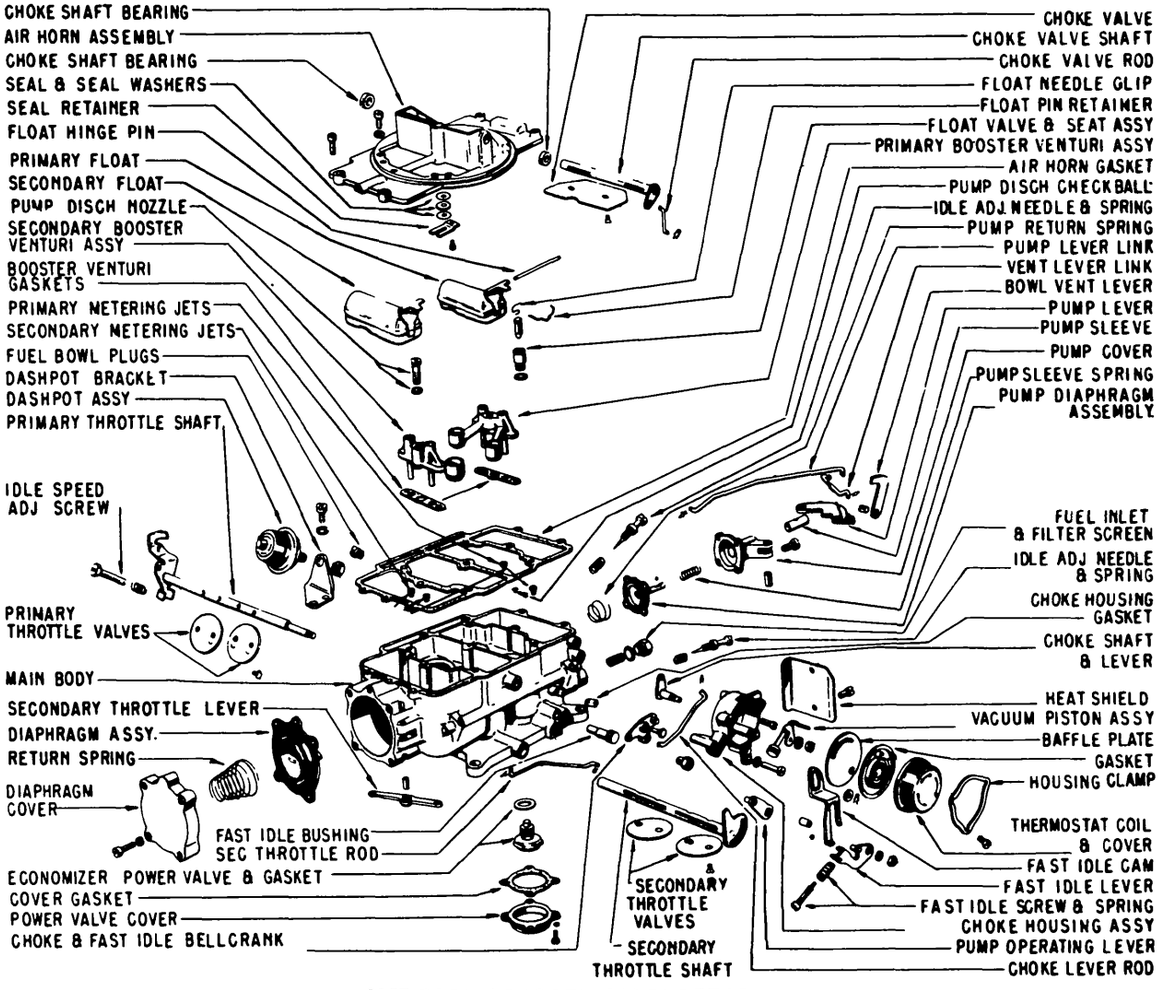
CONTINUED ON NEXT PAGE

FORD 2 & 4-BARREL CARBURETORS (C nt.)

to-main body screws and lockwashers. Lift off main body and remove throttle body gasket. On 4-barrel carburetors, disconnect choke rod at bellcrank assembly, then remove rod seal retainer from air horn and slide felt seal and two washers off rod. On all carburetors remove air horn-to-main body screws, then remove air horn and gasket. Remove choke plate from choke shaft, then remove choke rod and slide choke shaft from air horn.

Disass mbly (2-Barr l Carb.): 1) Remove fuel inlet fitting gasket and screen, then remove fuel bowl retaining screws. Fuel bowl, gasket, metering assembly, and metering assembly gasket will slide off main body. Separate metering assembly from fuel bowl and discard gaskets.

2) Remove vent valve, idle adjusting screws and gaskets, and the power valve and gasket from metering assembly. Remove external vent linkage retainer and spring, then remove vent and linkage from fuel bowl. Remove accelerating pump cover assembly from fuel bowl, then remove diaphragm and spring. Remove float retainer, then lift float out of bowl. Remove float spring and the "O" ring seal from fuel valve seat assembly, then remove baffle plate. Remove fuel valve seat and let the valve, spring, and pin fall out.



3) Remove choke rod pin from choke housing shaft and lever assembly. Remove thermostat housing and gasket from main body, then remove vacuum passage gasket. Remove nut, lockwasher, and spacer from choke housing shaft, then remove shaft and fast idle assembly. Remove choke piston and lever assembly. Remove choke rod pin from choke shaft lever. Remove choke rod, washers, and seal from main body. Remove choke valve from shaft, then slide shaft and lever out of choke housing.

4) Remove pump discharge nozzle screw, then lift pump discharge nozzle and gasket out of main body. Invert main body and let the pump discharge weight and ball fall out into the hand.

5) Remove dashpot assembly, then remove pump operating lever retainer and remove pump operating lever. Remove fast idle pick-up lever and fast idle cam lever and spring. If it is necessary to remove throttle valves, lightly scribe both valves along throttle shaft and mark each valve and its corresponding bore with a number or letter for proper replacement. Remove throttle valve screws and remove valves. Slide throttle shaft out of throttle body.

Disass mbly (4-Barr l Carb.): 1) Remove fuel inlet fitting, gasket and screen. With needle nose pliers, disconnect float shaft retainer, and remove the main jets. Invert main body and remove power valve cover and gasket, then remove valve and valve gasket. Remove idle adjusting needles and springs and remove distributor vacuum line fitting.

2) Remove accelerating pump discharge screw and gasket, then remove booster venturi assembly and gasket. Invert main body and let accelerating pump discharge ball fall into the hand. Remove accelerating pump operating rod and bowl vent rod. Remove accelerating pump

1957 FORD 4-BARREL CARBURETOR

cover, diaphragm assembly, and spring. Press pump rod sleeve toward diaphragm until sleeve retainer ball drops out. Remove sleeve and spring. Remove dashpot assembly and bracket.

3) Remove choke thermostat shield. Disconnect choke lever rod from choke housing lever, then remove thermostat housing retaining screws and clamp, thermostat housing, gasket, and the choke housing plate. Remove three choke housing-to-main body screws and lockwashers, then remove choke housing and gasket. Remove choke shaft and lever assembly retaining nut and spacer, then remove choke shaft and lever assembly, choke piston, lever and link assembly.

4) Remove nut and lockwasher securing fast idle adjusting lever assembly to throttle shaft, then remove lever assembly. Disconnect fast idle cam assembly at bellcrank, then remove fast idle cam. Remove bushing, primary throttle closing lever, and the inner bushing. Remove choke rod from bellcrank.

5) If it is necessary to remove throttle valves, lightly scribe both plates along the throttle shaft and mark each valve and its corresponding bore with a number or letter for proper installation. Remove throttle valve screws, then slide throttle shaft out of main body.

6) On the secondary side, disconnect float shaft retainer, then remove float and shaft, and the fuel inlet needle and clip. Remove fuel inlet needle seat and float retainer, and remove the secondary jets. Remove secondary diaphragm operating rod, diaphragm cover, return spring, and diaphragm assembly. Remove secondary booster venturi assembly retaining screw and lockwasher, then remove booster assembly and gasket.

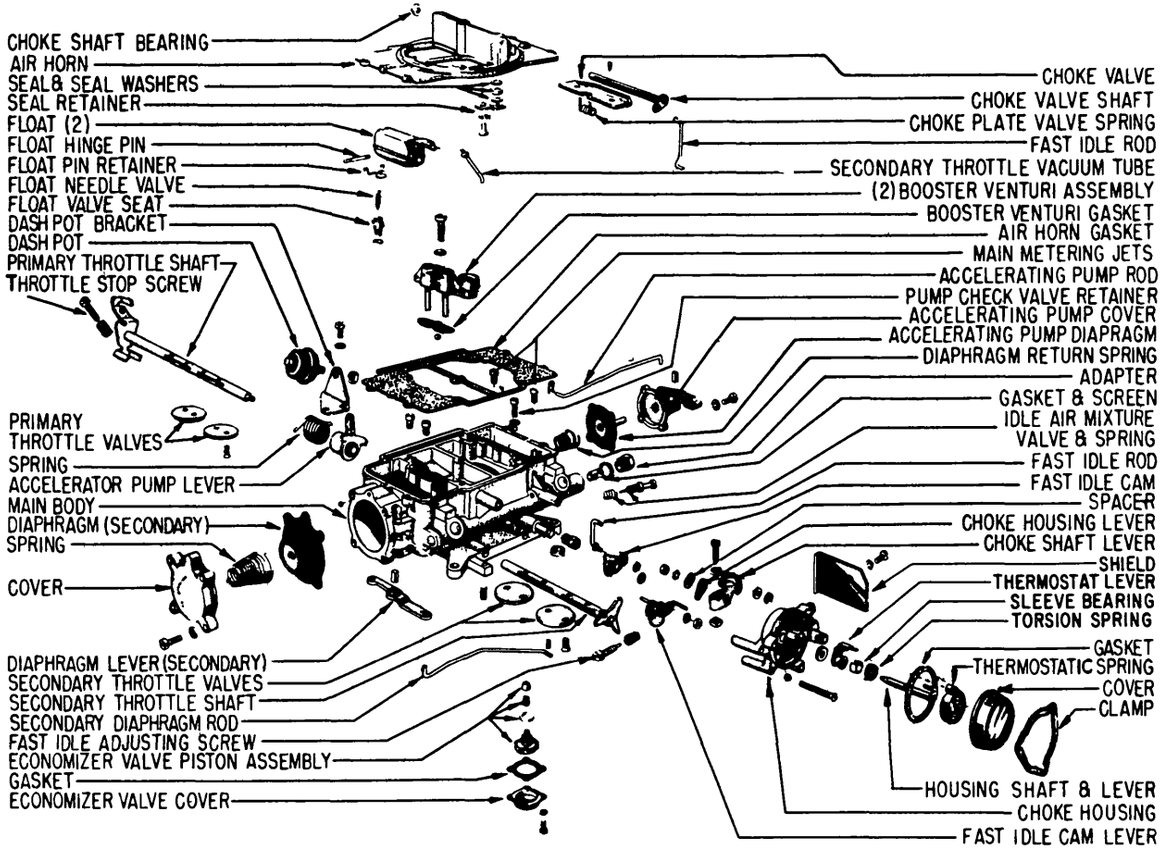
7) If it is necessary to remove throttle valve, proceed as for primary valve (above).

CONTINUED ON NEXT PAGE

FORD 2 & 4-BARREL CARBURETORS (C nt.)

1958-59 MODELS

Air Horn Disassembly (2 & 4-Bbl. Carbs.): Remove air cleaner anchor screw, then disconnect choke plate operating rod at choke lever. Remove air horn screws, then remove air horn by tilting it slightly as it is lifted off main body to remove choke plate operating rod from choke housing lever. Remove air horn gasket. Remove choke rod seal retainer from air horn and slide felt seal and two washers off choke operating rod. On 2-Barrel carburetors, remove choke plate from choke shaft and lever assembly by sliding it out of shaft from bottom of air horn. Remove choke operating rod, and slide choke shaft and lever assembly from air horn. On 4-Barrel carburetors if it is necessary to remove choke plate, remove secondary throttle vacuum pickup tube by prying it out with needle nose pliers (discard tube after removal). Remove choke plate screws, then remove choke plate assembly by sliding it out of shaft from bottom of air horn. Remove choke plate operating rod, then slide choke shaft from air horn.



Disassembly (2-Barrel Carbs.): 1) Remove fuel inlet fitting, gasket and screen, then use a hook and disconnect float shaft retainer and remove float, shaft, fuel inlet needle and clip. Remove fuel inlet needle seat and float shaft retainer, then remove main jets. Remove accelerating pump discharge screw and gasket, then lift nozzle bar and booster venturi assembly and gasket out of main body.

2) Invert main body and let accelerating pump discharge ball fall into hand. Invert main body and remove power valve cover and gasket, then remove power valve and gasket. Remove accelerating pump operating rod and pump cover, diaphragm and spring. Remove pump inlet ball check retainer screw and gasket, remove ball check.

3) Remove choke shield. Disconnect fast idle pickup lever on fast idle cam. Remove thermostatic spring housing retainer screws and clamp, then remove housing, gasket, and choke housing baffle plate. Remove choke housing from main body. Remove choke housing lever, then loosen screw on bellcrank clamp and slide bellcrank off choke housing shaft and lever assembly. Remove retainer from choke housing shaft and lever assembly and slide shaft out of choke housing. Remove fast idle cam retainer and slide fast idle cam off boss on main body.

4) Remove fast idle adjusting lever assembly from throttle shaft. Remove distributor vacuum line fitting, anti-stall dashpot (if so equipped), idle mixture adjusting screws and springs, and the hot idle adjusting screw and spring.

5) If it is necessary to remove throttle plates, lightly scribe both throttle plates along throttle shaft and mark each plate and its corresponding bore with a number or letter for proper identification. Remove throttle plate screws and remove throttle plates, then slide throttle shaft out of main body. Slide accelerating pump over-

1958-60 FORD 4-BARREL CARBURETOR ASSEMBLY (1958-59 CHOKE SHOWN)

travel spring and lever off the shaft.

Disassembly (4-Barrel Carbs.): 1) Remove fuel inlet fitting, gasket and screen, then use a hook and disconnect float shaft retainer from each float. Remove float and shaft, and inlet needle and clip from each fuel bowl. Remove fuel inlet needle seat and float shaft retainer from each fuel bowl and remove primary and secondary main jets. Remove accelerating pump discharge screw and gasket from primary side, then lift nozzle and bar assembly and gasket out of main body. Invert main body and let accelerating pump discharge ball fall out into hand.

2) Remove secondary nozzle bar and booster venturi assembly and gasket. Remove accelerating pump operating rod, then remove accelerating pump cover, diaphragm assembly and spring. Remove inlet ball check retainer screw and gasket, then remove ball check. Remove secondary diaphragm operating rod. Remove diaphragm cover, return spring, and diaphragm.

3) Invert main body and remove power valve cover and gasket, then remove power valve and gasket. Remove idle mixture adjusting screws and springs. Remove choke shield. Disconnect fast idle cam pickup lever at fast idle cam. Remove thermostatic spring housing retainer screws and clamp, then remove housing gasket, and choke housing baffle plate. Remove choke housing

4) Loosen screw on bellcrank clamp and slide bellcrank off choke housing shaft and lever assembly. Remove retainer from choke housing shaft and lever assembly and slide shaft out of choke housing. Remove fast idle cam retainer and slide cam off boss on main body.

5) Remove nut and washer securing fast idle adjusting lever assembly to primary throttle shaft and remove lever assembly. Remove distributor vacuum line fitting, anti-stall dashpot (if so equipped), and hot engine idle adjusting screw and spring.

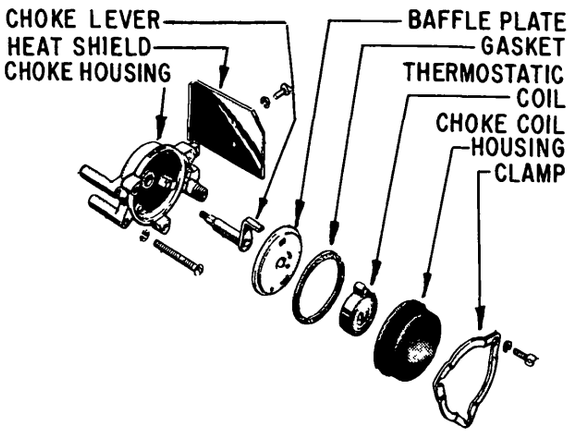
6) If it is necessary to remove throttle plates, lightly scribe primary and secondary throttle plates along throttle shafts and mark each plate and its corresponding bore with a number or letter for proper identification. Slide primary and secondary throttle shafts out of main

CONTINUED ON NEXT PAGE

FORD 2 & 4-BARREL CARBURETORS (C nt.)

body. Slide accelerating pump over-travel spring and lever off primary throttle shaft.

7) On the secondary side, disconnect float shaft retainer, then remove float and shaft, and the fuel inlet needle and clip. Remove fuel inlet needle seat and float retainer, and remove the secondary jets. Remove secondary diaphragm operating rod, diaphragm cover, return spring, and diaphragm assembly. Remove secondary booster venturi assembly retaining screw and lockwasher then remove booster assembly and gasket.



8) If it is necessary to remove throttle valve, proceed as for primary valve (above).

Cleaning & Inspecti n (All Carbs.): Wash all parts, except those noted below in clean solvent. *(CAUTION - Do not use solv nt on accel rating pump diaphragm, power valve, s condary perating diaphragm, and dashpot).* Blow out passages in casting with air. Inspect all parts for wear or damage with particular attention to the following: Inspect castings and main body cover for cracks or leaks, inspect main well tubes, metering jets, and idel tubes for wear or clogged passages. *(CAUTION - Clean with air, d not use drills to clean out calibrated penings).* Replace all worn or damaged parts.

R ass mbly (2 & 4-Barr l Carbs): Use all NEW gaskets. Install parts in reverse order of disassembly procedure (above) and note the following important points: **Thrott l Valv Installati n** - Refer to the line scribed on throttle valve at disassembly, and install valves in their proper location with the screws snug, but not tight. Little or no light should show between throttle valves and throttle bores. Tap valves lightly to seat them, then tighten the screws.

Fl at Installati n (4-Barrel Carb.) - Retainer grooves on float shaft are not equally spaced. To install, slide shaft in float lever so that the groove closest to end of shaft is toward outside of carburetor, then install float retainer.

Acc l rating Pump Ball Check - Seat ball with a brass drift and a light hammer. Make sure the ball is free, then proceed with reassembly.

1960 2 & 4-BARREL CHOKE ASSEMBLY

Air Horn - On 4-barrel carburetors, be sure to install a new fibre washer with the screw that enters the secondary vacuum passage.

Carburetor Adjustments - Make all the adjustments indicated. *See "Adjustments" above.*

1960 MODELS

Overhaul Procedures are the same as for 1958-59 Models (above) except as noted below.

Choke Housing Removal & Disassembly: Remove choke shield, then disconnect fast idle cam pickup lever at fast idle cam. Remove thermostatic coil spring housing and gasket. Remove choke housing-to-main body screws and lockwashers and remove choke housing. Remove choke housing lever attaching nut, spacer and lever, then loosen screw on bellcrank clamp and slide bellcrank off choke housing shaft and lever assembly. Remove retainer from choke housing shaft and lever assembly and slide shaft out of choke housing. Remove thrust washer from choke housing shaft. Slide thermostatic coil lever and bushing assembly off choke housing shaft (allow for twisting action of torsion spring when parts are separated). Remove torsion spring and white sleeve bearing from thermostatic coil lever and bushing assembly.

Ch ke Housing Reassembly & Installation: Install white sleeve bearing and torsion spring on thermostat lever and bushing assembly. *NOTE* - Long tang of spring should be positioned against stop on thermostat lever. Slide thermostat lever, bushing and spring assembly on choke housing shaft. Engage short tang of spring on tang of integral choke shaft lever and wind the spring up approximately one-half revolution by turning choke housing shaft as thermostat lever is positioned against choke shaft lever. Engage tang of choke shaft lever in slot provided in thermostat lever. Install thin thrust washer on choke shaft, then install complete choke housing shaft and lever assembly in choke housing so that thermostat lever is at top of choke housing. Install choke housing shaft retainer. Install bellcrank lever assembly on choke housing shaft and position it so that lever is against shaft retainer and the slot portion is to front of choke housing. Tighten clampscrew sufficiently to hold bellcrank lever in position, then adjust *(see "Fast Idle Cam & Bellcrank Lever Adjustment" above).*

SERVICE PARTS: Gasket Sets - Ford Part No. B7AZ-9502-A (B7A-9510-E,L,Q,W,Z): No. B7AZ-9502-B (B7A-9510-A,B,X); No. COAZ-9502-A (B8A-9510-K,L,N, P, B9A-9510-A,B,C, COAE-9510-AB,AC,AF,AG,H,M. ① - Stamped on choke plate flange.
② - Stamped on air horn section of main body.

►CHANGES, CAUTIONS, CORRECTIONS

►*4-BARREL CARBURETOR THROTTLE BODY-TO-MAIN BODY GASKET INSTALLATION CAUTION:* This gasket must be installed so ALL holes in gasket align with mating holes in throttle body. Because the gasket can be installed in either an inverted or rotated position, each gasket installation should be carefully checked before assembling carburetor.

►*1957 HESITATION & STUMBLE CORRECTION (2 & 4-Barrel Carbs.):* This condition may be caused by a binding fuel bowl vent linkage. Check the following points for misalignment: Accelerator pump to throttle shaft lever bind at the center shaft and lever contact alignment. Binding at accelerator pump lever on pin in pump cover assembly. Binding at float bowl vent selector where it enters float bowl casting. Bowl vent hanging on top of float bowl casting recess.

CONTINUED ON NEXT PAGE

HOLLEY 2 & 4-BARREL CARBURETORS (C ntinu d)

►*1957 AUTOMATIC CHOKE STICKING CORRECTION (2 & 4-Barrel Carbs.):* This may be caused by interference between carburetor main body and end of thermostatic choke lever rod. Correct by bending choke lever assembly (bellcrank) away from main body.

►*1957 STUMBLE ON ACCELERATION CORRECTION (2 & 4-Barrel Carbs.):* This condition may be caused by blocked passage in accelerating pump circuit due to misalignment between fuel bowl and metering block which will press the accelerating pump circuit ferrule into metering block and close the circuit. Remove and reposition ferrule as follows: Slip the end of a small piece of wire into ferrule, then using a pair of side cutters or similar tool, work ferrule from metering block. *NOTE - The wire is used only to keep ferrule from collapsing.* Reposition ferrule, remove wire, and then assemble fuel bowl to metering block, making sure that all parts are aligned.

►*1957 ACCELERATOR PUMP-TO-THROTTLE LEVER INTERFERENCE (2 & 4-Barrel Carbs.):* If interference is at the dashpot mounting bracket, correct by bending dashpot bracket upwards. Do not bend more than is necessary to provide clearance. Check and adjust alignment between end of dashpot and contact point on throttle lever by bending bracket outward slightly.

►*1957 HOLLEY 4-BARREL CARBURETOR SECONDARY FLOAT SETTING NOTE:* Some of these carburetors have a boss in the floor of the secondary float bowl which interferes with use of float gauge (Tool 9510-10, Ford; 9550-K-2, Mercury). *(NOTE - These are the gauges supplied with carburetor kit).* Existing instructions indicate the two positioning arms of gauge must touch side of bowl. However, on bowls with boss in floor, the top positioning arm should be tipped away from side of bowl so locating step will seat firmly on bottom of bowl and not ride on boss. Firm pressure on gauge will position gauge for correct float setting.

►*1957 HOLLEY CARBURETOR FLOAT BOWL PRODUCTION CHANGE & FLOAT SETTING CAUTION:* Float bowls and baffle plates have been revised during production as follows, to prevent leakage and flooding. (1) First design includes primary and secondary bowls with no retaining ribs and a baffle plate with a retaining hole through which the fuel inlet valve passes. An "O" ring is used between valve and baffle. (2) Second design has one baffle retaining rib and a baffle of same design as used in first type. (3) Third design bowls have two retaining ribs and a baffle plate which is slotted at the bottom to clear fuel inlet valve assembly. *CAUTION* - When baffle is installed, gently vibrate bowl and determine if baffle has a tendency to tilt toward float. If so, carefully bend upper portion of baffle untio this tendency is eliminated. If an "O" ring is used make sure that a good seating condition is established using a new "O" ring. Handle baffle carefully at all times as it is easily distorted. Do not bend more than indicated above.

►*1957 FORD TRUCK 4-BARREL CARBURETOR "DEPOPPER VALVE" NOTE:* The depopper device has been made inoperative on all 4-barrel carburetors by plugging the air inlet passage located between secondary venturi, next to air cleaner stud hole boss, to maintain proper idle characteristics. If the depopper device is needed, and a higher idle RPM can be maintained, the plug can be removed.

►*1957 FORD TRUCK 4-BARREL CARBURETOR CHOKE VALVE STICKING CORRECTION (B7T-9510-C):* The choke valves sticking in the closed position may be caused by sideways movement of the fast idle cam and shaft assembly. To correct this condition, bend end of choke rod lever which contacts the fast idle pickup arm approximately 10° outboard of its original position.

►*1958 FORD INTERCEPTOR AUTOMATIC CHOKE FAILURE TO COMPLETELY OPEN CORRECTION:* If the choke valves do not open completely or "come off" quickly enough, it may be due to improper sealing of choke stove to manifold. Correct by cementing gasket to manifold and the choke stove cover to the gasket with asbestos furnace cement.

►*1958 FORD FAILURE TO OBTAIN PROPER IDLE SPEED CORRECTION (Cars with 4-Barrel Carburetors):* If idle screw adjustment is ineffective, secondary throttle plate stopscrew may be incorrectly set. Remove carburetor from engine and turn secondary throttle plate stopscrew out until secondary throttle plates stick in throttle bore. Then turn the screw in, with throttle plates held closed, until it just touches tab on secondary operating lever. **Turn screw in an additional ¼ turn.** *NOTE* - Secondary throttle stopscrew is located on underside of lug on throttle body casting.

►*1958 LINCOLN, CONTINENTAL & MERCURY ENGINE STALLING AFTER COLD START CORRECTION:* This condition may be caused by incorrect choke linkage geometry. Check and correct as follows: Remove air cleaner, thermostatic coil housing and gasket. Locate center index mark on top of choke housing, then scribe a line one half notch beyond the last of the calibration marks on left side of center index mark (viewing carburetor from choke side). Rotate choke lever counterclockwise and note exact point choke plate closes. At the same time note exactly where front edge of choke lever stops (same edge of choke lever that contacts finger when choke lever was rotated). At this point, place a small straightedge between scribed mark on choke housing and center of choke lever stud in center of choke. Front edge of lever should contact straightedge at this time. If not, adjust choke operating rod at a point below main body flange so lever contacts straightedge as indicated above. Adjust fast idle setting (see "Adjustments" below). If the above corrections do not eliminate stalling, adjust choke setting 1 or 2 notches richer than specified.

►*1958 FORD & EDSEL STALLING AFTER NORMAL COLD ENGINE START CORRECTION:* This condition may be due to improperly adjusted choke linkage. To check and adjust, remove thermostatic coil housing and gasket, then move thermostatic lever counterclockwise. The choke plate should be completely closed before lever reaches limit of its travel (limit of travel is when edge of lever that contacts the thermostatic coil is approximately 5½ notches from center index mark on choke housing). If choke plate is not completely closed at this point, lengthen choke operating rod by bending at existing bend until correct adjustment is obtained. If the condition is not completely corrected by the above adjustment, set thermostatic coil housing one or two notches richer, as required. If both the above adjustments do not correct choke operation, replace carburetor.

►*1958 2 & 4 - BARREL CARBURETOR (ALL MODELS EXC. RAMBLER) VENT REWORK (To prevent spillag of fuel under flooding conditions):* Plug the vent hole in each of the carburetor throttle bores (located above throttle valve in side of throttle bore) using a 3/16" long, No. 4 type drive screw (Ford & Edsel Part No. 92032-S2. or Lincoln & Mercury Part No. 920328). A punch may be used to drive screws into place after choke assembly has been removed. Be careful not to distort contour of throttle body when installing screws.

►*1958 FORD TRUCK LOSS OF POWER CORRECTION (TRUCKS WITH 4-BARREL CARBURETORS):* This condition may be caused by the ball check in secondary diaphragm housing sticking and can be corrected by removing the ball check. *NOTE - Failure of secondary throttle valves to open, results from a sticking ball check.*

►*1958 FORD FLOAT BOWL PRODUCTION CHANGE & REVISED FLOAT & FUEL LEVEL SETTING PROCEDURE:* Later carburetors having the high fuel inlet bowls also have a removable plug located on face of bowl at hinge end of float, making it possible to gain access to float tab. To adjust fuel level, operate engine at idle speed, then remove fuel sight level plug and float tab access plug. To raise fuel level to bottom of sight level plug, insert a small screwdriver into plug opening and press downward on float tab. To lower fuel level, pry tab upward. *CAUTION - Only a small amount of bending is required to either raise or lower fuel level.*

►*1958 FORD (HOLLEY) CARBURETOR BOWL VENT PRODUCTION CHANGE:* Later carburetors have a mechanically operated bowl vent which closes when main metering system in operation. The new vent is operated by an extension of the wide open throttle stop lever on throttle shaft instead of from the accelerating pump operating lever. To adjust the later vent, bend vent as required to obtain a clearance of .050-.070" between vent valve and machined surface of fuel bowl with the throttle in normal idle position.

►*1958 FORD ENGINE BACKFIRE CORRECTION:* A new thermostatic choke coil housing, Part No. B8A-9848-E (292" Eng.), Part No. B8A-9848-A (332" Eng.) having a loop in the end of the bi-metal spring (to prevent closure of choke plate) is available for service replacement. The new housings can be identified by "57M-1" (B8A-9848-E), and "58L-1" (B8A-9848-A) cast in center of bakelite housing

CONTINUED ON NEXT PAGE

HOLLEY 2 & 4-BARREL CARBURETORS (C ntinu d)

►*1958 LINCOLN, MERCURY, EDSEL SLOW OPENING CHOKE CORRECTION:* If choke will not fully open or if engine remains on fast idle too long, check for freeness of choke assembly and linkage and free any binding condition. Check thermostatic choke heat tube to make sure asbestos insulator is installed, then check and make sure fast idle cam is operating freely. If the condition exists after the above checks, and choke operates freely, inspect heat stove cover for warping. If cover is warped, replace with the new cover, Part No. 5751311, and gasket, Part No. 5751312. Inspect cover plate mating surface for high spots, and if found, remove with a file to permit proper sealing.

►*1958 LINCOLN, MERCURY, EDSEL CARBURETORS REMAINING ON FAST IDLE TOO LONG CORRECTION:* Interference between choke rod retainer clip and weighted arm of fast idle cam may be causing the above condition and can be corrected by removing choke assembly from main body and bending the choke rod operating lever approximately 1/16" farther away from choke housing. The bend should be made as close as possible to choke housing shaft. Reinstall and check operation. On later carburetors, offset choke housing used (can be installed on early carburetors).

►*1958 4-BARREL CARBURETOR GASKET REPLACEMENT CAUTION:* When installing new throttle body-to-main body gasket make sure the correct gasket is used.

►*1958 LINCOLN & MERCURY ENGINE STALLING DURING WARM-UP CORRECTION:* If automatic choke opens too early, causing engine stalling, install choke thermostat housing, Part No. EDG-9848-B, identified by "58L2" cast in raised letters in center of bakelite cover. Adjust automatic choke setting so cover is centered (at index).

►*1958 LINCOLN & MERCURY THROTTLE LEVER AND SHAFT ASSEMBLY PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE (To minimize deflection of throttle lever stop and improve engine idle stability):* New throttle lever and shaft assemblies, Part Nos. 5751508 (B7A-9510-B Carb.), No. B8A-9581-D (EDJ-9510-A & EDG-9510-D Carbs.) are being used in production and can be used for service replacement. When installing the later type assemblies be sure the return spring is under tension with the inner tang resting on top of throttle body boss.

►*1958 RAMBLER AIR LEAKAGE AT THROTTLE BODY-TO-INTAKE MANIFOLD CORRECTION:* This condition may be indicated by rough engine operation, constant throttle surge, or by abnormal automatic transmission operation. To correct, install an additional gasket between throttle body and spacer.

►*1959 FORD PASS. CAR 332" ENG. AUTOMATIC CHOKE MALFUNCTION CORRECTION (Carburetor No. B9A-9510-A with Date Code "801"):* Poor engine performance may be caused by improper choke housing, Part No. B8A-9849-C (identified by numbers 34R-1523-B cast on back surface of housing directly below fast idle cam bushing) being installed. To correct the condition, set thermostatic coil housing 1 or 2 notches rich, or install choke housing, Part No. B7A-9849-B, which can be identified by numbers 34R-1523-B cast inside choke housing above center bushing. *NOTE - Carburetors with date code "801" which have been corrected in production have a daub of white paint on thermostatic coil cover.* The choke piston for Part No. B8A-9849-C is .510" O.D. Choke piston for B7A-9849-B is .477" O.D.

►*1959 FORD COLD DRIVEAWAY ACCELERATION (IN COLD WEATHER) CORRECTION:* Align lower (No. 2) hole in accelerating pump cam with lower (No. 2) hole in throttle lever and install the screw in lower holes.

►*1959 EDSEL & MERCURY IMPROPER RETURN TO IDLE SPEED NOTE (AUTOMATIC TRANSMISSION CARS):* This condition is due to improperly adjusted carburetor throttle rod. *See "Throttle Linkage Adjustment" on car model pages.*

DESCRIPTION: **2-Barrel Carburetor** - New design dual downdraft type with automatic choke consisting of a main body, throttle body, and a side mounted (on main body) fuel bowl and metering block assembly. The automatic choke is mounted on main body and is connected to choke valve shaft by a connecting rod. The accelerating pump is mounted in bottom of fuel bowl and is connected to throttle shaft by a bellcrank arm and lever. A power valve located in main body is controlled by vacuum and actuated by a power valve spring.

4-Barrel Carburetor - New design downdraft type with automatic choke. This carburetor is similar to the 2-Barrel (above). On the primary side there is an idle system, main fuel system, accelerating pump system, power system and choke system. The secondary side has an idle system, main fuel system and a power system. Throttle valves on secondary side are operated by a vacuum diaphragm.

►*1958 CARBURETOR CHANGES: 1957 and 1958 carburetor models are the same except as noted below:*

Fuel Inlet Needle Valve (Pass. Cars Exc. Rambler) - New type needle valves are solid steel. The former spring loaded actuating pin has been discontinued.

Idle Discharge Passage (Pass. Car 4-Barrel Carbs.) - An idle discharge passage to secondary throttle bores, just below the throttle plates, has been incorporated to provide a small amount of fuel during idling from secondary metering system.

Depopper Valve (Trucks) - On 4-Barrel carburetors, the former air bypass type depopper has been replaced by a fuel enrichment type depopper valve which is similar in appearance to the economizer (power) valve.

Secondary Economizer (Pass. Cars Exc. Rambler) - On 4-Barrel carburetors, the economizer (power valve) formerly used on the secondary side has been eliminated.

►*1959 CARBURETOR CHANGES: Carburetor models are the same as 1958 models except as noted below:*

External Fuel Level Adjustment (Rambler) - Fuel inlet valve has been changed to include an adjusting nut and a lock screw to provide for fuel adjustment without removal of fuel body assembly.

►*1960 CARBURETOR CHANGES: Carburetor models are the same as 1959 models except as noted below:*

External Fuel Level Adjustment (Rambler) - Same as for 1959 models (except Rambler). See above.

Fuel Bowl Level Balance Tube (Ford Truck & Dodge) - This tube connects primary and secondary fuel bowls and balances the fuel level between the two bowls.

"Cross-Over" Type Automatic Choke (Dodge) - This type automatic choke is a separate unit located in a well in intake manifold (in exhaust cross-over passage) and is linked to choke valve lever by a connector rod. Choke vacuum piston is located in a cylinder in carburetor main body and is linked directly to choke valve.

ADJUSTMENTS: *See "Fast Idle" below for Cold Engine idle speed setting.*

Idle Mixture Setting: *NOTE - Idle mixture screws are on primary side (Exc. Ford Truck), secondary side (Ford Truck).* Initial adjustment is 1½ turns open (Edsel, Ford, Lincoln); 1¼ turns open (Mercury), 1 turn open (Dodge & Rambler) from a lightly seated position. With engine at normal operating temperature, transmission in "N" (Neutral), turn both screws in until engine runs rough from lean mixture, then turn screws out until engine rolls from rich mixture. Finally turn screws in just enough for smooth idling at highest engine RPM and highest vacuum. Reset engine speed to correct engine RPM (See "Idle Speed Setting" below).

Idle Speed (Hot Engine) Setting: *See "Fast Idle" below for Cold Engine Idle Speed Setting.* With engine at normal operating temperature, fast idle screw backed off so it does not touch fast idle cam, choke valve wide open, and transmission in neutral (Synchro-mesh), proper range (Auto, Trans. - see table below), adjust engine idle speed to correct RPM (see table below) by rotating throttle stopscrew on left side of carburetor.

HOLLEY 2 & 4-BARREL CARBURETORS (Cont.)

Accelerating Pump Over-Rid Adjustment: Hold throttle valves wide open and depress pump arm fully Distance between pump lever adjusting screw hex head and pump arm should be 015" (Exc Rambler 2–Barrel Carbs) To adjust hold hex nut stationary and turn screw on pump lever On Rambler 2–Barrel carburetors turn screw on pump lever until it just contacts pump lever, then tighten screw ¼ turn Check accelerating pump to make sure that when throttle lever starts to move that pump lever also starts to operate *NOTE – One-half turn of adjusting screw is equivalent to 015" vertically*

Accelerating Pump Str ke Adjustment: *NOTE – This is a seasonal setting on all models except Mercury On Mercury, the "Normal (Summer) Setting" should be used for both summer and winter*

Normal (Summer) S tting – Align upper hole in accelerating pump cam with upper (No 1) hole in throttle lever and install screw through upper holes *NOTE – This provid s minimum stroke*

Wint r S tting – Align lower hole in accelerating pump cam with lower (No 2) hole in throttle lever and install screw through lower holes *NOTE – This provides maximum stroke*

Fu l B wl V nt Setting (Pass Cars): *NOTE - Adjustment is made on primary side of 4-Barrel carburetors* With throttle valves fully closed, distance between top of fuel bowl and vent button should be as indicated in table below To adjust, bend vent arm of accelerating pump lever *CAUTION - Do not bend vent valve rod*

►*1957 4-BARREL CARBURETOR SECONDARY FLOAT SETTING NOTE See "1957 Holley 4-Barrel Carburetor Secondary Float Setting Note ' above*

►*1958 FORD FLOAT & FUEL LEVEL SETTING PROCEDURE CHANGE See "1958 Ford Float Bowl Production Change & Revised Float & Fuel Level Setting Procedure ' above.*

►*1958 FORD FUEL LEVEL & FLOAT LEVEL NOTE*

Dry float settings are no longer considered adequate The float level is properly adjusted when fuel is level with lower surface of carburetor bowl sight plugs at engine idle speed If fuel flows from sight plug openings, at idle speed, it will be necessary to adjust float level

Fuel Level· With floats properly adjusted, fuel level should be as shown in table below

Car Model	Primary	Secondary
1958 Edsel	① ½"	① ¾"
1959 Edsel	③	③
1957 Ford 2-Bbl	② ½"	
1957 Ford 4-Bbl	② ½"	② 5/8"
1958 Ford 292" Eng	③	
1958 Ford 332" Eng	① ½"	
1958 Ford 352" Eng	③	① ¾"
1959-60 Ford (All)	③	③
1960 Dodge	③	③
1958 Lincoln	½"	③
1957 Mercury	½"	② 5/8"
1958 Mercury	½"	③
1959-60 Mercury	③	③
1958-60 Rambler	½"	5/8"

① - Below centerline of main discharge nozzle
② - Below centerline of bowl cover (upper) screw
③ - Lower edge of sight plug opening

Fu l Lev l Adjustm nt (Carburet rs with Adjustable Typ Inlet N dl) - With car on level floor, bring engine to normal operating temperature, then remove air cleaner and stop engine Remove sight plug in end of fuel bowl (use container to catch fuel) The fuel level within fuel bowl should be at lower edge of sight plug opening (plus or minus 1/16") Adjust as follows

Fuel Level Too High - With engine stopped, loosen lockscrew on top of fuel bowl just enough to allow rotation of nut underneath *CAUTION - Do not loosen lockscrew or attempt to adjust fuel level with engine running* Turn adjusting nut ½ turn clockwise to lower fuel level below specifications Tighten lockscrew, then run engine to stabilize fuel level Check fuel level at sight plug hole If level is not below specified level, repeat above step With fuel level below specified level, turn adjusting nut in increments of 1/6 turn until correct fuel level is obtained *NOTE - 1/6 turn of adjusting nut will change fuel level at sight plug opening 3/64'* After each adjustment, start engine and stabilize fuel level before checking level

Fuel Level Too Low - Proceed as for "Fuel Level Too High" except that it will not be necessary to initially decrease fuel level below specifications

Fuel Level Adjustment (Rambler) - If there is no sight plug in end of float bowl, fuel level should be 1/2"±1/16" (Primary) 5/8"±1/16" (Secondary), as indicated on Fuel Level Gauge J-10193 To check fuel level, remove either lower bowl attaching screw and install Gauge J-10193 using the bowl screw to attach gauge to bowl Tighten screw just enough to prevent fuel leakage Start engine and insert a 6" depth gauge scale into cylindrical opening in plastic gauge until it contacts **center** of fuel in opening **This measurement is the actual fuel level.** Remove depth gauge and measure down the same distance from top of plastic gauge body on calibrated face of gauge If fuel level is not correct, correct fuel level as indicated above will be registered at end of 6" depth gauge

Fast Idle - On Engine (Except Ford Trucks): With engine at normal operating temperature and "Hot" (slow) idle speed properly adjusted, place choke valve in wide open position and turn fast idle adjusting screw until it just touches **low step** of fast idle cam (1957-58 models & 1959-60 Ford & Rambler), **high step** (1959--60 Edsel, Mercury & Dodge) On 1957-58 models & 1958-60 Ford & Rambler, back off adjusting screw ¼-½ turn

Ford Trucks - On 2-barrel carburetors, fast idle will be properly adjusted when engine hot idle speed is adjusted *On 4-barrel carburetors, with engine at normal* operating temperature and "hot" idle speed adjusted, place primary throttle valves in the closed position and check clearance between fast idle cam and head of fast idle screw The clearance should be 010- 015" If clearance not correct, remove governor housing and insert a 060" rod into hole in end of fast idle screw fitting to prevent it turning, then turn fast idle screw as necessary for desired clearance *NOTE - ¼ turn in or out will change clearance approximat ly 008"* Reinstall governor housing and check clearance between fast idle cam and head of screw

CONTINUED ON NEXT PAGE

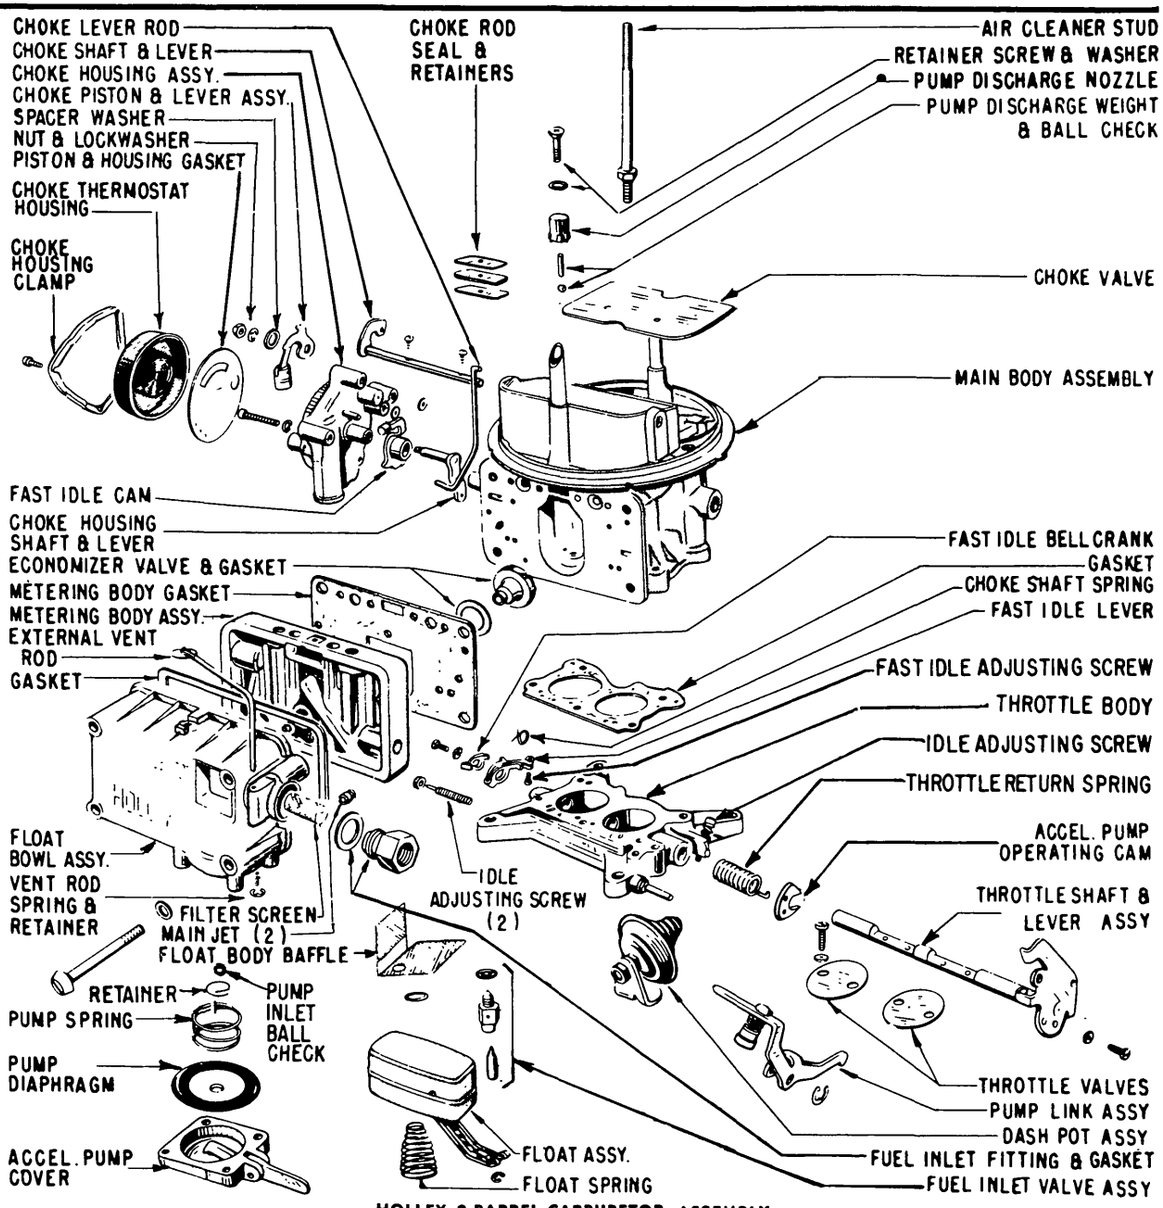
Form 41 3

HOLLEY 2 & 4-BARREL CARBURETORS (Continued)

Mercury (1960) - With choke valve wide open and throttle valves closed, adjust fast idle screw to obtain a clearance of .005-.008" between fast idle adjusting screw and lowest step of fast idle cam.

Automatic Choke Setting (Except Ford Trucks & Dodge): Loosen choke cover retaining clamp screws and rotate cover to align index mark on cover with correct mark on choke housing as indicated in table below.

Automatic Choke Setting



Car & Carb.	Choke Setting
1958 Edsel	Centered (On Index)
1959 Edsel	1 Notch Rich
1957 Ford	Centered (On Index)
1958 Ford	1 Notch Rich
1959 Ford	1 Notch Rich
1960 Dodge	©
1958 Lincoln	Centered (On Index)
1957-59 Mercury	Centered (On Index)
1958-59 Rambler	1 Notch Lean
1960 Rambler (2-Bbl.Carb.)	1 Notch Rich
1960 Rambler (4-Bbl. Carb.)	1 Notch Lean

© - "Cross-Over" type choke. See below.

Automatic Choke (Dodge): This automatic choke is separate "Cross-Over" type mounted in well in intake manifold (at cross-over passage) and linked to choke valve lever by a connector rod. Choke vacuum piston is located in cylinder in main body of carburetor and is linked to choke shaft lever. Choke setting is 1 notch rich. *See "Cross-Over Automatic Choke".*

OVERHAUL: Remove air cleaner anchor screw and lockwasher, and on 4-barrel carburetors, remove secondary diaphragm link assembly. On all carburetors, invert the carburetor and remove throttle body-to-main body screws and lockwashers, then lift off main body and remove throttle body gasket. Proceed as follows:

Disassembly (2-Barrel Carburetor): 1) Remove fuel inlet fitting, gasket, and screen, then remove fuel bowl retaining screws (fuel bowl, gasket, metering assembly and gasket will slide off the main body). Separate main metering assembly from fuel bowl and discard gasket. 2) Remove vent valve, idle adjusting screws and gaskets, and the power valve and gasket from metering assembly. Remove external vent linkage retainer and spring, then remove vent and linkage from fuel bowl. Remove accelerating pump cover assembly from fuel bowl, then remove diaphragm and spring. Remove float retainer, then lift float out of fuel bowl. Remove float spring and remove "O" ring seal from fuel valve seat assembly, then remove baffle plate. Remove fuel valve seat and let valve, spring, and pin fall into the hand. 3) Remove choke rod pin from choke housing shaft and lever assembly. Remove thermostat housing and gasket, then remove choke housing and gasket from main body. Remove nut, lockwasher, and spacer from choke housing shaft, then remove shaft and fast idle cam assembly. Remove choke piston and lever assembly. Remove choke rod pin from choke plate shaft lever. Remove choke rod, washers, and seal from main body. Remove choke valve from shaft, then slide shaft and lever out of choke housing.

HOLLEY 2-BARREL CARBURETOR ASSEMBLY

4) Remove pump discharge nozzle screw, then lift pump discharge nozzle and gasket out of main body. Invert main body and let pump discharge weight and ball fall into the hand.

5) Remove dashpot assembly (if so equipped), then remove pump operating lever retainer and remove pump operating lever. Remove fast idle pick-up lever and fast idle cam lever and spring. If it is necessary to remove throttle valve, lightly scribe both valves along the throttle shaft and mark each valve with a number or letter for proper replacement. Remove throttle valve screws and remove valves. Slide throttle valve shaft out of throttle body.

Disassembly (4-Barrel Carburetor): 1) From the primary side, remove fuel inlet fitting gasket, and screen, then remove primary fuel bowl retaining screws. Fuel bowl metering assembly and gaskets will slide off main body. Remove fuel line tubing and discard "O" ring seals.

CONTINUED ON NEXT PAGE

HOLLEY 2 & 4-BARREL CARBURETORS (C ntinu d)

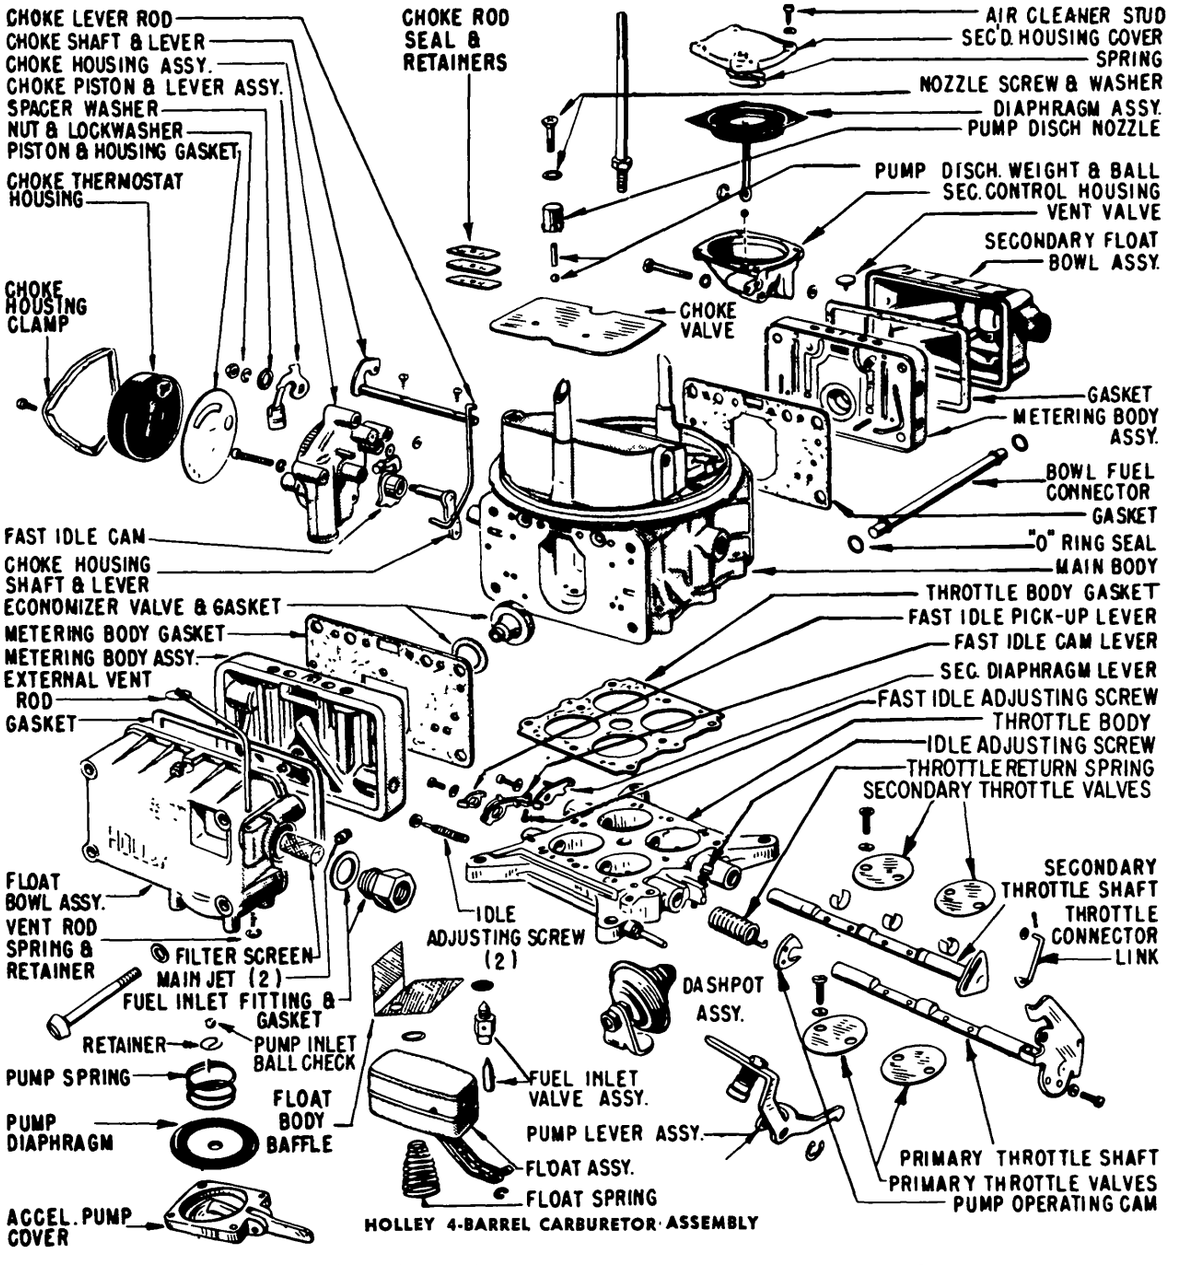
Separate main metering assembly from fuel bowl and discard the gasket then remove and discard main metering assembly gasket Remove vent valve. On passenger cars remove idle mixture adjusting needles and gaskets. Remove power valve and gasket and the jets from metering assembly. Remove external vent linkage retainer and spring then remove vent and linkage from fuel bowl Remove accelerating pump cover assembly then remove diaphragm and spring Remove float retainer then lift float and spring out of fuel bowl. Remove "O" ring seal from fuel valve seat assembly and remove the baffle plate. Remove fuel valve seat and let valve spring and pin fall out into the hand.

2) Remove secondary fuel bowl retaining screws and remove fuel bowl and metering block. Separate metering block from fuel bowl and discard gaskets. Remove vent valve and main jets from metering block.On trucks, remove main jets, fuel enrichment valve and gasket, and the idle adjusting needles and gaskets from metering block. On all models, slide baffle plate out of fuel bowl. Remove float retainer, then lift float and spring out of fuel bowl. Remove fuel inlet needle and seat.

3) Remove choke rod retainer from choke housing lever assembly. Remove thermostat housing and gasket, then remove choke housing and gasket from main body. Remove choke housing shaft nut, lockwasher and spacer, then remove choke housing lever and shaft assembly and fast idle cam assembly. Remove choke piston and lever assembly. Remove choke rod retainer from choke lever. Remove choke rod, washers and seal from main body, then remove choke valve from shaft and slide shaft out of choke housing.

4) Remove secondary diaphragm housing and gasket from main body. *(NOTE* - Housing must be removed before cover can be removed). Remove diaphragm housing cover, then remove spring and diaphragm from housing.

5) Remove pump discharge nozzle screw, then lift pump discharge nozzle and gasket out of main body. Invert main body and let pump check weight and ball fall into the hand.



6) Remove dashpot assembly (if so equipped), then remove pump operating lever retainer and pump operating lever. Remove secondary throttle connecting rod and washer. Remove secondary diaphragm lever assembly. Remove fast idle pickup lever and fast idle cam lever and spring. If it is necessary to remove throttle valves, lightly scribe valves along throttle shaft and mark each valve and its corresponding bore with a number or letter for proper installation then remove throttle plates. On the secondary side, remove the two throttle connecting rod retainers and washer. Slide throttle shafts out of throttle body. On primary throttle shaft, remove the throttle connecting rod and return spring.

Cleaning & Insp cti n (All Carbs.): Wash all parts except those noted below in clean solvent. *(CAUTION - Do not us solvent on accelerating pump diaphragm, power valve, secondary operating diaphragm, and dashpot).* Blow out passages in casting with air. Inspect all parts for wear or damage, with particular attention to the following: Inspect castings and main body cover for cracks or leaks, inspect main well tubes, metering jets and idle tubes for wear or clogged passages. *(CAUTION - Clean with air, do not use drills to clean calibrated openings).* Replace all worn or damaged parts.

R ass mbly (2 & 4-Barr l Carbs.): Use all NEW gaskets. Install parts in reverse order of disassembly procedure (above) and note the following important points.

Balance Tube (1960 Ford Truck & Dodge 4-Barrel Carbs.) - Install balance tube, "O" rings and washers so balance tube protrudes 1" from face of secondary metering body (Dodge). On Ford Trucks the balance

CONTINUED ON NEXT PAGE

HOLLEY 4-BARREL CARBURETOR ASSEMBLY

HOLLEY 2 & 4-BARREL CARBURETORS (C ntinu d)

tube should protrude equally from faces of primary and secondary metering bodies.

Throttle Valve Installation - Refer to line scribed on throttle valve at disassembly, and install valves in their proper location with the screws snug, but not tight. Little or no light should show between throttle valves and throttle bores. Tap valves lightly to seat them, then tighten the screws.

Accelerating Pump Ball Check - Seat ball with a brass drift and a light hammer. Make sure ball is free, then proceed with reassembly.

Seconadary Diaphragm Housing (4-Barrel Carbs.) - Install secondary diaphragm housing before installing the choke housing.

Carburet r Adjustm nts - Make all adjustments indicated. *S e "Adjustments" above.*

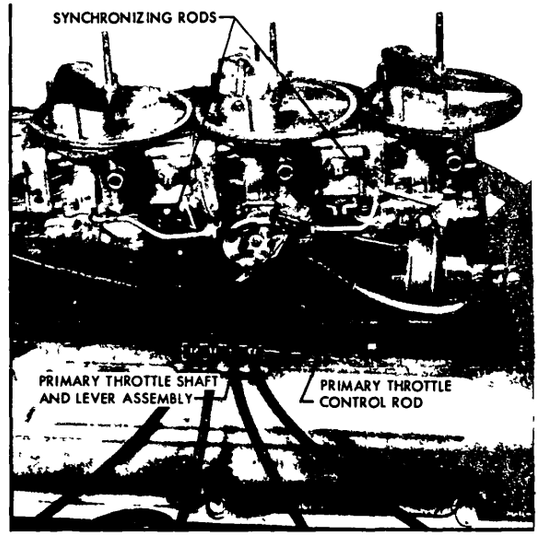
HOLLEY TRIPLE CARBURETORS

MERCURY (1958)	Carburetor No.
Front	5750613
Center	5750614
Rear	5750613

DESCRIPTION: Three Holley 2-Barrel Downdraft carburetors mounted in line on a special intake manifold are used, with the center carburetor having all the conventional carburetion circuits (Float, Idle, Power, Pump, and Choke). The front and rear carburetors have only a float circuit (fuel supply), power circuit, and a pre-calibrated non-adjustable idle metering system which supplies a portion of the idle fuel mixture required by the engine. Both the front and rear carburetors are operated by an externally mounted vacuum diaphragm assembly and connecting linkage. Vacuum for operation of front and rear carburetors originates in the right venturi of the center carburetor. Front and rear carburetors are also linked mechanically to the center carburetor and to each other for synchronization of operation. The linkage connecting the three carburetors moves in a slot in throttle lever on center carburetor which allows throttle valves in center carburetor to open without actuating front and rear carburetors except at wide open throttle.



ADJUSTMENTS (ON CAR): All adjustments are made on the center carburetor. *NOTE - It is important that all adjustments be made in the order indicated. If one of the idle adjustments is changed, other adjustments may be affected and should be checked.*

Idle Mixture Initial Adjustment: Turn each idle mixture screw in until it just touches seat, then back each screw out 1¼ turns.

Idle Mixture: With engine at normal operating temperature, turn fast idle speed adjusting screw out so it does not touch fast idle cam, then disconnect throttle linkage at both the front and rear carburetor (to make sure throttle valves are completely closed). Adjust engine idle speed to 500-525 RPM (transmission in neutral) with idle adjusting screw (throttle stopscrew). Turn one idle mixture screw in until engine begins to run rough, then back out same idle mixture screw until engine begins to "roll". Turn same idle mixture screw in just enough for smooth engine idle. Repeat this operation with other idle mixture screw. *NOTE - Final adjustment of idle mixture screws should favor "rich" side of mixture range.* If engine idle speed has changed, reset to 500-525 RPM with idle speed screw (throttle stopscrew), then adjust each idle mixture screw 1/8 turn in either direction for smoothest idle

Idle Speed (Hot Engine): 450 RPM (Automatic Trans.) with transmission in "Cruising Range". 500-525 RPM (Synchro-mesh Trans.). *NOTE - After idle mixture adjustment made, place transmission in "Cruising Range" (Automatic Trans.) and momentarily open throttle slightly and allow throttle to close. Engine idle should be approximately 450 RPM. If not adjust with idle speed adjusting screw (throttle stopscrew).*

Fast Idle (Cold Engine): With fast idle adjusting screw on high step of fast idle cam, adjust fast idle screw as required to obtain an engine speed of 1800 RPM.

CARBURETOR INSTALLATION — LEFT SIDE

Throttle Synchronizer Rod Adjustm nt: With throttle linkage disconnected at front and rear carburetors, loosen locknut on front synchronizer rod. Hold throttle of center carburetor in which open position, and hold throttle of front carburetor completely closed. Adjust synchronizer rod length so the end can be inserted in attaching hole in front carburetor throttle lever. **Sh rt n front synchronizer rod three c mpl te turns.** Install retaining clip on front carburetor throttle lever and connect synchronizer rod. Tighten locknut on rod. Loosen locknut on rear carburetor synchronizer rod, then hold throttle valves completely closed in both front and rear carburetors. Adjust length of rear carburetor synchronizer rod so the end can be inserted in rear carburetor throttle lever. Install retaining clip on throttle lever and connect synchronizer rod. Tighten locknut on rod. Hold center carburetor throttle wide open, then manually open and close front and rear carburetor throttles several times to assure free movement of linkage throughout entire length of slot in center carburetor throttle lever.

Dashpot: With idle mixture, idle speed and fast idle speed adjustments completed, loosen dashpot locknut. Hold dashpot plunger to limit of its travel, then rotate dashpot to obtain .067" clearance between dashpot plunger and center carburetor throttle lever. Use Gauge T109-234 (Mercury Tool 9545-B). Be sure throttle valve is closed so fast idle screw is against stop. Tighten locknut and recheck clearance.

REMOVAL: Remove each carburetor in the usual manner, starting with the front carburetor. *NOTE - This is necessary because of air cl aner flang ov rlapping fuel bowl on adjacent carbur tor.*

INSTALLATION: Reverse removal procedure, starting with rear carburetor. Alternately tighten each mounting nut, in a criss-cross pattern, to 12-15 ft. lbs.

OVERHAUL: Center Carburetor - *See "Holl y 2 & 4-Barr l Carbur tors".*

Fr nt & Rear Carbur tors: Except for removal & installation of parts not used on these carburetors, overhaul procedure is the same as for center carburetor.

ℂ - 272" ECW-Y Engine

►CHANGES, CAUTIONS, CORRECTIONS

►*1954 V8 239" ENGINE CARBURETOR PRODUCTION CHANGE & REPLACEMENT PARTS CAUTION:* Later carburetors (identified by "2" stamped on mounting flange opposite throttle lever) have different Nozzle Bars with bleed hole in idle crossover passage drilled through one wall only (nozzle bars on early carburetors have bleed hole drilled through both walls) Repair Kit, B4A-9590-F has two sets of Idle Jets and correct type should be used for each carburetor as follows **Early Carburetors** - Use Jet No EBU-9542-B (stamped "68") **Later Carburetors** - Use Jet No B4A-9542-A (stamped "54") below *See recommended correction following.*

►*1954 V8 239" ENGINE CARBURETOR STALLING CORRECTION & IMPROVED ECONOMY: See Production above.* To correct stalling on early carburetors, install new nozzles furnished in Nozzle Bar Replacement Kit No. B4A-9920-D in conjunction with Repair Kit No. B4A-9590-F. *CAUTION - Use Idle Jets stamped "54" with thin wall nozzles.* To improve economy and correct stalling, on all carburetors, install new Throttle Body furnished in Throttle Body Replacement Kit No B4A-9518-B

►*1954 CARBURETOR IDLE ADJUSTING NEEDLE PRODUCTION CHANGE & REPLACEMENT PARTS CAUTION:* Idle adjusting needle changed from 15° included angle tip to a 40° included angle tip New 40° needle can be used to replace former 15° needle in **pairs only.**

►*1956 HARD STARTING (272 Pass. Car Eng.)* New choke thermostat with new bi-metal spring, Ford No. B6A-9848 D (identification mark "56F1"), can be installed to replace choke thermostats with identification "56F" or "56D"

►*1956 ACCELERATOR PUMP PISTON ROD STICKING CORRECTION (272 Eng.)* When this rod sticks or binds, install new rod Ford No. B6A 9531-A, identified by deep blue color. Old rod was zinc plated. Free carburetor of burrs or foreign material when installing new rod.

►*HARD STARTING WHEN ENGINE HOT NOTE* Move pump link to shortest stroke position in throttle shaft plate.

►*HARD STARTING (Due to choke bind):* To correct binding condition check for bent choke shaft or shaft misaligned with choke plate on the choke shaft. If either condition found, replace air horn assembly. When choke plate operates hard manually and no binding exists, check automatic choke piston gasket. Slot must be properly aligned to permit choke plate to completely close.

►*1956 NOZZLE BAR CLEANING CAUTION:* Use only a solvent that will not affect rubber seals when cleaning bar assemblies.

DESCRIPTION

DESCRIPTION: Dual downdraft type with throttle operated accelerating pump and vacuum controlled economizer (power jet) 1954 and later models have a Spark Control Valve in throttle body consisting of a spring loaded diaphragm which controls opening of distributor advance control vacuum channel This valve remains open under normal operating conditions but closes under acceleration (with drop in manifold vacuum) cutting off manifold vacuum to distributor and retarding the spark advance The valve also closes when throttle is wide open

ADJUSTMENT

IDLING ADJUSTMENT

Idle Mixture - To start engine, turn screws in to bottom lightly, then turn screws out 1 turn. Run engine for 20 minutes at fast idle speed to bring it to normal operating temperature. Make sure fast idle cam is in slow position Turn each screw in equally until engine begins to run rough from lean mixture, then turn each screw out equally until engine begins to "roll" from rich mixture. Then turn each screw in an equal amount until engine runs smoothly. Always favor a rich mixture rather than a lean setting. *NOTE* - It may be necessary to reset idle speed after idle mixture adjusted.

Idle Speed Setting

Model	ℂ Idle Speed
1951 Synchro-mesh	475-500 RPM
1951-54 Fordomatic	440-460 RPM
1955 Fordomatic	450-475 RPM
1956-58 Fordomatic	475-500 RPM

ℂ - With transmission selector lever in "N" (Neutral)

►*1956-57 FORDOMATIC NOTE* After setting idle speed to correct specification (see above), with transmission in "N" (Neutral), place selector lever in "D" (Drive) and recheck idle speed Speed should be 425-450 RPM in "D" Readjust throttle stopscrew as necessary

ANTI-STALL DASHPOT

Setting - After idle speed adjusted (above), turn off ignition, loosen locknut on dashpot adjusting screw stud, turn screw out or counter clockwise until screw pushes dashpot rod up to the end of its travel, then turn screw in or clockwise 1½-2 turns and tighten locknut. This will provide correct clearance of .045-.064" between dashpot rod and adjusting screw (when rod bottomed in dashpot).

VACUUM SPARK CONTROL VALVE

No adjustment required Calibrating spring in valve is set to allow the valve to operate at 7-8" of manifold vacuum. If operation not satisfactory, remove and inspect valve for free movement of the valve stem and inspect passage in adapter screw.

ACCELERATING PUMP

Setting (Except B5A-9510-P, *See Note Below*) - Engage pump link in throttle shaft lever as follows Shortest stroke for hot weather, medium stroke for average conditions, and long stroke for cold weather operation.

►*B5A-9510-B CARBURETOR NOTE: The correct designation for this carburetor is B5A-9510-P.*

Setting (B5A-9510-P) - Accelerating pump links stamped "C" or "D" on side of body. Pump nozzles are identified by numerals "69" or "70" in top of nozzle. Set linkage as shown in table below.

B5A-9510-P Pump Setting

Transmission	Nozzle No.	Link Setting
Std & Overdrive	"69"	①#3 hole
Std & Overdrive	"70"	①#3 hole
Fordomatic	"69" or "70"	#2 hole

①—Farthest hole from shaft

ECONOMIZER (POWER VALVE)

Opens at 6-6½" (1951-54), 7.9-9.0" (1955-57) manifold vacuum No adjustment provided

FLOAT LEVEL

Fuel Level (1951-55) - Check fuel level with a sight indicator or other means Level should be 5/8"±1/32" below top edge of bowl.

Fuel Level (1956-57) - Install Tool T56L-9562-A in main jet plug holes. Operate engine at idle speed Fuel level should be at "LO" pins in gauge cap If not correct, remove carburetor air horn and set float level

Float Level - 1 275-1 305" (1951-55), 1.437-1.500" (1956-57) from lower face of bowl cover to bottom of float (at side of soldered seam) with needle valve closed To check float level, invert air horn and float assembly, place Float Gauge T52L-9510-AHD (1951-55), T56L-9550-A, (1956-57), squarely on gasket face of bowl cover with gauge leg extending over float adjacent to soldered seam *(CAUTION - Do not gauge top of seam)* "GO" end of gauge should just clear float. Adjust by bending tab on float arm which contacts intake needle *NOTE - Both ends of float should be gauged and adjusted for equal height.*

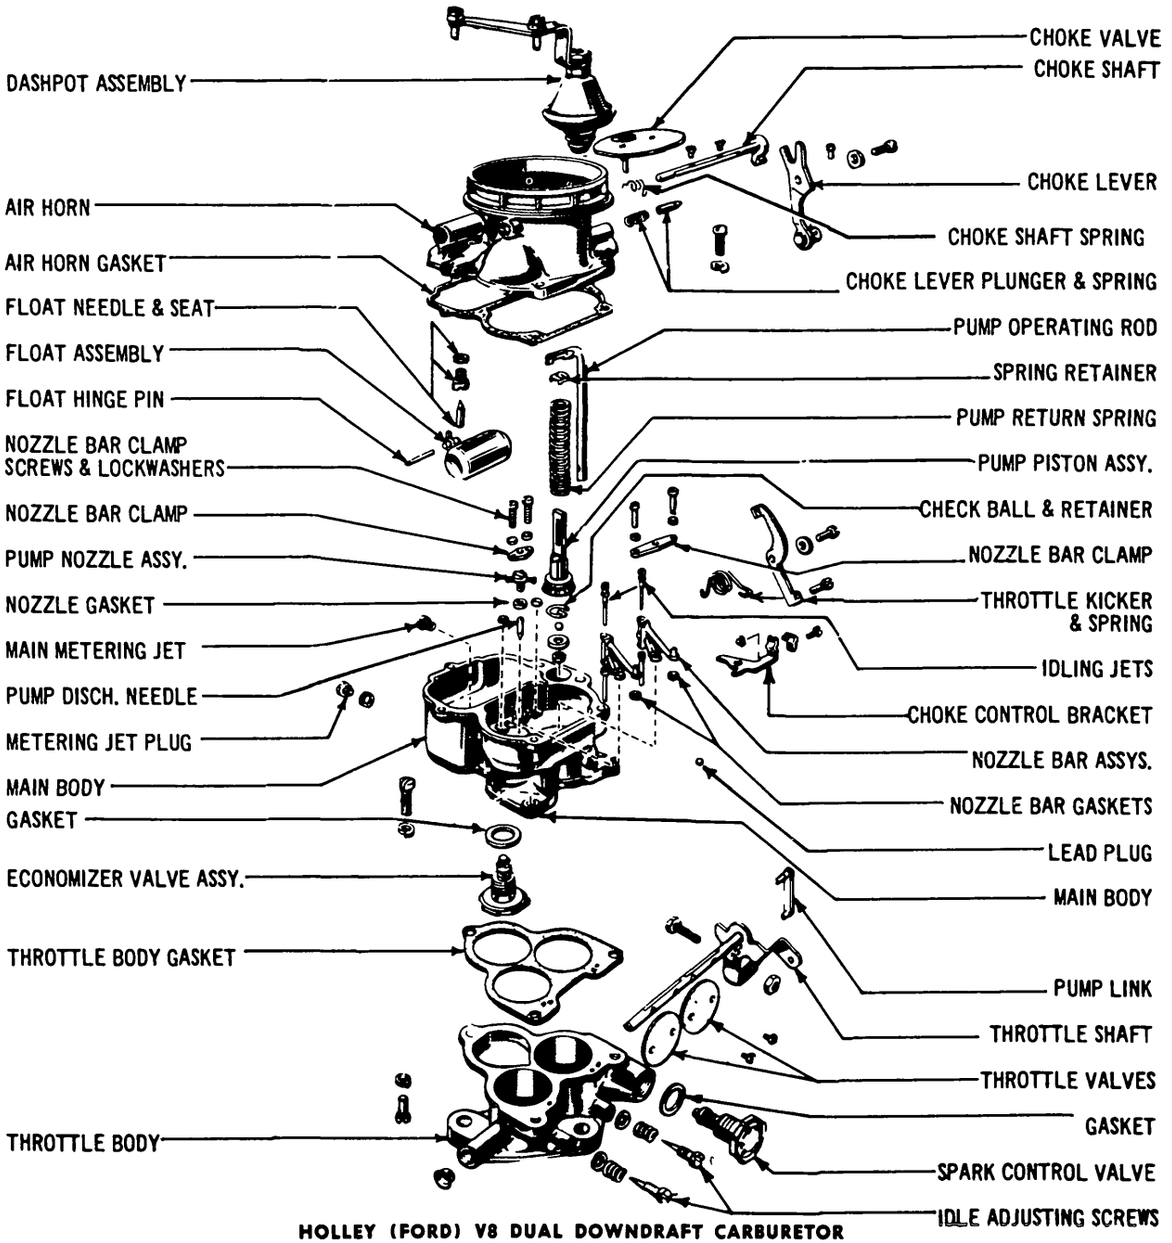
CONTINUED ON NEXT PAGE

HOLLEY (FORD) V-8 (C ntinu d)

OVERHAUL: Disassembly—Take out screw and flat washer attaching choke lever to air horn, remove lever, lift choke lever plunger and spring from air horn recess. Remove screw and washer attaching throttle kicker to main body, lift off throttle kicker and spring. Disconnect pump link from pump rod and throttle shaft lever and remove link. Take out throttle body attaching screws and remove throttle body gasket. Take out air horn attaching screws and remove air horn assembly and gasket.

Air Horn Disassembly—Take out float pivot shaft, remove float and inlet needle valve. Remove inlet needle valve seat. Do not remove choke valve unless parts replacement required. To remove valve, take out valve attaching screws, remove valve from shaft, slide choke shaft and lever assembly out.

Main Body Disassembly—Lift accelerating pump plunger assembly out. Remove attaching screws in each nozzle bar clamp, lift pump discharge nozzle and both nozzle bar assemblies out, remove gaskets. Invert body to drop out pump discharge needle. Remove access plugs and gaskets on side of body, use jet wrench T52L-9594-AAD to remove main metering jets. Remove pump inlet check ball retainer from bottom of pump cylinder, invert body to drop out the check ball. Remove idle jet tubes from both nozzle bar assemblies.



Throttle Body Disassembly—Remove both idle adjusting screws and springs. DO NOT remove throttle valves or disturb throttle assembly. *NOTE* Replace throttle body if valves or shaft worn.

Cleaning & Inspection: Clean all parts except Power Valve in cleaning solvent, make certain that all carbon deposits and gum or varnish completely removed, blow out all passages and make certain they are clean and not restricted. Inspect all parts for wear or damage. Replace throttle body if valves not snug fit or wear of looseness evident.

Reassembly: Use all NEW gaskets. Install parts in reverse order of disassembly procedure above and note the following important points:

Choke Valve Installation—Install choke shaft in air horn with tension spring properly positioned on shaft and engaged in slot in air horn so that valve will remain in closed position, install valve in shaft, install new screws loosely. Close valve and centralize it by tapping lightly, hold valve in position while tightening screws securely, stake screws. Check valve assembly for free operation. After air horn installed on main body, make certain that plunger and spring installed in air horn recess before installing choke lever.

"High Lift" Nozzle Bar Installation—Use two new gaskets for each nozzle bar, position nozzle bars in main body with high end of bar toward float bowl, install nozzle bar clamps, install nozzle bar clamp screws inserting the two **long** screws at the pump discharge side, tighten all screws evenly.

HOLLEY (FORD) V8 DUAL DOWNDRAFT CARBURETOR

►CHANGES & CORRECTIONS

►*1956 ACCELERATOR PUMP DISCHARGE NOZZLE DESIGN CHANGE & CAUTION:* Accelerator pump discharge nozzle pressed into main body recess and is locked in place with a pin. If nozzle becomes loose, replace the main body.

►*1956 HARD STARTING, ENGINE STUMBLING OR HESITATION DURING WARM WEATHER CAUTION:* During warm weather, the accelerator pump link should be placed in the hole in throttle shaft plate (hole nearest throttle shaft) giving the shorter stroke.

►*1957 CARBURETOR MODIFICATION TO ELIMINATE ENGINE PING (Carburetor No. B7A-9510-N):* To correct ping under load at low engine speeds, the following carburetor modifications should be made in addition to a distributor advance modification. *See 1957 Ford 6 Cyl. Pass. Car & Truck pages for distributor modification data*

1) Rework Distributor Vacuum Passages in Carburetor - With carburetor removed from engine, remove throttle body assembly *(see OVERHAUL below)*, remove wire retainer from lower end of distributor passage at mounting face of throttle body, remove nylon ball from passage *(CAUTION* - If ball sticks, dislodge ball by tapping throttle body on hand, DO NOT pound throttle body on bench which may mar mounting surface and prevent proper sealing when carburetor reinstalled). Drill out restriction at upper end of this vertical passage to .0585-.0605" using a No 53 drill. Working through distributor vacuum line connection hole, drill out restriction at inner end of horizontal passage to .051-.053" using a No. 55 drill *CAUTION* - Use extreme care to remove all drill chips from passages and mating surfaces of carburetor. Reassemble carburetor.

2) Main Metering Jet Change - Remove glass fuel bowl and install new Main Metering Jets as follows:

Main Metering Jet (New Sizes)

Altitude	Jet Size	Jet Part No.
0-5000 ft	069"	B7T-9533-A
5000-10000 ft.	.067"	B4C-9533-A
10000-15000 ft.	065"	5GA-9533-A

►*1958 CARBURETOR REPLACEMENT NOTE: Different distributors used which must be used with correct carburetor. See "Distributor" on Car & Truck model pages*

►*1958 SURGING & LEANNESS CORRECTION (EXC. B8A-9510-U): Install new main metering jet, No 1GA-9533 B (No 62) This jet used on B8A-9510-U Carburetor.*

►*METERING JET SPECIFICATION CHANGES: See "Holley (Ford) Downdraft Carburetor Jet Specifications" for production changes and latest jet specifications.*

DESCRIPTION: This carburetor has a very low over-all height, side opening glass fuel bowl, diaphragm type accelerating pump, and a special "Main Well & Power Valve Body" sub-assembly in which all of the calibrated metering parts (Main Jet, Power Valve, Pump Inlet and Outlet Check Valves and Fuel Inlet Valve) are mounted. This sub-assembly can be removed as a unit. Beginning with late 1956 carburetors, the Pump Discharge Nozzle was changed to a "pressed-in" type and cannot be removed If nozzle is loose, replace main body assembly. In 1957, the main fuel system was changed so main nozzle tube discharged into a booster venturi formed integrally with the choke valve. This booster venturi rotates with the valve and is turned across the air flow when choke valve is closed In 1958, the booster venturi was eliminated and the main nozzle discharged directly into main venturi.

ADJUSTMENTS: Make all adjustments exactly as follows

Idling Adjustment: If initial adjustment required to warm up engine, turn idle mixture screw in until lightly seated, then back screw out exactly 1 turn. Operate ending at fast idle until normal operating temperature reached (20 minutes for cold engine), then adjust as follows

Idle Mixture - With engine at normal operating temperature (choke valve wide open, fast idle inoperative), adjust idle speed (see below), turn idle mixture adjusting screw in until engine runs rough from lean mixture, then turn screw out until engine begins to roll from rich mixture, finally turn screw in just enough so that engine idles smoothly. This will provide a slightly rich mixture which is desired Recheck idle speed

Idle Speed - With engine at normal operating temperature so that throttle stopscrew resting on lowest point of fast idle cam (choke lever), adjust stopscrew for correct idle speed of 475-500 RPM (Synchro-mesh), 440-460 RPM (1952-54 Fordomatic), 450-475 RPM (1955 Fordomatic), 475-500 RPM (1956-58 Fordomatic) Transmission selector lever in "N" (Neutral) on Fordomatic models

►*1956-58 FORDOMATIC NOTE:* After setting idle speed with transmission in neutral, place selector lever in "D" (Drive) and recheck idle speed Speed should be 425-450 RPM in "D" Readjust throttle stopscrew as necessary

Antistall Dashpot (Fordomatic): After idle speed adjusted, check dashpot setting by depressing dashpot plunger fully with throttle valve closed. Clearance between end of dashpot plunger and adjusting screw on operating lever should be .045-.064". Adjust by loosening locknut and turning adjusting screw.

Accelerating Pump: Seasonal adjustment provided by two holes in throttle lever for pump link engagement
Inner Hole - Normal or hot weather (short stroke)
Outer Hole - Cold weather operation (long stroke)

Float Level: *NOTE* - Fuel level setting can be checked and adjusted with carburetor on engine, float level setting is a bench check when overhauling carburetor.
Fuel Level - 11/16" below power valve mounting surface To check fuel level, remove power valve diaphragm cover and valve assembly (adjacent to bowl), install gauge, Tool T52L-9550-AGE in this opening. Fuel in bowl should just touch "Low" gauge pin and should not touch "High" gauge pin If adjustment required, remove float bowl and install dummy bowl (with open top) using three of the regular retaining screws Adjust by bending float arm and recheck fuel level before installing regular bowl.
Float Level - With carburetor off engine and float bowl removed, invert carburetor, install special cardboard gauge (furnished in Repair Pkg) on edge of bowl at free

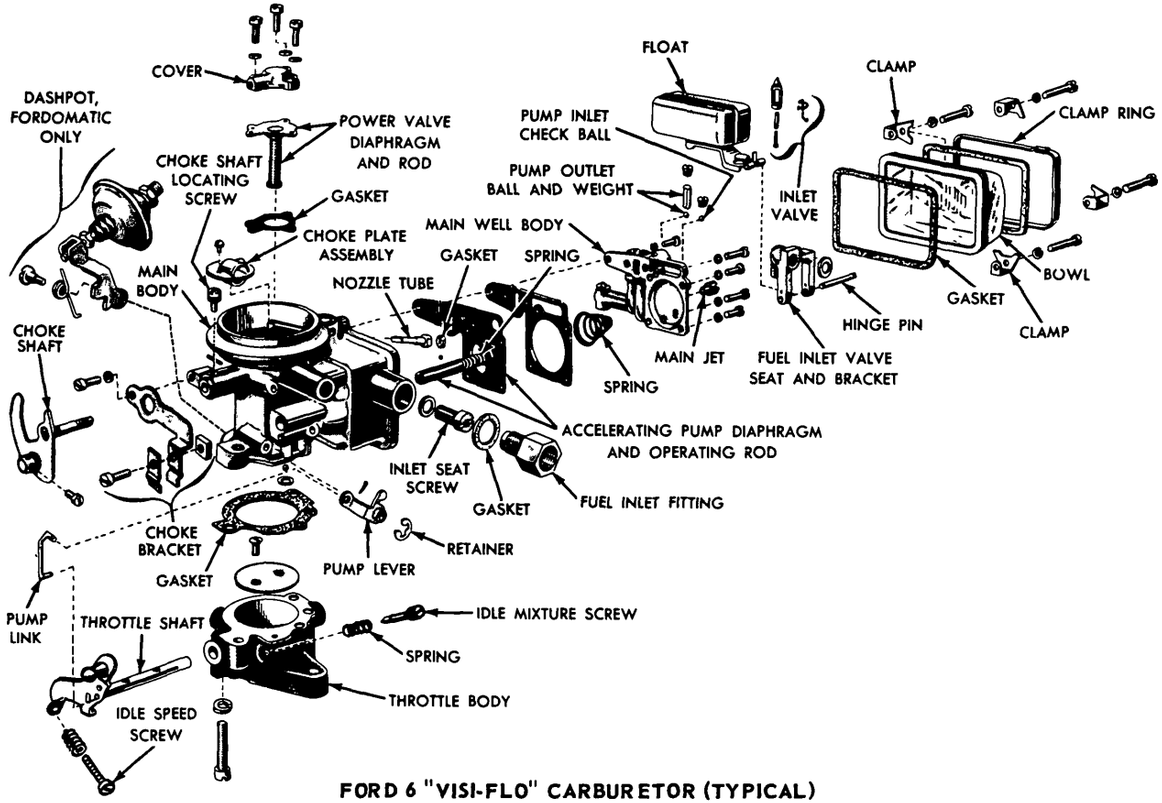
CONTINUED ON NEXT PAGE

1954-58 HOLLEY "VISI-FLO" (C nt.)

end of float. Lowest point on float should clear gauging leg. Adjust by bending float arm tab.

Power Valve: No adjustment provided. Power valve opens when manifold vacuum decreases to 9½-10".

Fast Idle: No adjustment required. Consists of a cam shaped section of the choke lever which serves as the stop for the throttle stopscrew.



OVERHAUL: With carburetor removed from engine, proceed as follows:

Disassembly: Disconnect and remove pump link. Take out two throttle body screws, lift off throttle body assembly, discard gasket. Remove fuel inlet fitting and gasket, remove dashpot assembly (if used). Take out float bowl retainer screws, remove retainer and clamps, retainer gasket, float bowl, and bowl gasket. Remove fuel inlet seat screw and gasket (in inlet passage), remove complete inlet valve and float assembly from within the main body, remove inlet seat gasket. Disassemble float by removing float shaft to free float, then remove wire clip, spring, and plunger from fuel inlet needle. Take out power valve diaphragm screws and lockwashers, lift the power valve diaphragm assembly out, separate the cover from diaphragm and stem assembly. Take out five main well screws and lockwashers, lift off main well assembly. Remove pump return spring from pump piston disc, remove spacer gasket, pull pump diaphragm out of main body. Remove pump operating lever retainer and slide lever off stud. Remove choke bracket screw and choke valve screw, slide choke shaft and lever assembly out, remove choke bracket. Slide main discharge nozzle out of opposite side of body, remove choke valve and booster venturi assembly. Invert main body, take out distributor passage ball retainer, remove ball from passage. Remove main metering jet, pump inlet and outlet check ball retainers from main well body, invert body to remove check balls (*CAUTION* - Balls are not same size, inlet ball is larger). Press pump rod sleeve toward diaphragm until sleeve retainer ball drops out, remove sleeve and spring. Remove idle mixture adjusting screw and spring, remove dashpot lever (if used). *NOTE* - If necessary to remove throttle valve, mark valve to insure correct reinstallation.

► *1954-EARLY 1956 CARBURETOR DISASSEMBLY NOTE:* Pump discharge nozzle in these carburetors is removable type and should be removed as follows: Remove pump discharge nozzle screw (visible at side of choke valve when looking down on carburetor), then lift discharge nozzle out. *Pump discharge nozzle in later carburetors is "pressed-in" type and must not be removed. If loose, replace main body assembly.*

Cleaning & Inspection: Soak all castings and metal parts (except dashpot) in cleaning solution or denatured alcohol. Blow out all passages and jets with air. Inspect all parts for wear or damage.

R ass mbly: Use all new gaskets. Install parts in reverse order of disassembly (above) and note the following important points:

FORD 6 "VISI-FLO" CARBURETOR (TYPICAL)

Choke Valve Assembly - Install choke bracket on main body, insert choke valve and booster venturi assembly in main body with poppet valve stem down, slide choke shaft and lever assembly in to engage valve, install choke valve screw loosely. Install main nozzle to engage opposite side of choke valve. Close choke valve and check for it being centered by holding main body up to a light (little or no light should show around edges of valve), tighten choke valve screw and check choke valve for free operation without binding. Install choke shaft locating screw and lockwasher.

Pump Assembly - Place pump operating lever on main body stud and install retainer on stud. Install spring on pump diaphragm rod, compress spring by pressing pump rod spring into rod, then drop retainer ball into hole in sleeve. Position pump assembly in main body (*CAUTION* - Make certain main nozzle gasket is in place on end of nozzle), place main well s pacer gasket over pump assembly. Install main well assembly (following).

Pump Discharge Nozzle (1952-Early 1956 Carbs.) - Use new gaskets on each side of nozzle, insert screw through grooved side of nozzle, allow nozzle to turn clockwise until stopped by edge of recess in main body when tightening the screw.

Main W ll Ass mbly - Install pump inlet and outlet check balls (*CAUTION* - Inlet check ball is larger), seat balls by using brass drift to tap ball gently down on seat, install inlet ball retainer and outlet ball weight and retainer. Seat large end of pump return spring in disc on pump diaphragm, insert main well attaching screws and lockwashers in body (*CAUTION* - Two longer screws are used in top and bottom center holes), then install main well body as follows: Apply pressure against protruding end of pump rod sleeve to fully compress pump return spring and at the same time press the main well body into position (*NOTE* - This will prevent spring pressure from disturbing alignment of pump diaphragm, spacer gasket, and main body). Tighten all five main well body screws before releasing pressure.

Float & Inlet Needle Valve Ass mbly - Assemble inlet valve parts and float on inlet valve seat (*CAUTION* - Needle must be clipped to float lever tab). Install gasket on inlet seat screw, insert screw in inlet fitting boss in main body, install seat gasket on end of screw protruding into fuel bowl. Set float assembly in position at end of screw, place float gauge under float hinge bracket and across lower corners or bowl mounting face to prevent assembly from tilting, tighten inlet seat screw

C NTINUED N NEXT PA E

1954-58 HOLLEY "VISI-FLO" (C nt.)

securely before removing gauge. Adjust Float Level using cardboard gauge furnished in repair kit *(see Float Level under ADJUSTMENTS).*

Fu l B wl Installation - Install new gasket in bowl recess of main body, assemble new gasket and retainer on bowl, position bowl on main body. Assemble clamps, screws, and lockwashers. Tighten two center screws first, and then the two end screws, alternately and evenly, to approximately 8-10 in. lbs. torque. *CAUTION* - Do not overtighten these screws which may crack the bowl.

Carburetor Adjustments - *Make all adjustments listed under ADJUSTMENT above.*

SERVICE PARTS: Gasket Sets - Ford No. B2A-9502-C (EAA-9510-D,E,G,H,L,M, EAG-9510-B,D, EBP-9510-A, B, B5A-9510-S,V, B8A-9510-M); Ford No. B7A-9502-C (B6A-9510-G,H, B6C-9510-A, B7A-9510-C, D, N, Y, B7C-9510-C); Ford No. B2A-9502-A (B7A-9510-C); Ford No. B8A-9502-C (B8A-9510-J,U, B8C-9510-B,C).

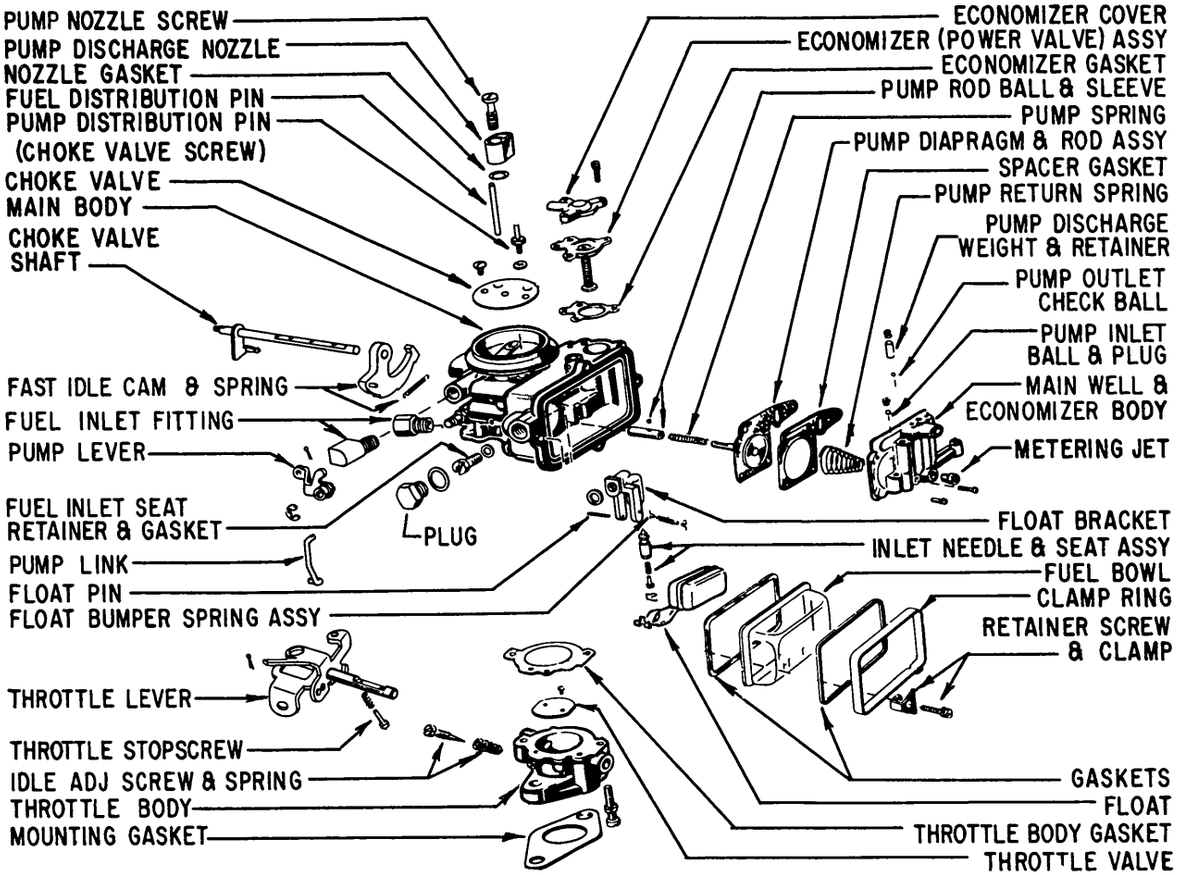
►CHANGES, CAUTIONS, CORRECTIONS



►*1959 EDSEL & FORD POOR ENGINE PERFORMANCE OR ROUGH IDLE* May be caused by blocked carburetor vacuum passage preventing proper distributor advance action Correct by cleaning out the horizontal passage extending from distributor vacuum line boss on side of carburetor to opening in venturi throat

►*1959 EDSEL POOR GASOLINE MILEAGE COMPLAINTS* If this complaint persists after engine has been tuned and all carburetor adjustments made as specified, the fibre pad and screen can be removed from beneath air cleaner cover This will reduce air restriction in cleaner

►*1959 EDSEL & FORD AUTOMATIC TRANSMISSION CAR CARBURETOR MAIN METERING JET CHANGE FOR IMPROVED ECONOMY* Main metering jet can be changed as listed below for improved economy on **automatic transmission cars only** *NOTE* - Carburetors code tagged "AAA9BC" or later have this new jet installed in production

Edsel & Ford 6 Main Metering Jet

Use	First Type Jet	Later Type Jet
0-5000 ft	62 (1GA-9533-B)	60 (1GA-9533-C)
5,000-10,000 ft	60 (1GA-9533-C)	58 (78-9533-F)
10,000-15,000 ft	58 (78-9533-F)	56 (78-9533-E)

HOLLEY "VISI-FLO" CARBURETOR (WITH MANUAL CHOKE)

►*1959 RAMBLER CHOKE SETTING CHANGE TO CORRECT STALLING OR ROUGHNESS DURING WARM-UP* Automatic choke should be set 1 Notch Rich (superseding original specification of "Centered") or, in some cases, 2 Notches Rich to correct above complaint *See Automatic Choke Setting below*

►*1960 COMET (MANUAL CHOKE CARBURETOR CARS) ROAD LOAD SURGE AT PART THROTTLE CORRECTION:* If proper engine tune-up procedures *(see "Part Throttle Surge Correction" under TUNE-UP on car model page)* do not correct the condition, proceed as follows

Synchro-mesh Transmission Cars - Replace spark control valve assembly with a new assembly marked No. 50 and a new spark valve gasket. Recheck operation of car and if surging still exists, install a **one size larger** main metering jet (No. 52 to No. 53).

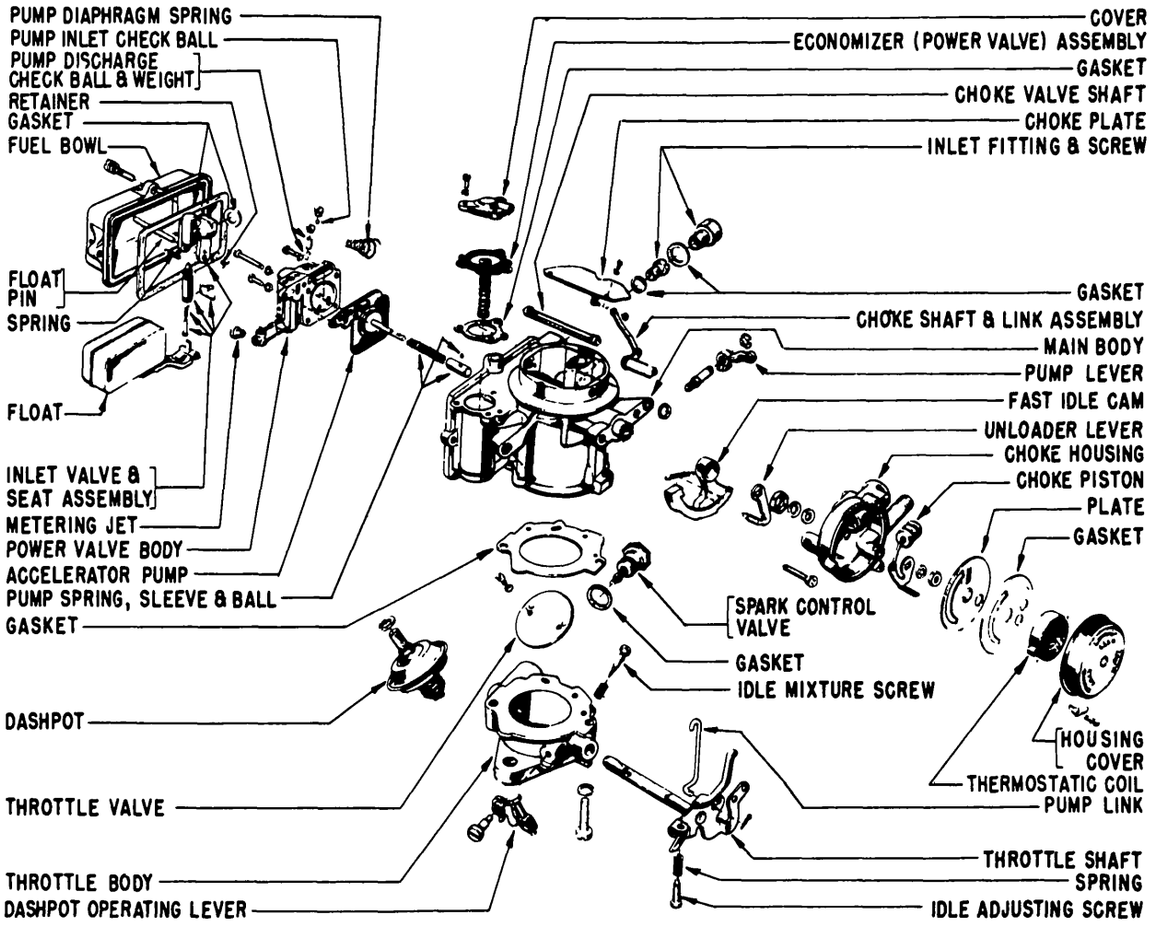
Automatic Transmission Cars - Replace main metering jet with a jet **one size larger** (No 51 to No. 52) Replace spark valve gasket. Automatic transmission carburetors that have been changed in production are identified by a daub of yellow paint on economizer cover or the letter "D" (or later) on carburetor code tag.

CONTINUED ON NEXT PAGE

1959-60 HOLLEY "VISI-FLO" CARBURETORS (C ntinu d)

►*1960 COMET HESITATION ON ACCELERATION CORRECTION:* This condition may be caused by accelerator pump plunger sticking in bore. To correct, remove carburetor, then remove accelerator pump diaphragm and operating rod assembly. Clean plunger bore in carburetor body with cleaning solvent and a brush. *CAUTION - Plunger bore in carburetor body and the pump push rod sleeve have a protective coating. Do not try to increase bore by drilling or reaming and do not buff or polish push rod sleeve with emery cloth as coating will be destroyed.* Install a new pump pushrod sleeve, Part No. B8A-9934-A, then lubricate sleeve and bore in carburetor with two or three drops of lock lubricant (oil and graphite). After reassembly, wipe surplus lubricant from plunger and carburetor body.

►*1960 COMET (CARS WITH AUTOMATIC CHOKE) FAST IDLE SPEED REDUCTION PROCEDURE FOR HOT WEATHER OPERATION:* If normal fast idle speed is unsatisfactory (cars operating in warm temperatures), it may be reduced as follows: Remove carburetor air cleaner, then remove choke thermostatic coil housing attaching screw (on side opposite choke heat tube). Obtain an 8-32 fillister head screw 1 11/32" long, Part No. 31165-58, and cut it to a length of 1¼". Remove all burrs, then install housing clamp from original screw to new longer screw. With choke plate in closed position, install long screw in place of original screw and tighten securely. *NOTE - New screw will serve as a stop for fast idle cam, preventing it from reaching its former position.* Remove idle adjusting screw and file or grind approximately 1/16" off screw. Install screw and spring and turn it in until it contacts **second step** on cam. Adjust engine idle speed to specifications and install air cleaner. *NOTE - For cold weather operation, either remove long screw and install original screw, or "store" long screw by installing a ½" long sleeve, made from ¼" copper tube, between screw head and housing clamp (this will move end of screw away from fast idle cam and allow cam to rotate to first step). Readjust engine idle speed to proper specifications.*



►*1960 EDSEL MAIN METERING JET CHANGE (TO IMPROVE PERFORMANCE AT HIGH ALTITUDE):* See *"Holley Single Barrel (Visi-Flo) Jet Specifications".*

DESCRIPTION: Single barrel downdraft type with automatic choke (Rambler & Later Comet models), manual choke (all other models). Design is similar to 1954-58 carburetors and have the following features.

Main Fuel System (Except Comet Automatic Choke Carburetors) - Main nozzle tube is pressed into venturi wall directly below choke valve axis and discharges into a cutout section of choke valve. A fuel distribution pin (crosswise in choke valve shaft) extends into air stream and improves nozzle action.

Pump Discharge Nozzle (Except Comet Automatic Choke Carburetors) - Nozzle is a separate part mounted on upper ledge of venturi and retained by a special nozzle retainer screw.

Automatic Choke & Fast Idle (Rambler) - Automatic choke is a separate assembly mounted on the air horn (choke valve shaft extends into automatic choke housing and is directly linked to thermostatic coil and vacuum piston link). Fast Idle Cam is mounted on choke valve shaft (behind choke housing) and serves has a stop for the throttle stopscrew. No separate fast idle setting is required.

HOLLEY "VISI-FLO" CARBURETOR (WITH AUTOMATIC CHOKE)

Automatic Choke & Fast Idle (Comet Automatic Choke Carburetors) - Automatic choke is a separate assembly mounted on air horn with choke shaft linked to choke valve shaft within the air horn. Fast idle cam is mounted on choke shaft (behind choke housing) and serves as a stop for the throttle stopscrew. No separate fast idle adjustment is required. The automatic choke has a free floating type choke piston which opens the choke plate to a pre-determined opening for initial cold operation of engine. This opening is controlled by a piston stop located near bottom of piston bore.

Spark Control Valve (Comet, Edsel, Falcon & Ford Carburetors): This unit is a spring loaded diaphragm type valve located in the distributor control vacuum passage terminating at the throttle valve edge (manifold vacuum). The valve is normally open but closes momentarily during acceleration (when manifold vacuum drops) to prevent excessive distributor advance (second port terminating at the venturi provides vacuum to control distributor under these conditions). The valve also provides an intermediate distributor retard position under load conditions where normal spark advance would be too great and where wide open throttle spark retard is not required. No adjustment is provided.

Fuel Bowl - The glass bowl formerly used has been replaced with a metal bowl on some carburetors.

ADJUSTMENTS: Make all adjustments exactly as follows:

Idling Adjustment: If initial adjustment required to warm engine, turn idle mixture screw in until lightly seated, then back screw out 1-1½ turns (Comet & Falcon); ¾-1¾ turns (Edsel); ½-1½ turns (Ford); 1¼ turns (Rambler). Operate engine at fast idle until normal operating temperature reached, then adjust as follows:

Idle Mixture - With engine at normal operating temperature (choke valve wide open, fast idle inoperative), adjust idle speed (see below), turn idle mixture adjusting screw in until engine runs rough from lean mixture, then turn screw out until engine begins to roll from rich mix-

CONTINUED ON NEXT PAGE

1959-60 HOLLEY "VISI-FLO" CARBURETORS (Continued)

ture, finally turn screw in just enough so that engine idles smoothly. This will provide a slightly rich mixture which is desired. Recheck idle speed.

Idle Speed - With engine at normal operating temperature so that throttle stopscrew resting on lowest point of fast idle cam (choke lever), adjust stopscrew for correct idle speed as listed in table below. *NOTE* - On Fordomatic cars, set hand brake to hold car and place selector lever in Neutral, then recheck idle speed with selector lever in Drive "D" position. *See Fordomatic Note below.*

Idle Speed Setting

Car Model	Engine RPM S.M. Trans.	Auto. Trans.
1960 Comet	500-525	①500-525
1959 Edsel (Std.)	475-500	450
1959 Edsel (Air Cond.)③	500-525	①450-475
1960 Edsel	475-500	①⑨450
1960 Falcon	500-525	①475-500
1959 Ford Pass. Cars	475-500	②475-500
1960 Ford Pass. Cars	475-500	①450-475
1959 Ford Trucks	475-500	②475-500
1960 Ford Trucks	475-500	①450
1959-60 Rambler (Std.)	550	⑤475
1959 Rambler (Air Cond.)③	550	⑤500
1960 Rambler (Air Cond.)③	500	⑤500

① - Transmission in "D" (Drive) Range.
② - Transmission in "N" (Neutral) Range. *See Fordomatic Not below.*
③ - Air Conditioner turned ON.
⑨ - See note following for roughness correction on 1960 models.
⑤ - Transmission in "N" (Neutral) Range.

►*1960 EDSEL 6 CYL. ROUGHNESS OR VIBRATION (Auto. Trans. Cars):* If roughness or vibration noted when idling in "D", tailor the idle speed to the individual car as follows: Set parking brake, place selector lever in "D", then adjust idle speed until roughness and vibration are eliminated or improved. Idle speed may vary between 475 and 525 RPM

►*1959 EDSEL DASHPOT PRODUCTION CHANGE NOTE: Two different dashpots used in production which are adjusted differently. For identification see Car Model pages.*

►*1960 FALCON DASHPOT ADJUSTMENT SPECIFICATION CHANGE:* The dashpot adjustment on early cars with Accelerator Retracting Spring, Part No. CODD-9737-C identified by 35¾ coils and an O.D. of .68", is different than for later cars with spring, Part No. CODD-9737-D identified by 22¼ coils and an O.D. of .80". *See "Dashpot Adjustment" below.*

Anti-Stall Dashpot (Cars & Trucks with Automatic Transmission, Except Rambler): With idle speed properly adjusted, check dashpot setting by depressing plunger fully with throttle valve closed. Clearance between end of plunger and adjusting screw should be as indicated in table below. Adjust by loosening locknut and turning adjusting screw.

Car Model	Dashpot Specification	Clearance
1960 Comet		130-.150"
1959 Edsel (Early)①		045-.064"
1959 Edsel (Late)②		060-.090"
1960 Edsel		.060-.090"
1959 Ford Pass Cars		.045-.064"
1960 Ford Pass Cars		.060-.090"
1959-60 Ford Trucks		.045-.064"
1960 Falcon (Early)③		.060-.090"
1960 Falcon (Late)③		.130-.150"

① - See "Edsel Dashpot Production Change" above.
③ - See "Falcon Dashpot Adjustment Specification Change" above

Accelerating Pump: Seasonal adjustment provided by two holes in throttle lever for pump link engagement:
Inner Hole - Normal or hot weather (short stroke).
Outer Hole - Cold weather operation (long stroke).

Float Level: *NOTE* - Fuel level setting can be checked and adjusted with carburetor on engine, float level setting is a bench check when overhauling carburetor. Fuel level should be checked after carburetor reinstalled on engine.

Fuel Level - *See table below for fuel level and checking gauge.* To check fuel level, remove Power Valve diaphragm cover and valve assembly. Install checking gauge in this opening and crank engine to fill bowl. Fuel in bowl should touch "Low" gauge pin and should not touch "High" gauge pin. If adjustment required, remove float bowl and install dummy bowl (with open top) using three of the regular retaining screws. Adjust by using bending tool to bend float arm tab, recheck fuel level before installing regular bowl.

RAMBLER NOTE - Use scale inserted through power valve mounting hole to measure fuel level.

Fuel Level Setting

Car Model	① Fuel Level	Checking Gauge
Comet	23/32" ± 1/32"	9550-AE-4
Edsel	11/16" ± 1/32"	9550-AA-3
Falcon	23/32" ± 1/32"	T52L-9550-AEE
Ford (All)	11/16" ± 1/32"	T52L-9550-AEE
Rambler	23/32" ± 1/32"	Use Scale

① - Below mounting surface of power valve.

Float Level - *This is a bench check and Fuel Level should be checked after carburetor has been reinstalled on engine.* On all models, (Except Rambler) use float gauge furnished in repair package (see table below). On Rambler, use Float Gauge, Holley No. J-10-194 for spring loaded intake needle valve, and Holley No. 1-10-180 for solid intake needle valve. With bowl removed and carburetor inverted, install gauge as follows: On all models except Rambler, place gauge on edge of bowl mounting flange at free end of float. Lowest point on float should clear lower leg of gauge. On Rambler, adjust float bumper spring tab so that end of float is 3/16" from floor of fuel bowl (carburetor in an upright position). Install float gauge, attaching it to bowl attaching bolt holes. With carburetor inverted, check setting on both the "touch" and "no touch" legs of float. Adjust by bending small tab in float lever that contacts head of fuel inlet needle.

Fuel at Level Setting

Car Model	① Fuel at Level	Checking Gauge
Comet	.160-.191"	MC-157
Edsel	.188-.218"	9590-1
Falcon	.160-.191"	MC-157
Ford (All)	.188-.218"	MC-157
Rambler ②		J-10-180
Rambler ③		J-10-194

① - Carb. inverted. Distance from roof to lowest point of float.
② - With solid needle valve.
③ - With spring loaded needle valve.

Power Valve: *NOTE - Used on all carburetors except Ford Taxi (Special Economy). No adjustment provided.* Power valve opens when manifold vacuum drops to 6-7".

Spark Control Valve (Except Rambler Models): Spark control valve is not adjustable.

Automatic Choke (Rambler & Later Comet Models): Adjust by loosening cover retaining screws and rotating choke cover and thermostatic coil assembly. Choke should be set at index. *NOTE - On Comet models, do not vary choke setting more than two notches in either direction from index.*

Fast Idle: No adjustment required. Fast idle speed will be correct when hot (slow) idle speed properly set. *NOTE - On Comet models, if fast idle speed is not satisfactory in high temperature operation, see "Fast Idle Speed Reduction Procedure" above.*

Unloader (Rambler & Later Comet models with Automatic Choke): With throttle valve in wide open position and with choke valve closed against unloader lever, clearance between edge of choke valve and wall of air horn should be ¼" (Comet), 7/16" (Rambler). To adjust, bend unloader tab on throttle lever.

OVERHAUL: With carburetor removed from engine, proceed as follows:

Disassembly: Disconnect and remove pump link. Take out two throttle body screws, lift off throttle body assembly, discard gasket. Remove fuel inlet fitting and gasket, remove dashpot assembly (if used). Take out float bowl retainer screws, remove retainer and clamps, retainer gasket, float bowl, and bowl gasket. Remove fuel inlet seat screw and gasket (in inlet passage), remove complete inlet valve and float assembly from within the main body, remove inlet seat gasket. Disassemble float by removing float shaft to free float, then remove wire clip, spring, and plunger from fuel inlet needle. Take out power valve diaphragm screws and lockwashers, lift the power valve diaphragm assembly out, separate the cover from diaphragm and stem assembly. Take out five main well screws and lockwashers, lift off main well assembly. Remove pump return spring from pump piston disc. Remove main metering jet from main well and economizer body. Take out pump inlet and discharge check valve retainers, invert main well and economizer body to drop out the pump inlet check valve ball, discharge valve weight, and discharge check valve ball (*CAUTION* - Balls are not same size and must not be interchanged). Remove and discard spacer gasket. Remove accelerating pump assembly from main body. Invert pump assembly and press pump rod sleeve toward diaphragm to compress pump spring which will allow sleeve retainer ball to drop out. Slide pump rod sleeve and spring off diaphragm rod. Pump diaphragm

CONTINUED ON NEXT PAGE

1959-60 HOLLEY "VISI-FLO" CARBURETORS (C ntinued)

and rod assembly should be discarded and new part used when reassembling carburetor. Remove pump operating lever retainer, slide pump operating lever off stud. On Rambler & Comet models with automatic choke, disassemble automatic choke assembly *(see Note below)*. On all models, if necessary to remove choke valve assembly, remove bowl vent tube and scribe a line on upper surface of choke valve to insure installation in same position. Support choke shaft by placing a length of brass tubing over fuel distribution pin (if so equipped) on underside of shaft, then drive pin down and out of shaft into tubing. *CAUTION - Use correct size flat tip punch to avoid damaging pin and shaft.* Remove choke valve screws, slide choke valve out, remove choke shaft. Take out pump discharge nozzle screw and remove nozzle and gasket. Remove idle mixture adjusting screw and spring. If necessary to remove throttle valve and shaft, scribe valve lightly to insure, correct reassembly. *CAUTION - Do not attempt to remove main nozzle, or any of the pressed in passage plugs or air bleed plugs.*

► *COMET & RAMBLER AUTOMATIC CHOKE DISASSEMBLY NOTE:* To disassemble the automatic choke, take out cover retaining screws, remove cover and thermostatic coil assembly, gasket, and heat retainer plate. Remove piston lever retaining nut from end of shaft, take out choke housing mounting screws, lift off choke housing and piston assembly. Remove vacuum piston and link from choke housing. Remove felt shaft seal and washer from end of choke shaft. For choke shaft removal, see regular disassembly data above.

Cleaning & Inspection: Clean all carburetor parts (ex cept Dashpot, Spark Control Valve, and power valve or pump diaphragms) in cleaning solution or alcohol, rinse parts in hot water, and dry with compressed air. Blow out all passages and jets with air. Inspect all parts for wear or damage. If throttle shaft worn and loose, or binding in body, replace throttle body.

Reassembly: Use all new gaskets, seals, and diaphragms. Install parts in reverse order of disassembly (above) and note the following important points:

Choke Valve Assembly - On models with manual choke, position choke bracket on main body but DO NOT install bracket screw. On Rambler, assemble fast idle cam on choke shaft and install fast idle cam spring. Install choke shaft in main body and insert choke valve with scribed line in correct position. Install distribution pin (if so equipped) by driving pin in. *CAUTION - Support shaft by length of brass tubing beneath shaft.* Clearance between each end of pin and venturi must be equal with choke valve wide open. Install choke valve screws. *CAUTION* - On Rambler, brass screw with pump discharge distribution pin is installed on pump nozzle side of venturi. Check choke valve for binding by moving it from closed to open position, then tighten screws with valve closed and stake the screws in place. Install bowl vent tube. On models with manual choke, install choke bracket screw. On automatic choke carburetors, install automatic choke as follows:

Automatic Choke (Rambler & Later Comet Models) - Install washer and felt seal on choke shaft, then install choke housing gasket and housing, tighten housing retaining screws. Install choke piston and lever assembly, engaging lever on end of choke shaft, then tighten retaining nut. Install heat retainer plate and gasket. Install cover and thermostatic coil assembly. *CAUTION - Make sure lug on piston lever engages loop of thermostatic coil.* Center automatic choke on index and

Pump Discharge Nozzle Installation - Install pump discharge nozzle with a new gasket. Insert nozzle discharge screw on side of nozzle having deep grooved surface. *NOTE - Screw has drilled passage for pump discharge terminating at the relieved section under screw head.* Tighten screw only finger tight. After carburetor installation on engine, check and adjust nozzle aim. On all models except Rambler, nozzle should discharge into cutout section of choke valve when choke valve is closed. On Rambler, nozzle should discharge directly at brass pump distribution pin on choke valve. When nozzle correctly positioned, tighten nozzle screw.

Accelerating Pump Assembly - Place pump operating lever on stud on main body (on all models except Rambler, install brass washer and return spring on stud under lever, engage long spring tang in hole in body, and short tang over lever), install retainer. Place spring on pump discharge rod, compress spring by pressing rod sleeve on rod, drop retainer ball into hole in sleeve and make sure it engages slot in rod. Position pump assembly in main body, place main well spacer gasket over pump assembly. Install main well assembly.

Main Well Assembly -Install pump inlet and outlet check balls *(CAUTION* - Inlet check ball is larger), seat balls by using brass drift to tap ball gently down on seat, install inlet ball retainer and outlet ball weight and retainer. Seat large end of pump return spring in disc on pump diaphragm, insert main well attaching screws and lockwashers in body *(CAUTION* - Two longer screws are used in top and bottom center holes), then install main well body as follows: Apply pressure against protruding end of pump rod sleeve to fully compress pump return spring and at the same time press the main well body into position *(NOTE* - This will prevent spring pressure from disturbing alignment of pump diaphragm, spacer gasket, and main body). Tighten all five main well body screws before releasing the pump rod sleeve pressure. *(NOTE* - On Rambler, tighten screws only finger tight without compressing lockwashers, then release the pump rod sleeve which will stretch the pump diaphragm properly, tighten screws evenly).

Float & Inlet Needle Valve Ass mbly - Assemble inlet valve parts and float on inlet valve seat *(CAUTION* - Needle must be clipped to float lever tab). Install gasket on inlet seat screw, insert screw in inlet fitting boss on main body, install seat gasket on end of screw protruding into fuel bowl. Set float assembly in position at end of screw, place float gauge under float hinge bracket and across lower corners or bowl mounting face to prevent assembly from tilting, tighten inlet seat screw securely before removing gauge. Adjust Float Level using cardboard gauge furnished in repair kit *(se Float Level under ADJUSTMENTS).*

Fuel Bowl Installation - Install new gasket in bowl recess of main body, assemble new gasket and retainer on bowl, position bowl on main body. Assemble clamps, screws, and lockwashers. Tighten two center screws first, and then the two end screws, alternately and evenly, to approximately 8-10 in. lbs. torque. *CAUTION* - Do not overtighten these screws which may crack the bowl.

Carburetor Adjustments - *Mak all adjustm nts list d under ADJUSTMENT above.*

SERVICE PARTS: Gasket S ts - Comet & Ford Part No. CODZ-9502-A (CODE-9510-A,B,C,D), Comet Part No. C1KY-9502-A (C1KE-9510-A,B); Edsel & Ford Part No. B8A-9502-A (B9A-9510-F); Edsel Part No. 58EK-9502-A (COAE-9510-E,G,U,Z); Ford Part No. B9AE-9502-A (B9AE-9510-A), Ford Part No. B8A-9502-C (COAE-9510-U,Z).

Repair Kits - Comet & Ford Parts No. CODZ-9590-A (CODE-9510-A,C), Comet Part No. C1KY-9590-A (C1KE-9510-A,B), Comet & Ford Part No. CODZ-9590-B (CODE-9510-B), Comet & Ford Part No. CODZ-9590-C (CODE-9510-D), Edsel & Ford Part No. B8A-9590-A (B8A-9510-F), Edsel & Ford Part No. COAZ-9590-E (COAE-9510-E,G,U); Edsel & Ford Part No. COAZ-9590-F (COAE-9510-Z); Ford Part No. COAZ-9590-K (COAE-9510-Y); Ford Part No. B2AZ-9590-A (COTE-9510-S), Holley Part No. 85-981 (R-2166-A, R-2168-2), Holley Part No. 85-642 (R-1598-1A), Holley Part No. 85-964 (R-1598-2A).

1954 LINCOLN-MERCURY 4-BARREL "CENTRI-QUAD"

LINCOLN	Carburetor No.
1954 Early	EAD-9510-N
1954 Later	⑤ED-EAD-9510-S
MERCURY	
1954 Synchro-mesh	EBY-9510-G
1954 Mercomatic	EBY-9510-H
1954 Later Cars	⑤ED-EBY-9510-K

⑤—These carburetors have new Cover with revised External Vent system to correct fuel spill-over on sharp turns. *See Fuel Spill-over Correction below.*

►CHANGES, CAUTIONS, CORRECTIONS

►***HIGH ALTITUDE OPERATION CAUTION:*** **All production carburetors are equipped with "Sea Level" size main metering jets. On cars operated at higher altitudes, BOTH main metering jets should be replaced with proper size jets for the altitude at which car being operated.**

►***EXTERNAL VENT CHANGE & SEASONAL ADJUSTMENT TO IMPROVE COLD STARTING (1954 Lincoln & Mercury & 1952-53 Lincoln Carburetors where External Vent Kit has been installed):*** On carburetors with external vent through hollow pump rod, spring type Adjustable Clip, No. EAD-99608-A, can be installed on lower end of accelerator pump rod to provide means for cutting off vent during winter operation. See "EXTERNAL VENT ADJUSTMENT" below *NOTE*—This clip will be installed in production on later carburetors.

►***1954 LINCOLN & MERCURY FUEL SPILL-OVER FROM EXTERNAL VENT ON SHARP RIGHT TURNS CORRECTION (Cars with early carburetors):*** Correct by installing new Carburetor Bowl Cover No. ED-EAD-99983-F (Lincoln), ED-EBY-99983-C (Mercury). Install cover as follows:

1)—Remove air cleaner. Remove carburetor cover and gasket, and accelerating pump assembly.

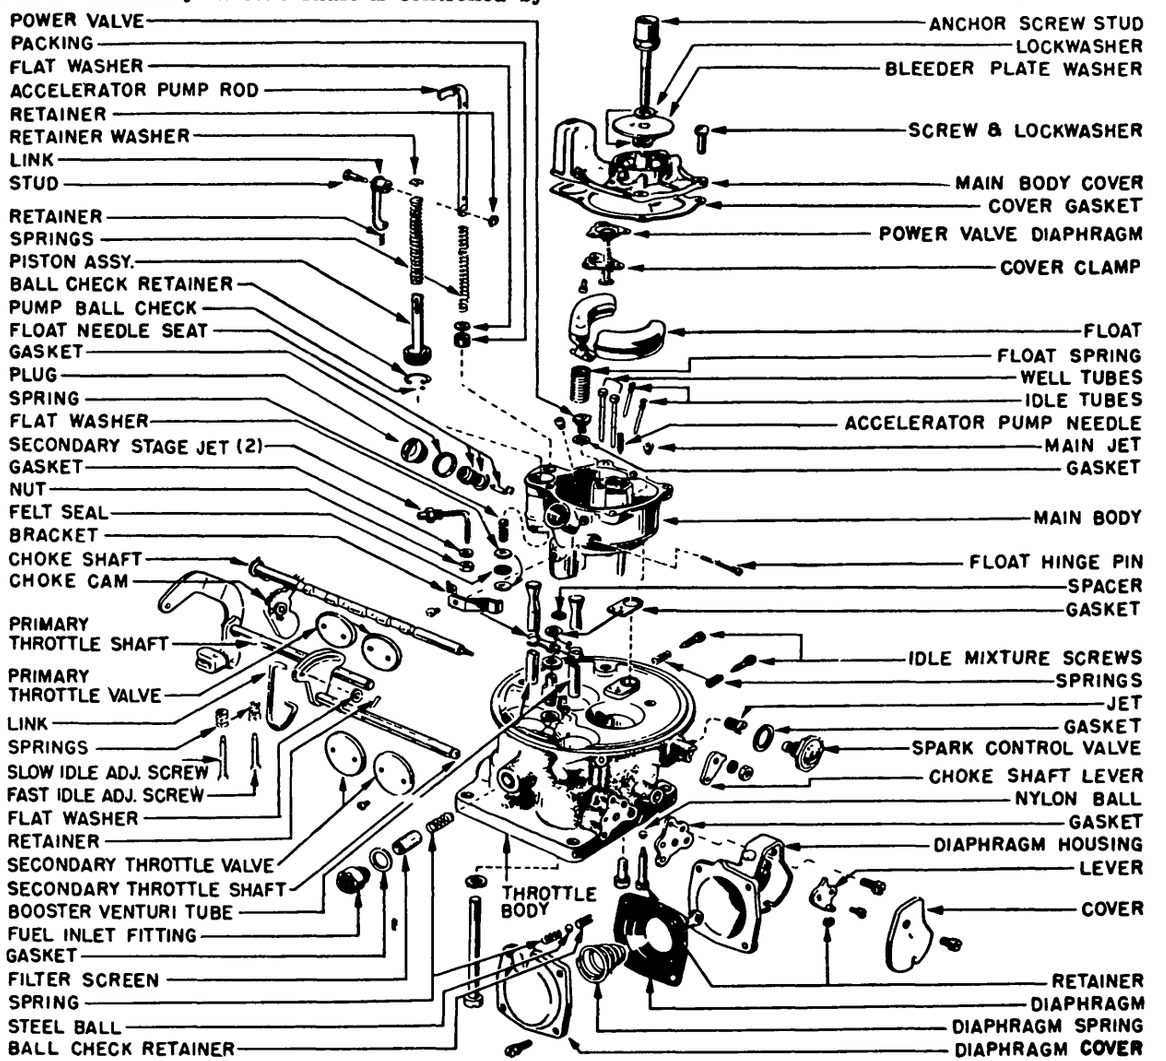
2)—Insert piece of ⅛" string solder in existing vent hole located ¼" down in web between fuel bowl and accelerating pump chamber. Cut off solder so that slight amount protrudes into float chamber *(CAUTION*—do not allow more than 1/16" protrusion in pump cylinder). Use needle-nose pliers to squeeze solder in hole to securely plug this vent hole.

►*CAUTION*—Minimum amount of solder should be left in pump chamber to avoid damage to pump plunger leather piston (use thin shim stock to protect leather when inserting pump plunger in cylinder).

3)—Reassemble carburetor, using new Bowl Cover Assembly as listed above with new gasket. These new bowl covers have a vent passage connecting the accelerating pump chamber with the float bowl which eliminates necessity of vent in web.

NOTE—Later type carburetors ED-EAD-9510-S (Lincoln), ED-EBY-9510-K (Mercury) have this new type bowl cover and revised vent system.

►***1953-54 LINCOLN & 1954 MERCURY AUTOMATIC CHOKE CONTROL HEAT TUBE ASSEMBLY CHANGE (To minimize exhaust gas leakage into automatic choke):*** New type heat tube assemblies (as listed below) and new intake manifolds were used in 1954 production starting approximately June 25, 1954 (Lincoln), August 16, 1954 (Mercury). This assembly can be installed on earlier cars provided that NEW Intake Manifolds are also installed. *NOTE*—Previous type Heat Tube Assemblies are furnished for use with first type manifolds.



Choke Heat Tube Assy.

Part	Part No.
Heat Tube Assembly	B4A-9890-A
Retaining Nut	B4A-9864-A
Washer Gasket	353999-S
Intake Manifold (Lincoln)	EAD-9425-D
Intake Manifold (Mercury)	EBY-9425-D

DESCRIPTION: The 4-Barrel Centri-Quad carburetor is similar in design to previous dual Centri-flo carburetor with following new features:

Vacuum Control of Secondary Stage Throttle Valves—Secondary throttle shaft is controlled by vacuum diaphragm unit mounted on throttle body. Vacuum passage terminates at right primary stage venturi so that secondary throttle valves open during periods of heavy engine loads or high speed operation (open when vacuum rises to point where atmospheric pressure on opposite side of diaphragm is sufficient to overcome diaphragm spring pressure). The mechanical linkage at the opposite end of the secondary throttle shaft closes the secondary throttle valves promptly (overcoming any lag in vacuum system) when the throttle is closed. *NOTE*—This mechanical linkage will hold secondary throttle valves closed in the event of failure of the vacuum control mechanism.

CONTINUED ON NEXT PAGE

1954 LINC LN-MERCURY "CENTRI-QUAD" 4-BARREL CARBURETOR

1954 LINCOLN-MERCURY "CENTRI-QUAD" (C nt.)

ADJUSTMENT: ***Make all adjustments exactly as follows:***

Idle Setting: First set BOTH primary idle mixture adjusting screws EXACTLY 1¼ turns open (no screws used for secondary stage). Start engine and operate it until normal operating temperature secured with choke valve wide open and fast idle cam in slow idle position. Back off fast idle adjusting screw (inner screw on throttle lever) so that it clears the fast idle cam. Set engine speed to correct hot or slow idle speed (see below) by turning slow idle speed adjusting screw (outer screw on fast idle cam). Turn both idle mixture adjusting screws equally ⅛ turn at a time in or out until smoothest idle performance obtained with highest steady vacuum reading. If engine speed changes during this operation, reset speed and repeat idle mixture adjustment. After idle adjustment completed, adjust fast idle (all models), and Anti-stall Dashpot (Mercury Mercomatic Cars).

►***IDLE SPEED SETTING NOTE:*** It is recommended that the idle speed be set with selector lever in NEUTRAL to approximately 475-500 RPM. (Synchro-mesh Cars), 460 RPM. (Automatic Trans. Cars). Then place selector lever in DRIVE and recheck engine idle speed which should be within range shown in table below. Readjust if speed is not within specified range.

Idle Mixture Setting

All Models	1¼ turns open

	Idle Speed Setting	
	Synchro-mesh	**Auto-Trans.**
1953-54 (Lincoln)		①400-425 RPM
1954 (Mercury)	475-500 RPM	①425-440 RPM

①—With selector lever in "DR" position.

►***CAUTION***—Unless idle adjustment made exactly as outlined above (turning screws equally and in same direction), an apparently correct setting may result with a too-rich setting of one screw tending to offset a too-lean setting of the other screw (due to interconnected idle fuel passages in base of throttle body). Screws must be set alike except for slight variation in making final fine adjustment.

Dashpot Setting (Mercury with Mercomatic): After idle adjustment completed, turn ignition off, see that fast idle cam in slow idle position, hold throttle lever in closed position, turn dashpot adjusting screw out (counter-clockwise) until dashpot rod is pushed in to the limit of its travel, then turn adjusting screw in (clockwise) 1½-2 turns which will provide correct clearance of .045-.064".

Seasonal Adjustment for Externally Vented Carburetors: See "Changes, Cautions, Corrections" above for installation of spring clip on pump rod for vent control. Adjust clip as follows to provide best Hot & Cold Starting performance:

Summer (Temp. above 50°F)—Slide clip up on pump rod so that vent holes are exposed.

Winter (Temp. below 50°F)—Slide clip down on pump rod to close off vent holes.

Fast Idle Setting: After completing slow idle setting (above) and with engine at normal operating temperature, so that fast idle cam in slow idle position, turn fast idle adjusting screw (inner screw on throttle lever) in until screw just contacts lowest step on fast idle cam. This will provide correct fast idle speed. *NOTE*—If fast idle speed is unnecessarily high with above setting, fast idle screw may be backed off ***not to exceed one full turn.***

►***CAUTION***—If fast idle screw backed off more than one full turn from specified setting (above), engine flooding and stalling may occur during fast idle operation due to engine speed being too low to burn all fuel discharged into intake manifold.

Accelerating Pump Setting: Seasonal adjustment provided by three holes in primary throttle shaft lever for pump link engagament:

Center Hole—Normal operating conditions.

Outer Hole—Extreme cold weather.

Inner Hole—Extreme hot weather.

Float (Fuel) Level: To check fuel level with carburetor on car, remove air cleaner and main body cover from carburetor, crank engine with starter to fill bowl to operating level. Install Gauge 9550-B (1953 Lincoln) Gauge 9550-AH (1954 Lincoln-Mercury) squarely on top edge of main body so that gauging pins extend down into bowl. Fuel should be at least as high as longer "GO" pin but must not touch shorter "NO GO" pin. Adjust by bending float tab.

►***FLOAT LEVEL ADJUSTING NOTE:*** Due to carburetor design (position of secondary jet tubes above floats), use of Float Adjusting Tool 9550-E may be difficult and following procedure is recommended for float level adjustment: **To raise fuel level**—Support float assembly with finger placed under float bracket, insert tip of medium screwdriver between bottom of float needle seat and edge of float tab, twist screwdriver so as to bend float tab downward. **To lower fuel level**—Support each segment of float by placing finger on top of float, insert tip of medium screwdriver beneath float tab and pry tab upward.

►***CHECKING FLOAT LEVEL:*** After making float level adjustment, remove some fuel from bowl, crank engine (with ignition off) to bring fuel level up to new setting. Recheck fuel level and readjust if necessary.

CAUTION—Both floats must be same height and floats must not contact walls of float bowl.

FUEL LEVEL

All Carburetors	①1/2" ± 1/32"

①—With fuel pump pressure of 3½-4½ lbs.

Automatic Choke: ***NOTE—Choke is separate unit mounted on side of intake manifold and linked to choke valve lever by a rod.*** Mark on cover should be in line with center mark of scale on choke housing. Adjust by loosening three cover retainer screws and rotating cover assembly.

Setting—Centered.

►***CHOKE OPERATING ROD ADJUSTMENT:*** Operating rod length should be checked and adjusted whenever manifold, carburetor, automatic choke, or choke linkage removed and replaced. ***See Step 4 under CARBURETOR INSTALLATION ON ENGINE for operating rod adjustment.***

Spark Control Valve: No adjustment required Calibrating spring in valve is permanently set to allow valve operating at 9½-10½" (1953), 8-10" (1954) of manifold vacuum. If operation not satisfactory, remove and inspect valve for free movement of the valve stem and inspect passage in screw

Power Valve: No adjustment required. Power valve is calibrated to open below 7.5-9" of manifold vacuum.

Spark Advance Control Cable: ***Adjustment required when carburetor installed on engine or whenever linkage disturbed or disconnected. See Lincoln Tune-Up data in Car Model Section.***

Primary & Secondary Throttle Plate Synchronization: Adjust hot engine idle speed to specifications (see Idle Setting above). Clearance between stop located on loose lever on secondary throttle shaft and secondary throttle lever should be .038-.044". To adjust without removing carburetor from engine, bend or file stop tab on loose lever arm. As a bench check, place .039" wire gauge (No. 61 drill) between primary throttle plate and throttle bore on throttle lever side of carburetor. With .039" gauge in position, tab on secondary loose lever on secondary throttle shaft should have a slight play between it and secondary throttle lever. Remove .039" gauge and replace with .040" wire gauge (No. 60 drill). There should be no play between loose lever and secondary throttle lever.

OVERHAUL: *NOTE*—Carburetor Holding Fixture 9510-C can be used to mount carburetor for overhaul if special adapter plate made up to match mounting holes of this carburetor. Check Secondary Throttle Operating Diaphragm before disassembling carburetor (see below). Then disassemble and overhaul carburetor as follows:

►***SECONDARY THROTTLE OPERATING DIAPHRAGM CHECK (Before disassembling carburetor):*** Fully open secondary throttle valves and block off diaphragm passage at opening in primary stage venturi (use eraser end of a pencil) BEFORE releasing secondary throttle valves. Release secondary throttle valves. Valves should remain open as long as venturi opening is blocked off. If valves do not remain open, diaphragm or gasket seal between diaphragm assembly and throttle body may be defective. Remove assembly from carburetor, disassemble, and inspect. Also inspect ball check valve located in diaphragm cover.

Disassembly (Secondary Throttle Operating Diaphragm): Take out attaching screw and remove vacuum diaphragm assembly cover plate. Remove retainer securing diaphragm rod to pin on lever and screw holding diaphragm lever on secondary throttle shaft, remove lever. Take out three screws retaining diaphragm housing on carburetor throttle body, remove diaphragm assembly and gasket.

Disassembly (Carburetor—after Secondary Throttle Operating Diaphragm removed): Mount carburetor on Holding Fixture 9510-C (modified for use with four barrel carburetors) and proceed as follows: Remove air cleaner anchor screw and air bleed washer from top of main body cover, remove four attaching screws and lockwashers holding cover on main body, remove cover and gasket. Remove pump rod pin and retainer from pump operating rod (hold top of pump piston while removing pin from pump rod), lift out pump piston assembly, remove pump rod upper seal and washer, remove pump rod lower seal, washers, and spring.

Main Body Disassembly—Remove float needle seat plug and gasket, using tool 9510-BB, remove float needle seat and gasket, using tool 9564. Remove screw and bracket retaining secondary venturi booster tubes, remove venturi tubes. Loosen locknuts holding secondary jets in man body, remove secondary jets, gaskets, and nuts. Remove float

C NTINUED N NEXT PAGE

1954 LINCOLN, MERCURY "CENTRI-QUAD" (C nt.)

hinge pin, lift entire float assembly out (float, float needle, clip, and float spring). Remove power valve and gasket, using tool 9510-AA. Remove main metering jets, using tool 9533. Remove idle jet tubes, using tool 9544. Remove accelerating pump ball check retainer, using a wire hook to remove retainer from pump cylinder. Tip carburetor up and catch pump ball check, discharge needle, and main well tubes which will fall out of main body. Remove retainer from pump link pin, remove link from throttle lever. Remove two screws and lockwashers retaining main body on throttle body lift off main body *(CAUTION*—Note gasket and spacer between main body and throttle body, and "O" ring seal on fuel inlet adapter). Remove fuel inlet adapter and booster venturi bracket and gaskets *(NOTE*—One gasket on each side of bracket).

Throttle Body—Remove spark control valve and gasket from boss on throttle body, remove metering jet from inside spark control valve housing. Remove fuel inlet adapter, filter, gasket, and spring. Remove both idle adjusting screws and springs. Take out ball retainer in distributor vacuum passage, remove nylon ball. DO NOT disturb throttle valve and shaft assemblies, fast idle cam, or choke valve and shaft assembly unless replacement required due to wear or damage as determined by inspection. If replacement required, install NEW Throttle Body Assembly. Disconnect and remove secondary throttle control rod. If necessary to remove fast idle cam, proceed as follows:

Fast Idle Cam—Tap out retaining pin, remove fast idle cam from shaft. *CAUTION*—do not attempt to remove the cam shaft from the throttle body (retained by pin in body).

Power Valve Diaphragm—DO NOT remove assembly from main body cover unless tests indicate that replacement required. Remove by taking out three attaching screws and lifting off cover clamp and diaphragm assembly.

Cleaning & Inspection: Wash all parts except those noted below in clean solvent *(CAUTION*—Do not use solvent on pump piston leather, power valve diaphragm, spark control valve, nylon fuel inlet needle valve, nylon distributor passage ball, dashpot assembly, or secondary throttle operating diaphragm). Blow out passages in castings with air, dry all parts with air. Inspect all parts for wear and damage with particular attention to the following: Inspect castings and main body cover for cracks or leaks, inspect main well tubes, metering jets, and idle tubes for wear or clogged passages *(CAUTION* —clean with air, do not use drills to clean out calibrated openings). Replace all worn or damaged parts

Reassembly: Use all NEW gaskets. Install parts in reverse order of disassembly procedure (above) and note the following important points:

Distributor Passage Nylon Ball Caution—If new ball installed, make certain that correct size used.

Choke Valve Installation—Slide choke shaft in through throttle body and install nozzle tube drum on shaft as it enters each venturi *(CAUTION*—rounded opening on drums must face inlet side of carburetor and tapered side of hole must face downward). Install choke valves, hold valves closed while tightening attaching screws. Install choke lever on end of shaft and make certain that pin on lockout lever engages slotted hole in choke lever, secure lever on shaft with lockwasher and nut. Install "C" washer on pin of choke lockout lever.

Choke Valve Plate Position—Check choke valve angle in closed position as follows: Hold choke valves closed at limit of travel, measure distance from top edge of venturi to top edge of choke valves at rear side. This distance must be 1/16". Adjust by bending stop tab on choke lever shaft. *NOTE*—*Choke operating rod length is adjusted as part of carburetor installation procedure. See step 4 under CARBURETOR INSTALLATION ON ENGINE below.*

Secondary Throttle Valve Equalization—If secondary throttle valve removed, use strips of .004" shim stock 1/8-3/16" wide between lower side of each valve (viewed from bottom) and carburetor throat, and hold valves closed against shims while tightening retaining screws. This method will insure proper closing of valves which is necessary for maximum manifold vacuum.

Main Body & Throttle Body Assembly—Install fuel inlet adapter, filter, spring, and gasket. Install fuel inlet fitting and bracket with a gasket on each side of the bracket, tighten the fitting securely. Apply light film of lubricant to "O" ring seal and install seal on fuel inlet adapter. Install gasket on main body support and position main body on throttle body aligning rounded opening of each nozzle tube drum with its discharge nozzle and properly positioning choke lever on fast idle cam. Tighten main body-to-throttle body attaching screws to 4-5 ft.lbs. torque. *(NOTE*—One long screw is located in recessed hole in center of bottom face of throttle body and special small diameter washer must be used with this long screw).

Secondary Jet Installation—Use a new gasket on each secondary jet, insert jets through openings in main body, install locknut on end of each jet with chamfered face of nuts toward carburetor wall. Position jets by moving lower ends to each side as far as possible to avoid interference with power valve operating rod, securely tighten retaining nuts.

Power Valve Diaphragm Installation—*This must be installed as follows to properly seat diaphragm on main body cover:* Place cover clamp over diaphragm stem, compress spring and wind rubber band tightly around stem and spring to hold spring compressed while assembly being installed. Position assembly on main body cover, tighten three attaching screws securely, then remove rubber band and check for free operation by pressing on diaphragm stem. Action must be absolutely free.

Carburetor Adjustments—Make all adjustments listed in ADJUSTMENTS above.

CARBURETOR INSTALLATION ON ENGINE: Install carburetor exactly as follows:

►***CAUTION—DO NOT use gasket sealer or compound on carburetor mounting gaskets.***

1) Position spacer on carburetor mounting pad on manifold with one gasket BELOW and second gasket ABOVE spacer.

2) Position carburetor over mounting studs and start fuel line and choke control inlet tube fittings but DO NOT tighten fittings at this time. Do not connect vacuum lines.

3) Install carburetor attaching nuts and lockwashers and tighten exactly as follows: Tighten all nuts just snug, then tighten each pair alternately in a criss-cross to a torque of 12-15 ft. lbs. *CAUTION* —Correct tightening is important to prevent air leaks or fuel leaks at grooved passages in base of carburetor throttle body.

4)—Install choke operating rod. Make certain that choke valve closed position is correct (see Reassembly), then check choke rod length as follows: With rod disconnected from carburetor lever, hold choke plates in fully closed position, raise rod to highest position, and check whether rod end enters carburetor lever freely. If not, bend rod (first type), adjust trunnion on rod (later type) until rod end enters hole in lever freely, connect rod.

5)—Tighten choke control inlet tube fitting, distributor vacuum line, and fuel line connection.

6)—Start engine and run it sufficiently to fill carburetor bowl with fuel. Check fuel level. *See Float Level data above.*

7)—Re-install main body cover (CAUTION—Do not use gasket sealing compound on cover gasket). Install bleeder plate washer (install lockwasher below and above bleeder plate washer), tighten anchor stud screw to 4-5 ft. lbs. torque.

8)—After engine warmed up, make all carburetor adjustments. See ADJUSTMENTS above.

SERVICE PARTS: ***CAUTION—Metering jets furnished in repair kits listed below are STANDARD (for 0 to 5000 ft. Altitude). See High Altitude Carburetor Note (above) for special high altitude metering jets.***

Gasket Set—Lincoln-Mercury No. HDK-9502A (Lincoln Carb.), No. MEK-9502-A (Mercury Carb.).

Repair Kit (With Std. Metering Jets)—Lincoln-Mercury No. HDK-9590-B or HDK-9590-C (1953 Lincoln), No. HEK-9590-B (1954 Lincoln & Mercury).

② - 292" & 312" Engines

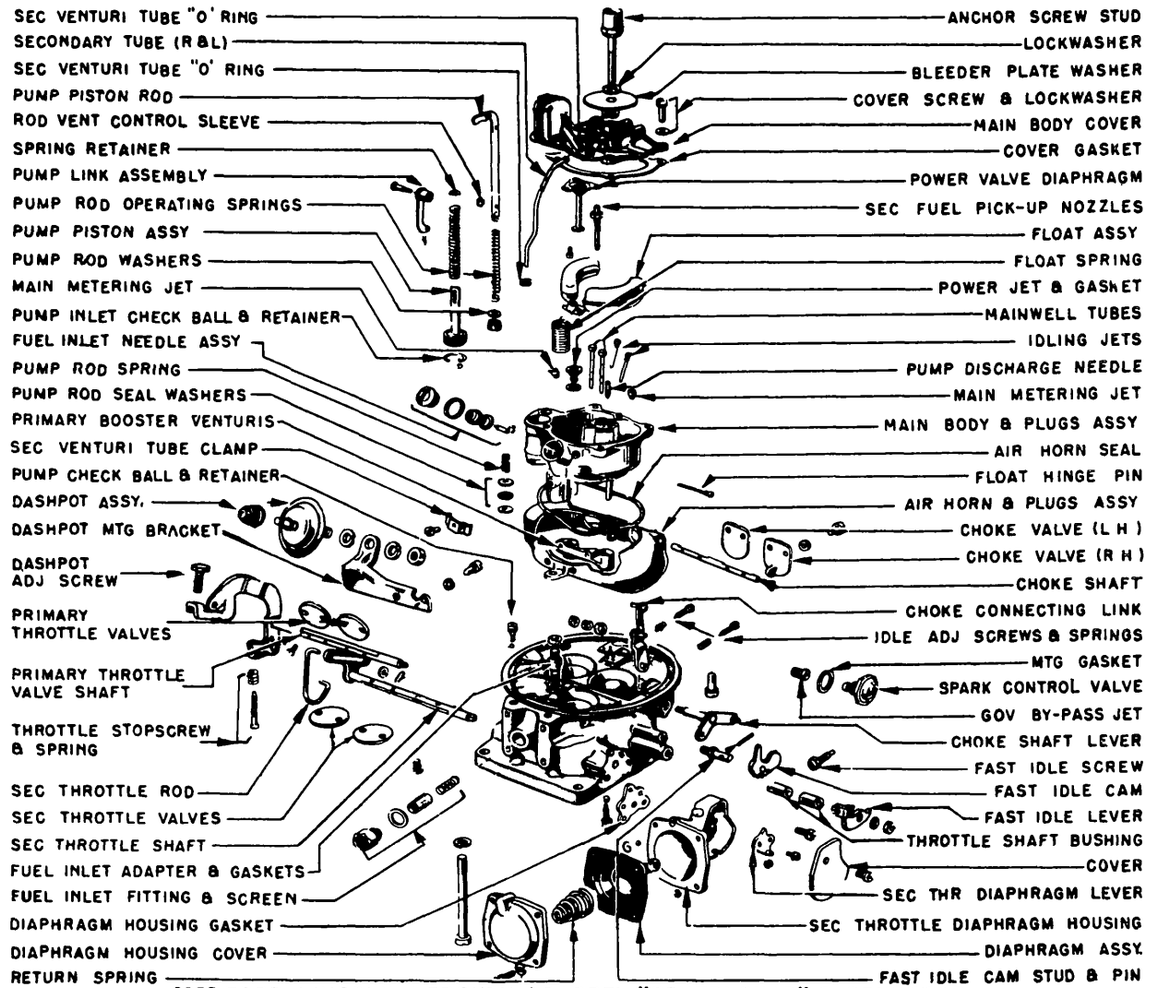
③ - When used on Fordomatic or Mercomatic cars, a dashpot and attaching parts are also required

④ - With 300 HP Supercharged Engine

⑤ - Use B5A-9510-G for replacement.

⑥ - Use B5A-9510-H for replacement.

⑦ - B6T-9510-B,C,D replaced by B6T-9510-F B6T-9510-F replaced by B6T-9510-G



►CHANGES, CAUTIONS, CORRECTIONS

►*1955 CARBURETOR INSTALLATION CAUTION (First Cars with Choke Inlet Air Tube Washer in Throttle Body)* First carburetors have "0" Ring seal and retaining washer in recess in top surface of throttle body which seals air inlet tube when carburetor installed on engine This washer must be properly staked in throttle body and care must be used when installing carburetor that washer and seal are not dislodged by tube **Loose washer or seal may be carried into combustion chamber with resulting damage to engine** If washer is loose, install later type rubber grommet (Ford No B5A 9655 A) which replaces both "0" ring seal and washer

►*1955 CHOKE VALVE BIND CORRECTION (Ford Carburetors)* On first carburetors if choke valves bind on upper surface of throttle body, correct by grinding a slight depression in the top surface of the throttle body to provide 020 minimum clearance between valves and body *NOTE*–Later carburetors have additional clearance at this point

►*1956 FORD HARD COLD STARTING CORRECTION (CARS WITH B6A-9510-L, M CARBURETORS)* Install Choke Kit, Part No. B6A-9849-D which contains all parts used on the later B6A-9510-N, Q carburetor choke assemblies. The complete kit must be installed as the individual parts are not interchangeable with the earlier parts. Install kit as follows Disconnect choke outlet tube and remove the bi-metal spring cover, gasket and plate. Remove choke housing as an assembly (the fast idle cam will be loose and can also be removed). Remove choke plate nearest to choke housing. Check for any binding in linkage after plate removed. Install new plate, but do not tighten. Align choke plate by placing a ⅛" wide strip of paper between choke plate and air horn. Close choke plate and tighten the screws (check for any binding before screws are tightened). Position new fast idle cam and bearing assembly. Use a new gasket and install the new choke housing as a complete unit. *(NOTE* - On early cars where the fast idle cam swings on a boss which is an integral part of the main body, it will be necessary to use the original cam plus the new spacer) Check operation, then open choke plates fully by means of the bi-metal arm. Position template (part of choke kit) on choke housing so that bi-metal operating arm protrudes through hole in template. Rotate template clockwise to close the choke completely Scribe a mark on the choke housing at position where point of arrow on template indicates (this will be the central point of the bi-metal spring adjustment). Remove template and install gasket, plate and bi-metal spring cover. Set the cover on the line scribed on housing (disregard notches cast in choke housing). Connect the choke control outlet tube to choke housing, and place accelerator pump link in the hole giving the longest stroke. Adjust carburetor.

CONTINUED ON NEXT PAGE

1955 FORD, LINCOLN, MERCURY 4-BARREL "CENTRI-QUAD" CARBURETOR

1955-57 FORD, LINCOLN, MERCURY "CENTRI-QUAD" (C nt.)

►*1956 CHOKE BINDING NOTE* This condition may be caused by front portion of the aluminum heat baffle being bent toward the rear causing it to bind on choke linkage.

►*1956 FORD ACCELERATING PUMP PISTON ROD REPLACEMENT (ON B6A-9510-N CARBURETOR) NOTE* The later type piston rod with an additional hole in the top end, Part No. B6A-9531-C, can be used as a replacement when used with later Main Body Cover, Part No. B6A-9984-D.

►*1956 FORD CARBURETOR DRY FLOAT LEVEL CAUTION* B6A-9510-Q carburetor float level is 7/32". Float level of other carburetors is 1 /4 '.

►*1956 LINCOLN & CONTINENTAL HARD COLD STARTING CORRECTION* If after depressing the accelerator, the choke plates do not set themselves, the cause may be that too much stock has been removed from upper tip of cam at the point where cam contacts the choke link roller. Correct by replacing the choke cam assembly. Check the choke by operating the choke plates by hand with the throttle plates held open, to determine if the bi-metal spring in the assembly is imparting a closing action to the choke plates. If there is no closing tension, check the following Choke link must be in place and held in its position by tab of thermostat lever. If link is found to be disengaged, reinstall choke link and bend tab of choke thermostat lever toward link sufficiently to prevent link from becoming disengaged, allowing sufficient clearance between tab of thermostat lever and choke link to permit operation without binding or sticking. Eye on thermostat spring must fit over tang on thermostat lever. Adjust choke setting.

►*1956 LINCOLN ECU-9510-D & MERCURY B6A-9510-N CARBURETOR PRODUCTION CHANGE* A sleeve spacer, Part No. B6A-9644-A designed to provide a bearing surface for the fast idle cam assembly on these carburetors is available for service replacement, and should be installed between the integral choke housing and throttle body.

►*1956 LINCOLN VAPOR LOCK NOTE* This condition may be caused by the fuel pump-to-fuel tank tube hose assembly being too small. The correct hose is Part No. LE-9288-A and an inside diameter of .310".

►*1956 LINCOLN & MERCURY AUTOMATIC CHOKE MALFUNCTION NOTE & AIR HEATER TUBE PRODUCTION CHANGE* Improper choke action may be caused by a broken or leaking air heater tube which would be indicated by carbon deposits in choke housing. If this is the case, replace the early type air heater tube with Part No. ECU-9890-S (Lincoln), B6A-9890-A (Mercury) as follows Remove intake manifold and inspect both ends of tube for leakage or insufficient clearance, particularly the small end (right side of manifold), which may be constricted or not properly entering hole in manifold. In this case it will be necessary to ream the small hole using a 5/16" Keystone expansion reamer with the adjusting screw removed. Turn reamer into manifold until 1/2" of cutting surface is sticking out. *(NOTE* - Later manifolds having ar "X" stamped on right exhaust leg just below choke, have the manifold reamed slightly larger in production and do not require additional reaming). Install the new heat tube by inserting the small end of tube into large hole in manifold and guide it through heat riser until the end is started into small opening. Drive tube the rest of the way with a punch large enough to contact full diameter of tube.

►*1956 LINCOLN & MERCURY FLOAT & FLOAT SPRING PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE (To Maintain a Steady Fuel Level)* A new float Part No. B6A-9550-B, and float spring, Part No. B6A-9958-A is being used in production and can be used for service replacement on earlier 1956 carburetors. Carburetors having the later type float and spring assembly are identified by an "S" stamped on carburetor mounting flange adjacent to the idle adjusting screws. With the use of the later type float and spring, the dry float level has been changed to 7/32" in order to maintain a fuel level of 1/2".

►*1956 MERCURY HARD STARTING CORRECTION (ON A FEW EARLY CARS)*· On carburetors built before the third week in September, identified by a date code on accelerator pump tower of the float bowl cover (Example 5-9-3 means 1955, September, 3rd week), turn the automatic choke cover clockwise three additional notches.

►*1956 FORD, LINCOLN, MERCURY BOWL EXTERNAL VENT SEASONAL SETTING CHANGE* For winter operation, close vent for temperatures below 30° F. and open vent for temperatures above 30° F.

►*ROUGH ENGINE IDLE CORRECTION: (Due to Leakage):* Check engine at 2000 RPM to stabilize fuel level in bowl. If engine idles smoothly immediately after operation at 2000 RPM, but roughens progressively with length of time on idle, it can be assumed that leakage at inlet needle or gasket is occuring. Remove inlet needle, seat and gasket. Clean carburetor carefully to remove any foreign material. Install new inlet needle, seat and gasket. If rough idle not corrected by above and by engine tune-up (including valve lash), intake manifold should be checked for air leakage at gasket between manifold and cylinder head mating surface.

►*HESITATION UPON ACCELERATION CORRECTION.* When a slight hesitation is felt upon light acceleration check to see that the carburetor is equipped with the correct accelerator nozzle and link and that link is set to correct adjustment. See Accelerating Pump below.

DESCRIPTION: 4-Barrel downdraft type with vacuum operated secondary throttle valves The automatic choke assembly on 1955 models is located on intake manifold and linked to choke operating shaft & lever on carburetor. 1956-57 carburetors have an integral automatic choke assembly mounted on throttle body assembly and linked to choke intermediate shaft. 1955 and 1956-57 carburetor designs are similar, however, due to internal differences the repair procedures are different as indicated below.

ADJUSTMENTS: *Make all adjustments exactly as follows:*

Idle S tting: First set BOTH primary idle mixture adjusting screws (see table below) for initial adjustment. Start engine and operate it until normal operating temperature is reached with choke valve wide open and fast idle cam in slow idle position. Back off fast idle screw so it clears the fast idle cam. Set engine idle speed to correct hot or slow idle (see table below) by turning slow idle speed adjusting screw. Turn one idle mixture screw in until engine begins to run rough (lean), then back off screw until engine begins to roll (rich), then turn screw inward just enough to provide smoothest engine idle Fuel mixture should favor the rich side Repeat this procedure on other mixture screw Recheck idle speed and if not within limits, readjust to correct specifications

Initial Idle Screw Setting

Model	Turns Out
1955 Ford (B5A-9510-G,H)	1¼
1955 Ford (B5A-9510-M,N)	½-5/8
1956-57 Ford (All)	5/8
1955-56 Continental, Lincoln & Mercury	1½

Idle Speed

Model	Idle Speed
1955 Ford (Synchro-mesh)	475-500 RPM
1955 Ford Pass.Cars (Fordomatic)	① 450-475 RPM
1955 Ford Interceptor (Fordomatic)	① 475-500 RPM
1955 Ford Thunderbird (All)	① 475-500 RPM
1955 Continental & Lincoln	② 425-450 RPM
1955 Mercury (Synchro-mesh)	475-500 RPM
1955 Mercury (Mercomatic)	② 425-450 RPM
1956 Ford (Synchro-mesh)	475-500 RPM
1956 Ford (Fordomatic)	② 475-500 RPM
1956 Lincoln	① 475-500 RPM
1956 Mercury (Synchro-mesh)	475-500 RPM
1956 Mercury (Mercomatic)	③ 475-500 RPM
1957 Ford 300 HP Supercharged	① 500-525 RPM

① - Transmission selector lever in "N" (Neutral).

② - Transmission selector lever in "D" (Drive).

③ - With transmission in "N" (Neutral). Recheck with transmission in "D" (Drive), and adjust to 425-450 RPM, if necessary.

Dashpot Setting (All Auto. Transmissions): After idle adjustment completed, turn ignition off, see that fast idle cam in slow idle position, hold throttle lever in closed position, turn dashpot adjusting screw out (counter-clockwise) until dashpot rod is pushed in to the limit of its travel, then turn adjusting screw in (clockwise) 1½-2 turns which will provide correct clearance of 045- 064 '

Accelerating Pump Setting: Set pump link in hole closest to throttle shaft (shortest stroke) for average or hot weather operation, outer hole for cold weather operation.

Bowl External Vent Seasonal Setting: Adjust clip on lower end of accelerator pump rod to open or close vent hole for best operation as follows

Winter Operation (Temperatures below 50°F)—Slide clip down on pump rod so that vent hole is CLOSED.

Summer Operation (Temperatures above 50°F)—Slide upward on pump rod so that full diameterof vent hole is open

CONTINUED N NEXT PAGE

1955-57 FORD, LINCOLN, MERCURY "CENTRI-QUAD" (C nt.)

Fast Idle Setting: After making idle speed adjustment and with engine at normal operating temperature, turn fast idle speed adjusting screw until it just touches lowest step of fast idle cam *NOTE*—If this setting is unnecessarily high, the idle speed may be reduced by backing off the adjusting screw not to exceed one full turn

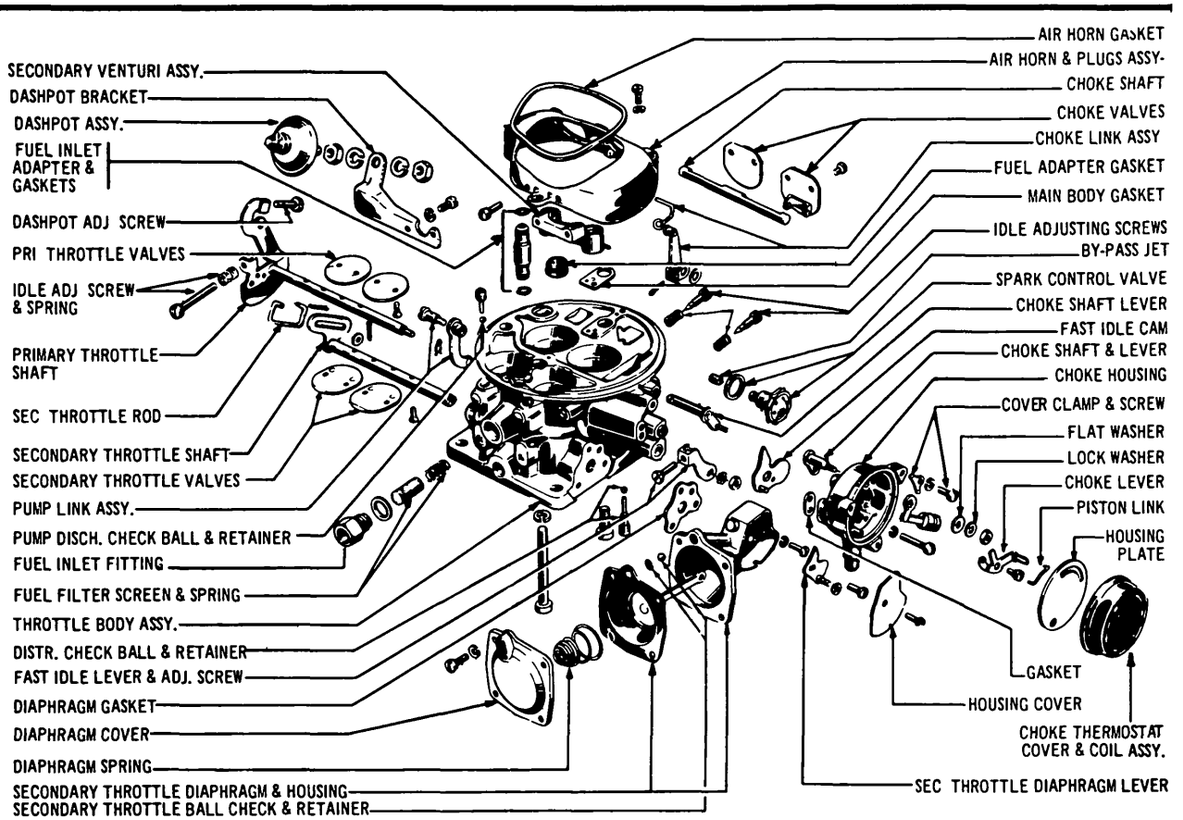
D p pper Adjustment (Trucks): *(NOTE*—Depopper adjusting screws are located on underside of throttle body and carburetor must be removed for adjustment. Turn each screw in until spring is completely compressed, then back off screw 2 7/8 turns (adjustment must be held as close to this specification as possible). If engine popping is evident after idle adjustment and depopper ball adjustment is correct, back off depopper adjusting screws 1/8 turn at a time until popping is eliminated.

S c ndary Throttle Operating Diaphragm Check: Remove carburetor from engine, remove main body and choke housing from throttle body Fully open (at the linkage) both primary and secondary throttle Block off the secondary vacuum openings in the right primary and secondary venturi with the fingers Release sedondary throttle linkage while holding primary throttle linkage open If no leak exists secondary throttle plates should remain partially open To check diaphragm unit, remove complete diaphragm and housing assembly from carburetor Pull diaphragm rod in a direction to compress spring Cover slot located in housing to carburetor mounting face with finger Release diaphragm rod If no leaks exist spring should remain partially compressed

►*1956 FLOAT LEVEL PRODUCTICN CHANGE (CONTINENTAL, FORD, LINCOLN & MERCURY): See "Changes, Cautions, Corrections" above.*

Fl at (Fuel) Level: To check fuel level with carburetor on car, remove air cleaner and main body cover from carburetor, crank engine with starter to fill bowl to operating level Install Gauge T54L-9550-C (Ford), 9550-AH (Lincoln-Mercury) squarely on top edge of main body so that gauging pins extend down into bowl Fuel should be at least as high as longer GO pin but must not touch shorter NO GO pin Adjust by bending float tab

► *CAUTION* Both floats must be the same height and floats must not contact walls of float bowl



FUEL LEVEL

All Carburetors	① 1/2±1/32'

①—With fuel pump pressure of 3½-4½ lbs

Aut matic Choke Setting. Mark on cover should be in line with center mark of scale on choke housing Adjust by loosening three cover retainer screws and rotating cover assembly

►*1955 CHOKE ROD LENGTH NOTE:* Mercury engine has manifold to carburetor spacer EBJ-9447A (½" thick) and automatic choke rod B5A-9869-A (4¼" long) Whenever difficulty is experienced in adjusting choke rod for proper closing of choke plates, check dimension of these two parts

1956-57 FORD, LINCOLN, MERCURY CENTRI-QUAD CARBURETOR THROTTLE BODY ASSY.

Automatic Choke Rod Adjustment (1955 Carburetors): Remove air cleaner, choke connector rod retainer and pull trunnion out of choke lever. Hold choke plates in fully closed position, raise and hold choke connector rod in its uppermost position and align the adjustable trunnion (on upper section of rod) with hole in carburetor choke shaft lever. Adjust the trunnion two additional turns upward (to lengthen connecting rod). Secure trunnion to choke shaft lever.

Spark Control Valve: No adjustment required If operation not satisfactory, remove and inspect valve for free movement of the valve stem and inspect passage in adapter screw

OVERHAUL: Check Secondary Throttle Operating Diaphragm before disassembling carburetor (see below). Then disassemble and overhaul carburetor as follows

►*SECONDARY THROTTLE OPERATING DIAPHRAGM CHECK (Before disassembling carburetor).* Fully open secondary throttle valves and block off diaphragm passage at opening in primary stage venturi (use eraser end of a pencil) BEFORE releasing secondary throttle valves. Valves should remain open as long as venturi opening is blocked off. If valves do not remain open, diaphragm or gasket seal between diaphragm assembly and throttle body may be defective. Remove assembly from carburetor, disassemble, and inspect. Also inspect ball check valve located in diaphragm cover

Disassembly (Secondary Throttle Operating Diaphragm): Take out attaching screw and remove vacuum diaphragm assembly cover plate. Remove retainer securing diaphragm rod to pin on lever and screw holding diaphragm lever on secondary throttle shaft, remove lever. Take out three screws retaining diaphragm housing on carburetor throttle body, remove diaphragm assembly and gasket.

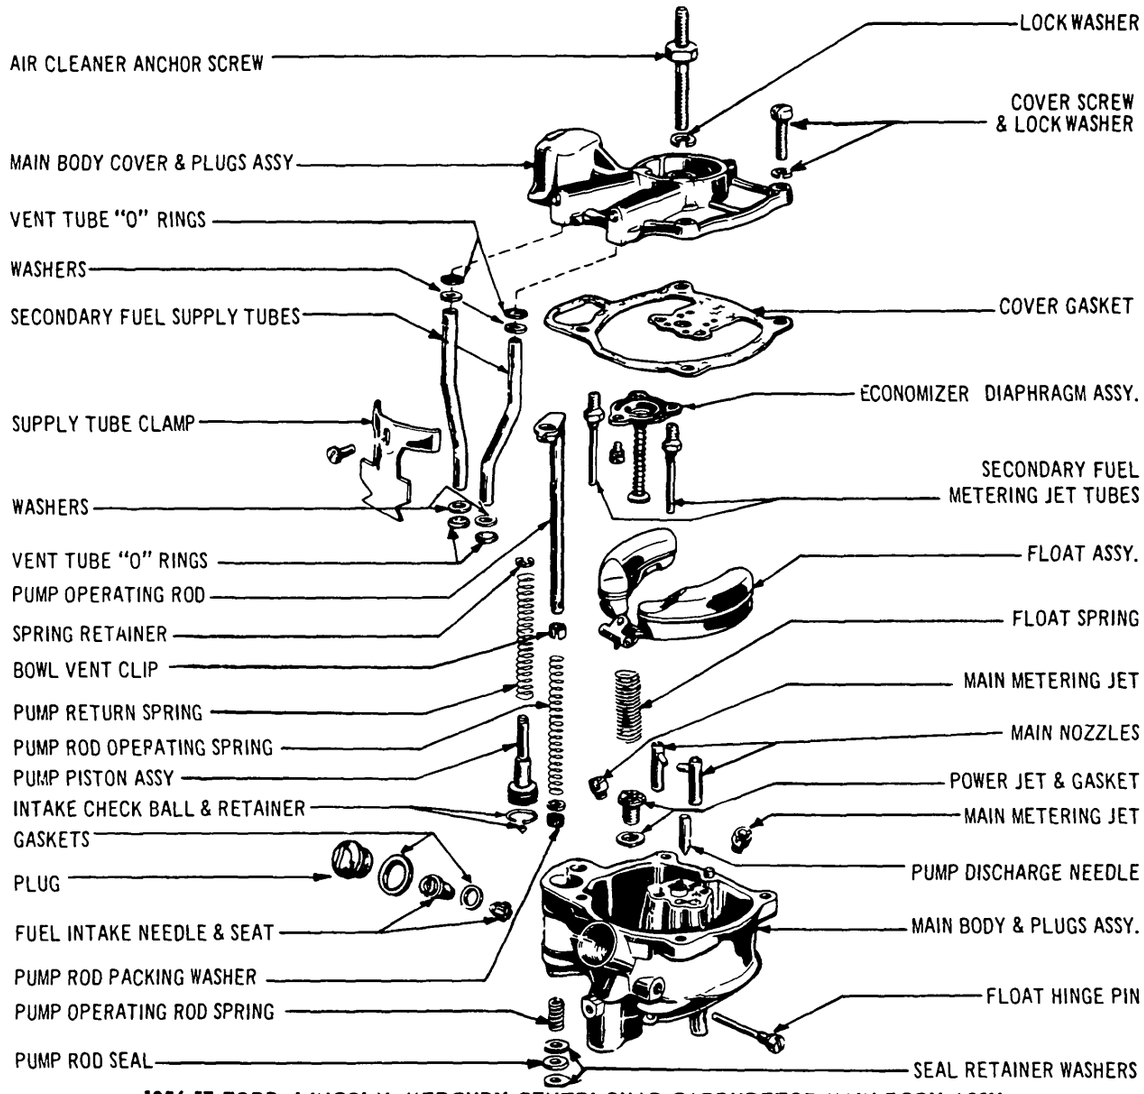
1955 MODELS

Disassembly (Carburetor—after S condary Throttle Operating Diaphragm removed): Remove carburetor cover and gasket. Remove pump rod pin from accelerator pump activating rod. Lift out pump piston. Remove pump rod upper seal and washer, accelerating pump rod lower seal, washers, and spring. Remove hairpin retainer from pin of the pump link, and link from throttle lever.

Main Body Disassembly—Remove float needle seat plug and gasket, and float hinge pin. Lift out float, float needle and clip, and float spring from carburetor bowl. Remove power valve and gasket, main metering jets and idle tube jets. Remove accelerating pump

CONTINUED ON NEXT PAGE

1955-57 FORD, LINCOLN, MERCURY "CENTRI-QUAD" (C nt.)



ball check retainer, invert carburetor to release main well tubes, accelerator pump discharge needle, and accelerator pump ball check valve. Remove two screws and lockwashers and separate choke housing from main body, remove main body. Remove spacer between main body and throttle body, remove fuel inlet adapter from main body.

Throttl B dy Disass mbly - Remove spark control valve and gasket and spark control metering jet from inside of spark control valve bore. Remove fuel inlet adapter, screen, filter, gasket, and spring, idle mixture adjusting screws, and the two screw-in plugs in secondary fuel passages Invert throttle body and remove two steel balls. Remove two screws securing dashpot bracket to throttle body and remove bracket and dashpot assembly. Remove pin retainers from each end of throttle control rod, and flat washer from stop lever end of rod, remove rod. If fast idle cam not defective, remove retaining pin with a punch and remove fast idle cam. DO NOT ATTEMPT TO REMOVE FAST IDLE CAM SHAFT If it is necessary to remove throttle plates for cleaning or repair, each plate must be identified as to the bore from which it was removed (left or right) so that plates can be installed in their original positions

Power Valve Diaphragm—DO NOT remove assembly from main body cover unless tests indicate that replacement required. Remove by taking out three attaching screws and lifting off cover clamp and diaphragm assembly.

1956-57 MODELS

Main B dy Disass mbly - Remove center stud and lockwasher. Remove cover retaining screws, then lift cover off main body. Remove screw and bracket retaining secondary fuel tubes. Remove secondary fuel tubes by gently pulling them from throttle body *(CAUTION* - Do not bend secondary fuel tubes). Remove accelerator pump link from operating rod and throttle lever. Remove stud and vent clip from lower end of pump operating rod, then lift pump assembly out of main body. Remove pump rod dust seal, washer and spring. Remove pump rod upper seal and washer. Lift main discharge nozzles out of main body with a pair of needle nose pliers. Use care not to damage nozzles. Invert carburetor and catch pump discharge needle as it falls out. Remove float inlet needle seat spring and seat. Unscrew float hinge pin and lift float assembly out of main body. Remove float damper spring. Remove main jets, then remove power valve. Make a small hook on a suitably sized wire, then lift accelerator pump inlet check ball retainer out of pump well. Invert carburetor and catch inlet check ball as it falls out. Remove secondary jets from main body cover, remove power valve diaphragm retaining screw, then remove diaphragm and stem assembly. If necessary, disassemble accelerator pump assembly. Slip piston cup off end of piston stem. Compress stem spring, pry off stem retainer, then remove the stem and spring from operating rod. Remove air horn to throttle body screw. Invert carburetor and remove two throttle body to main body screws. Lift off the main body and remove main body gasket. Lift air horn off throttle body, and disengage choke actuating lever from choke plate.

1956-57 FORD, LINCOLN, MERCURY CENTRI-QUAD CARBURETOR MAIN BODY ASSY.

Throttle Body Disassembly - Remove idle adjustment needles and springs. Remove the three choke retaining screws, then remove cover and gasket. Remove choke heat shield. Remove thermostatic spring lever, and the small wire connecting rod. Remove three choke housing retaining screws and remove choke housing and gasket. Remove nut, lockwasher and spacer, then slip choke piston assembly out of housing. Remove lever from back side of choke housing. Remove fast idle cam. Remove spark control valve and gasket. Remove fuel inlet fitting, gasket, filter screen, and spring. Remove secondary fuel system check ball retainers, then invert throttle body and catch the two balls as they fall out. Remove vacuum passage check ball retainer from bottom of throttle body, and shake out the check ball. If so equipped, remove dashpot and bracket assembly. *NOTE* - If it is necessary to remove throttle plates for cleaning or repair, each plate must be identified as to bore from which it was removed (left or right) so that plates can be installed in their original positions.

CONTINUED ON NEXT PAGE

1955-57 FORD, LINCOLN, MERCURY "CENTRI-QUAD" (C nt.)

Air Horn Disassembly - Remove choke plate screws. Slide choke plate shaft out of air horn. Remove lock wire from booster venturi screws, then remove the screws.

1955-57 MODELS

Cl aning & Inspection: Wash all parts except those noted below in clean solvent *(CAUTION*–Do not use solvent on pump piston leather, power valve diaphragm, spark control valve, nylon fuel inlet needle valve, nylon distributor passage ball, dashpot assembly, or secondary throttle operating diaphragm). Blow out passages in castings with air, dry all parts with air. Inspect all parts for wear and damage with particular attention to the following: Inspect castings and main body cover for cracks or leaks, inspect main well tubes, metering jet, and idle tubes for wear or clogged passages *(CAUTION*–clean with air, do not use drills to clean out calibrated openings). Replace all worn or damaged parts.

R assembly: Use all NEW gaskets. Install parts in reverse order of disassembly procedure (above) and note the following important points:

Throttle Plate Installation–In addition to replacing each plate in its original position, place a .004" piece of shim stock 1/8-3/16" wide between the upper side (viewed from top) of each secondary throttle plate and the throat. Hold throttle plates closed against shim stock and tighten throttle plate screws. This assures maximum manifold vacuum for smooth efficient engine idle.

Main Body to Choke Housing & Throttle Body–Install spacer over mounting hole for long screw in throttle body, choke plate link so as to permit free travel of link under main body. Be sure "O" ring seal is not displaced and that main body locating dowels engage the throttle body. Small diameter washer must be used with longer of two main body to throttle body screws.

Accelerating Pump–Drop check ball into cylinder bore and tap lightly, using brass rod and mallet, to seat ball. Ball spring retainer projection must be placed over ball, and spring must bottom in cylinder bore groove.

Float Installation–Float spring must seat over boss in main body. Clip must hook the under side of float tab.

Main Body Cover Gasket–Make sure all holes have been punched in new gasket and that no foreign material has adhered to it. Never use any gasket sealer or any form of sealing compound on carburetor gaskets.

Power Valve Diaphragm Installation–Place new assembly on main body cover, position clamp, install the screw and secondary supply jets finger tight. Compress power valve stem to full limit of its travel, then tighten retaining screw and secondary supply jets. *NOTE*–Screw and tubes must be tightened while stem is in the compressed position to insure full travel of the power valve stem.

►*AIR CLEANER ANCHOR SCREW TIGHTENING CAUTION:* Over tightening may cause distortion of the carburetor main body and affect calibration of the metering passages.

Carburetor Adjustments–Make all adjustments listed in ADJUSTMENTS above.

CARBURETOR INSTALLATION ON ENGINE: Install carburetor exactly as follows:

►*CAUTION: DO NOT use gasket sealer or compound on carburetor mounting gaskets.*

1) On 1955 carburetors, position spacer on carburetor mounting pad on manifold with one gasket BELOW and second gasket ABOVE spacer.

2) Position carburetor over mounting studs and start fuel line and choke control inlet tube fittings but DO NOT tighten fittings at this time. Do not connect vacuum lines.

3) Install carburetor attaching nuts and lockwashers and tighten exactly as follows: Tighten all nuts just snug, then tighten each pair alternately in a criss-cross to a torque of 12-15 ft. lbs. *CAUTION*–Correct tightening is important to prevent air leaks or fuel leaks at grooved passages in base of carburetor throttle body.

4) On 1955 carburetors, adjust automatic choke rod (see above). On all carburetors, attach throttle rod to carburetor lever and secure with a clip. Tighten choke inlet tube fitting, distributor vacuum lines and fuel line connection at carburetor. Install air cleaner.

SERVICE PARTS: *NOTE - M t ring j ts furnish d in repair kits listed below are STANDARD (for 0-5000 ft. alt.).*

Gasket Set - Ford No. B5A-9502-B (B5A-9510-G,H, M,N); Ford No. B6A-9502-D (B6A-9510-L,M,N,Q); Ford No.. B7A-9502-G (B7A-9510-AC, V); Ford No. B6T-9502-B (B6T-9510-B); Lincoln & Mercury No. MFK-9502-A (EBJ-9510-D, F, ECK-9510-C,D,G,H); Lincoln & Mercury No. MGK-9502-A, (B6A-9510-L,M,N,Q); Lincoln & Mercury No. MGK-9502-C (ECU-9510-B,C,D,E).

Repair Kit (With Std. Metering J ts) - Ford No. B5A-9590-B (B5A-9510-G,H); Ford No. B5A-9590-E (B5A-9510-M,N); Ford No. B6A-9590-D (B6A-9510-L,M,N,Q); Ford No. B7A-9590-N (B7A-9510-AC,V); Ford No. B6T-9590-AA (B6T-9510-B); Lincoln & Mercury No. HGK-9590-C (ECU-9510-E); Lincoln & Mercury No. MGK-9590-A (B6A-9510-L,M,N,Q); Lincoln & Mercury No. HFK-9590-A (EBJ-9510-D); Lincoln & Mercury No. MFK-9590-B (ECK-9510-C,D); Lincoln & Mercury No. MFK-9590-E (ECK-9510-G,H).

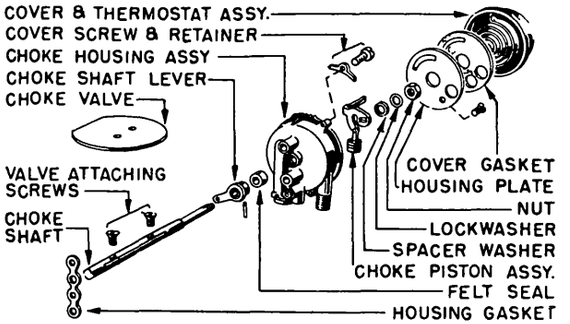
LINCOLN & MERCURY AUTOMATIC CHOKE

F rd 4-Bbl. Carb. (1955)
Lincoln & Mercury 2 & 4-Bbl. Carbs. (1954-55)

►1956 & LATER AUTOMATIC CHOKE NOTE: *Integral type chokes used. Se carburetor pages.*

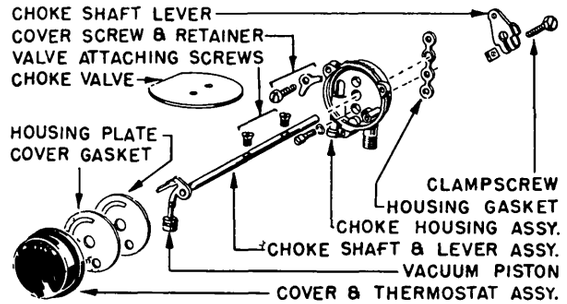
►***ERRATIC ENGINE PERFORMANCE (Erratic Idle Speed, Poor Gasoline Mileage, or Mis-firing caused by automatic choke opening late or not opening fully):*** May be caused by air leak in hot air tube between manifold and choke housing due to use of 5/16" fitting instead of ¼" type. See that correct type fittings used and that all connections are tight.

DESCRIPTION: ***Two types used (1) Integrally mtd. (on carburetor air horn), (2) Separately mtd. (on manifold and linked to choke valve lever by connector rod).***



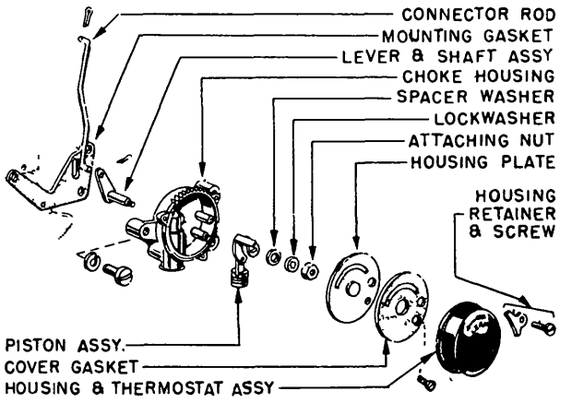
(1) Integrally Mtd. Type—Assembly is mounted on carburetor and linked directly to the choke valve shaft. It consists of a thermostatic coil and vacuum piston assembly to control the choke valve, a fast idle linkage which opens the throttle valve to provide a faster engine idle speed when cold, and an unloading device to correct engine flooding.

(2) Separately Mtd. Type—Choke assembly is similar to first type except that the complete assembly is mounted on the intake manifold by three attaching screws with air and vacuum channels (for control) terminating in ports at the mounting gasket. Automatic choke shaft lever is linked to carburetor choke shaft lever by a connector rod.



OPERATION: Automatic Choke—Thermostatic coil is bi-metal type and tends to "wind-up" and close the choke valve when the engine is cold so that the choke valve is fully closed for cold starting. In this position, the vacuum piston is at the top of the cylinder. As soon as the engine begins to fire, manifold vacuum tends to pull the piston down in the cylinder which opens the choke valve partially (valve is offset and air flow through the air horn also tends to open the valve). As the engine warms up, the thermostatic coil "unwinds" lessening the tension on the choke valve and allowing it to open so that at normal operating temperatures the choke valve will be wide open. Warm air is introduced into the choke housing to effect this unwinding of the thermostatic coil (filtered air from air horn passes through stove in manifold and then flows to the housing). This air flow is controlled by the vacuum piston (slots in the cylinder are uncovered when piston moves down in cylinder and warm air is drawn into housing).

Fast Idle—Consists of a stepped fast idle cam linked to the choke valve shaft and serving as the stop for the throttle valve idle speed adjusting screw.



Unloading Device—When the throttle valve is opened wide, the throttle lever opens the choke valve slightly through the fast idle linkage. This can be used to correct flooding caused by over-choking.

LINCOLN INTEGRAL AUTOMATIC CHOKE

MERCURY INTEGRAL AUTOMATIC CHOKE

LINCOLN & MERCURY SEPARATE AUTOMATIC CHOKE

CHOKE SETTING: Centered (At Index). Reference mark on edge of thermostatic coil and cover assembly shound be aligned with center (longer) line of scale on housing. If a richer or leaner setting required, setting should be changed not more than one division either way from centered setting.

Automatic Choke Adjustment—Loosen 3 cover retaining screws, rotate cover and coil assembly in direction of the arrow for Leaner setting and less choke action, and in opposite direction for Richer setting or more choke action.

FAST IDLE SETTING: Fast idle is set in production and should not require adjustment in the field.

DISASSEMBLY: ***Each type disassembled as follows:***

Integrally Mtd. Type—Disconnect and remove connector rod linking choke lever and fast idle cam. On Mercury take out clampscrew and remove choke lever from shaft. Take out retaining screws and remove choke valve. Remove screws and retainers on cover, rotate cover and thermostatic coil assembly toward "lean" to disconnect coil hook, remove cover assembly and gasket. Take out attaching screw and remove housing plate. On Mercury, rotate shaft until vacuum piston is free from the cylinder, withdraw shaft and piston assembly from air horn. On Lincoln, remove nut, lockwasher, and spacer washer from end of shaft, rotate shaft and remove piston and link assembly (shaft cannot be removed until after choke housing removed). Remove choke housing attaching screws, remove housing and mounting gasket from air horn (On Lincoln, felt seal and shaft can then be removed from air horn).

Separately Mtd. Type—Disconnect and remove rod linking choke lever and carburetor choke valve lever. Take out three attaching screws and remove choke assembly and mounting gasket from air horn. Remove screws and retainers on cover, rotate cover and thermostatic coil assembly toward "lean" to disengage coil hook, remove cover assembly and gasket. Take out attaching screw and remove housing plate. Remove nut, lockwasher, and spacer washer on end of shaft, rotate shaft and remove vacuum piston and link assembly, withdraw choke shaft and lever through back of housing.

INSPECTION: See that all parts of choke mechanism are clean and that choke shaft and piston assembly operate freely and that piston edges and cylinder are free from burrs. *NOTE*—Carbon deposits on piston or in choke housing indicate possibility of exhaust gas leakage in Inconel Tube passage (see 1952 Lincoln Improper Choke Operation Note above). Blow out all passages in choke housing (and in carburetor on integrally mounted type) with compressed air. Use all new gaskets and seals when reassembling unit. DO NOT lubricate any part of the choke mechanism.

REASSEMBLY: Reverse disassembly directions (above). When installing cover and thermostatic coil assembly, see that coil hook is down, then rotate cover toward "rich" (opposite to direction of arrow) until hook is felt to engage choke shaft prong, install cover locking plates and screws. Readjust automatic choke after installation.

1955 256" Eng. (Late)	B5T-9510-A

①—For 5000-10000 ft. alt.—not furnished for service. See High Altitude Carburetor Note below.

►CHANGES & CORRECTIONS

►*1954 FORD TRUCK HESITATION OR DETONATION WHEN ACCELERATING FROM SLOW SPEEDS (Engines with Camshaft No. B4T-6250-A):* Correct by installing the "New" parts listed below in the original carburetor No. EBZ-9510-C OR by installing Replacement Carburetor No. B4T-9510-A. These parts furnished in Kit No. B4R-9590-B. *NOTE*—This replacement carburetor has the new parts and should be installed if carburetor replacement is required.

Kit B4T-9590-A Carburetor Parts

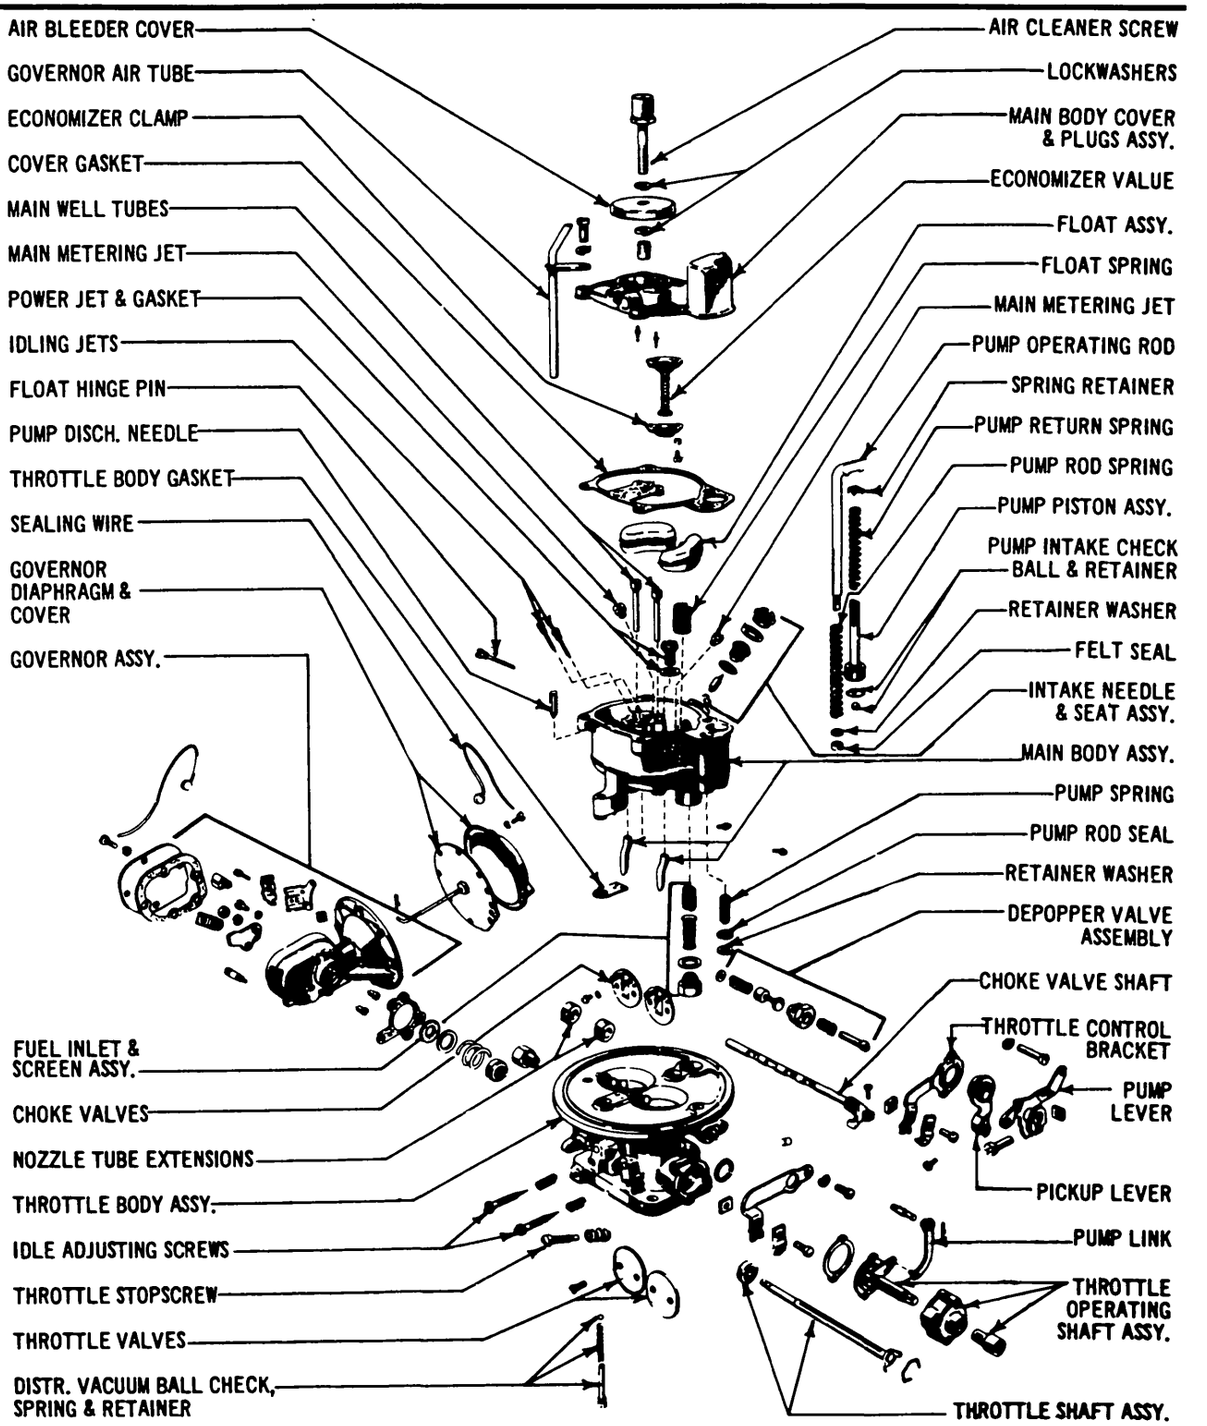
Carburetor Part	New Part No.
Main Well Tube Assembly	①B4T-9991-A
Vacuum Ball Check Valve Spring	②B4T-9606-A

①—Supersedes Part No. EBZ-9991-A.
②—Supersedes Part No. EAM-99515-B.

DESCRIPTION: These "Centri-flo" models are similar to previous type "Dual Concentric" carburetors with following new features:

Air Horn Eliminated—No air horn casting used and air cleaner fits down around main body to form the air intake passage resulting in lower over-all height.

New Discharge Nozzle & Choke Valve Assy.—Main discharge nozzles consist of two drums mounted concentrically on the choke valve shaft (one drum mounted within each choke valve—valves are cut out to clear drums and rotate around them). Choke valve assembly is mounted in venturi throat in throttle body and no secondary venturis are used.



Diaphragm Type Power Valve—Diaphragm type power valve is mounted in main body cover to eliminate possibility of leakage which was possible with previous piston type valve.

De-icing Feature—Consists of two drilled passages in manifold riser, spacer, and slot in base of main throttle body to permit warmed manifold air to heat area around idle jets and passages and prevent condensation and freezing of moisture in idle system.

Vacuum Spark Control Valve (Lincoln only)—Consists of vacuum operated spark control valve assembly on carburetor throttle body (see illustration) which prevents excessive spark advance when engine accelerated (used on all except first 450 cars).

New Vacuum-operated Dashpot (Mercury Merc-O-Matic Cars)—Mounted on carburetor throttle body and operates pick-up lever which opens throttle valves independently of the throttle linkage to prevent engine stalling.

CONTINUED ON NEXT PAGE

HOLLEY (FORD) FORD V8 TRUCK "CENTRI-FLO" CARBURETOR

FORD V8 TRUCK
"CENTRI-FLO" (Cont.)

►*NOTE*—Truck carburetors have main body enclosed in air cleaner horn on Cab Forward models and in the air cleaner on other models, plus the following special features.

Governor Assembly—Governor unit is mounted on throttle body and linked directly to end of throttle valve shaft. Throttle body is modified for governor mounting and throttle valve shaft is special type for governor connection.

Depopper Valve—Consists of a spring-loaded piston type valve built in the throttle body. This valve controls a by-pass through which part of the idle air supply passes around the closed throttle valves (a conventional idle system with idle mixture adjusting screws is used to supply the engine idling fuel supply in the usual manner) Valve is normally open during engine operation but closes when manifold vacuum rises to 22" (when throttle is closed). Closing of the valve enriches the idle fuel mixture to the point where it will not support combustion in the engine or exhaust system thus eliminating any "popping." An adjusting screw is provided for Depopper adjustment. See ADJUSTMENTS below.

Choke Control—Convention manual type (automatic choke not used).

ADJUSTMENT: Make all adjustments as follows:
Idle Setting—Turn adjusting screws in to lightly seat and back off each screw ½ turn. Run engine until operating temperature is obtained, then adjust each screw ⅛ turn in the direction which gives smoothest idle at a high steady manifold vacuum Final position of both screws should not vary more than ½ turn. Reset idle speed. ***See depopper valve adjustment below.***

IDLE SPEED SETTING

Ford Trucks	475-500 RPM

►*NOTE*—On Trucks, engine speed should be controlled by adjusting throttle stop screw and not by depopper valve positioning screw.

Float (Fuel) Level: 1/2" ± 1/32" below top edge of bowl with fuel pump pressure of 3½-4½ lbs. Use Fuel Level Gauge 9550-B to check fuel level placing gauge squarely on top edge of main body so that gauging pins extend down into bowl. Fuel should be at least as high as longer GO pin but must not touch shorter NO GO pin. Adjust by bending tab on float lever which contacts intake needle.

CAUTION—Both floats should be set to same height and floats must not contact float bowl walls.

Depopper Valve Adjustment—Adjust throttle screw to close throttle plates to where they will not bind in bores. Turn depopper valve adjusting screw inward (clockwise) until valve seated (closed) CAUTION—Do not force valve against seat Turn depopper valve adjusting screw outward (counter clockwise) ⅜-½ turn Make **Idle Setting & Idle Speed Adjustment** as given above If engine fails to run when throttle released, increase idle speed sufficently (Idle stop screw) to maintain operation of engine If popping is evident after high road speed or maximum engine RPM, upon deceleration without brake action, check depopper valve piston actuating spring as follows

Depopper Piston Spring Test—Use Tool No T54T-9976-A to check calibration of spring and proceed as follows Remove air cleaner, depopper retainer and valve adjusting screw from throttle body Install screw adapter in throttle body, install sleeve on screw adapter until pointer reads approximately 16 ounces Pull back runner (rod protruding from gauge) and release gently Then push runner forward. NOTE—The pointer will move indicating that valve is not seated Screw sleeve in until pointer reads 16½ ounces Repeat step of pulling runner back, releasing runner gently and pushing runner forward in ½ ounces increments until pointer will not move when pushed forward The pointer should then read within 21 0-21 5 ounces NOTE—If reading is not within specifications of 21 0-21 5 ounces, adjust depopper piston spring tension adjusting screw and repeat above procedure Turn adjusting screw clockwise to increase tension and counter clockwise to decrease tension

Alternate Method (Tool not available)—This will give approximate adjustment for emergency operation Connect vacuum gauge to intake manifold Increase engine speed manually to approximately 2000 RPM Close throttle quickly and notice vacuum reading when hissing sound of air is first heard in carburetor This is point when depopper valve opened If vaccum reading was not between 22 5-23 5 inches of mercury, the piston spring tension adjusting screw should be turned until correct vacuum reading is obtained

►*DEPOPPER CLEANING NOTE:* If necessary to clean depopper valve with carburetor on engine, apply light grease to center section of spring tension washer to hold it in place on end of tension adjusting screw during assembly Add light application of grease to end of spring to hold it in valve recess so valve and spring can be installed together without dislodging washer from end of adjusting screw

Accelerating Pump: Seasonal adjustment provided by three holes in throttle shaft lever for pump link engagement:
Center Hole—Normal operating conditions.
Outer Hole—Extreme Cold weather.
Inner Hole—Extreme Hot weather.

Automatic Choke: ***NOTE—Choke is separate unit mounted on side of intake manifold and linked to choke valve lever by a rod.*** Mark on cover should be in line with center mark of scale on choke housing. Adjust by loosening three cover retainer screws and rotating cover assembly.

Choke Setting—Centered

Choke Rod Adjustment—With rod disconnected from choke valve lever, hold choke valves closed, raise rod to upper limit of travel If rod end does not enter hole in lever freely, adjust rod length by bending it at the offset Connect rod and check entire choke linkage for free movement without binding

Fast Idle: No adjustment required (fast idle cam operated directly by lever on choke valve shaft). Fast idle speed will be correct if throttle stopscrew correctly set (Idle Speed setting above).

OVERHAUL: Work on carburetor will be facilitated by use of Holding Fixture 9510-C (hinged fixture which can be clamped in a vise).

Disassembly: Remove air cleaner anchor screw and air bleed washer from top of main body cover, remove four attaching screws and lockwashers holding main body cover on main body, remove cover and gasket Remove pump rod stud from lower end of pump rod, disconnect and remove pump link while holding pump rod and piston assembly down against spring tension, lift out pump piston and rod assembly.

Main Body Disassembly—Remove float needle seat plug, unscrew float needle seat with tool 9564, remove inlet needle. Unscrew and remove float hinge pin, lift float and float spring out. Remove power valve using tool 9510-AA. Remove main metering jets using tool 9533. Remove idle jet tubes using tool 9544. Take out accelerating pump ball check retainer spring using needle-nose pliers. Tip carburetor up and catch pump discharge needle, pump ball check, main well tubes which will fall out of main body. Take out two screws and lockwashers holding main body on throttle body, lift off main body and gasket.

Throttle Body Disassembly—Remove idle adjusting needles and spring, then remove governor plate, gasket and spring Remove cotter pin from vacuum rod and push rod from governor lever Remove governor lever nut, lockwasher and lever Remove governor retaining screws, governor housing and diaphragm Remove depopper valve adjusting screw assembly but DO NOT remove adjusting screw from nut Remove depopper valve, tension spring and spring washer, DO NOT remove tension spring adjusting screw from throttle body Remove throttle shaft seal retainer and spring Throttle plates and

CONTINUED ON NEXT PAGE

FORD V8 TRUCK "CENTRI-FLO" (C nt.)

shaft should not be removed from throttle body If necessary to remove choke plates and shaft, file off tips of choke plate screws and choke plates Slide shaft out of body Identify plates so they can be installed in original positions Clean and inspect all parts for justifiable replacement

Power Valve Diaphragm—DO NOT remove assembly from main body cover unless tests indicate that replacement is necessary. Remove by taking out three attaching screws and lifting off cover clamp and diaphragm assembly.

Distributor Control Nylon Ball—Remove retaining pin and remove nylon ball from vacuum passage in throttle body.

Cleaning & Inspection: Wash all parts except those noted below in clean solvent *(CAUTION*—Do not use solvent on pump piston leather, power valve diaphragm, spark control valve, nylon fuel inlet needle valve, or nylon distributor passage ball). Blow out all passages in castings with dry air, dry all parts with air. Inspect all parts for wear and damage with particular attention to the following: Inspect castings and main body cover for cracks or leaks, inspect main well tubes, metering jets, and idle tubes for wear or clogged passages *(CAUTION* —clean with air, do not use drills to clean out calibrated openings). Replace all worn or damaged parts (nicked or burred gasket surfaces can be stoned lightly but parts should be replaced if stoning does not clean up surfaces).

Reassembly: Use all NEW gaskets. Install parts in reverse order of disassembly procedure (above) and note the following important points:

Distributor Passag Nylon Ball Caution—If new ball installed, make certain that correct size used.

Throttle Valv Installation—Valves have depression on one side and must be installed with this depressed side down. After valves installed, check for free operation and if binding noted, correct by loosening screws and retightening while valves held closed. Stake screws with staking pliers 9586 after installation completed.

Chok Valve Installation—Slide choke shaft in through body and install nozzle tube drum on shaft as it enters each venturi *(CAUTION*—rounded opening on drum must face inlet side of carburetor and tapered side of hole must face downward). Install choke valves and tighten attaching screws while holding valves closed and applying pressure on threaded end of shaft. Check valves for free operation and make certain that nozzle drums rotate freely within choke valves.

Throttle Body Assembly—Install control shaft and housing on throttle body with new gasket A correctly installed throttle shaft and lever will close plates but will not open them Install spring, retainer and throttle shaft seal with seal shoulder inside retainer Install governor housing using new gasket Install governor lever, lockwasher and nut on shaft Install diaphragm rod through lever and secure it with cotter pin Install governor spring Install depopper spring tension washer properly centered on adjusting screw Install spring, depopper valve, and adjusting screw assembly with new gasket Turn valve adjusting screw "IN" until just seated See depopper adjustment while on engine, above Install governor plate with new gasket Install fuel needles and springs Close needles gently against seats, then back out ½ turn for preliminary adjustment

Main Body Assembly—Install main well tubes, idle jet assemblies and main jets Install power valve with new gasket Install float valve seat and plug with new gasket Install float spring, float, inlet needle valve and secure float with hinge pin Install accelerating pump piston and operating rod Install pump discharge needle Install power diaphragm assembly in cover with edge of diaphragm visible all around to insure against leakage Hold cover in position on bowl with new gasket in place and install center screw and plate Install retaining screws NOTE—One of retaining screws also secures the governor air vent tube which seats in the throttle body when sub-assemblies are reassembled

Main Body & Throttle Body Assembly—Install main body and new gasket on throttle body, aligning rounded opening of each nozzle drum with its discharge nozzle, and properly positioning choke opening lever on fast idle cam as main body is seated on throttle body, install attaching screws and lockwashers from underside of throttle body flange.

Diaphragm Assembly Installation—***Assembly must be installed as follows to properly seat diaphragm on main body cover:*** Place cover clamp over diaphragm stem, compress spring and wind rubber band tightly around stem and spring to hold spring compressed while assembly being installed. Position assembly on main body cover, tighten three attaching screws securely, then remove rubber band and check for free operation by pressing on diaphragm stem. Action must be absolutely free.

Accelerator Pump Installation & Check—Use care not to damage piston leather when installing pump piston and rod assembly. Pump system can be checked after bowl filled with fuel as follows: Use blunt instrument (small drift, etc.) to press down on discharge needle while pressing pump piston down in cylinder. If fuel forced past discharge needle, clean needle and seat and reseat needle by tapping needle lightly using a brass drift and light hammer. Replace needle if leakage continues. Also while pressing on pump piston, note if fuel level rises in bowl or if bubbles evident at pump intake hole in base of bowl indicating leakage at pump intake ball check. If leakage noted, remove ball retainer, clean ball and seat and reseat ball by tapping ball lightly using a brass rod and light hammer. If leakage continues, examine seat for foreign material or imperfections and replace ball.

Main Body Cover & Plug Assy. Installation: Tighten air cleaner anchor screw to 4-5 ft.lbs. torque (this supersedes 6-9 ft. lbs. previously recommended). When installing new type Cover Assembly (see Changes & Corrections above), use ¼" lockwasher **above** and **below** the bleeder plate washer (one at each point).

Carburetor Adjustments—Make all adjustments listed in ADJUSTMENTS above.

SERVICE PARTS: ***CAUTION—Metering jets furnished in repair kits listed below are STANDARD (for 0 to 5000 ft. Altitude). See High Altitude Carburetor Note (above) for special high altitude metering jets.***

Gasket Set—Ford No B2Q-9502-B

Repair Kit (incl. Std. Metering Jets)—Ford No. B4T-9590-A (includes B2Q-9502-B gasket set).

FORD V8 TRUCK DUAL CONCENTRIC

FORD V8 TRUCKS	Carburetor No.
1956 272 (ECR)	ℂ B6T-9510-A

ℂ - Replace by B6T-9510-E

DESCRIPTION· Concentric, dual, downdraft carburetor with main body enclosed within air cleaner on all models except Cab Forward On Cab Forward models main body enclosed in carburetor air cleaner horn. Choke plates mounted in air horn and booster venturis used.

Governor Assembly—Governor unit is mounted on throttle body and linked directly to end of throttle valve shaft Throttle body is modified for governor mounting and throttle valve shaft is special type for governor connection

Depopper Valve—Consists of a spring-loaded piston type valve built in the throttle body This valve controls a by-pass through which part of the idle air supply passes around the closed throttle valves (a conventional idle system with idle mixture adjusting screws is used to supply the engine idling fuel supply in the usual manner) Valve is normally open during engine operation but closes when manifold vacuum rises to 22" (when throttle is closed) Closing of the valve enriches the idle fuel mixture to the point where it will not support combustion in the engine or exhaust system thus eliminating any "popping" An adjusting screw is provided for Depopper adjustment See ADJUSTMENTS below

Choke Control—Convention manual type (automatic choke not used)

ADJUSTMENTS· Make all adjustments as follows

Idle Setting - Turn adjusting screws in to lightly seat and back off each screw 1 turn Run engine until operating temperature is obtained, then turn mixture screws in until engine begins to run rough from lean mixture. Turn screws out until engine begins to "Roll" from rich mixture Turn screws in until engine runs smoothly Always favor a rich mixture rather than a lean setting Reset idle speed after an idle mixture setting. See Depopper valve adjustment below

Idle Speed Setting - 475-500 RPM (Synchro mesh), 475-500 RPM (Fordomatic in Neutral) *NOTE* - Adjust idle speed in Neutral to obtain 425-450 RPM in DR (drive) range on all Fordomatic Trucks

► *CAUTION:* If Anti stall Dashpot adjusting screw holds throttle open and prevents proper idle adjustment, loosen locknut, turn Dashpot adjusting screw clockwise until idle speed can be adjusted, then readjust Dashpot set-

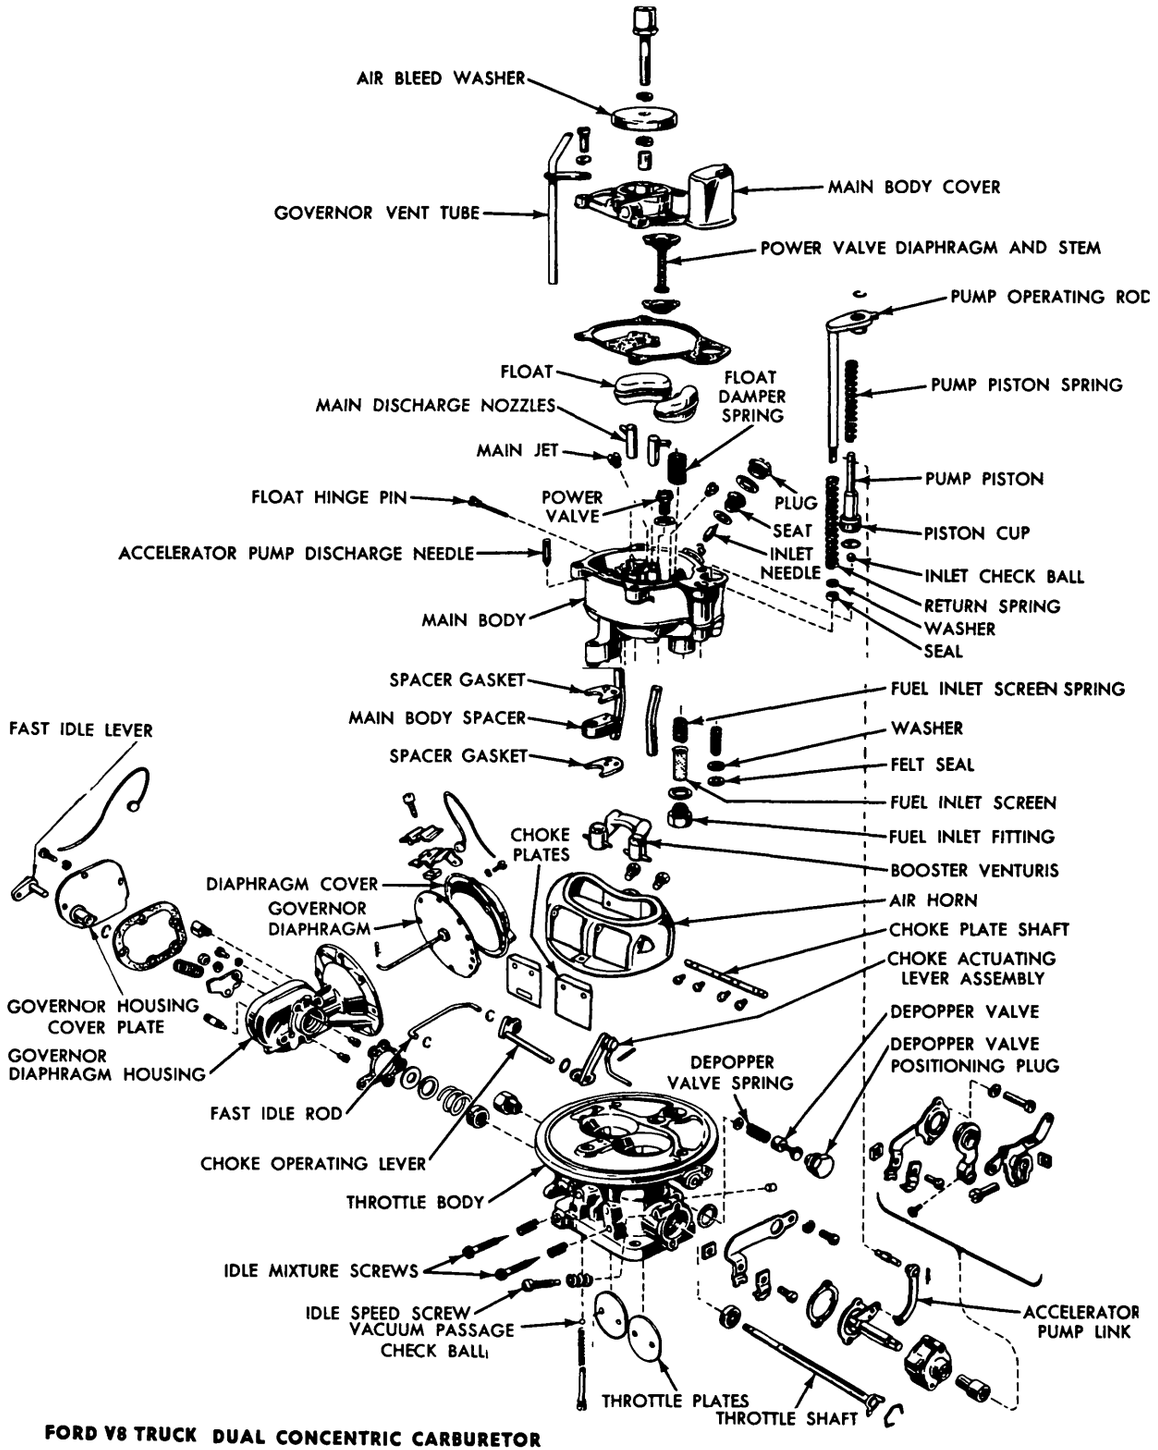
CONTINUED ON NEXT PAGE

FORD V8 TRUCK DUAL CONCENTRIC (C nt.)

ting, see below.

Accelerating Pump Adjustment—Fuel discharge controlled by position of pump link in throttle lever holes (two). Closest hole for hot weather, longer hole for cold weather.

Fuel Level Setting—Use Gauge T54L-9950-C. Remove air cleaner, main body cover plate and gasket, run engine to secure normal fuel level, check fuel level with tool. Distance from fuel to top of machine casting of bowl should be ½" ± 1/32". To correct level setting bend float lever tab up or down to bring level within limits.



Depopper Valve Adjustment—Adjust throttle screw to close throttle plates to where they will not bind in bores. Turn depopper valve adjusting screw inward (clockwise) until valve seated (closed). CAUTION—Do not force valve against seat. Turn depopper valve adjusting screw outward (counter clockwise) ⅜-½ turn. Make **Idle Setting & Idle Speed Adjustment** as given above. If engine fails to run when throttle released, increase idle speed sufficently (Idle stop screw) to maintain operation of engine. If popping is evident after high road speed or maximum engine RPM, upon deceleration without brake action, check depopper valve piston actuating spring as follows:

Depopper Piston Spring Test—Use Tool No. T54T-9976-A to check calibration of spring and proceed as follows: Remove air cleaner, depopper retainer and valve adjusting screw from throttle body. Install screw adapter in throttle body, install sleeve on screw adapter until pointer reads approximately 16 ounces. Pull back runner (rod protruding from gauge) and release gently. Then push runner forward. NOTE—The pointer will move indicating that valve is not seated. Screw sleeve in until pointer reads 16½ ounces. Repeat step of pulling runner back, releasing runner gently and pushing runner forward in ½ ounces increments until pointer will not move when pushed forward. The pointer should then read within 21.0-21.5 ounces. NOTE—If reading is not within specifications of 21.0-21.5 ounces, adjust depopper piston spring tension adjusting screw and repeat above procedure. Turn adjusting screw clockwise to increase tension and counter clockwise to decrease tension.

Alternate Method (Tool not available)—This will give approximate adjustment for emergency operation. Connect vacuum gauge to intake manifold. Increase engine speed manually to approximately 2000 RPM. Close throttle quickly and notice vacuum reading when hissing sound of air is first heard in carburetor. This is point when depopper valve opened. If vaccum reading was not between 22.5-23.5 inches of mercury, the piston spring tension adjusting screw should be turned until correct vacuum reading is obtained.

►***DEPOPPER CLEANING NOTE:*** If necessary to clean depopper valve with carburetor on engine apply light grease to center section of spring tension washer to hold it in place on end of tension adjusting screw during assembly. Add light application of

CONTINUED ON NEXT PAGE

FORD V8 TRUCK DUAL CONCENTRIC CARBURETOR

FORD V8 TRUCK DUAL CONCENTRIC (C nt.)

grease to end of spring to hold it in valve recess so valve and spring can be installed together without dislodging washer from end of adjusting screw.

DISASSEMBLY: Divided into three sections as follows:

►*DISASSEMBLY CAUTION:* Use separate container for component parts: throttle body and main body. DO NOT remove throttle plates and choke plates (unless necessary) to prevent difficulty in correct positioning. Remove booster venturis only when damage makes replacement necessary.

Main B dy Disass mbly - Remove center stud, two lockwashers, and air bleed washer, cover retaining screws, lift out governor vent tube from air horn, remove cover and gasket. Remove accelerator pump link from operating rod, lift pump assembly from well. Remove pump rod dust seal, washers, and spring. Lift out main discharge nozzles carefully, invert carburetor and catch pump discharge needle. Remove float inlet needle plug, inlet needle seat spring, and seat. Unscrew float hinge pin, lift float assembly out and remove float damper spring. Remove main jets and power valve. Lift accelerator pump inlet check ball retainer out of pump well with hooked wire. Invert carburetor and catch inlet check ball. Remove three power valve diaphragm retainer screws from main body cover, and remove power valve diaphragm assembly. To disassemble accelerator pump assembly when necessary, slip pump piston cup off end of piston stem, compress stem spring, pry off stem retainer, then remove stem and spring from operating rod.

Main B dy, Air H rn & Thr ttle B dy S parati n - Invert carburetor, remove fuel inlet fitting, two screws retaining main body to throttle body, lift main body off air horn removing main body spacer and two gaskets at the same time. Remove air horn to throttle body retaining screw, lift air horn off throttle body. Disengage choke actuating lever from choke plate using care not to bend lever.

Throttle Body Disassembly - Remove idle fuel adjusting needles and springs, disconnect fast idle rod from choke lever, and remove governor cover plate and gasket. If necessary, pry off fast idle shaft retainer and remove shaft from cover plate. Remove governor spring and cotter pin from vacuum rod, push rod out of governor lever. Remove governor lever nut, lockwasher, and lever. Remove three retaining screws, then remove governor housing and diaphragm. Remove throttle shaft seal, retainer, and spring, throttle lever and throttle pick-up lever. Remove hand throttle control wire bracket screws, then remove bracket, throttle shaft housing, operating shaft assembly, and gasket. Throttle plates and shaft should not be removed from throttle body. To remove choke lever assembly, when necessary due to binding or damage, remove cotter pin from choke shaft and actuating lever assembly, slide choke shaft out of throttle body, remove actuating lever assembly and washer. Remove depopper valve positioning plug, depopper valve, tension spring, and tension spring washer. DO NOT REMOVE spring tension adjusting screw from throttle body.

Air H rn Disass mbly - Remove choke plate screws, choke plates, slide choke plate shaft out of air horn. Remove lock wire from booster venturi screws, remove screws.

REASSEMBLY: Assemble by reversing disassembly procedure and following sequence below:

1) Assemble all parts of Air Horn.
2) Assemble all parts of Throttle Body.
3) Assemble the Main Body with the Air Horn and Throttle Body.
4) Assemble all parts of Main Body.

Reassembly Notes - 1) Chokeplates must be free of any bind in Air Horn.
2) Be sure fast idle lever is properly positioned in choke lever and fast idle lever.
3) Use light application of grease to hold main body spacer (with gasket on each side) to boss on main body while installing main body on air horn.
4) Hold float in closed position and measure distance from gasket surface on main body to toe of float. Bend float lever tab to obtain 1/4" float level. Float toes must be at same level.
5) Be sure main discharge nozzle tips are pointing away from each other after installation.

SERVICE PARTS: Gasket Set - Ford No. B6A-9502-B.
Repair Kit - Ford No. B6T-9590-A.

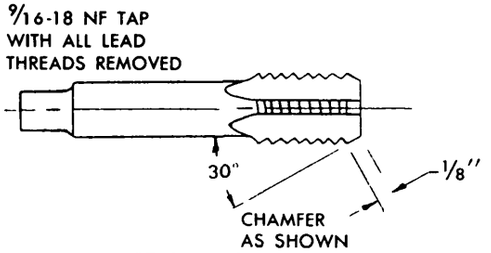
ROCHESTER "RAMJET" FUEL INJECTION

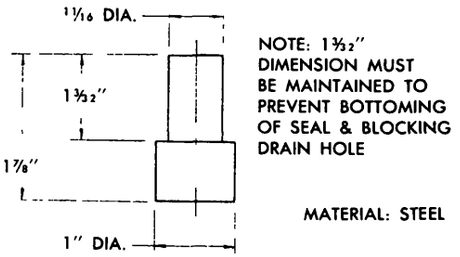
Chevrolet Corvette (1957-60)
Chevrolet Pass. Cars (1958-59)
Pontiac Bonneville (1957)
Pontiac (1958)

►CHANGES, CAUTIONS, CORRECTIONS



►*1958 PONTIAC FUEL INJECTION FUEL INLFT HOSE NOTE:* On fuel injection cars before Engine No. 47830, a fuel inlet hose having an oversize I.D. was used. In order to prevent possibility of a fuel leak, replace the oversize hose with Part No. 530831. Cars having the correct size hose will be marked with a daub of white paint on hose (outside of fuel injection housing).

►*1958 PONTIAC IMPROPER OPERATION OF FAST IDLE CORRECTION:* This condition may be caused by an improperly scribed cold enrichment cover assembly. To correct these assemblies and to check indexing of any unit, proceed as follows: Normalize car temperature to 75°F (by letting car set in 75°F temperature overnight), then remove shroud assembly and disconnect cold enrichment lead at ignition resistor. Loosen cold enrichment cover and connect a vacuum gauge in cold enrichment line. Start engine, then rotate cold enrichment cover in **lean** direction until a vacuum reading is noted in cold enrichment line. Rotate cover in **rich** direction until vacuum cuts off. Rotate cover an additional 4½ notches rich from point of vacuum cut off. *This is the center index point.* Scribe cover and housing for future reference. Set enrichment cover **one notch rich** from index point and tighten securely. Reconnect cold enrichment at ignition resistor.



►*1958 PONTIAC FUEL DISTRIBUTOR LINE "O" RING INSTALLATION CAUTION (To prevent a serious fuel leakage into lower shroud):* Fuel distributor line-to-fuel meter is sealed with a small "O" ring (1957 units used a self-sealing installation) which must be correctly installed as follows: Position "O" ring on end of fuel distributor line and fully against shoulder on line, then coat ring with a light coating of petrolatum to prevent cutting on installation. Position end of line in fuel meter and tighten retaining nut fully

►*1958 PONTIAC IDLE MIXTURE NOT LEANING OUT SUFFICIENTLY WITH THE MIXTURE SCREW CORRECTION & DIAGNOSIS: See "Trouble Shooting"*

►*HIGH PRESSURE FUEL PUMP DRIVE SHAFT SEAL LEAKAGE CORRECTION & SHAFT SEAL INSTALLATION NOTE:* Fuel leakage noted at rear of fuel in-injection fuel meter may be caused by a worn drive shaft seal on high pressure fuel pump and may be corrected by installing a new shaft and seal (furnished in Kit No. 7017174). *NOTE - To remove and install s al and shaft, make a seal remover and a seal installer as indicated in illustrations.* To install shaft and seal, remove pump from fuel meter. *NOTE - Mark pump body, gear housing, and front cover for installation in same position.* Remove front cover and mark relationship of idler gear to drive gear with a wax pencil, then remove gear housing and idler gear. Remove drive gear by extending shaft beyond gear so drive pin can be removed. Screw seal remover tool (see illustration) so it is seated in seal not more than two or three turns *(CAUTION - Screwing tool in further will cause damage to rear bushing),* then drive seal and tap out of pump housing using old drive shaft inserted from bearing end. Slide drive shaft through pump body and remove through seal end to avoid damage to bushing. Place a new seal in position in pump body with open end of seal downward and press it into place with seal installer (see illustration). Lubricate new drive shaft and install in housing from seal end. Install drive gear, idler gear, and gear housing in their original positions (remove wax pencil markings). Assemble front cover and inst all screws finger tight. At the same time, rotate drive shaft counterclockwise (looking into drive cable end). If shaft turns freely, gear housing is properly centered. Tighten two of the Allen screws diagonally across front cover. If shaft turns freely, tighten remaining two screws and recheck shaft for free rotation. If shaft is not binding, tighten screws to 40 inch pounds. If pump tends to turn hard, loosen screws and reposition gear housing.

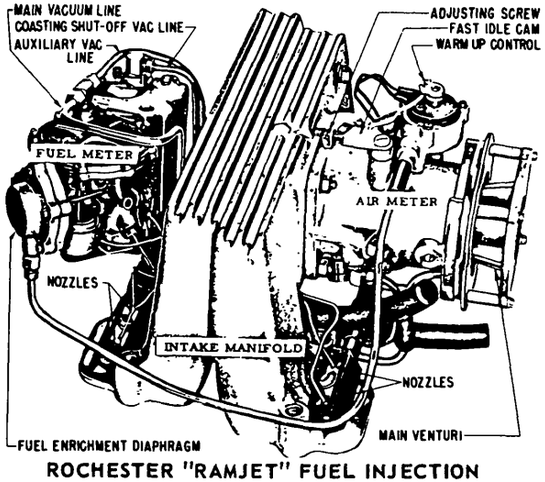
SEAL REMOVER TOOL

SEAL INSTALLER TOOL

DESCRIPTION: This fuel injection system is the "continuous flow" type in which fuel is sprayed through calibrated nozzles adjacent to each intake port. At this point it is combined with air (in proper ratio) from intake manifold. An "air meter" containing a throttle valve and a venturi controls the amount of air admitted to the intake manifold and provides the necessary vacuum for fuel control under various operating conditions. A "fuel meter" containing a fuel reservoir, high pressure pump, and fuel controls, governs the amount of fuel required according to load and speed. Auxiliary controls for fuel cut-off during deceleration and for engine starting are also contained in the fuel meter.

►*1958 & LATER FUEL INJECTION NOTE: 1958 and later model fuel injection units are similar to 1957 models except as indicated below.*

Chevrolet Pass. Cars & Corv tt - A spark port is used to accommodate distributor vacuum advance and the fuel enrichment assembly has been improved for a more stable idle speed, improved hot starting, better par throttle performance and improved fuel economy. On 1959 and later models, the intake manifold adaptor has been redesigned to provide easier distributor removal. Distributor pad on intake manifold is lower and a spacer and gaskets are used to maintain proper distributor level. *NOTE - On 1959 and later models, remove spacer with distributor after removing cap and rotor.* On 1959 and later models, individual manifold-to-adaptor gaskets are used for better alignment, and the air cleaner adaptor and cleaner element are mounted on radiator support.



Chevrolet Corvette - In addition to changes noted above, the Starting Cut-Off Switch, Starting Solenoid, Starting Bypass Fuel Tube, Idle Vacuum Signal Tube, and Signal Boost Tube have been eliminated. Elimination of separate idle vacuum signal tube and signal boost tube, vacuum signals for fuel control are now transmitted to main control diaphragm by a single line for all operations except starting. Auxiliary vacuum signals formerly supplied by separate boost tube and idle vacuum signal tube are added to main control diaphragm vacuum signal by means of internal air meter passage connections to main signal tube pickup point. Elimination of starting solenoid, switch, and bypass fuel lines was made possible by application of manifold vacuum during cranking to provide fuel delivery. A normally open diaphragm valve is tapped into injector manifold which transmits manifold vacuum created during cranking through a restriction to main control diaphragm. This substitute vacuum source is eliminated once the manifold vacuum exceeds 1.4" (of mercury), as manifold vacuum completely overcomes diaphragm spring tension at that point. Comparatively, manifold vacuum applied to main control diaphragm on Corvette positions spill plunger to provide fuel meter fuel delivery to nozzles during cranking whereas on Pass. Cars and earlier fuel injection units, fuel delivery is is accomplished through a solenoid activated by the engine cranking circuit which causes spill plunger to be fully depressed to allow engine fuel pump pressure to be delivered directly to nozzles through a starting bypass fuel line. Once the engine starts, operation of Pass. Car and Corvette units is the same.

Pontiac - A simplified cold enrichment system with many passages enclosed in air meter casting has been added. Other new features include a simplified signal system which entails only one vacuum line between air meter and fuel meter for control signal. The idle signal system is built into the air meter. For starting, a manifold vacuum valve is used to introduce cranking vacuum to the signal system to boost control signal for starting. This replaces the solenoid formerly used. The spill plunger and sleeve can be removed as an assembly and replaced without disturbing other parts of fuel meter.

CONTINUED ON NEXT PAGE

ROCHESTER "RAMJET" FUEL INJECTION (C nt.)

Fu l Supply & Regulati n: Fuel is supplied to reservoir in fuel meter by a conventional type fuel pump, and fuel level is maintained in reservoir by a float system similar to that used in conventional carburetors. The high pressure pump is externally driven by a cable from ignition distributor, and feeds fuel under high pressure to the fuel control valve. Incoming fuel passes through a filter screen and passes upward through center of fuel control valve where it lifts a ball check and passes through a series of small holes into main metering chamber. At this point the fuel passes through small holes into fuel distributor tubes or it flows upward and out the spill ports, depending on engine requirements. The position of the spill plunger determines how much fuel is spilled back to the reservoir or diverted to fuel nozzles. The spill plunger position is determined by fuel pressure from below balanced against the force of the control lever from above. For low fuel flow, the spill plunger is in its raised position so that all spill ports are uncovered allowing a **minimum** fuel flow to nozzles. For high fuel flow, the plunger is in its lowest position which shuts off all spill and raises pressure in metering chamber, allowing a **maximum** fuel flow to nozzles. For starting, the

ROCHESTER "RAMJET" FUEL INJECTION INSTALLATION ON ENGINE (TYPICAL)

fuel valve is mechanically forced off its seat so that fuel can by-pass the ball check and flow directly to nozzles. With valve off its seat, a fuel by-pass passage is uncovered which admits fuel from fuel inlet at supply pump pressure to help supply sufficient fuel for engine at cranking speed.

Fuel Contr l Linkage: The correct metering of fuel for a given air flow is accomplished by the main control diaphragm and linkage as follows: A fuel control diaphragm operating on venturi vacuum and linked to the fuel control linkage moves upward with increased vacuum and acts on the linkage to force the spill plunger downward. As the plunger is forced down, the amount of spill is reduced and the fuel flow to nozzles is increased (the spill plunger will come to rest at a point where fuel pressure and lever force are in balance). The system is calibrated so that for a given air flow, venturi vacuum will move diaphragm and linkage so the right amount of spill is allowed for proper fuel pressure and flow to nozzles.

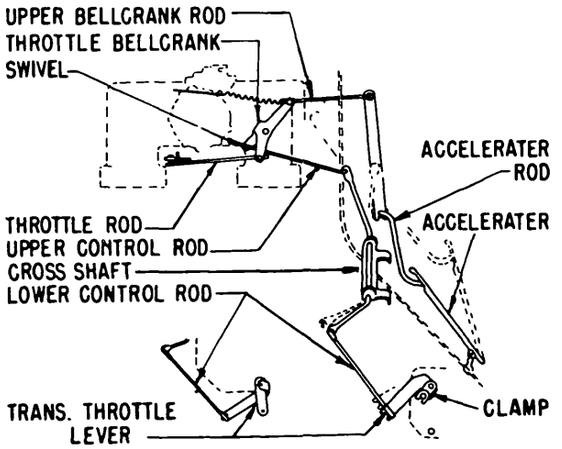
Mixture Control: For starting, warmup, and power, mixture control is accomplished by changing the pivot point of the fuel control lever which in turn changes the effect of the main control diaphragm on the spill plunger. A ratio lever located between main control diaphragm link and spill plunger can be rotated by the enrichment diaphragm to change the pivot point. With ratio lever moved to extreme left side (no vacuum in enrichment diaphragm), the main control diaphragm will depress spill plunger and allow maximum fuel to be delivered to nozzles. As vacuum in the venturi increases, the ratio lever moves to right side allowing spill plunger to rise and uncover spill ports resulting in less fuel to nozzles. For normal driving, the ratio lever is maintained in its extreme right position.

Nozzle Operation: Fuel is fed from fuel meter through fuel distributors to eight nozzles which are a factory matched set. Fuel is metered by the nozzle orifice and is sprayed across an air duct through a larger hole directly into intake manifold just outside the intake valve. An air duct in the nozzle allows fuel to be discharged to atmospheric pressure which allows better fuel control. Fuel is delivered continuously so that a full charge is ready whenever intake valve is open.

Air Flow & Control System: Air flow is controlled by the accelerator which opens and closes a throttle valve located in the air meter assembly which is attached to intake manifold. A cone shaped diffuser fits in place in main bore of air meter, forming a venturi at the point where air enters air meter. Air flow at the venturi creates a vacuum that is used to control the main control diaphragm and the fuel meter so that a proper amount of fuel can be fed in correct ratio to the air which is flowing.

OPERATION: The fuel injection system operates under various engine conditions as follows:

Idle Air Flow: During idle operation, the throttle valve is completely closed against bore of air meter and air is introduced to intake manifold through a by-pass system. Air taken into the by-pass system above the throttle valve is directed through a passage to a point below the throttle valve. An idle air screw at this point regulates the amount of air allowed through the by-pass system and controls engine idle speed. In addition to idle air taken in through the air meter, a portion of air for idle is also taken in through each of the eight fuel nozzles air ducts.



Idle Fuel Control: Since the venturi vacuum is light at idle speed and a higher vacuum is required to provide a richer mixture, the venturi vacuum is strengthened by the addition of a regulated amount of manifold vacuum. Vacuum is supplied to this system at idle needle valve hole and can be controlled by the idle needle. This auxiliary vacuum is transmitted to a "T" at the main control diaphragm where it passes a restriction and combines with main venturi vacuum to operate the main control diaphragm. As the throttle valve is opened, vacuum is introduced to the system through the off-idle port and, at this point, the vacuum is controlled by the restriction in the tube. As the throttle valve continues to open, auxiliary vacuum decreases and the main venturi vacuum operates the diaphragm.

Acceleration: The extra charge of fuel required for acceleration is obtained as follows: As the throttle valve is opened for acceleration, the air flow and the main venturi vacuum increase immediately. Because of the throttle valve opening, vacuum on the auxiliary vacuum system decreases but the decrease is delayed by the restriction in the vacuum line; so, for a short period, a very high vacuum is maintained at the control diaphragm, resulting in an extra charge of fuel for acceleration.

Power: For power operation, the ratio lever in the fuel control linkage is moved to its rich position by means of a vacuum diaphragm which is connected to manifold vacuum. When manifold vacuum is high and lean mixtures can be used, the diaphragm is held in a lean position. When power is required and engine vacuum drops, a calibrated spring moves the diaphragm to the rich position and holds it there until manifold vacuum rises. Stops are provided on the fuel meter casting to determine proper rich and lean mixtures. *CAUTION - These stops must not be moved in the field as doing so would require a complete recalibration of the system.*

Coasting Shut-Off: In order to cut off the flow of fuel during deceleration, a diaphragm controlled coasting shut-off valve is included in the fuel meter, which operates as follows: A heavy calibrated spring holds down a large check valve in the high pressure pump outlet so that under normal driving conditions high pressure fuel is fed to the metering system. The heavy spring is connected to a diaphragm and whenever the very high vacuum (due to deceleration) is applied to

CONTINUED ON NEXT PAGE

TURBOGLIDE POWERGLIDE
CHEVROLET TRANSMISSION THROTTLE LINKAGE WITH FUEL INJECTION

ROCHESTER "RAMJET" FUEL INJECTION (C nt.)

the diaphragm, it overcomes the spring and lifts the check valve causing the high pressure pump to discharge directly into fuel reservoir and no pressure is applied to metering system. To prevent operation of the coasting shut-off valve except during prolonged deceleration, a fitting containing a check ball and a restricted opening is installed in the coasting shut-off vacuum line at the diaphragm end. When a high vacuum is applied to this fitting, the check ball is pulled off its seat, and vacuum is applied to the diaphragm through the restricted opening. This has the effect of slowing down diaphragm reaction so that fuel is shut-off only during continuous deceleration. When throttle valve is opened and vacuum drops, the ball falls off its seat and relieves vacuum on the diaphragm.

Starting: Because of the low fuel pressure from the gear pump during engine cranking, a starting solenoid is included in the fuel meter which mechanically forces the fuel valve off its seat so that fuel can flow directly from reservoir inlet to nozzles as follows. The starting solenoid which is energized by the starting circuit forces the spill plunger downward, through linkage, until it forces the fuel valve off its seat. This action uncovers a special by-pass fuel line which delivers fuel at supply pump pressure to the metering chamber where it is combined with gear pump pressure to supply sufficient fuel for starting. As soon as engine starts and ignition switch is returned to "run" position, solenoid current is cut off causing the fuel valve to return to normal position, shutting off the fuel by-pass.

C ld Enrichment: To provide a richer mixture during engine warmup, manifold vacuum is cut-off from the enrichment diaphragm causing it to retain the ratio lever in the rich position, as follows. A thermostatically controlled check valve in the manifold vacuum line is pulled upward by manifold vacuum, cutting off vacuum to the enrichment diaphragm and exerting a pull on the enrichment piston. Opposing the vacuum pull on this piston is the tension of a thermostatic coil which will hold the piston up and leave check ball in a closed position until coil is heated and relaxes. A heating element in the thermostatic coil is energized by generator whenever engine is running. When coil has been heated sufficiently to relax its tension, vacuum pulls piston all the way down and piston stem unseats the check ball so that vacuum is applied to enrichment diaphragm, causing it to move the ratio lever to lean position.

Unloading: To allow cranking without use of the fuel by-pass, a solenoid cut-off switch is attached to air meter next to the throttle lever. Whenever the throttle valve is opened three quarters or wider, a cam on throttle lever operates a micro-switch to break the circuit to fuel by-pass solenoid, allowing a flooded engine to be "unloaded" and restarted.

ADJUSTMENT

► *ADJUSTMENT NOTE. Make all adjustments in the order indicated below*

CHEVROLET PASS. CARS & CORVETTE

Idl Spe d & Mixtur : For an initial adjustment, turn both the idle air adjustment screw (located below and to rear of fuel enrichment housing and facing left side of car), and the idle fuel adjustment screw (located below and to rear of fuel enrichment housing - this screw faces rear of car and is closer to side of engine than idle air adjustment screw), two full turns open from a fully seated position. With engine at normal operating temperature and running, adjust air adjusting screw to obtain best possible idle speed. Adjust idle fuel adjusting screw to smooth out the idle speed. Readjust idle air adjusting screw and fuel adjusting screw until best idle is obtained at approximately 500 RPM (Auto. Trans. in "DR"), 600 RPM (Std. Trans.), 700 RPM (with solid lifter camshaft).

Throttle Linkage (Synchro-mesh Trans.): With accelerator pedal pressed to floor and throttle bellcrank rotated so throttle valves are in wide open position, adjust upper bellcrank rod for free entry into bellcrank lever.

Throttle Linkage (Powerglide & Turboglide): Same as for standard carburetors. *See "Carburetor" on Car Model pages.*

Cold Enrichment Coil Adjustment: Scribe mark on coil cover should be set 1½ notches rich from scribe mark on housing.

Cold Enrichment Rod Adjustment (Chev. Pass. Cars): With engine turned off and cool, disconnect rubber sleeve from cold enrichment housing signal boost tube and insert a short length of rubber hose over tube (such as windshield wiper hose). Crack throttle valve as necessary to place throttle tab just on high step of fast idle cam, then close the throttle. Hold trip lever against counterweight tab and blow into hose while listening at the air meter. If choke rod length is correct, slight air flow should be heard. Repeat check but with throttle tab on second step of fast idle cam. No air should be heard. If necessary, bend rod as required with Bending Tool J-6492 to shorten or lengthen rod in order to meet above requirements.

Cold Enrichment Rod Adjustment (Corvette): To hold trip lever and the counterweight tab together, twist the attaching screw its full limit clockwise. Note point where fast idle screw contacts cam. If rod length is correct, fast idle screw will just touch at center of high step of cam. Otherwise bend rod to lengthen or shorten as required to provide correct adjustment.

Fast Idle Setting: With engine at normal operating temperature, fast idle speed should be 1600-1700 RPM with throttle tab (Pass. Cars), fast idle screw (Corvette) on high step of fast idle cam. To adjust, bend throttle tab (Pass. Cars), rotate fast idle screw (Corvette) to to bring engine to specified RPM.

PONTIAC

► *PONTIAC NOTE:* The fuel injection system used on Pontiac is basically the same as that used on Chevrolet models however, the complete system is fully enclosed in a sheet metal shroud and air is introduced through a conventional type air cleaner

Idl Spe d & Mixture: Remove idle adjustment cover (in center of shroud), and air adjustment plug (on left hand end of shroud) from upper shroud Connect a tachometer and vacuum gauge to engine Insert a screwdriver through hole in shroud and adjust the air screw to obtain a correct idle speed of 480-500 RPM (with transmission selector lever in "Dr" (Drive) range) Set idle mixture screw (through opening in top of shroud) to best idle, highest vacuum and RPM. *(NOTE* - Turn screw in to lean mixture, out to richen mixture). Recheck idle RPM. If any slight stalling tendency shows up on road test, use a slightly richer (1/8 turn) mixture adjustment.

Throttle Linkage Adjustment (Hydra-Matic Cars): Same as for standard carburetors. *S "Carbur t r" n Car Model pages.*

Throttle Return Check Adjustment: Disconnect throttle return check vacuum line and plug manifold to avoid leakage of air. Run engine until completely warm (make sure there is no cold enrichment). Adjust contact screw of throttle return check to obtain 1200 RPM engine speed. Reinstall vacuum connection to manifold.

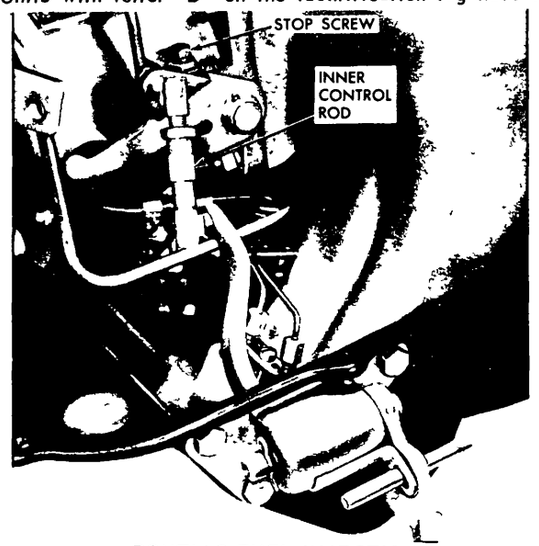
Cold Enrichment Coil Adjustment: Scribe mark on coil cover should be set 5 notches rich (1957 after Unit No. 1039), 1 notch rich (1958).

Fuel Injection Throttle Control Linkage Adjustm nt: Remove throttle return check from bracket and disconnect inner control rod at throttle lever on air meter. Make sure throttle plate is fully closed (not on fast idle cam), then insert Gauge Pin J-2544 through hole in bracket and hole in lever (on outside of shroud). Adjust length of inner control rod so that with gauge pin installed the air meter throttle plate will be in fully closed position. Connect inner rod to throttle lever and remove gauge pin. *CAUTION - D not adjust clos d throttle stopscrew on air m t r. This is a factory calibrated adjustment.* Install throttle return check on bracket.

Cold Enrichment Rod Adjustm nt (1957 Models): While holding throttle valve open, move choke trip lever clockwise to its full travel. With trip lever in full clockwise position and in contact with tang on cold enrichment lever, check point at which fast idle adjusting screw contacts cam. The screw should be on high step of cam and from flush to .050" from the step. To adjust, bend link at center angle. *CAUTION - In h t idle position, fast idle scr w must be ntirely cl ar of cam.*

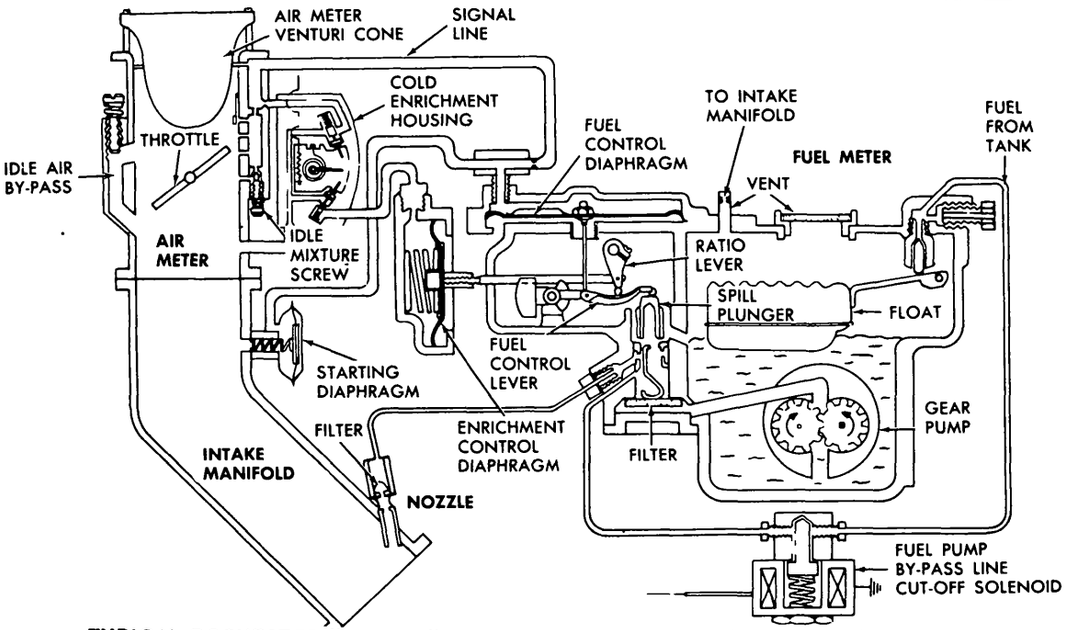
Cold Enrichment Rod Adjustm nt (1958 Mod ls): With engine running, rotate cold enrichment lever and trip lever as a unit (keeping both levers in contact) until fast idle screw is positioned at end of second step of fast idle cam. Screw should be overhanging low step of cam. While holding levers in this position, check position of enrichment lever fuel meter. Lever should be against "rich" stop. Rotate cold enrichment lever and trip lever until fast idle screw is positioned on low step of cam and against second step. While holding levers in this position check enrichment lever on fuel meter. Enrichment lever should now be against "lean" stop. If relationship between cam and cold enrichment assembly is incorrect, bend fast idle link to adjust.

Fast Idle Sp d Adjustm nt (All Mod ls): With engine at normal operating temperature, remove upper shroud and



CONTINUED ON NEXT PAGE

ROCHESTER "RAMJET" FUEL INJECTION (C nt.)



adjust fast idle screw to obtain 1500 RPM with screw on top step of fast idle cam.

TROUBLE SHOOTING & DIAGNOSIS: Check to make sure that all adjustments have been properly made before diagnosing fuel injection trouble.

►*1958 PONTIAC IDLE MIXTURE NOT LEANING OUT SUFFICIENTLY WITH THE MIXTURE SCREW CORRECTION & DIAGNOSIS:* With engine operating at normal temperature, disconnect vacuum line at cranking signal valve. If engine leans out with line disconnected, there is a vacuum leak either through cranking valve or from air meter. To locate leak, cover cranking valve outlet tube and cranking valve vacuum line with fingers or rubber plugs. If engine again runs rich the trouble is in the air meter; but if it stays lean, the cranking signal valve is leaking manifold vacuum and must be replaced. If after checking as above and correcting leakage, the engine continues to run rich, the trouble is in the fuel meter and the unit must be removed from the car. After removal, check bypass solenoid valve for proper sealing. This can be done by attempting to blow air through bypass line. If valve is fully seated there should be no leak. Actuate solenoid with 12 volt current. Air should pass freely through bypass line. Remove fuel control diaphragm cover and fuel control diaphragm and gaskets. Install a new fuel control diaphragm and gasket using only one gasket under the diaphragm in place of the two used in production. *NOTE --When installing diaphragm, it must be positioned evenly to allow flex.* Remove spill sleeve and spill plunger and check spill splunger for freeness in sleeve. *NOTE- Units with letter "D" on the identification tag have a light weight spill plunger to aid in leaning out idle mixture. The lighter plunger is recognized by an undercut to remove excess weight.* On earlier units, the spill sleeve and plunger should be replaced with the light weight type, Part No. 7017081. Reassemble unit and reinstall on car, using new manifold gaskets.

PONTIAC FUEL INJECTION THROTTLE CONTROL LINKAGE

TYPICAL ROCHESTER "RAMJET" FUEL INJECTION SYSTEM (SCHEMATIC)

Failure To Start: Check to make sure that depressing the throttle on a cold engine will allow the fast idle cam to index, and that throttle remains closed until engine has started. Check starting solenoid on fuel meter to make certain it operates when starter is engaged. Make sure fuel is flowing from nozzles. If fuel flows from nozzles, and car won't start, check for large air leaks, such as loose nozzle blocks. If no fuel flows from nozzles, check gas tank and supply pump. Check the gear pump drive cable. There is also the possibility that foreign material under the coasting shut-off valve will prevent pump from delivering fuel.

Starts & Dies: Check for vacuum leaks, especially in lines to main control diaphragm. If this trouble occurs on cold starts, check the thermostat cover for proper location. Check thermostat housing for leaks and make sure the check ball in the sleeve is free to move. Check the spill plunger for sticking by moving it manually (push on solenoid plunger). Check for a leak in main control diaphragm, either at seal between cover and casting or in the diaphragm (diaphragm leakage may be checked by applying a 2.5" vacuum on control line). Check fuel supply pump for capacity and pressure. Be sure the by-pass solenoid is returning to "run" position.

Hesitation or Flat Spot: Check for leaks in control lines and fittings. Check the venturi signal system in the Air Meter for cleanliness and make sure the auxiliary signal passages are clear. Check main control diaphragm for leaks. Make sure there is a restriction in the "tee" on the auxiliary signal side. Check for sticking spill plunger. Apply an 18" vacuum to enrichment diaphragm to check leakage. Check enrichment linkage for proper cut-in and mixture ratio limits (Enrichment lever should leave power stop at 4" of vacuum and reach the economy stop at 8" of vacuum. Check to be sure enrichment diaphragm is receiving manifold vacuum; if not, look for trouble in the thermostat housing, such as a broken heat element or a sticky piston.

Surge: Check the enrichment diaphragm and spill plunger (see above). Disconnect coasting shut-off diaphragm line and plug it to prevent a vacuum leak into the air meter; if this cures the surge, check adjustment of the coasting shut-off and check springs for distortion.

Rough Idle: Check for correct idle speed and mixture adjustments. Look for plugged nozzle (to do this, short out the spark plugs, one by one). Check for any vacuum leaks in control lines and nozzle blocks. Be sure enrichment lever is on the economy stop when engine is warm.

Cold Driveaway: Check for proper adjustment of cold enrichment cover and the fast idle rod. Check thermostat control piston to make sure it is not sticking and that the enrichment lever rests on the power stop during warm-up. *(See "Starts & Dies" above).* Check for vacuum leaks throughout system.

Fuel Economy: Be sure the enrichment lever rests on economy stop during normal operation. *(See "Hesitation & Flat Spot" above).* Check to see that mixture stop screws are locked in place so they cannot move and vary the mixture. *CAUTION - These stops are preset.*

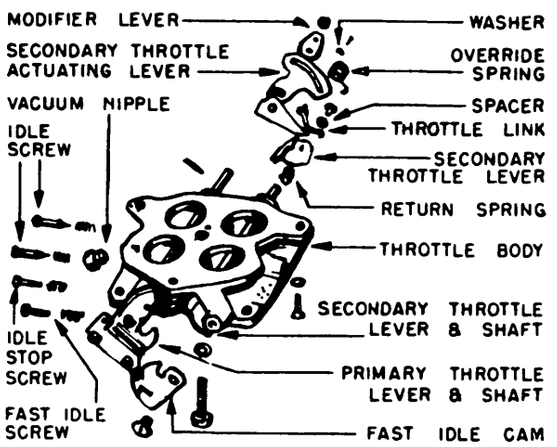
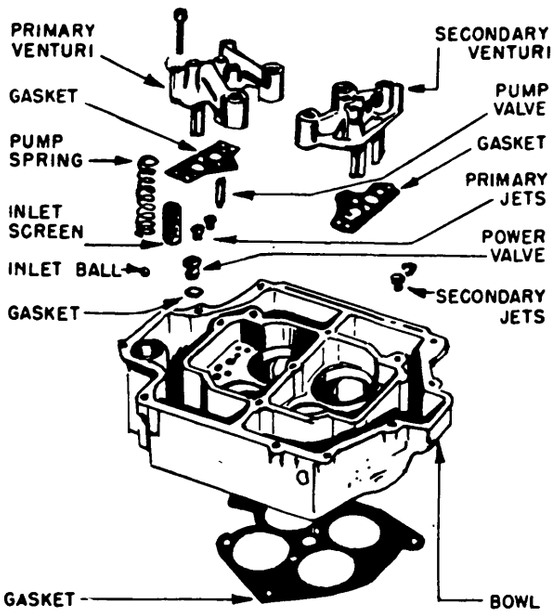
►CHANGES, CAUTIONS, CORRECTIONS

►*1954 CADILLAC "SPEED-UP" CONTROL ON AIR-CONDITIONED CARS:* This device automatically increases engine idle speed when air-conditioning turned on while engine idling with selector lever in Neutral "N" position. *See Speed-Up Control Adjustment following Idle Adjustment below.*



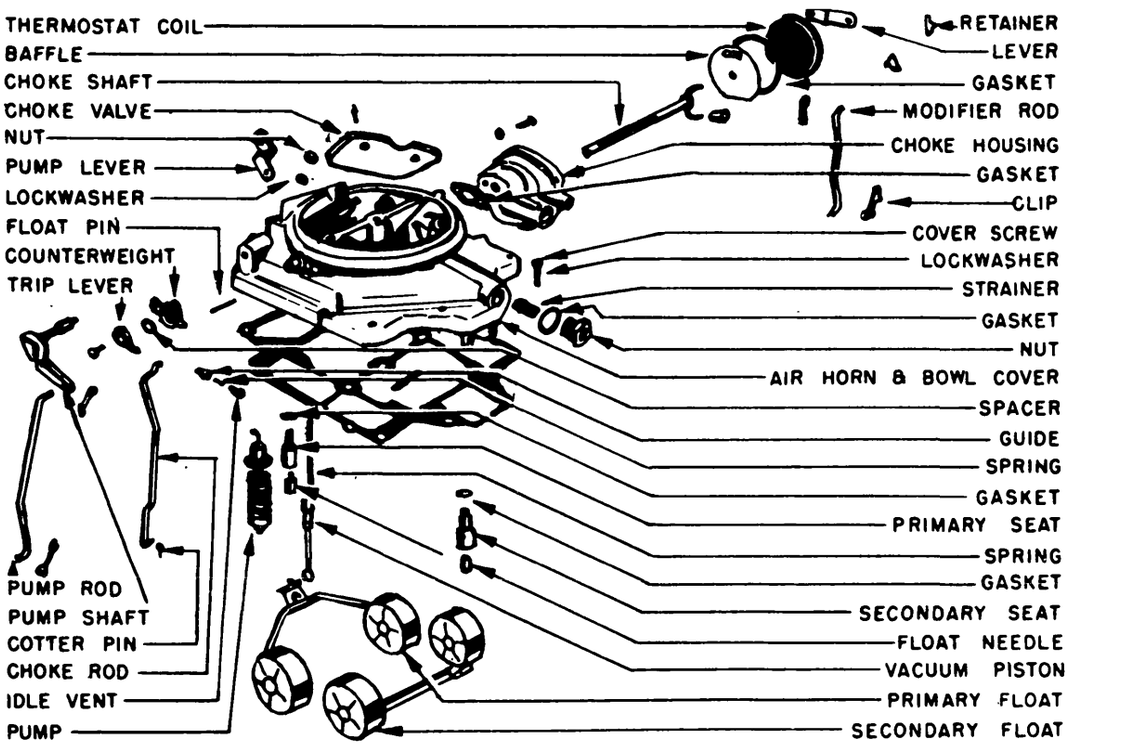
►*1954 CADILLAC CARBURETOR PRODUCTION CHANGE (To eliminate Surge in 20-30 MPH. Speed Range):* Carburetor No. 7006962 used on later cars. This carburetor has revised idle circuit (New Idle Tubes and changed idle channel resistance), New Main Metering Jets, and New Throttle Body. Adjustment specifications are same as for previous carburetor models.

►*1954 CADILLAC IDLE SPEED SETTING CAUTION ON AIR-CONDITIONED CARS:* Idle speed setting should be adjusted seasonally: (1) When air-conditioning use discontinued for winter months, (2) When air-conditioning is put into use for summer months. This is necessary to compensate for compressor load when engine idling in "Dr." *See Idling Adjustment below. CAUTION—Engine may stall during summer months, or operate at too fast an idle speed during winter months, if proper procedure not followed.*



DESCRIPTION: These models are essentially double dual (two-barrel) carburetors with a conventional dual **primary** unit supplemented by a similar dual **secondary** unit for maximum engine performance. Both the primary and secondary units have separate feul bowl and float systems, idle systems, main metering and discharge systems, and interconnected throttle valves as described below. Only the primary unit has an accelerating pump system and choke valve with an automatic choke control (the secondary throttle valves are locked closed for starting and warming up and remain closed during part-throttle operation). *See Throttle Linkage data below.*

Fuel System: A single fuel inlet is used (located on secondary side of bowl cover) with a passage in the cover leading to the fuel inlet valve for each float chamber. Each bowl has a twin float assembly controlling the fuel inlet valve. Bowls are vented to the air horn by vent tubes and have additional vent passages terminating at the air cleaner mounting flange. *See also Idle Vent data below.*



CONTINUED ON NEXT PAGE

THROTTLE BODY ASSEMBLY

MAIN BODY ASSEMBLY

R CHESTER 4GC 4-BARREL CARBURETOR AIR H RN & B WL C VER ASSEMBLY

1954-55 ROCHESTER 4-BARREL 4GC CARBURETORS (C nt.)

Idling & Low Speed—Entire idle system is duplicated for both the primary and secondary sides of the carburetor except that idle mixture adjusting screws are provided only on the primary side. Both idle systems discharge into the primary carburetor barrels so that both idle systems are controlled by the opening of the primary throttle valves (idle systems drop out as primary throttle valves open and main nozzles come into action and take over). Secondary throttle valves are locked out by the choke mechanism when the engine is cold and even when the engine is warm these valves do not begin to open until primary throttle valves are 50-60% open.

Accelerating Pump—Used only on primary side of carburetor. Pump is conventional type with pump plunger linked to primary throttle valve lever so that the additional fuel needed for acceleration is discharged through the pump jets into the primary carburetor barrels when the primary throttle valves are opened for acceleration. A relief check valve is located in the pump discharge channel to prevent excessive pressures in the pump circuit (opening of the check valve permits fuel to be by-passed back into the bowl).

Primary & Secondary Throttle Linkage: Secondary throttle valve lever is linked to a secondary actuating lever on the primary throttle valve shaft with an overrun provision so that secondary valves do not begin to open until primary valves are 50-60% open. The linkage provides a more rapid opening of the secondary valves so that both the primary and secondary valves reach the wide open position at the same time. This linkage must be checked and adjusted to insure this synchronized opening. *See Adjustment data.*

Secondary Throttle Lock-out: A means is provided by which the choke mechanism locks the secondary throttle valves closed while the choke is in operation so that no choke valve is required on the secondary side of the carburetor. This lock-out mechanism differs on the various carburetors but all types must be checked and adjusted to insure unlocking of the secondary valves for normal operation. *See Adjustment data.*

Atmospheric Idle Vent: This is an outside bowl vent controlled by a ball or disc type check valve which is opened mechanically (by an arm on the pump countershaft or operating lever) when the throttle valves are closed. This permits fuel vapors to escape and minimizes hot weather starting or idling difficulties due to fuel vapor formation. Vent must close when throttle valves open and vent setting should be checked and adjusted as part of the carburetor adjustment procedure. *See Adjustment data.*

ADJUSTMENT: ***CAUTION—Adjustments must be made in exact sequence as given below (except for Idle Mixture and Idle Speed Tune-up adjustments).***

Idle Setting: ***Adjust only with engine at normal operating temperature with automatic choke not operating*** (choke valve wide open, fast idle inoperative so that engine idles at hot or slow idle speed). With engine warm, set idle speed adjusting screw (throttle stopscrew) for correct idling speed as shown in table below (use tachometer), then adjust each idle mixture adjusting screw (one screw for each primary carburetor barrel—two screws only) until engine idles smoothly and RPM. is at maximum. Recheck idle speed.

OLDSMOBILE NOTE—It is recommended that after above adjustment (for highest vacuum reading and maximum idle speed), each idle screw be turned out ¼ turn for slightly richer mixture (both idle speed and vacuum reading will drop off slightly). Check setting by slowly opening throttle until engine speed increases to 1000 RPM., then close throttle rapidly. If a slightly rich roll is noted as engine returns to idle speed, turn each idle screw in not more than ⅛ turn.

NOTE—Change in Idle Speed affects throttle linkage adjustment on all cars except Oldsmobile. Oldsmobile split throttle lever design insures throttle linkage remaining as set when idle speed adjusted.

IDLE SPEED

Car Model	Synchro-mesh	Auto. Trans.
Buick ('55)	450 RPM	450 RPM
Cadillac ('52)	400 RPM	①375 RPM
Cadillac ('53)③	400 RPM	②400 RPM
Cadillac ('54)		④400 RPM
Oldsmobile ('52-53)	425 RPM	②400 RPM
Oldsmobile ('54)	425 RPM	①400 RPM
Oldsmobile ('55) ⑤	425 RPM	①400 RPM
Packard ('55)	400-450 RPM	400 RPM in "High"
Pontiac ('55)	450-470 RPM	390-410 RPM

①—With selector lever in either "Dr" position.
②—With selector lever in "Dr" (Hydra-Matic Drive Cars), "P" position (Dynaflow Drive Cars).
③—See "Speed-Up" Control below for special idle speed on Air-conditioned Cars.
④—with selector lever in "DR" and Air-conditioner "ON" (Summer months), "OFF" (Winter months). See special procedure following.
⑤—Air Conditioning must be turned "ON" on cars with Air Conditioning equipment.

►***CADILLAC IDLE SPEED SETTING PROCEDURE:*** Set idle speed in accordance with season as follows: When air-conditioning being used (Summer months), place selector lever in "Dr," turn Air-conditioner "ON," set idle speed at 400 RPM. When air-conditioning not being used (Winter months), place selector lever in "Dr," see that Air-conditioner "OFF," set idle speed at 400 RPM. (it will be necessary to cut idle speed setting down from summer setting to maintain this 400 RPM. idling speed).

Cadillac Speed-Up Control (Air-conditioned Cars): This unit increases engine idle speed when idling with selector lever in "N" and air-conditioner "ON."

Adjustment—With engine warm and idling, place selector lever in "N," turn air-conditioning ON, loosen locknut on diaphragm shaft and turn knurled adjusting nut to obtain engine speed of 900 RPM., tighten locknut. *NOTE*—This setting supersedes previous recommendation of 750-800 RPM.

Throttl Return Check Dashpot Adjustm nt: Check setting by opening throttle for a few seconds, then quickly release accelerator pedal. If engine stalls, adjustment is required.

Adjustment (Cadillac)—Check alignment of adjusting screw and contact arm on secondary throttle lever, bend return check bracket as necessary to center screw on contact lever radius. Check performance with selector lever in "Dr" or "L," by opening throttle and quickly releasing accelerator pedal. *(CAUTION*—apply brakes firmly when making this test). If engine stalls, adjust by turning adjusting screw (hold shaft with ⅜" wrench while turning screw), repeat test and readjust until stalling condition eliminated.

Adjustment (Oldsmobile)—Turn adjusting screw in or out of return check plunger to secure 1/16" clearance between screw and throttle lever with plunger bottomed in return check and throttle valves closed in hot or slow idle position. *NOTE*—Plunger travel 7/32" from inner to outer position.

Float Setting: ***CAUTION—Both Primary and Secondary Float Assemblies must be checked and adjusted separately and both FLOAT LEVEL & FLOAT DROP must be checked for each assembly.*** Remove bowl cover and float assembly from carburetor but DO NOT remove bowl cover gasket for following checks:

Float Level—***CAUTION—Do not remove bowl cover gasket.*** Invert bowl cover, install float gauge on cover and against curvature in air horn bore, or use scale to measure distance from gasket on cover to highest point on each float. If floats do not almost touch top portion of gauge between gauge legs, or if scale distance not correct, adjust by bending float arms at rear of float assembly *(CAUTION*—all floats must be set alike). Bend float arms horizontally until each float is centered between the gauge legs and check this setting by tilting bowl cover assembly 90° to each side to make certain that floats do not touch gauge legs under these conditions *(CAUTION*—this adjustment important to prevent floats touching sides of bowl and hanging up in service).

FLOAT LEVEL SETTING
(Primary & Secondary Floats)

Car Model	Float Height	Gauge No.
Buick ('55)	1 35/64"	J-6151
Cadillac ('52)	1 3/4" ①	②BT-85
Cadillac ('53)	1 9/16"	③BT-87
Cadillac ('54)	1 19/32"	BT-101
Oldsmobile ('52)	1 1/4"	BT-66
Oldsmobile ('53)	1 9/16"	BT-87
Oldsmobile ('54-55)	1 5/8"	BT-89
Packard ('55)	1 5/8"	④BT-89
Pontiac ('55)	1 19/32"	J-6179

①—For carburetors WITHOUT Float Balance Springs only (supersedes 1⅜" setting applicable to carburetors WITH balance springs).
②—Cadillac No. J-5198.
③—Cadillac No. J-5465. ④—Packard No. 5399.

CONTINUED ON NEXT PA E

1954-55 ROCHESTER 4-BARREL 4GC CARBURETORS (C nt.)

Float Drop—*CAUTION—Do not remove bowl cover gasket.* Hold bowl cover assembly in upright position so that floats are free to hang down. Use scale to measure distance from bottom face of gasket on bowl cover to bottom of floats. If this distance or float travel (see table below) not correct, adjust each model as directed below *(CAUTION*—All floats must be set alike).

Cadillac Carburetors (without Balance Spring). Bend float tang on float arm under float hinge which contacts side of needle seat (this tang repositioned as part of balance spring removal procedure) away from needle seat to increase float drop, or toward seat to decrease float drop.

Oldsmobile Carburetors (With Balance Spring). Bend tang at rear of float assembly (which contacts balance spring) away from the balance spring to increase float drop, or toward balance spring to decrease float drop.

FLOAT DROP SETTING
(Primary & Secondary Floats)

Buick ('55)	2 1/4"
Cadillac ('52)	①2 1/4"
Cadillac ('53-54)	2 1/4"
Oldsmobile ('52)	② 1 15/16"
Oldsmobile ('53-55)	2 1/4"
Packard ('55)	2 1/4"
Pontiac ('55)	2 1/4"

①—For carburetors WITHOUT Float Balance Springs only (supersedes 1 15/16" setting applicable to carburetors WITH balance springs).
②—2¼" on later carburetors.

Accelerating Pump Stroke: *CAUTION—This is a linkage adjustment and not a seasonal change recommendation.* Back off idle speed stopscrew and fast idle screw so that primary throttle valves are fully seated, hold throttle lever in this position, use scale to measure height of pump plunger rod (from top surface of bowl cover to bottom edge of pump plunger rod). If height not correct (see table below), adjust by bending pump rod as required.

PUMP STROKE SETTING

Buick ('55)	1 3/32"
Cadillac ('52-54)	15/16"
Oldsmobile ('52-55)	1 1/16"
Packard ('55)	1 3/32"
Pontiac ('55)	1 1/16"

CAUTION—Do not readjust fast idle screw until after Choke Modifier has been adjusted on Cadillac.

Atmospheric Idle Vent: *CAUTION—Targeting or centering of the lever tang on the vent valve must be done first to insure proper closing of the valve (hanging up of valve in open position may cause poor mileage).*

Targeting of Lever Tang—Check position of idle vent lever tang and bend tang, as necessary, to centralize it on the vent valve.

Setting—Close primary throttle valves against wire gauge of correct size (see table below) installing gauge on side opposite idle adjusting screws, hold throttle valves in this position while adjusting idle vent. The operating tang on the lever should just touch vent valve. Adjust by bending contact arm using bending tool BT-69.

IDLE VENT SETTING

Car Model	Gauge Size & No.
Cadillac	①② .063" BT-79
Oldsmobile	① .040" BT-67
Packard	①③ .040" BT-67

①—LARGE end of gauge.
②—Cadillac Gauge No. J-5195.
③—Packard No. J-6061.

Automatic Choke: *CAUTION—Cadillac carburetor has Choke Modifier and is adjusted differently as follows:*

Choke Modifier (Cadillac)—With throttle stopscrew and fast idle screw backed off so that primary throttle valves fully seated, loosen retainer screw in index lever and rotate the index pointer on the Choke cover 1 Notch Rich position or one graduation counter-clockwise from long scribed line or center graduation on cover (1952-53), Center At Index (1954), tighten lever retaining screw. Then adjust choke rod, fast idle, unloader.

AUTOMATIC CHOKE SETTING

Car Model	Choke Setting
Buick ('55)	Centered At Index
Cadillac ('52-54)	See Choke Modifier
Oldsmobile ('52-53)	Centered At Index
Oldsmobile ('54-55) Synchro-mesh	1 Notch Lean
Oldsmobile ('54-55)Hydra-Matic	Centered At Index
Packard ('55)	Centered At Index
Pontiac ('55)	Centered At Index

Choke Rod: With automatic choke correctly set (above), turn fast idle screw in until it contacts intermediate step of fast idle cam, rotate cam until fast idle screw is against shoulder of highest step on cam and make certain that choke trip lever is in contact with choke counterweight. Measure choke valve opening by inserting wire gauge of correct size (see table below) between top edge of choke valve and dividing wall in air horn. If valve opening not correct, adjust by bending choke connector rod.

CHOKE ROD SETTING

Car Model	Gauge Size & No.
Buick ('55)	③ .040" J-6152
Cadillac ('52-53)	①② .031" BT-78
Cadillac ('54)	① .040" BT-102
Oldsmobile ('52-55)	① .053" BT-68
Packard ('55)	①③ .053" BT-68
Pontiac ('55)	.054" KMO-480A

①—SMALL end of gauge.
②—Cadillac Gauge No. J-5196.
③—Packard No. J-6056.
④—Large end of gauge.

Fast Idle: *NOTE—Adjustment can be made with carburetor OFF ENGINE or with carburetor ON ENGINE:*

Carburetor Off Engine—With automatic choke and choke rod correctly adjusted, move fast idle cam so that choke valve is fully closed, hold primary throttle valves closed so that fast idle screw is aligned with highest step of fast idle cam. Adjust fast idle screw in against fast idle cam until throttle valve opening is correct as measured by wire gauge (see table below) inserted between edge of valve and carburetor wall on side opposite idle screws.

FAST IDLE SETTING

Car Model	Gauge No.
Buick ('55)	.020" J-1388
Cadillac ('52-54)	①.028" BT-79
Oldsmobile ('52-53)	①.020" BT-67
Oldsmobile ('54-55)	①.024" BT-90
Packard ('55)	①②.024" BT-90
Pontiac ('55)	.033" J-6178

①—SMALL end of gauge.
②—Packard No. J-6057

Carburetor On Engine—Run the engine until both the engine and transmission are at operating temperature. With engine idling and transmission in neutral, and with choke valve wide open, rotate fast idle cam so that high step of cam is under the fast idle screw. Adjust fast idle screw for correct engine speed as shown in table below (use tachometer). *CAUTION—Air cleaner must be in place.*

FAST IDLE SPEED

Buick ('55)	1800 RPM
Cadillac ('52-55)	1700 RPM
Oldsmobile ('52-55)	① 1400-1500 RPM
Packard ('55)	① 1500 RPM
Pontiac ('55)	1800 RPM

①—With transmission in neutral.

Unloader: With automatic choke and choke rod correctly adjusted, hold choke trip lever down so that it is in contact with the choke counterweight, move throttle valves to wide open position, measure choke valve opening by inserting wire gauge of correct size (see table below) between upper edge of valve and dividing wall in air horn. If choke valve opening not correct, bend tang on fast idle cam using tool BT-69.

UNLOADER SETTING

Car Model	Gauge Size & No.
Buick ('55)	③ .115" J-6152
Cadillac ('52-53)	①② .067" BT-78
Cadillac ('54)	① .125" BT-102
Oldsmobile ('52-53)	① .092" BT-68
Oldsmobile ('54-55)	① .115" BT-90
Packard ('55)	①④ .115"BT-90
Pontiac ('55)	.115" J-6178

①—LARGE END of gauge.
②—Cadillac Gauge No. J-5196.
③—Use small end of gauge.
④—Packard No. J-6057.

Secondary Throttle: *CAUTION—Three separate adjustments required as follows:*

1) Secondary Throttle Position—Move both choke and primary throttle valves to wide open position. If secondary throttle valves not wide open, remove throttle operating link, bend tangs on wide open stops on primary and secondary shafts as required to obtain wide open position, then bend throttle operating link to proper length.

2) Secondary Throttle Lock- ut—With choke valve partially closed, check side clearance between secondary lock-out lever tang and edge of slot in fast idle cam using a feeler gauge of correct thickness (see table below). If clearance not correct, adjust by bending tang on lever using BT-18 tool.

3) Secondary Throttle Clearance—With choke valve wide open check clearance between lower face of secondary lock-out lever tang and edge of fast idle

C NTINUED ON NEXT PAGE

1954-55 ROCHESTER 4-BARREL 4GC CARBURETORS (Cont.)

cam using a feeler gauge of correct thickness (see table below). If clearance not correct, adjust by bending tang on lever up or down using BT-69 bending tool (1952-53), BT-91 (1954-55).

SECONDARY THROTTLE SETTING

	Feeler Gauge Thickness	
Setting:	**(2) Lock-out**	**(3) Lever Clearance**
Buick	.015"	.030"
Cadillac	.015"	.015"
Oldsmobile	.015"	.035"
Packard	.015"	.015"
Pontiac	.015"	.015"

Car Starter Switch Setting (Buick): Back off throttle stop screw to close throttle valves completely Make pencil mark on switch end of primary throttle shaft to line up with longest of three indicator marks on casting. With test light across switch terminals, slowly open throttle valves Light should come on when pencil mark is between the two marks on casting. Adjust by changing shims (Maximum .066"). Reset idle RPM to specifications.

Dampener Valve Setting (Buick): Remove fast idle cam and replace retaining screw Adjust lever tang (Tool J-6058A) to give measurement of 51/64" (Tool J-6153 No 1 end) from cam screw shoulder vertical to top of counterweight lever Hold lever in this position, seat damper valves against outside of bore and tighten in place Readjust tang to give 53/64" (Tool J-6153 No. 2 end) from cam screw shoulder vertical to top of lever. Proper adjustment prevents valve edge striking bore when in closed position

OVERHAUL: ***CAUTION—When disassembling carburetor, be sure to keep PRIMARY and SECONDARY side parts separate so they will not be confused or interchanged when carburetor reassembled.***

Disassembly: Carburetor consists of three main subassemblies (Air Horn & Bowl Cover, Carburetor Bowl, and Throttle Body) which can be overhauled separately as follows:

Air Horn & Bowl Cover—On Cadillac, disconnect and remove choke modifier rod. On all models, disconnect and remove pump connector rod. Remove trip lever retaining screw from end of choke shaft, remove trip lever and spacing washer from shaft. Take out fast idle cam pivot screw, remove choke rod with lever and cam as an assembly. Take out all air horn retaining screws *(CAUTION*—there are 13 screws—3 inner and 10 outer—with **one screw in counterbore in dividing wall just inside edge of air horn**). Lift air horn and bowl cover assembly straight up using extreme care not to damage float assemblies *(CAUTION*—break cover loose from bowl with finger pressure only, DO NOT pry on cover flange). Disassemble as follows: Invert the cover assembly, take out float hinge pins and remove floats and intake needles, remove needle seats and gaskets *(CAUTION*—Keep each float assembly, intake needle, and seat together, DO NOT mix primary and secondary side parts). Remove power piston by rotating retaining washer until flat side allows piston to pass, remove piston spring. Remove idle vent valve, spring, and retainer by pressing on retainer with a screwdriver and sliding assembly up out of well in bowl cover. Remove pump plunger and rubber seal as an assembly by disengaging plunger shaft from pump lever and pulling assembly out of cover (seal, retainer, washer, and spring can be removed from plunger for cleaning). Remove pump inner lever from countershaft by removing nut and washer, then slide countershaft out of cover boss. Remove fuel inlet fitting, gasket and strainer. If choke to be disassembled, proceed as follows: On Cadillac, remove retaining screw and lift off choke modifier lever. Remove cover attaching screws and retainers, lift off thermostat cover and coil assembly *(CAUTION*—On Cadillac, do not remove metal pointer or coil from shaft in cover), remove gasket and baffle plate. Remove choke valve (remove staking burrs from valve screws before taking screws out). Rotate choke shaft counter-clockwise until choke piston clears cylinder, slide shaft out and remove shaft and piston as an assembly (piston can be disconnected by using a wire to push piston pin out of piston and link). Remove choke housing by taking out two attaching screws, remove and discard choke housing gasket.

Carburetor Bowl—Take out three attaching screws and lockwashers in each venturi cluster, carefully remove clusters by lifting them straight up to avoid damaging idle tubes and main well tubes *(CAUTION*—Clusters are serviced as an assembly and should not be disassembled further). Keep primary and secondary side clusters separate (primary cluster has pump discharge nozzles). Remove all main metering jets (located in bowl adjacent to venturi cluster support). *CAUTION*—Primary and secondary side metering jets are different size and must not be interchanged. Remove power valve and gasket (located in bowl adjacent to primary metering jets). Remove pump return spring from pump cylinder, then invert bowl casting to remove aluminum pump inlet ball (from bottom of pump cylinder) and brass pump outlet check needle (from passage under primary venturi cluster mounting face). *CAUTION*—Do not lose these parts and NEVER substitute a steel ball for the aluminum inlet ball. Remove pump inlet screen from intake passage at side of cylinder.

Throttle Body—Remove large screw and washer from counterbore in center of throttle body (visible when bowl and throttle body inverted), remove three smaller screws and lockwashers from flange, carefully separate throttle body from bowl, remove and discard gasket. Remove both idle adjusting screws and springs, idle stop screw and spring, and fast idle screw and spring *(CAUTION*—keep each screw and its proper spring together). On Cadillac, remove choke modifier lever and retaining screw from primary throttle shaft. Free secondary throttle actuating link by taking out cotter pin in each end, unhook inner end of primary throttle shaft override spring from lever using long-nose pliers, remove override spring retaining screw from primary throttle shaft, remove secondary throttle lever retaining screw and washer, then slide secondary throttle actuating lever and override spring off primary throttle shaft, remove link. Slide secondary throttle lever and return spring from secondary throttle shaft. This completes throttle body disassembly.

►***CAUTION—Throttle body is furnished as an assembly with throttle valves and shafts and no attempt should be made to remove throttle valves (disturbing valves will upset low speed metering performance).***

Cleaning & Inspection: Wash all parts thoroughly in carburetor cleaning solvent **except** following parts which should be cleaned in clean gasoline: Choke cover and coil assembly, pump plunger, primary venturi cluster (with pump discharge nozzles). Blow out all passages in castings with air, remove all gum and carbon deposits *(CAUTION*—do not use drills to clean out jets and passages). Inspect strainer screens and replace if distorted or plugged. Check floats for dents, leaks, or wear at hinge pin holes. Inspect fast idle cam for wear on steps. Inspect throttle body carefully for wear at throttle valves and bore and shaft wear in bore (replace as an assembly if worn excessively). Inspect all parts for wear or damage and replace as required.

Reassembly: Use new gaskets. Install all parts in reverse order of disassembly procedure (above) and pay particular attention to the following:

Secondary Throttle Lever & Spring Installation: Install return spring on secondary throttle shaft with bent end of spring in hole in throttle body, wind up spring one complete turn, then install secondary lever on shaft over straight end of spring (bent portion of lever should be above shaft), install spacer and retaining screw in end of shaft. Install secondary throttle actuating link (insert plain end through lever hole, install cotter pin on shaft side to clear return spring).

Primary Throttle Lever & Spring—Start secondary throttle actuating lever on primary throttle shaft with curved slot portion outward and toward the rear. With inner portion of lever on shaft, start override spring on shaft with long end inward, then slide lever and spring on shaft and engage washer end of secondary throttle actuating link in slot in lever. Install override spring retaining screw through loop end of spring and into primary throttle shaft from upper side. Hook inner end of override spring over top edge of secondary throttle actuating lever. Install washer and cotter pin on end of secondary throttle actuating link. On Cadillac, install choke modifier lever and retaining screw on end of primary throttle shaft (lever must point upward when throttle closed and marking "RP" must be outward).

Throttle Body-to-Bowl Assembly Caution—Install new gasket on bottom surface of bowl with largest projecting tab on primary side and surrounding vacuum passage to power valve piston *(CAUTION*—gasket is not reversible). Install all throttle body attaching screws loosely (including large screw in center of throttle body), then tighten all screws evenly.

Venturi Cluster Installation Caution—Make certain that brass pump discharge needle installed in pump passage in bowl before installing primary venturi cluster. Use new gaskets and install each venturi cluster in correct position making certain that clusters correctly aligned by the tangs on the cluster. CAUTION—Primary and Secondary clusters not interchangeable and can be identified by brass pump discharge nozzzles used on primary cluster only.

►***1953 OLDSMOBILE VENTURI CLUSTER PRODUCTION CHANGE***—See data under Changes, Cautions, Corrections above for different types used in production and replacement parts caution.

Metering Jet Installation Caution—Primary and secondary side metering jets are DIFFERENT sizes

CONTINUED ON NEXT PAGE

1954-55 ROCHESTER 4-BARREL 4GC CARBURETORS (Cont.)

(in general, secondary jets are larger size than primary jets) and must be installed in correct positions. *NOTE*—On later Cadillac carburetors, primary jets are brass finish, secondary jets are copper-plated.

►*1953 OLDSMOBILE METERING JET PRODUCTION CHANGE*—See data under Changes, Cautions, Corrections above for different sizes used in production and recommended replacement jet sizes.

Accelerating Pump Plunger Assembly—When installing rubber seal on plunger stem, slide seal on shaft with larger end toward the piston, see that upper end engaged in groove in plunger stem. Insert assembly through bowl cover from below and pull seal through cover so that cover edge engages groove in seal. When installing cover, guide plunger carefully into pump cylinder.

Float and Intake Valve Assembly—Make certain that parts installed in correct position (primary and secondary parts not interchangeable). On Cadillac, make certain that float hinge pins installed in holes farthest from bowl cover. On Oldsmobile, see that tang on float arm is back of float balance spring (balance springs not used on later Cadillac carburetors and should be removed and discarded on earlier carburetors—see Changes & Corrections above). Adjust float level and float drop or travel (see Adjustment data above).

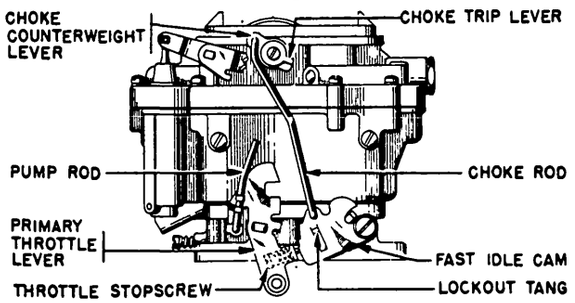
Air Horn & Bowl Cover Installation—Use new gasket, carefully align all holes in gasket and cover. When installing cover, use care in guiding pump plunger into pump cylinder and power valve piston into its bore, and see that floats not bent by striking on edge of bowl. Install all bowl cover attaching screws, tighten inner screws first, and then outer screws, evenly and securely.

Choke Valve Installation—After choke shaft and piston assembly installed in air horn, slide choke valve through shaft with letters "RP" upward, use new screws and install screws loosely, then tighten screws as follows: **Cadillac**—press firmly on choke housing end of shaft and hold valve tightly closed, tighten screws securely and stake ends of screws lightly taking care not to bend choke shaft. **Oldsmobile**—First install counterweight, spacing washer, and trip lever on end of choke shaft, press lightly on end of choke shaft to obtain minimum clearance of .020" between spacing washer and counterweight, tighten choke valve attaching screws with shaft in this position, stake screws lightly taking care not to bend choke shaft. Install choke baffle plate with curved slot over tang on choke lever.

Thermostatic Housing & Coil Installation—With retainer screws loose, rotate cover counter-clockwise until coil hook picks up choke lever tang, then position cover for correct choke setting (see Adjustment data) and tighten retaining screws. On Cadillac, install choke modifier lever loosely (lever should be forward and slightly down when metal pointer is at scribed line), tighten lever screw as part of Choke Modifier adjustment (see Adjustment data).

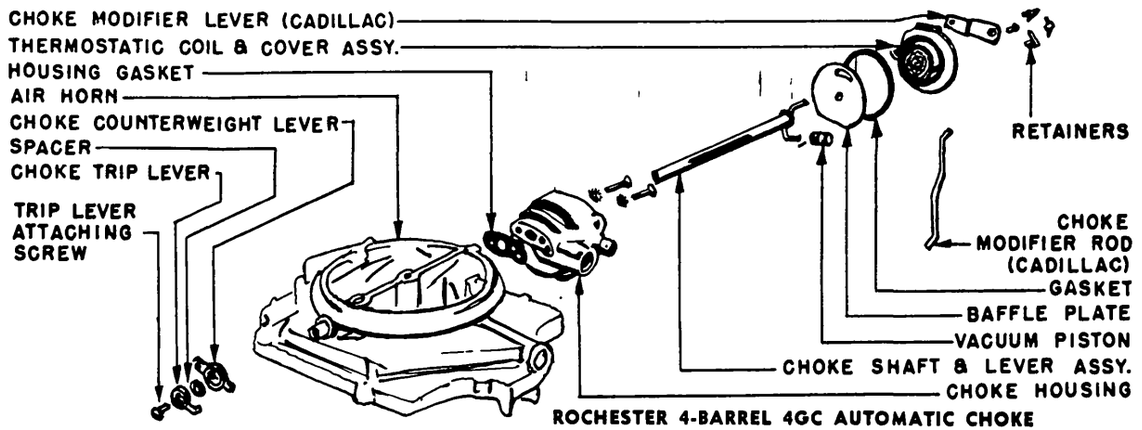
Carburetor Adjustments—Make all adjustments as directed in Adjustment section above.

SERVICE PARTS: Gasket Sets—Rochester No. 7004690 (7004300, 4500, 4800, 5100, 5600, 5700, 6125, 6250), No. 7006135 (7005900, 6000, 6220, 6221, 6250, 6962), No. 7007134 (7007000, 7230), No. 7008804 (7006200).



Repair Kit Pkg.—Rochester No. 7004691 (7004500), No. 7005588 (7005100, 6215), No. 7005592 (7004300, 4800, 5600, 5700, 6250), No. 7006375 (7006220, 6221, 6962), No. 7006133 (7005900, 6000, 7000, 7230), No. 7008803 (7006200).

ROCHESTER 4-BARREL "4GC" AUTOMATIC CHOKE



DESCRIPTION: Automatic choke and fast idle mechanism is similar to type used on Rochester dual carburetors and is adjusted in the same manner. Choke valve is located on primary side of the air horn and controls the primary barrels only (Secondary throttle valves are locked closed while the choke is in operation and no choke valve is required).

Cadillac Choke Modifier—Consists of linkage between the thermostatic coil and the throttle lever so that the thermostatic coil tension is controlled by the throttle and is lessened as the throttle is opened to provide a continuously variable unloading action which improves performance and economy during warm-up period.

DISASSEMBLY: On Cadillac, remove retaining screw and lift off choke modifier lever (*CAUTION*—do not remove metal pointer or coil from shaft in cover). Remove thermostatic coil cover attaching screws and retainers, lift off cover and coil assembly, remove gasket and baffle plate. Take out choke trip lever attaching screw, remove choke trip lever, spacing washer, and choke lever and collar assembly from choke shaft. Take out fast idle cam attaching screw, remove choke lever and collar assembly, choke rod, and fast idle cam as an assembly. Remove choke valve by taking out two valve attaching screws (remove staking burrs from screws before removing them). Rotate choke shaft counter-clockwise to free choke piston from cylinder, withdraw shaft and piston assembly from housing. Take out piston pin to remove piston from choke lever. Remove two choke housing-to-air horn screws, remove housing and gasket from air horn.

ROCHESTER 4-BARREL 4GC FAST IDLE

ROCHESTER 4-BARREL 4GC AUTOMATIC CHOKE

Cleaning & Inspection: Wash all metal parts thoroughly in carburetor cleaning solvent **except** choke cover and coil assembly (clean with clean gasoline). Inspect choke shaft for wear in bore in air horn, check fast idle cam for wear on steps or in rod attaching holes. Inspect thermostatic coil for distortion. Blow out all passages with compressed air.

REASSEMBLY: Use new gaskets, install parts in reverse order of disassembly procedure and note the following important points:

Choke Valve Installation—After choke shaft and piston assembly installed in air horn, slide choke valve through shaft with letters "RP" upward, use new screws and install screws loosely, then tighten screws as follows: **Cadillac**—press firmly on choke housing end of shaft and hold valve tightly closed, tighten screws securely and stake ends of screws lightly taking care not to bend choke shaft. **Oldsmobile**—First install counterweight, spacing washer, and trip lever on end of choke shaft, press lightly on end of choke shaft to obtain minimum clearance of .020" between spacing washer and counterweight, tighten choke valve attaching screws with shaft in this position, stake screws lightly taking care not to bend choke shaft. Install choke baffle plate with curved slot over tang on choke lever.

Thermostatic Housing & Coil Installation—With retainer screws loose, rotate cover counter-clockwise until coil hook picks up choke lever tang, then position cover for correct choke setting (see Adjustment data) and tighten retaining screws. On Cadillac, install choke modifier lever loosely (lever should be forward and slightly down when metal pointer is at scribed line), tighten lever screw as part of Choke Modifier adjustment

① - See SEPARATE "Cadillac (Carter & Rochester)" data for adjustment specifications and procedures.
② - 3700 RPM Governor. ③ - 4000 RPM Governor.
④ - These carburetors may not have a model number designation but may be identified by Idle Air Bypass Adjusting Screw located on throttle body.

►CHANGES, CAUTIONS, CORRECTIONS

►*1956 BUICK PRIMARY MAIN METERING JET CHANGE (To Improve Performance in Part Throttle Range):* Leaner jets, Part No. 7001860 are used in later production carburetors having a "D" stamped on identification tag. If new jets are installed on early carburetors, use the later type jets.

►*1956 BUICK STUMBLE CORRECTION (ON EARLY CARS):* This condition is noticeable on light acceleration under cold operating conditions and may be caused by the accelerating pump spring being too light. Correct by installing Accelerating Pump Spring, Part No. 7009651 having a .042" diameter wire. Production carburetors having the later type spring are identified by C6, D6, etc., date stamp following the carburetor part number.

►*1956 BUICK PRIMARY MAIN METERING JET PRODUCTION CHANGE (For Increased Fuel Economy):* In later production, Rochester Primary Main Metering Jet, Part No. 7001860, (size .055") is being used and can be used for service replacement. Carburetors having the later type jet can be identified by the letter "D" stamped on the carburetor identification tag.

►*1956 BUICK ACCELERATING PUMP ASSEMBLY CHANGE (To Correct Hesitation on Light Acceleration):* Install Pump Assembly, Part No. 7009129, replacing Part No. 7009279.

►*1956 BUICK COLD ENGINE STALLING & LOADING UP (First Cars):* This condition can be eliminated by installing all parts furnished in special kit, Buick No. 7009948 (Choke Housing, Thermostat Cover & Gasket, Choke Housing Gasket, Choke Piston, Pin, and Lever & Link Assy.). When these parts installed, set carburetor to following specifications:

1) **Choke Setting**—Centered (At Index).
2) **Fast Idle Setting**—1700 Engine RPM (hot engine with fast idle screw on high step of fast idle cam).
3) **Unloader Setting**—Unloader must operate correctly. See Choke Rod & Unloader Adjustment below.

NOTE—When above changes made, stamp letter "C" in lower left hand corner of brass identification tag. Production carburetors on which this change made will also be stamped "C".

►*1957 BUICK FLOAT DROP SETTING CHANGE:* The float drop setting specification has been changed from 1 7/8" ± 1/32" to 1 13/16" ± 1/32".

►*1957 BUICK VACUUM SWITCH STICKING NOTE:* If the vacuum switch sticking is found to be caused by the steel ball sticking in the "up" position and cleaning the unit does not correct the condition, the ball seat may be improperly staked. If this is the case, replace the throttle body.

►*1957 BUICK (WITH CARBURETOR No. 7010070) PRIMARY VENTURI CLUSTER CHANGE (To Correct an Acceleration Flat Spot When Car is Coasted Back From Speed Above 40 MPH and Then Again Accelerated at 30 MPH):* Install primary cluster kit, Part No. 7011329. Make sure that the brass identification tag included in the kit is installed on carburetor along with the original tag. *NOTE - Carburetors built after October 1956 will have this change made and can be identified by the letters "C", "D" or higher on the original identification tag.*

►*1957 BUICK STUMBLE AND FLAT SPOT CORRECTION (CARS WITH CARBURETOR No. 7010070): (NOTE - If carburetor identification tag is not "C" or "D" or later, install primary venturi kit, see "Primary Venturi Cluster Change" above, then proceed as follows):* Install a new pump shaft and lever, Part No. 7011462, which has three holes in end of lever for pump travel adjustment. Install the pump rod in the inner hole. Adjust pump setting to provide a distance of 1 3/32" between bottom of plunger and cover casting (with pump rod in inner hole of lever). Check and adjust float drop (see *"Float Drop Change" above*). Check position of vacuum piston which should be 1/32" to 1/16" above the flush position, (see *"Choke Piston Setting Change" below*). Check choke rod adjustment and adjust the ignition timing.

►*1957 BUICK CHOKE PISTON SETTING CHANGE:* With choke valve held fully closed, vacuum piston should be exposed 1/32" to 1/16" out of cylinder (NOTE—This setting supersedes previous "flush" setting. To adjust, bend intermediate rod (connecting link on choke to choke valve shaft).

►*1957 BUICK CARBURETOR (No. 7010070) MODIFICATION (To correct a lean flat spot condition in part throttle and power ranges):* Install Kit, Part No. 7011481 as outlined in instructions contained in kit and note the following: If carburetor tag does not have the letter "C", "D" or later, make sure the primary venturi cluster has been changed (see *"Primary Venturi Cluster Change" above*). After installation of kit, adjust accelerating pump so that distance from top of air horn casting to bottom of pump plunger shaft is 1 1/64". Install pump rod in outer hole for warm weather and in inner hole for cold weather operation.

►*1957 BUICK CHOKE HOUSING INDEX POINT CHANGED (Moved From Bottom of Housing to Top:* Only the new housing, Part No. 7011276 and Cover, Part No. 7010778 will be available for service. If necessary to replace either of these parts on carburetors having identification tags with the letter "C" or earlier, both parts will have to be replaced. On later carburetors, either part may be replaced

►*1957 CHEVROLET CARBURETOR (No. 7009846) PUMP JET CHANGE (For improved fuel atomization):* A new pump jet cluster assembly, Part No. 7011576, having four (.024") pump jets instead of the customary two, can be used for replacement on this carburetor.

►*1957 CHEVROLET CARBURETOR (No. 7009846) PRIMARY MAIN METERING JET PRODUCTION CHANGE AND SERVICE REPLACEMENT NOTE :* Primary main metering jets, Part No. 7002645 (.045") used in early carburetors were changed to Part No. 7002647 (.047") in carburetors identified by an "A" on the identification tag. Later carburetors with "B" on the identification tag used main metering jets, Part No. 7002648 (.048").

►*1957 CHEVROLET TRUCK CARBURETOR (No. 7011161) PRIMARY MAIN METERING JET CHANGE:* Main metering jet, Part No. 7002647 (.047") replaced Part No. 7002648 (.048") on carburetors identified by "B" or later stamped on the identification tag.

►*1958 BUICK FADE OUT ON TURNS CORRECTION:* Increase the float drop setting 1/32" (from 1 5/16" to 1 11/32"). The increased float drop setting should be used only in cases of the engine cutting out or fading out on turns.

►*1958 BUICK CARBURETOR PRODUCTION CHANGE:* A new carburetor, Buick & Rochester Part No. 7013100 replaced Part No. 7011600. Changes made in the later carburetor are as follows:

Primary Float & Needle Seat - Changed from a needle and seat to a "ball & seat" with a .125" orifice seat (primary), .101" (secondary).

Vent Holes (Secondary Side of Throttle Body) - These vent holes have been eliminated and venting is now accomplished through slots in throttle body-to-float bowl gasket. *CAUTION - Use only gasket, Part No. 7012894*

CONTINUED ON NEXT PAGE

1956-58 ROCHESTER 4GC 4-BARREL CARBURETORS (Cont.)

on later type carburetors.

►*1956 OLDSMOBILE ENGINE STALLING (In Warm Weather Immediately after Starting or is Hard To Start):* Adjust choke to one notch lean (from index). Adjust fast idle to 1500 RPM. Adjust throttle return check clearance to .020". Readjust throttle downshift screw so that screw is turned in 1½ to 2 turns after it just contacts tang of downshift lever. Make sure .020" clearance exists on the car between fast idle cam and top side of secondary throttle lockout tang to be sure choke valve is free to close. *CAUTION - Do not bend tang too far so that interference exists between bottom side of tang and fast idle cam.*

►*1957 OLDSMOBILE CARBURETORS (Nos. 7009470 & 71) POWER VALVE & POWER PISTON PRODUCTION CHANGE:* Carburetor No. 7009470 with letter "E" and later, and carburetor No. 7009471 with letter "D" and later stamped on the identification tag have a new power valve assembly, Part No. 7009349, replacing Part No. 7010918; and a new power piston assembly, Part No. 7000204, replacing Part No. 7008612. Only the latest power valve and power piston should be used for service replacement.

►*1957 OLDSMOBILE HARD (HOT) STARTING NOTE: After partial warm-up or partial cooling the car will run below idle speed for a few seconds then either speed up and throw clouds of black smoke or else stall out entirely.* This condition is caused by the choke being set two or three notches rich. (Because of the choke modifier it is not possible to tell visually whether choke setting is correct). Adjust choke as specified under "Adjustments" below.

►*1957 OLDSMOBILE CARBURETOR UNLOADER SETTING CHANGE:* Adjust the unloader to obtain .115"± .015" clearance (Gauge BT-90) between upper edge of choke valve and dividing wall in air horn. *See "Adjustments" below.* This supersedes previous setting of .090" ± .015".

►*1957 OLDSMOBILE IDLE MIXTURE & IDLE SPEED SETTING CAUTION:* These adjustments must be made with the air cleaner in place on the carburetor.

►*1958 OLDSMOBILE HIGH SPEED MISS, FLAT SPOT, OR STICKING THROTTLE CORRECTION:* This condition may be caused by the carburetor-to-manifold gasket being installed improperly. Primary and secondary throttle holes in the gasket are of different size and if the gasket is installed in reverse, would cause secondary throttle valves to contact the gasket and allow only a partial valve opening. Make sure the "V" tab on primary side of gasket is installed toward front of car.

►*1956 PACKARD CARBURETOR HIGH ALTITUDE ADJUSTMENT NOTE:* Leaner jets are not required for operation above 5000 ft. The choke should be set to three notches lean, and the secondary contour clearance should be set at .020" rather than .015".

►*1956 PACKARD CARBURETOR SYNCHRONIZATION (CARS WITH TWO 4-BARREL CARBS.): Special adjustment procedure required for balanced operation.*

See CARBURETOR in Packard Car Mod l pags.

►*1956 PONTIAC COLD ENGINE STALLING CORRECTION & WARMING UP IMPROVEMENT (First Cars with No. 7008697 & 7007900 Carbs.):* Install new choke piston, No. 7009710 (can be identified by single bleed hole on side of piston—first type had two diametrically opposite holes) and set automatic choke 1 Notch Rich (supersedes Centered setting). *NOTE—Carburetors on which this change made in production are stamped "F" on identification tag.*

►*1956 PONTIAC CARBURETOR LOADING-UP (DURING WARM UP) CORRECTION & CHOKE PISTON LINK PRODUCTION CHANGE:* On later production cars, the choke piston link contour has been changed to give an increased opening on cold idle. This change can be make on earlier carburetors by bending the choke link (using a pair of pliers) so that the choke piston protrudes 1/16" from the cylinder and the piston pin is one-half exposed when choke valve is fully closed. Make sure no bind exists after bending link.

►*1956 PONTIAC (EXC. 285 H.P. ENGINE) HARD STARTING CORRECTION (With Partially Warmed-up Engine):* Change choke setting from one notch rich to center index. If hard starting is not eliminated completely with this change, set choke to one point lean.

►*1956 PONTIAC 285 H.P. ENGINE CARBURETOR CHANGE (To Improve Hot Starting Characteristics):* Install a new throttle body-to-bowl gasket, Part No. 7009256. The later gasket is identified by each venturi hole in gasket having an elongated section, and is being used in production beginning approximately March 1, 1956.

►*1956 PONTIAC 285 H.P. ENGINE STALLING (AFTER A FAST STOP) CORRECTION:* This condition can be corrected by removing the air horn assemblies from both carburetors and drilling out one internal vent on each side of each carburetor with a 1/8" drill as follows On automatic choke side of carburetor, drill out the internal vent hole located toward rear of air horn partition. On opposite side of carburetor, drill out the vent located on forward side of air horn partition.

►*1956 PONTIAC CARBURETOR FLOODING CORRECTION (Early Cars):* Install fuel filter, Part No. 854345 which is precipitation type filter having an impregnated fibre element.

►*1957 PONTIAC CARBURETOR MODIFICATION TO PREVENT A FLOODING CONDITION: The following modifications are recommended to eliminate a flooding and stalling condition:*

Fuel Filter Element - Install the later type fuel filter element Part No. 854467.

Float Needle & Seat Assembly - Install Package No. 7012295 which includes needles, seats and gaskets for both the primary and secondary side of carburetor. The needle seat is a new type having a narrower seating area. Do not seat needles by tapping or lapping into place as this would damage the narrow seating area.

Drilling Fuel Balance Ports - With air horn removed from carburetor, drill out the balance passage holes (located below gasket surface of main body in wall of float chambers on side adjacent to choke housing). Use a 3/16" drill, and drill out the existing balance passage holes. *(CAUTION* - These holes are drilled at an angle and care should be taken to make sure the drill does not contact other areas of the carburetor.

Cleaning & Inspection - Use air pressure and clean all passages in carburetor. Remove idle mixture screws and use a light or a tag wire to make sure passages are clean. Remove all gum and carbon deposits.

Float Level Adjustment - Adjust float level to 1 3/8" using gauge J-6628 *(see "Adjustments" below).* (NOTE - Adjust float tip so that lower edge of float tip is flush to 1/16" above gasket surface). Adjust float drop *(see "Adjustments" below).*

Idle Speed - Adjust idle speed to 500 RPM. *See "Adjustments" below for idle mixture and idle speed adjustment procedures.*

►*1957 PONTIAC SECONDARY THROTTLE VALVE SPRING ADJUSTMENT NOTE:* This is a new adjustment to insure positive closing of secondary throttle valves on idle, and must be made with carburetor on the car. *See "Adjustments" below.*

►*1958 PONTIAC ROUGH IDLE & STALLING (CAUSED BY BUILD-UP OF GUM IN THROTTLE BORES) CORRECTION:* Remove carburetor. *(NOTE* - Do not remove gum deposits from throttle bores). Invert carburetor and drill a 1/8" diameter hole in each **primary** throttle plate at a point approximately centered in the half of the throttle plate located adjacent to outside edge of throttle body. Remove chips and reinstall carburetor. Adjust hot idle speed to 500 RPM, then adjust throttle rod setting with gauge pin and adjust the idle mixture screws.

DESCRIPTION: 4-Barrel downdraft type with automatic choke (4GC), without automatic choke (4G), similar in design to previous models except as noted below:

1957 Buick - Float bowl has been lowered and spring balanced, cutaway floats are used. Automatic choke housing has been moved from float bowl to throttle body. Counterweighted type auxiliary throttle valves have been replaced by spring loaded, factory calibrated auxiliary throttle valves which are located in the fuel bowl assembly.

1957 Oldsmobile - Choke housing has been moved from air horn to float bowl and a choke modifier has been added.

1957 Pontiac - Float bowl has been lowered with new type spring balanced, cutaway type floats. Automatic choke housing has been moved from air horn to float bowl.

1958 Pontiac - Engine idle speed is controlled by an Idle Bypass Adjusting screw instead of by the throttle stopscrew used on previous models. An "Idle Compensator" mounted between venturi on secondary side consists of a bi-metal strip which, when heated, opens a valve into a passage leading from secondary side to a point below primary throttle valves prevents engine stalling during prolonged idling.

ADJUSTMENTS: *Make all adjustments in sequence given below (except for Idle Mixture and Idle Speed Tune-up Adjustments).*

►*1956-57 PONTIAC IDLE ADJUSTING SCREW (THROTTLE STOPSCREW NOTE):* The throttle stopscrew (slow idle screw) as such, has been eliminated and replaced by a flat spring for positive closing. The screw

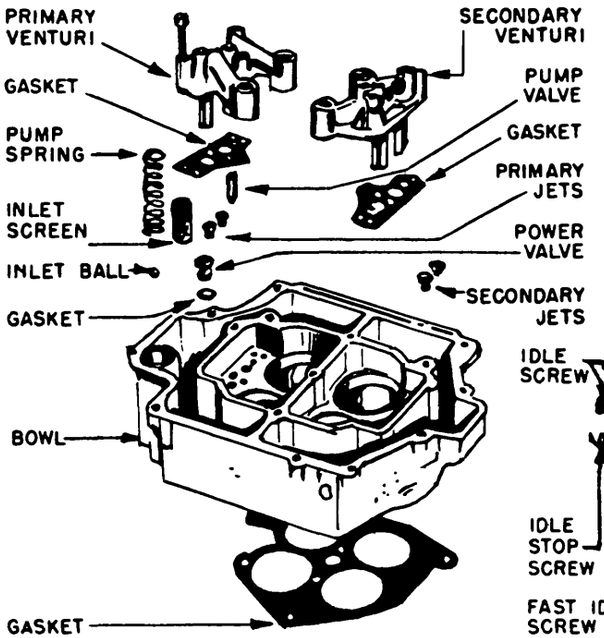
CONTINUED ON NEXT PAGE

1956-58 ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)

which was formerly the fast idle screw is now both fast and slow idle screw. The low step of the fast idle cam is used as a base for slow idle adjustment.

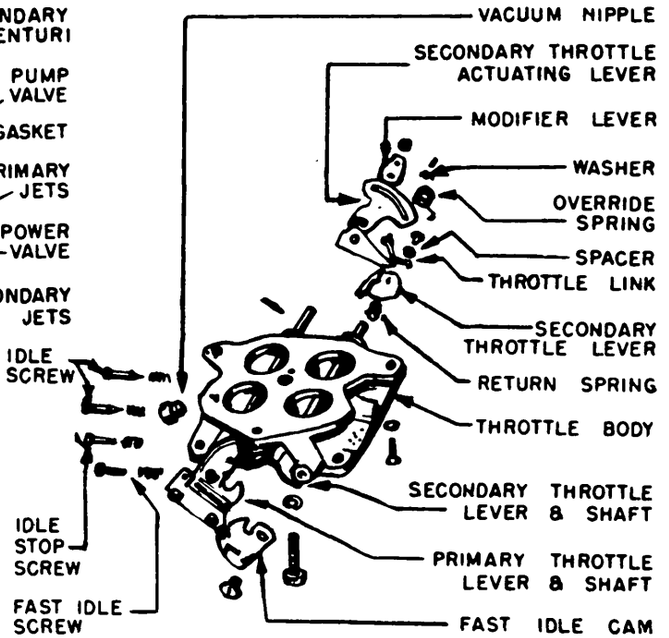
►*1958 PONTIAC IDLE SPEED SETTING NOTE:* Throttle valves are completely closed at slow idle speed and air is admitted through Idle Air Bypass System which consists of a bypass passage (primary side only) through which air for closed throttle operation is taken from above the throttle valves through a metered non-adjustable orifice to each primary bore. An idle speed screw (single screw for both primary bores) controls the adjustable orifice, and all idle speed adjustments are made with this screw (throttle stopscrew not used).

►*OLDSMOBILE IDLE SETTING NOTE: Air cleaner must b in position on carbur tor when idle speed and idle mixture adjustments are mad .*



Idle Setting (Exc pt 1958 Pontiac): As an initial setting, back out idle mixture screw 1 full turn from a lightly seated position, then with engine at normal operating temperature, automatic choke not operating (choke valve wide open), and fast idle inoperative so engine idles at hot or slow idle speed, adjust engine to correct idle speed (see table below). Adjust each idle mixture screw (one screw for each primary barrel) until engine idles smoothly and RPM is at maximum (see Oldsmobile Note following). Recheck engine idle speed.

►*1958 PONTIAC IDLE SETTING CAUTION:* Idle Compensator Thermostatic Valve must be held closed while making idle speed adjustments. If necessary, hold closed with a drill rod. Do not damage valve.



Idl Sp d & Mixtur S tting (1958 Pontiac): As an initial adjustment, turn mixture screws out 1 turn from a lightly seated position and idle air screw out 2 turns. With engine at normal operating temperature, choke fully open and fast idle inoperative, place transmission in "D" (Drive) range and adjust idle air screw to obtain an idle speed of 480-500 RPM. Turn idle mixture screws for best quality (highest RPM) idle. Reset air screw for 480-500 RPM, then recheck mixture adjustment for smoothest possible idle. *NOTE - Always recheck idle mixtur scr w s tting after making idle speed adjustment with idl air scr w*

►*OLDSMOBILE NOTE:* Manufacturer recommends that after setting idle as above (for highest vacuum reading and engine RPM), each screw should be turned out (rich) ¼ turn which will provide desired idling performance. Check this setting by opening throttle to 1000 RPM point and then snapping throttle closed. If engine rolls from richness, turn each screw in (lean) 1/8 turn.

NOTE–Change in Idle Speed affects throttle linkage adjustment on all cars except Oldsmobile. Oldsmobile split throttle lever design insures throttle linkage remaining as set when idle speed readjusted.

MAIN BODY ASSEMBLY

① - With Air Conditioner turned "ON".
② - Transmission in "N" (Neutral).
③ - 550 RPM on Air Conditioned Cars.
④ - Transmission in "D" (Drive).
⑤ - 520 RPM on Air Cond. cars with Air Conditioner control lever at extreme right and "Maximum" button pushed in.
⑥ - Transmission in "High" range.
⑦ - 510-530 RPM with Air Cond. turned "OFF".
⑧ - 500-520 RPM with Air Cond. turned "ON".
⑨ - 500 RPM with modified carburetors. See modification above.
⑩ - 540-560 with Air Cond. turned "OFF".

MAIN BODY ASSEMBLY

►*OLDSMOBILE THROTTLE LINKAGE ADJUSTMENT NOTE:* Carburetors have "Split Throttle Lever" and linkage adjustment will not be disturned by Idle Speed Adjustment.

►*1956 PACKARD 5688 (310 H.P. ENGINE) THROTTLE LINKAGE ADJUSTMENT:* See *CARBURETOR on Car Model pages.*

►*1956 PONTIAC 285 H.P. ENGINE THROTTLE LINKAGE ADJUSTMENT:* See *CARBURETOR on Car Model pages.*

Fl at S tting: *Both Primary and Secondary Float Assemblies must be checked and adjusted separately and both FLOAT LEVEL & FLOAT DROP (Float Tip, on cars with "Spring Balanced" floats), must be checked*

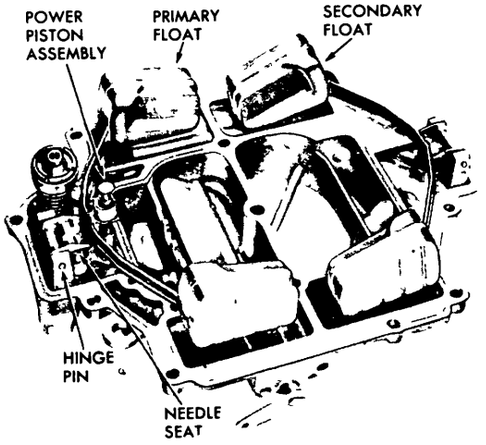
CONTINUED ON NEXT PAGE

1956-58 ROCHESTER 4GC 4-BARREL CARBURETORS (Cont.)

for each assembly. Remove bowl cover and float assembly from carburetor but DO NOT remove bowl cover gasket for following checks:

►*1958 PRIMARY FLOAT SETTING CAUTION (Oldsmobile 7012400, 7012401, Pontiac 7011701):* A new type vacuum assist primary float is used (operated from an extension on power piston) which allows full fuel flow on heavy acceleration and provides added buoyancy when correct fuel level is reached. Adjustment procedures are different for this float as noted below.

Float Level (Except Carburetors with "Vacuum Assist" Type Floats) - With bowl cover gasket in place, invert bowl cover, then install correct float gauge (see table below) on cover and against curvature in air horn bore (Chevrolet Cars & Trucks) over highest point on float (Others). Upper portion of float should just touch gauge. To adjust, bend float arm at rear of float. With float gauge still in position and centered in air horn, each float should be centered between gauge legs. To adjust, bend float at point where float attached to arm. After centering float, check alignment by aligning screw holes in air horn gasket, with screw hole in air horn. Make sure floats are centered in cut-out section of gasket and sides of floats are parallel with adjacent edges of gasket.



Float Level (Carburetors with "Vacuum Assist" Type Floats) - With bowl cover gasket in place, invert bowl cover, then install float gauge (see table below) under heel of floats. With gauge vertical, floats should just contact gauge. To adjust, bend float arms at rear. Slide gauge under toe of float. In this position, lower surface of float should just touch gauge. Lower surface of float should now be parallel to air horn surface and gauge should slide freely under floats. With gauge still under floats, hold lug on lower surface of gauge against inside of air horn casting. Floats should center in cut-out portion between gauge legs. If alignment is needed, bend float arms horizontally (directly back of floats) until floats are centered at heel and toe. Make sure floats do not rub sides of gauge legs under any condition.

Car Model	Float Height	Gauge No.
1956 Buick	1 35/64"	BT-117
1957 Buick	1 3/8"	BT-132
1958 Buick ①	1 3/8"	BT-132
1958 Buick ②	③ 1 13/32"	BT-150
1956-57 Chev. Pass.	1 5/8"	BT-89
1957 Chev. Truck	1 19/32"	BT-101
1958 Chev. Pass. & Truck	⑦ 1 5/8"	BT-89
1956-57 Oldsmobile	1 5/8"	BT-89
1958 Oldsmobile	③ .276	BT-140
1956 Packard	1 5/8"	BT-89
1956 Pontiac	1 19/32"	BT-101
1957 Pontiac	1 3/8"	BT-132
1958 Pontiac	③ 9/32"	BT-140

① - Early cars with 7011600 Carburetor.
② - Late cars with 7013100 Carburetor.
③ - Primary float. Adjust secondary float to 1 3/8". (BT-132).
⑦ - Primary float. Adjust secondary float to 1 11/16" (BT-143).

Float Toe Adjustment (1957 Buick & Pontiac Carburetors): Move Gauge BT-132 to small end of floats. With gauge held vertically, the upper edge of float at the point where the radius ends should align between scribe marks on gauge.

Float Toe Adjustment (1958 Carburetors, Except Chevrolet Pass. Cars & Trucks and "Vacuum Assist" Type Primary Floats): With air horn inverted and gasket in place, measure distance from gasket to center of dimple on side of float at toe (small end). This distance should be 3/8". To adjust, bend toe of float up or down while holding float arm directly back of float. *CAUTION - Always recheck float level adjustment if toe adjustment is necessary.*

FLOAT ASSEMBLY WITH "VACUUM ASSIST" PRIMARY FLOATS

Vacuum Assist Spring ("Vacuum Assist" type Primary Floats): With air horn held upright, hold power piston in full up position. Jounce float lightly to make sure cup retainer on assist spring is not binding on power piston stem. Measure distance from gasket to center of dimple on float at the toe (small end). This distance should be 1 5/32" (Oldsmobile), 1 1/32" (Cadillac). To adjust, bend tang at center of float arms (tang engages stem of power piston).

Float Drop Adjustment (Except 1958 Chevrolet Pass. Cars & Trucks and "Vacuum Assist" Type Primary Floats): With air horn held upright and level, gasket in place and floats hanging freely, measure distance from gasket to center of dimple on side of float toe (small end). Jounce floats slightly to make sure they are fully settled in position. Distance should be as indicated in table below.

Float Drop Adjustment ("Vacuum Assist" Type Primary Floats): With air horn held upright and power piston fully extended measure distance from gasket to center of dimple. This distance should be as indicated in table below. To adjust, bend tang at rear float hanger towards needle seat to lessen drop and away from seat to increase drop.

Float Drop Setting

Car Model	Float Drop Primary	Float Drop Secondary
1956 Buick	2 1/4"	2 1/4"
1957 Buick	1 13/16"	1 13/16"
1958 Buick (7011600)	1 3/8"	1 3/8"
1958 Buick (7013100)	1 13/32"	1 3/8"
1956-58 Chev. (All)	2 1/4"	2 1/4"
1956-57 Oldsmobile	2 1/4	2 1/4"
1958 Oldsmobile	1 1/2"	1 5/16"
1956 Packard	2 1/4"	2 1/4"
1956 Pontiac	2 1/4"	2 1/4"
1957 Pontiac	1 13/16"	1 13/16"
1958 Pontiac	1 1/2"	1 5/16"

Accelerating Pump Rod Adjustment: *CAUTION - This is a linkage adjustment and not a seasonal change recommendation.* Back out slow idle speed screw (except carburetors with "Idle Air Bypass") and fast idle screw until throttle valves are completely closed. Hold throttle valves in the closed position and proceed as follows: On Buick carburetors with three holes in accelerating pump arm, place pump rod in center hole. If scale is used, measure height of pump rod plunger from top surface of bowl cover to bottom edge of pump plunger rod (see table below for proper setting). If gauge is used, place proper gauge (see table below) on top of air horn next to pump plunger. Pump plunger shaft should slide freely into hole of gauge marked "pump". If height not correct (see table below), or pump plunger does not slide into hole of gauge, bend pump rod as necessary to obtain the correct adjustment.

Pump Rod Setting

Car Model	④ Height
1956 Buick	1 1/32"
1957-58 Buick ②	1 1/64"
1956-58 Chevrolet (All)	1 1/16"
1956 Oldsmobile	1 1/16"
1957-58 Oldsmobile	1 3/64"
1956 Packard	1 1/16"
1956 Pontiac	61/64"
1957-58 Pontiac	15/16"

④ - The following gauges may be used in place of scale measurement: BT-145 (1 1/16"), BT-147 (1 3/64").
② - *See "1957 Buick Stumble and Flat Spot Correction" above.*

►*1958 OLDSMOBILE PUMP ROD ADJUSTMENT NOTE:* Two holes are provided in pump arm. Normal pump rod position is in "inner" (long stroke) position. Pump rod position should **never** be changed on cars operated in moderate or cold climate, and not in warm climates or high altitudes unless there is a complaint of stumble on acceleration (with engine properly tuned-up). *CAUTION - Pump rod adjustment SHOULD NOT be changed to compensate for the shorter stroke, but idle vent MUST be checked and corrected.*

Atmospheric Idle Vent Adjustment: Idle vents not used on all carburetors. Adjustment procedures are different as indicated below.

1956 Oldsmobile & 1956-57 Pontiac - With primary throt-

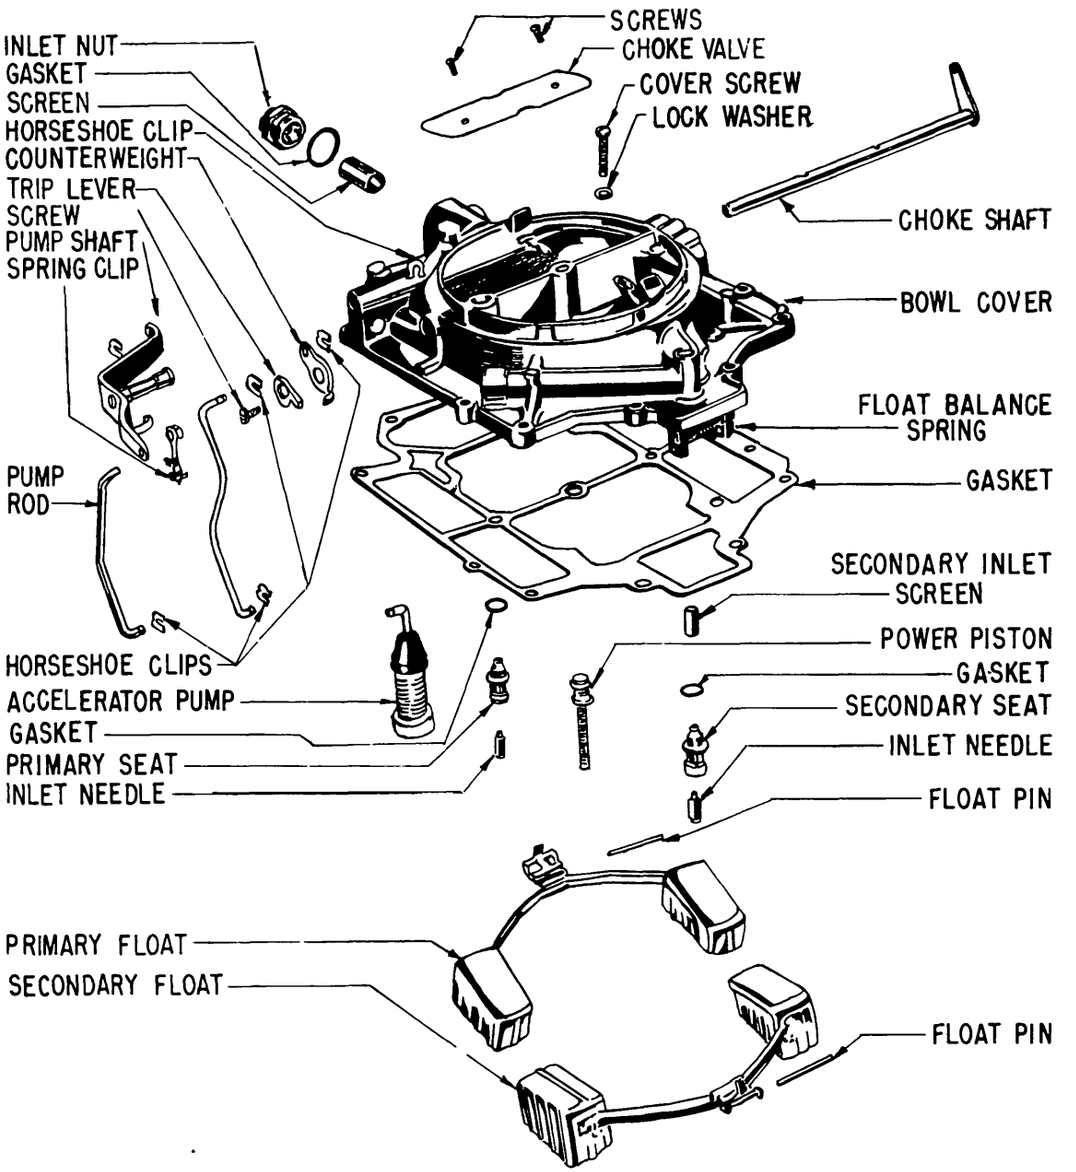
CONTINUED ON NEXT PAGE

1956-58 ROCHESTER 4GC 4-BARREL CARBURETORS (Cont.)

tle valves closed against a .063" wire gauge (BT-79), bend idle vent tang so tang just touches face of valve. **1957 Oldsm bil** - Open throttle valves enough to obtain a measurement of 13/16" from air horn to bottom of pump plunger shaft. At this point, idle vent should just close. To adjust, bend tang on pump lever.

1957-58 Ch vr l t Truck (Exc. Carb. No. 7009661), 1958 Oldsm bil & 1958 P ntiac - Open throttle valves to point where vent valve is just closed. Distance from top of air horn to bottom side of pump plunger shaft should be 31/32" (Chev. Truck); 29/32" (Oldsmobile); 53/64" (Pontiac). *NOTE - If Gauge BT-145 (Chev-Truck) or Gauge BT-147 (Oldsmobile is used, place gauge on top of air horn with side marked "vent" next to pump plunger shaft. With throttle valve open to point where vent valv is just closed, the hole marked "vent" should slide fre ly over pump plunger shaft.* To adjust, bend tang on pump plunger shaft.

Int rm diat Ch k R d (1957-58 Buick, Oldsmobile & Pontiac): Hold choke valve closed and bend intermediate rod (rod connecting lever on choke shaft to choke lever on automatic choke housing) so that end of choke piston is flush to 1/32" out of choke sleeve. *NOTE - 1958 Pontiac piston must be flush.*



Aut matic Ch k Setting (Except Models with Choke M difi r): To adjust, loosen choke heat suction tube connection on cover and loosen cover retaining screws. Rotate cover until index mark on cover is aligned with correct mark on housing (see table below). Tighten all cover retaining screws and heat tube connection.

Aut matic Choke Setting

Car M d l	Choke Setting
1956-58 Buick	Centered
1956-57 Chevrolet Pass. Cars	1 Notch Lean
1958 Chev. Pass. (Powerglide)	1 Notch Lean
1958 Chev. Pass. (Turboglide)	Centered
1956 Oldsmobile (Synchro-mesh)	2 Notches Lean
1956 Oldsmobile (Auto. Trans.)	1 Notch Lean
1957 Oldsmobile	Centered
1958 Oldsmobile	①
1956 Packard	Centered
1956 Pontiac (Exc. 285 HP Eng.)	② 1 Notch Lean
1956 Pontiac (285 HP Eng.)	Centered
1957-58 Pontiac	Centered

① - See "Choke Modifier Adjustment" below.
② - Supersedes previous Centered setting (see changes above).

Ch ke M difier Adjustm nt: Oldsm bile - With fast and slow idle screws backed out and primary throttle valves tightly closed, loosen the choke modifier lock screw and rotate the index pointer counter-clockwise from free position until the thermostat spring begins to close choke valve. Continue counter-clockwise until pointer lines up with index position on thermostat cover.

ROCHESTER 4GC CARBURETOR AIR HORN & BOWL COVER ASSEMBLY

Fast Idl Setting: *NOTE - 1956-58 Ch vrol t Pass. Cars & 1956-57 Pontiac fast idle adjustm nt will b corr ct aft r "slow idl " speed and chok rod adjustments have been mad . On oth r mod ls, th "On Engin " fast idl adjustment must be made after carburetor installed to insure proper warm-up performance.*

"Off Engine" Adjustment (1956-58 Buick & Oldsmobile, 1956 Packard, 1958 P ntiac) - Turn fast idle screw against high step of fast idle cam until proper gauge (see table below) fits between throttle valve and bore opposite idle adjusting needles.

CONTINUED ON NEXT PAGE

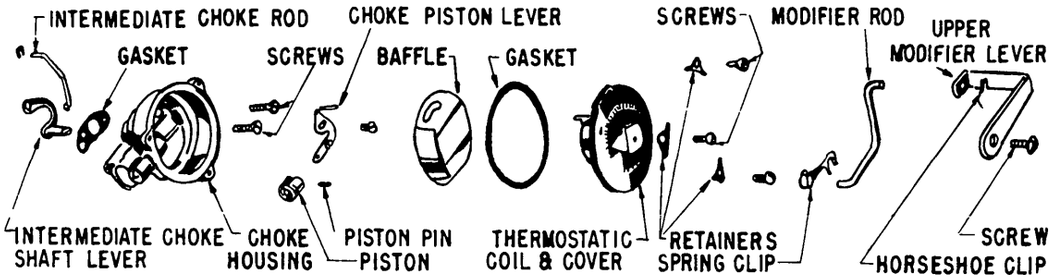
1956-58 ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)

Fast Idle Setting (Off Engine)

Car Model	Gauge No.	Throttle Opening
1956-57 Buick	BT-90	024"
1958 Buick	BT-79	028"
1956-58 Oldsmobile	BT-90	024"
1956 Packard(7008610)	BT-90	024"
1956 Packard(7009600)	BT-120	020"
1956 Packard(7009601)	BT-121	030"
1958 Pontiac		033"

"On Engine" Adjustment (Exc. 1958 Pontiac) - With engine at normal operating temperature, rotate fast idle cam so fast idle adjusting screw is on high step of fast idle cam Adjust fast idle screw so engine operates at 1500 RPM (Buick & Oldsmobile), 1700 RPM (Packard 7008610), 1850 RPM (Packard 7009600), 2300 RPM (Packard 7009601).

►*1956 PACKARD FAST IDLE ADJUSTMENT NOTE (CARS WITH TWO 4-BARREL CARBS.): Special adjustment procedure required. See CARBURETOR on Packard Car Model pages.*



'On Engine" Adjustment (1958 Pontiac) - With hot idle speed and mixture properly adjusted, move fast idle cam so **highest step** is under end of fast idle screw. Adjust fast idle screw to obtain an engine speed of 2700 RPM. *NOTE - Fast idle screw position on highest step of fast idle cam is for adjusting purposes only. Under normal operating conditions (after fast idle has been set as above), fast idle speed will be 1500-1700 RPM.*

Choke Rod Adjustment: *NOTE* - This rod connects choke valve shaft to fast idle cam. Rotate choke valve and fast idle cam until fast idle screw (Exc. 1956-58 Chev. & 1956-57 Pontiac), slow idle screw (1956-58 Chev., 1956-57 Pontiac) is in contact with SECOND STEP of fast idle cam, then close choke valve until screw is against highest step of fast idle cam, making certain that choke trip lever is in contact with choke counterweight lever Measure choke valve opening or clearance between top edge of valve and dividing wall in air horn (see table below for gauge and clearance specifications). Adjust by bending choke at angle with Tool BT-18.

Choke Rod Setting

Car Model	Gauge No.	Choke Opening
1956 Buick	BT-115	140"
1957-58 Buick	BT-135	148"
1956-58 Chevrolet	BT-131	.043"
1956-58 Oldsmobile	BT-68	052"
1956 Packard		052"
1956 Pontiac	BT-68	052"
1957-58 Pontiac	BT-79	063"

Unloader Setting *After choke rod adjusted (above),* move throttle lever to wide open position, make certain that choke trip lever is in contact with choke counterweight Measure choke valve opening or clearance between upper edge of valve and dividing wall in air horn (see table below for gauge and clearance specification) Adjust by bending tang on fast idle cam using BT 69 bending tool

AUTOMATIC CHOKE ASSEMBLY (WITH MODIFIER)

Unloader Setting

Car Model	Gauge No.	Choke Opening
1956 Buick	BT-115	.115"
1957-58 Buick	BT-135	.128"
1956-58 Chevrolet	BT-131	.235"
1956 Oldsmobile	BT-90	.115"
1957 Oldsmobile	BT-90	092"
1958 Oldsmobile	BT-90	.115"
1956 Packard(7008610)	BT-90	.115"
1956 Packard (Others)	BT-119	.150"
1956-58 Pontiac	BT-90	.115"

Secondary Throttle Valve Lock Spring Adjustment (1958 Pontiac): *NOTE - This adjustment must be made accurately. If tension is too great it will interfere with idle speed adjustment.* With choke held fully open and fast idle cam released, close primary throttle valves on a .015" wire gauge inserted between valve and bore at center on same side as idle ports. With throttle valves positioned as above, measure clearance between secondary lock spring and secondary throttle operating lever. This clearance should be .035". Bend lock spring to adjust.

Secondary Throttle Lockout Setting· Close choke valve completely Bend lockout lever to obtain .015' clearance between cam and widest surface of lockout lever.

Secondary Throttle Contour Setting. Hold choke valve completelv closed Bend lockout lever to obtain clearance (see table below) between cam and narrowest surface of lockout lever.

Secondary Throttle Contour Setting

Car & Model	Contour Setting
Buick	030"
Chevrolet	015"
Oldsmobile	.035"
Packard	015"
Pontiac (All)	015"

Buick Vacuum Starter Switch Timing Check (1956): Back off throttle stopscrew to close throttle completely. Make pencil mark on switch end of primary throttle shaft to line up with longest of three indicator marks on casting. With test light across switch terminals, slowly open throttle valves. Light should come on when pencil mark is between the two small marks on casting. Adjust by changing shims (maximum .066"). Reset idle RPM to specifications.

Buick Vacuum Start r Switch Timing Ch ck (1957-58): Back off throttle stop screw and rotate fast idle cam to slow idle position, then fully close throttle valve. *(CAUTION* - Make sure dashpot does not prevent full closing of throttle). Measure distance from diaphram flange of dashpot to near edge of dashpot arm on throttle lever. With ignition turned on, slowly open throttle while holding scale in position against flange of dashpot. When cranking motor is energized, note distance from flange of dashpot to near edge of dashpot arm. Subtract the two measurements. If switch is properly timed, the difference should be 1/2" - 3/4". Adjust by changing timing shims located below contact spring in terminal cap.

Dampener Valve Setting (1956 Buick): Remove fast idle cam and replace the screw. Adjust lever tang (Tool J-6058A) to give measurement of 51/64" (Tool J-6153 No 1 end) from cam screw shoulder vertical to top of counterweight lever. Hold lever in this position, seat damper valves against outside of bore and tighten in place Readjust tang to give 53/64" (Tool J-6153 No. 2 end) from cam screw shoulder vertically to top of lever. Proper adjustment prevents valve edge striking bore when in closed position.

►*AUXILIARY SECONDARY THROTTLE VALVE CAUTION (EXCEPT 1956 BUICK) Auxiliary secondary throttle valves are calibrat d at the factory and fi ld adjustments are not requir d.*

Throttle Return Check Adjustm nt (1956-58 Buick & Oldsmobile & 1958 Chevrol t, With Turb glide): *See "CARBURETOR" on Car Mod l pag s.*

OVERHAUL· *CAUTION–When disassembling carburetor, be sure to keep PRIMARY and SECONDARY side parts separate so they will not be confused or interchanged when carburetor assembled.*

Disassembly: Carburetor consists of three main subassemblies (Air Horn & Bowl Cover, Carburetor Bowl, and Throttle Body) which can be overhauled separately as follows

1956 MODELS

Air Horn & Bowl Cover–On Cadillac, disconnect and remove choke modifier rod On all models, disconnect and remove pump connector rod. Remove trip lever retaining screw from end of choke shaft, remove trip lever and spacing washer from shaft. Take out fast idle cam pivot screw, remove choke rod with lever and cam as an assembly. Take out all air horn retaining screws *(CAUTION*–there are 13 screws–3 inner and 10 outer– with **one screw in count rb re in dividing**

CONTINUED ON NEXT PAGE

1956-58 ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)

wall just inside dge of air h rn). Lift air horn and bowl cover assembly straight up using extreme care n ot to damage float assemblies (CAUTION–break cover loose from bowl with finger pressure only, DO NOT pry on cover flange). Disassemble as follows: Invert the cover assembly, take out float hinge pins and remove floats and intake needles, remove needle seats and gaskets (CAUTION–Keep each float assembly, intake needle, and seat together, DO NOT mix primary and secondary side parts). Remove power piston by rotating retaining washer until flat side allows piston to pass, remove piston spring. Remove idle vent valve, spring, and retainer by pressing on retainer with a screwdriver and sliding assembly up out of well in bowl cover. Remove pump plunger and rubber seal as an assembly by disengaging plunger shaft from pump lever and pulling assembly out of cover (seal, retainer, washer, and spring can be removed from plunger for cleaning). Remove pump inner lever from countershaft by removing nut and washer, then slide countershaft out of cover boss. Remove fuel inlet fitting, gasket and strainer. If choke to be disassembled, proceed as follows: On Cadillac, remove retaining screw and lift off choke modifier lever. Remove cover attaching screws and retainers, lift off thermostat cover and coil assembly (CAUTION–On Cadillac, do not remove metal pointer or coil from shaft in cover), remove gasket and baffle plate. Remove choke valve (remove staking burrs from valve screws before taking screws out). Rotate choke shaft counter-clockwise until choke piston clears cylinder, slide shaft out and remove shaft and piston as an assembly (piston can be disconnected by using a wire to push piston pin out of piston and link). Remove choke housing by taking out two attaching screws, remove and discard choke housing gasket.

1957-58 MODELS

Air Horn & B wl C v r - On Cadillac, (with air conditioning), remove idle speed-up control and bracket. On Chevrolet Pass. Cars, remove choke cover, gasket, and coil assembly from housing. On all cars (except Chevrolet), disconnect intermediate rod from choke shaft lever. On all cars, disconnect pump rod from pump lever. Remove choke trip lever, then disengage choke lever and collar assembly from choke shaft and disengage lower end of choke rod from fast idle cam. Remove choke lever, collar, and rod as an assembly. Remove choke valve, then on all cars (except Chevrolet), remove choke shaft. On Chevrolet Pass. Cars, rotate choke shaft counterclockwise to free choke piston from housing and remove piston and shaft assembly by sliding from bowl cover. Remove choke housing from bowl cover. On all cars, take out all air horn retaining screws (CAUTION - One screw is located in counterbore in dividing wall just inside edge of air horn), then carefully lift air horn straight up from main body to avoid damage to floats, pump plunger and vacuum piston. *(CAUTION - Break cov r loose from bowl with finger pressur only. DO NOT PRY ON COVER).* Invert bowl cover and take out float hinge pins and remove floats and inlet needles, seats, and gaskets. *(NOTE* - On carburetors with spring balanced floats, it is not necessary to remove the balance spring). Keep each float assembly intake needle, and seat together. DO NOT mix primary and secondary parts. Remove power piston assembly by compressing spring and letting it snap repeatedly until hammering action of power piston drives staked retaining disc from air horn. *(NOTE* - It may be necessary to remove burrs if heavy staking is encountered). Remove horseshoe clip from top of accelerating pump plunger shaft and disengage plunger shaft from pump lever. Pull pump plunger, with rubber boot, downward and out of bowl cover. Remove pump lever and choke countershaft. Remove fuel inlet, gasket and strainer.

1956 MODELS

Carburetor Bowl–Take out three attaching screws and lockwashers in each venturi cluster, carefully remove clusters by lifting them straight up to avoid damaging idle tubes and main well tubes (CAUTION–Clusters are serviced as an assembly and should not be disassembled further). Keep primary and secondary side clusters separate (primary cluster has pump discharge nozzles). Remove all main metering jets (located in bowl adjacent to venturi cluster support). CAUTION–Primary and secondary side metering jets are different size and must not be interchanged. Remove power valve and gasket (located in bowl adjacent to primary metering jets). Remove pump return spring from pump cylinder, then invert bowl casting to remove aluminum pump inlet ball (from bottom of pump cylinder) and brass pump outlet check needle (from passage under primary venturi cluster mounting face). CAUTION–Do not lose these parts and NEVER substitute a steel ball for the aluminum inlet ball. Remove pump inlet screen from intake passage at side of cylinder.

1957-58 MODELS

Carburetor Bowl - On Cadillac & Oldsmobile, remove modifier lever from choke cover. On all cars (except Chevrolet Pass. Car & Truck), remove thermostat cover and coil assembly. Remove choke piston lever screw and slide choke piston out of vacuum passage. Disconnect choke piston from link attached to shaft by tapping piston and letting it fall into the hand. Remove choke housing from bowl (or throttle body). Remove intermediate choke shaft lever from housing. On all cars, remove accelerator pump spring, then remove power valve and gasket. Remove primary and secondary venturi clusters. *(CAUTION - Break clusters loose with finger pressure only).* Remove and discard venturi cluster gaskets. On Oldsmobile, disconnect throttle return check vacuum line at throttle flange, then remove throttle return check from carburetor body. On all cars, remove metering jets from primary and secondary sides, keeping each jet separate in separate groups. Invert bowl casting and remove pump inlet and outlet check valve balls. If necessary, remove pump inlet screen and retainer from bottom of float bowl.

1956 MODELS

Throttl Body–Remove large screw and washer from counterbore in center of throttle body (visible when bowl and throttle body inverted), remove three smaller screws and lockwashers from flange, carefully separate throttle body from bowl, remove and discard gasket. On all cars except Buick & Cadillac, remove the secondary auxiliary throttle valve assembly from carburetor body by lifting it out of the secondary throttle bores. Remove both idle adjusting screws and springs, idle stop screw and spring, and fast idle screw and spring. *(CAUTION - Keep each screw and its proper spring together).* On Cadillac, remove choke modifier lever and retaining screw from primary throttle shaft. Free secondary throttle actuating link by taking out cotter pin in each end, unhook inner end of primary throttle shaft override spring from lever using long nose pliers, remove override spring retaining screw from primary throttle shaft, remove secondary throttle lever retaining screw and washer, then slide secondary throttle actuating lever and override spring off primary shaft, remove link. Slide secondary throttle lever and return spring from secondary throttle shaft. This completes throttle body disassembly.

► *CAUTION: Secondary Auxiliary Throttle Body and Main Throttle Body are furnished as an assembly with throttl valves and shafts and no attempt should be made to remove throttle valves (disturbing valves will upset low speed metering performance).*

1957-58 MODELS

Throttle Body - Remove large screw and washer from counterbore in center of throttle body. On Cadillac, with air conditioning, remove idle speed-up control vacuum pipe. On all cars, remove three small screws and lockwashers from flange and carefully separate throttle body from bowl. Remove and discard gasket. Remove secondary auxiliary throttle valve assembly from carburetor body by lifting it out of secondary throttle bores. Remove both idle adjusting screws and springs, idle stop screw and spring, and fast idle screw and spring. On Cadillac, remove idle air by-pass screw and spring. *(NOTE* - Keep each adjusting spring with its screw for easier identification). On Cadillac and Oldsmobile, remove choke modifier lever and retaining screw from primary throttle shaft. On all cars, free secondary operating link by taking out cotter pin in each end. Unhook inner end of primary throttle shaft override spring from lever. Remove override spring retaining screw from primary throttle shaft, remove secondary throttle lever retaining screw and washer, then slide secondary throttle operating lever and override spring off primary shaft. Slide secondary throttle lever and spring from secondary throttle shaft.

► *CAUTION: Secondary Auxiliary Throttle Body and Main Throttle Body are furnished as an assembly with throttl valves and shafts and no attempt should be made to remove throttle valves (disturbing valves will upset low speed metering performance).*

1956-58 MODELS

Cleaning & Inspection: Wash all parts thoroughly in carburetor cleaning solvent **except** following parts which should be cleaned in clean gasoline: Choke cover and coil assembly, pump plunger, primary venturi cluster (with pump discharge nozzles). Blow out all passages in castings with air, remove all gum and carbon deposits (CAUTION–do not use drills to clean out jets and passages). Inspect strainer screens and

CONTINUED ON NEXT PAGE

1956-58 ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)

replace if distorted or plugged. Check floats for dents, leaks, or wear at hinge pin holes. Inspect fast idle cam for wear on steps. Inspect throttle body carefully for wear at throttle valves and bore and shaft wear in bore (replace as an assembly if worn excessively). Inspect all parts for wear or damage and replace as required.

Reassembly: Use new gaskets. Install all parts in reverse order of disassembly procedure (above) and pay particular attention to the following:

Auxiliary Secondary Throttle Valve Assembly - Install the auxiliary secondary throttle valve assembly into base of carburetor body from bottom side (make sure the calibrated spring, nylon bushing and operating pin are in position in throttle body assembly).

Secondary Throttle Lever & Spring Installation: Install return spring on secondary throttle shaft with bent end of spring in hole in throttle body, wind up spring one complete turn, then install secondary lever on shaft over straight end of spring (bent portion of lever should be above shaft), install spacer and retaining screw in end of shaft. Install secondary throttle actuating link (insert plain end through lever hole, install cotter pin on shaft side to clear return spring).

Primary Throttle Lever & Spring—Start secondary throttle actuating lever on primary throttle shaft with curved slot portion outward and toward the rear. With inner portion of lever on shaft, start override spring on shaft with long end inward, then slide lever and spring on shaft and engage washer end of secondary throttle actuating link in slot in lever. Install override spring retaining screw through loop end of spring and into primary throttle shaft from upper side. Hook inner end of override spring over top edge of secondary throttle actuating lever. Install washer and cotter pin on end of secondary throttle actuating link. On Cadillac, install choke modifier lever and retaining screw on end of primary throttle shaft (lever must point upward when throttle closed and marking "RP" must be outward).

Throttle Body-to-Bowl Assembly Caution—Install new gasket on bottom surface of bowl with largest projecting tab on primary side and surrounding vacuum passage to power valve piston (*CAUTION*—gasket is not reversible). Install all throttle body attaching screws loosely (including large screw in center of throttle body), then tighten all screws evenly.

Venturi Cluster Installation Caution—Make certain that brass pump discharge needle installed in pump passage in bowl before installing primary venturi cluster. Use new gaskets and install each venturi cluster in correct position making certain that clusters correctly aligned by the tangs on the cluster. *CAUTION*—Primary and Secondary clusters not interchangeable and can be identified by brass pump discharge nozzles used on primary cluster only.

Metering Jet Installation Caution—Primary and secondary side metering jets are DIFFERENT sizes (in general, secondary jets are larger size than primary jets) and must be installed in correct positions. *NOTE*—On later Cadillac carburetors, primary jets are brass finished, secondary jets are copper plated.

Accelerating Pump Plunger Assembly—When installing rubber seal on plunger stem, slide seal on shaft with larger end toward the piston, see that upper end engaged in groove in plunger stem. Insert assembly through bowl cover from below and pull seal through cover so that cover edge engages groove in seal. When installing cover, guide pump plunger into cylinder.

Floats and Intake Valve Assembly - Make certain that parts are installed in correct position (primary and secondary parts not interchangeable). On carburetors with spring balanced floats, make sure float arm is back of float balance spring. Adjust float level and float drop or travel. *See "Adjustments" above.*

Air Horn & Bowl Cover Installation—Use new gasket, carefully align all holes in gasket and cover. When installing cover, use care in guiding pump plunger into pump cylinder and power valve piston into its bore, and see that floats not bent by striking on edge of bowl. Install all bowl cover attaching screws, tighten inner screws first, then outer screws, evenly and securely.

Choke Valve Installation—After choke shaft and piston assembly installed in air horn, slide choke valve through shaft with letters "RP" upward, use new screws and install screws loosely, then tighten screws as follows: **Cadillac**-Press firmly on choke housing end of shaft and hold valve tightly closed, tighten screws securely and stake ends of screws lightly taking care not to bend choke shaft. **Oldsmobile**—First install counterweight, spacing washer, and trip lever on end of choke shaft, press lightly on end of choke shaft to obtain minimum clearance of .020" between spacing washer and counterweight, tighten choke valve attaching screws with shaft in this position, stake screws lightly taking care not to bend choke shaft. Install choke baffle plate with curved slot over tang on choke lever.

Thermostatic Housing & Coil Installation—With retainer screws loose, rotate cover counter-clockwise until coil hook picks up choke lever tang, then position cover for correct choke setting (see Adjustment data) and tighten retaining screws. On Cadillac, install choke modifier lever loosely (lever should be forward and slightly down when metal pointer is at scribed line), tighten lever screw as part of Choke Modifier adjustment (see Adjustment data).

►CHANGES, CAUTIONS, CORRECTIONS

►*1959 BUICK INOPERATIVE CHOKE MECHANISM* On early cars, this condition may be caused by foreign material or corrosion in choke housing due to road splash To correct, remove choke thermostat housing, piston, and baffle and thoroughly clean parts with water *(CAUTION* - Do not leave parts in water longer than necessary) and dry with compressed air *NOTE* - Later cars have improved fender skirts and baffles to prevent road splash in engine compartment These parts can be installed on early cars

►*1959 BUICK CARBURETOR PRODUCTION CHANGE (To correct a cutout condition when making a sharp turn under hot operating conditions)* The later carburetor, identified by letter "A" on code tag, has four vertical vent tubes projecting from top of air horn which prevent fuel from spilling into bores on turns A new air horn gasket having the openings at primary float only half cut out (forward half of area is solid gasket) is used With the new gasket, adjustment of primary float requires a slightly different procedure *(see "Float Level Adjustment" below)*

►*1959 BUICK (LATE) PRIMARY FLOAT LEVEL ADJUSTMENT CHANGE:* On later model Rochester No. 7013044 carburetors identified by tag change letter "C" or "D" appearing after part number on the identification tag, or on earlier carburetors which have "A", "B" or no letter following the part number and which have been modified by breaking off the forked tang on the primary float hanger and adding the primary balance spring, adjust primary float as indicated below for late 7013044 carburetors

►*1959 BUICK CARBURETOR PRODUCTION CHANGE TO CORRECT CUTTING OUT ON TURNS* Carburetors code tagged "C" or later have been modified by removal of the cup and spring from the vacuum power piston stem so that there is no "Vacuum Assist" action on the primary floats Float arm tang (which engaged the cup) was not eliminated *NOTE* - On some earlier carburetors, this tang was removed in the field to eliminate the vacuum assist action

►*1959 CADILLAC THROTTLE RETURN CHECK RATTLE (Cars before Engine No 001180) See "Throttle Return Check Rattle Correction" under CARBURETOR on Cadillac Car Model page for installation of restriction in vacuum hose*

►*1959 CADILLAC ENGINE STALLING & STUMBLING (WITH COLD ENGINE) CORRECTION & PRODUCTION CHANGE·* Install a new choke baffle, Cadillac No 7010598, having a ½" wide extension set at right angle on one side Later carburetors with the letter "B" on brass identification tag have the later type baffle

►*1959 CHEVROLET 283" & 348" ENGINE CARBURETOR PRODUCTION CHANGES FOR IMPROVED PERFORMANCE* Rochester Carburetor Nos 7013004, 7013006, 7013010, 7013012 have been changed as listed below to correct conditions listed Changes in adjustment procedure due to these new parts are listed under ADJUSTMENTS

Cutting Out on Turns (Hot weather Operation) Correction – Solid type Air Horn Gasket, No 7015173, furnished for service to correct this condition Use of this gasket requires different Float Level checking procedure

Improved Cold Starting Operation - New Choke Piston, No 7015887 (Carb Nos 7013006 & 7013012), No 7015890 (Carb Nos 7013004 & 7013010) used on later carburetors This change need not be made on earlier carburetors

Air Horn Internal Venting Change - New Air Horn, No 7015794, has four corner pitot tubes for venting Primary vertical vent has been closed and the two large tubes eliminated This is merely a production change

Choke Piston Lever & Link Assembly (Carb. Nos. 7013006 & 7013012) - New assembly, No 7012748, furnished for service Piston link has been lengthened 1/32" for ease in making Intermediate Choke Rod Adjustment

Metering Jet Changes - *See Rochester 4-Barrel Jet Specifications for latest jet recommendations*

►*1959-60 CHEVROLET V8 (AIR CONDITIONED CARS) CUTTING OUT ON TURNS CORRECTION (EARLY CARS WITH CARB. NOS 7013010 & 7013012)* To correct this condition, install Kit, Part No 7017804 which contains two float assemblies, two float assist torsion springs, primary and secondary float gauges and new identification tags Adjust float level to later specifications *(see "Float Level Setting" below)* Install identification tag 7015010 (to replace 7013010) and tag 7015012 (to replace 7013012)

►*1959-EARLY 1960 CHEVROLET V8 (EXCEPT AIR CONDITIONED CARS) CUTTING OUT ON TURNS CORRECTION* To correct this condition on cars with Carburetor Nos 7013004 & 7013006, install modification kit as follows On carburetors identified by a change letter "B" or later on the identification tag, install Kit, Part No 7017803 which contains two torsion springs, float gauges, and new identification tags (floats not included) On earlier carburetors (before change letter "B"), install Kit, Part No 7017804 which contains new floats, two torsion springs, float gauges and new identification tags Adjust float level to later specifications *(see 'Float Level Setting' below)* Install identification tag 7015004 (to replace 7013004) and tag 7015006 (to replace 7013006)

►*1960 CHEVROLET V8 CARBURETOR PRODUCTION CHANGE:* New carburetors, Part No 7015010 (283" Eng. Air Cond cars), 7015012 (348" Eng Air Cond cars), 7015004 (283" Eng. Exc Air Cond. cars), 7015006 (348" Eng Exc Air Cond cars) are being used in production to replace earlier carburetors. These new carburetors have new type float assemblies and new float assist torsion springs Float level settings are different *See "Float Level Setting" below. NOTE - Earlier carburetors may be converted to later type as indicated below.*

►*1960 CHEVROLET AIR HORN GASKET NOTE:* Service replacement gaskets are not fully cutout in the area of the float bowls (production gaskets are) This change was made in service gaskets to eliminate the possibility of engine cutting out on turns during hot weather

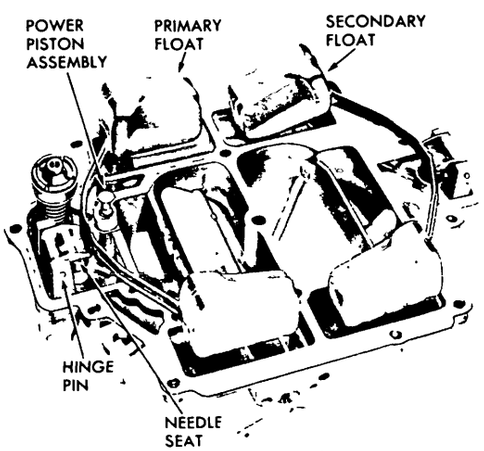
►*1960 CHEVROLET V8 (AIR CONDITIONED CARS) CUTTING OUT ON TURNS CORRECTION (EARLY CARS WITH CARB. NOS. 7013010 & 7013012):* To correct this condition, install Kit, Part No 7017804 which contains two float assemblies, two float assist torsion springs, primary and secondary float gauges and new identification tags Adjust float level to later specifications *(see "Float Level Setting" below)* Install identification tag 7015010 (to replace 7013010) and tag 7015012 (to replace 7013012).

►*1960 CHEVROLET V8 7013004 & 7013006 CARBURETOR PRODUCTION CHANGE·* Carburetors identified by a change letter "B" or later on the identification tag have new type primary and secondary float assemblies Float level setting is the same as for earlier carburetors

►*1959 OLDSMOBILE 4GC CARBURETOR PRODUCTION AND ADJUSTMENT CHANGE* On later carburetors, a positive slow idle stop has been incorporated into the throttle body The slow idle adjusting screw now contacts throttle body in a vertical position allowing adjustments to be made more easily Carburetors having this new feature require a "Secondary Actuating Lever Adjustment" *See ADJUSTMENTS below*

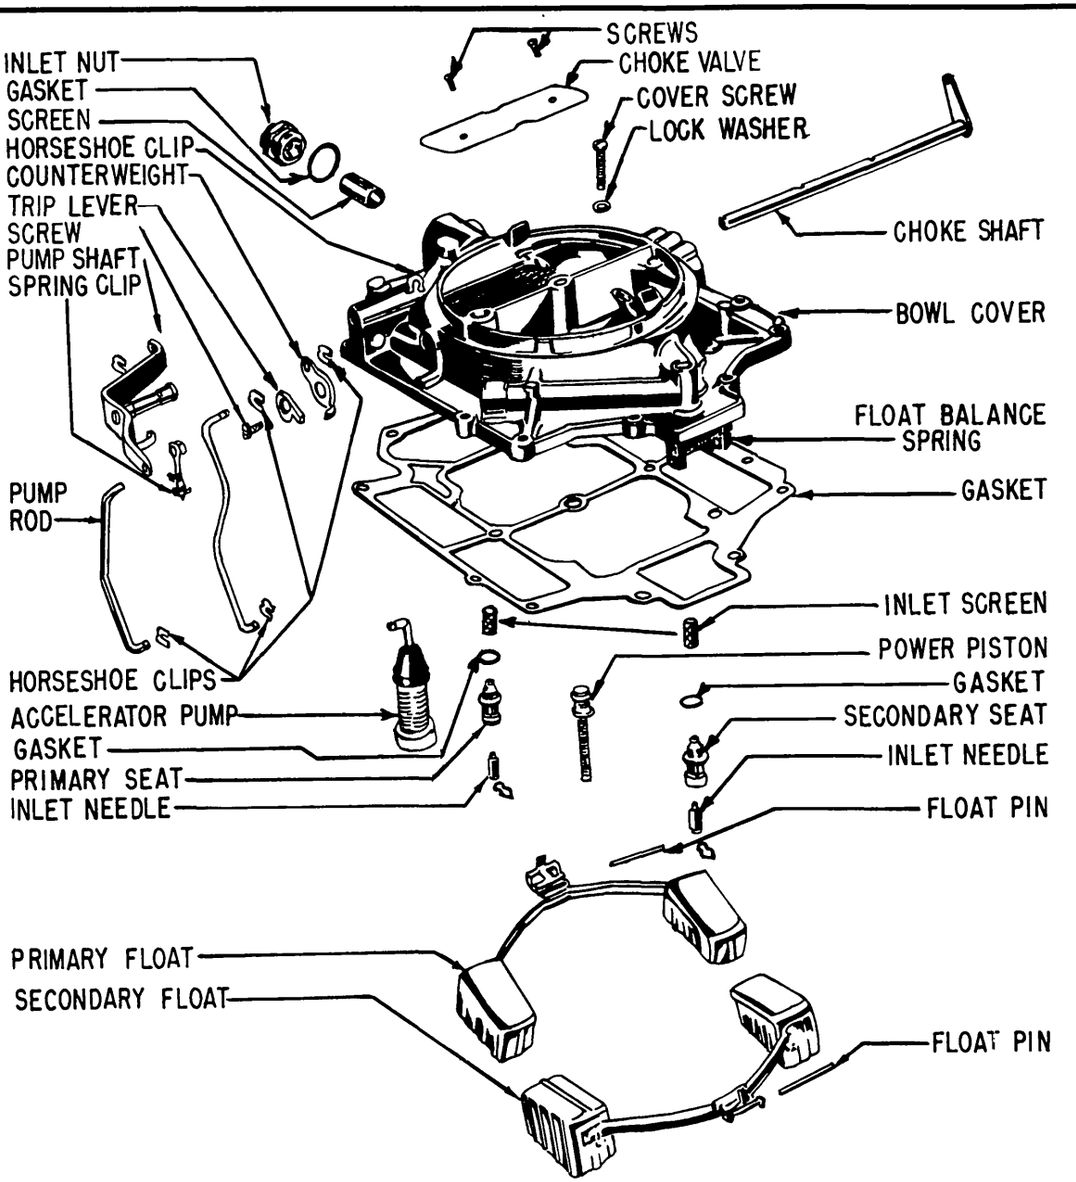
CONTINUED ON NEXT PAGE

1959-60 ROCHESTER 4G & 4GC 4-BARREL CARBURETOR (C nt.)



DESCRIPTION: 4-barrel downdraft type with automatic choke (4GC), without automatic choke (4G). Design is similar to corresponding previous models except for the new features indicated below.

Idle Compensator Valve: This new feature is usedon some carburetors (see below) and is mounted between the main venturi on secondary side. The unit consists of a valve, bi-metal strip, holder and mounting bracket. The purpose of the compensator is to admit additional air under hot idle conditions and to prevent engine stalling. With high air temperature in carburetor, the valve opens allowing additional air to be drawn into carburetor bores below the throttle valves, offsetting enrichening effects of hot idle.



Buick: Throttle levers have been changed and a boss has been added to throttle body casting to provide a more positive stop for the idle speed screw. Four idle vent tubes have been installed in air horn to prevent fuel from spilling into bores on sharp turns. A "vacuum assist" type primary float is used on Early 1959 cars *(see "1959 Buick Carburetor Production Change To Correct Cutting Out on Turns" above).* An "Idle Compensator" is used on all models to prevent stalling during prolonged hot idling conditions.

Cadillac: Choke modifier (used on previous models) has been eliminated. An "Idle Compensator" is used to prevent stalling during prolonged "hot idle" conditions on all models. The down-tubes on secondary cluster have been eliminated and secondary discharge holes have been added above the secondary throttle valves.

Chevrolet Pass. Cars: The automatic choke housing has been relocated on the bowl assembly and an intermediate choke rod and lever (requires adjustment) has been added. A secondary idle system (carburetors used on the 348" engine) has been added to smoothout engine operation between the time secondary valves start to open and the time the auxiliary valves open. An "Idle Compensator" is used in carburetors on air conditioned cars to prevent stalling during prolonged "hot idle" conditions.

FLOAT ASSEMBLY WITH "VACUUM ASSIST" PRIMARY FLOATS

ROCHESTER 4GC CARBURETOR AIR HORN & BOWL COVER ASSEMBLY

Oldsmobil : A secondary idle system has been incorporated. Idle tubes have been added to the secondary cluster to provide fuel to lower idle air bleed tubes in the primary venturi. A new "fast action" choke is used on all models. With this design, the choke valve can be timed to open faster, yet fast idle speed remain high enough for an adequate length of time. Movement of fast idle cam is now directly related to movement of choke coil, instead of following the action of choke valve. This new feature allows fast idle to be regulated separately from the choke valve. An "Idle Compensator" is used in carburetors on air conditioned cars to prevent stalling during prolonged "hot idle" conditions.

CONTINUED ON NEXT PAGE

1959-60 ROCHESTER 4G & 4GC 4-BARREL CARBURETOR (C nt.)

ADJUSTMENTS: *Make all adjustments in sequence given below (except for Idle Speed & Mixture adjustments).*

►*CADILLAC IDLE SPEED SETTING NOTE:* Throttle valves are completely closed at low idle speed and air is admitted through Idle Air System which consists of a by-pass passage (primary side only) through which air for closed throttle operation is taken from above the throttle valves through a metered (non-adjustable) orifice and an adjustable orifice to each primary bore. An idle speed screw (single screw for both primary bores) controls the adjustable orifice and all idle speed adjustments are made with this screw (throttle stopscrew not used).

►*IDLE SPEED SETTING CAUTION (CARS WITH IDLE COMPENSATOR):* Make sure that idle compensator is closed when adjusting idle speed. If necessary, idle compensator valve can be held closed with a pencil. After idle speed is adjusted, press down on idle compensator valve to see if speed is affected. If speed drops, readjust idle speed, being sure that compensator valve is closed.

Idl Sp d & Mixtur S tting (Except Cadillac): If preliminary adjustment required to warm up engine, set both idle mixture adjusting screws 1½ turns open from a lightly seated position. With engine at normal operating temperature (choke valve wide open and fast idle inoperative so that engine idles at hot or slow idle speed), set throttle stopscrew for correct idle speed as listed below. Adjust both primary idle mixture adjusting screws equally so that engine idles smoothly and RPM is at maximum (see special notes below). Recheck idle speed.

BUICK NOTE - Turn each adjusting screw in until engine begins to lag or run unevenly from lean mixture, then turn screw out until engine begins to roll from rich mixture, finally turn screw in just enough to provide smoothest operation. Adjust both screws alike.

CHEVROLET NOTE - Turn adjusting screw in to lean mixture until engine is moderately rough (slight vacuum and RPM drop), then turn screw out 1/4 turn to enrich mixture. Adjust both screws alike.

OLDSMOBILE NOTE - After adjusting idle mixture screws (above) for smoothest idle with highest vacuum reading and engine RPM, turn each adjusting screw out 1/4 turn (vacuum and RPM will drop off slightly).

►*1960 CADILLAC IDLE SPEED ADJUSTMENT CAUTION:* Due to vacuum released parking brake, it is impossible to set the brake with transmission selector lever in "Dr" position unless the vacuum release is disconnected. Disconnect diaphragm at neutral safety switch and tape switch opening to prevent any air leak.

Idle Spe d & Mixture Setting (Cadillac): With engine at normal operating temperature, transmission in "N" (Neutral), choke valve fully open and carburetor on "slow" idle, loosen throttle lever jam nuts at carburetor trunnion. Place transmission selector lever in either "D" range. Adjust engine idle to not more than 480 RPM using the idle air by-pass screw (idle speed adjusting screw) on throttle body. Turn one idle mixture screw until highest engine RPM is reached and highest vacuum is obtained at the same time, then repeat this operation with the other screw. Check and reset engine idle speed. Repeat idle mixture adjustment until turning the adjusting screws will not increase engine RPM and the smoothest engine idle is obtained. *CAUTION* - Idle mixture screws must be adjuxted last and must always be readjusted when an idle speed adjustment has been made.

Car Model	Idle Speed Setting Synchro-mesh	Auto. Trans.
Buick (Std.)		② 485 RPM
Buick (Air Cond.) ①		② 550 RPM
Cadillac ③		④ 480 RPM
Chevrolet Cars ③	475 RPM	④ 450 RPM
Chevrolet Trucks	475 RPM	④ 450 RPM
Oldsmobile (Std.)	460 RPM	④ 460 RPM
Oldsmobile (Air Cond.) ⑤	460 RPM	④ 520 RPM

① - With air conditioner turned OFF.
② - Selector lever in Neutral "N" or Park "P".
③ - With air conditioner operating on air conditioned cars.
④ - Selector lever in Drive "D".
⑤ - Air conditioner turned OFF (Carburetors with Idle Compensator), turned ON (Carburetors without Idle Compensator).

Anti-Stall Dashpot & Throttle Return Check Adjustment: *See Throttle Linkage Adjustment under CARBURETOR on each car model page.*

Float Setting: *Both Primary and Secondary Float Assemblies must be checked and adjusted separately and FLOAT LEVEL & FLOAT DROP (Vacuum Assist Spring on carburetors with this feature) must be checked for each assembly.* Remove bowl cover and float assembly from carburetor but DO NOT remove bowl cover gasket.

►*PRIMARY FLOAT SETTING ADJUSTMENT NOTE (Carburetors with later type solid or partially cut-out float bowl gasket):* With this type gasket, there is no opening for locating tangs on straight edge of float level gauge (first type). When checking primary float level on these carburetors, use special float level gauge listed in Float Setting table. These gauges have single locating lug on straight side of gauge (for primary float gauging) which engages **outer** edge of cover flange. *NOTE*- Opposite end of gauge is marked PUMP SIDE and gauge must be installed with this marking on same side as accelerating pump.

►*1959 BUICK FLOAT ADJUSTMENT CHANGE NOTE:* Different settings required for early and later 7013044 carburetors. *See "1959 Buick (Late) Primary Float Level Adjustment Change" above.*

Primary Float Level Adjustment (Except Late 1959-60 Buick & 1959-60 Chevrolet) - With bowl cover gasket in place, invert bowl cover and float assembly, then install correct float level gauge on gasket at heel of floats with gauge legs extending upward on each side of each float. On carburetors with solid type gaskets, single locating lug on gauge should be against outer edge of cover flange and gauge marking PUMP SIDE should be on accelerating pump side. Make two adjustments as follows: **1)** With gauge vertical, floats should just touch edge of cutouts in gauge. Adjust by bending float arms at rear. Move gauge to toe of floats and repeat the float check and adjustment. With correct adjustment, lower surface of floats should be parallel to air horn surface and gauge should slide freely from one end of float to the other. **2)** With gauge still in place and locating lug against edge of flange, floats should be centered between gauge legs at both heel and toe ends. Adjust by bending float arms horizontally. Check adjustment by moving float assembly from side to side at hinge pin. Floats must not rub sides of gauge legs.

Buick (Late 1959) - *NOTE - See "Production Change" above.* With air horn inverted, position float gauge BT-171 over heel of float (large end). Upper portion of float pontoon should just touch gauge. Bend float arm to adjust. With float gauge in position and centered in air horn, each float pontoon should be centered between gauge legs. If necessary, align by bending float arms. Move float assembly from side to side at hinge pin to make sure float does not rub gauge legs. *NOTE - Float setting 1 3/8" measured from gasket to top of float at heel (large end).*

Buick (1960) - With air horn inverted and gasket in place, position float gauge (see table below) under float (between gasket and float), with cutout in float gauge centered under float seam. Float should just touch gauge and be parallel to gasket surface. Adjust float level by bending float arms at a point adjacent to needle valve. To adjust float toe (parallel with gasket surface), bend arm where it connects to float. Check each primary float separately To align floats, install gauge BT-171 over floats, then bend float arms so floats are centered between gauge legs. *NOTE -Gaug will not fit over heel of float and should not be used to make heel setting.* Move float assembly from side to side at hinge pin to make sure floats do not rub sides of gauge.

Chevrolet (1959-60) - *NOTE - Primary and secondary floats are adjusted in same manner except special gauges are settings are required as indicated in tabl below.* With bowl cover and float assembly inverted and gasket in place, install correct float level gauge over floats and against curvature of air horn so that gauging legs rest on cover gasket with locating lugs on inner legs extended into the air horn. Make two adjustments as follows: **1)** With gauge vertical, upper surface of floats should just touch edge of cutouts in gauge. Adjust by bending float arm at rear. **2)** With gauge still in place and centered in air horn, floats should be centered between legs. Adjust by bending float arms horizontally. Move floats from side to side at hinge pin to make sure they do not rub on sides of gauge legs.

Primary Float Toe Adjustment (Late 1959 Buick 7013044 Carb.) - With air horn still inverted and gasket in place, measure distance from gasket to center of dimple on side of float pontoon at toe (small end). This measurement should be ½". To adjust, bend toe of pontoon up or down while holding float arm immediately back of float. Recheck float heel adjustment if float toe adjustment is necessary.

CONTINUED ON NEXT PAGE

1959-60 ROCHESTER 4G & 4GC 4-BARREL CARBURETOR (C nt.)

Secondary Float Level Adjustment (Chevrolet Carburetors) - Procedures are the same as for Primary Floats (above). Specifications and tools are different than for primary floats. *See "Primary Float Adjustment (Chevrolet)" above.*

Secondary Float Level Adjustment (Except Chevrolet Carburetors) - After checking primary floats (above), invert float gauge and install gauge over heel end of floats so that gauging legs rest on cover gasket with locating lugs on inner gauge legs extending into air horn. Make two adjustments as follows: 1) With gauge vertical, upper surface of floats should just touch edge of cutouts in gauge. Adjust by bending float arm at rear. 2) With gauge still in place and centered in air horn, floats should be centered between gauge legs. Adjust by bending float arms horizontally. Check adjustment by moving float assembly from side to side at hinge pin. Floats must not rub on sides of gauge legs. Then check and adjust float toe (following).

Secondary Float Toe Adjustment (Buick) - With air horn inverted and gasket in place, measure distance from gasket to center of dimple on side of float at toe (small end). This distance should be 3/8". To adjust, bend float as necessary while holding float arm adjacent to float. Recheck float heel adjustment if float toe adjustment is necessary.

Secondary Float Toe Adjustment (Cadillac & Oldsmobile) - With bowl cover and float assembly inverted, raise gasket and sight across flat surface of cover at toe end of secondary floats. Toe end of each float must be FLUSH with this surface. Adjust by bending float arm at a point close to float. Recheck float heel adjustment if toe adjustment is necessary.

Float Level Setting (Primary Floats)

Car Model	Height & Gauge No.
1959 Buick (Early) 7013044) ①	9/32" BT-171
1959 Buick (Late 7013044) ①	1 3/8" BT-171
1960 Buick	9/64" BT-178
1959-60 Cadillac	15/64" BT-172
1959-60 Chevrolet Pass. Cars ②	1 43/64" BT-164
1959-60 Chevrolet Pass. Cars ③	1 33/64"
1959 Chevrolet Trucks	1 43/64" BT-164
1959-60 Oldsmobile	9/32" BT-171

① - See "1959 Buick (Late) Primary Float Level Adjustment Change" above.
② - Carburetors without float assist torsion spring. *See "Chevrolet Production Changes" above.*
③ - Carburetors with float assist torsion spring. *See "Chevrolet Production Changes" above.*

Float Level Setting (Secondary Floats)

Car Model	Height & Gauge No.
1959-60 Buick	1 3/8" BT-171
1959-60 Cadillac	1 3/8" BT-171
1959-60 Chevrolet Pass. Cars ①	1 47/64" BT-165
1959-60 Chevrolet Pass. Cars ②	1 37/64"
1959 Chevrolet Trucks	1 47/64" BT-165
1959-60 Oldsmobile	1 3/8" BT-171

① - Carburetors without float assist torsion springs. *See "Chevrolet Production Changes" above.*
② - Carburetors with float assist torsion springs. *See "Chevrolet Production Changes" above.*

Primary Float Vacuum Assist Spring Adjustment (Except Chevrolet Carburetors): *NOTE - This adjustment not required on early Buick carburetors where float arm tang removed, or later carburetors where vacuum piston stem cup and spring omitted.* With bowl cover and float assembly held upright, hold vacuum piston in full up position, jounce floats lightly to make certain that the vacuum assist spring cup is not binding on the piston stem. Use scale to measure from face of gasket to center of dimple on side of primary floats at toe (free) end with power piston held in full up position. If this distance not correct as shown in table below, adjust by bending tang on float arm which engages power piston stem. Use bending tool BT-142.

Vacuum Assist Spring Setting

Car Model	Primary Float Height
Buick	1 3/64"
Cadillac	① 1 3/32"
Oldsmobile	1 3/64"

① - Supersedes original specification of 63/64".

Float Drop Setting: *Check the Float Drop after the Float Level Setting and Vacuum Assist Spring Adjustment have been made.*

Primary & Secondary Float Drop Adjustment (Except Chevrolet Carburetors) - *NOTE - On carburetors with Vacuum Assist Spring Primary Floats, the vacuum piston must be fully extended in the "down" position when checking float drop of primary floats.* With bowl cover and float assembly held upright, use a scale to measure from face of gasket to center of dimple on side of floats at toe (free) end. *(CAUTION* - On vacuum assist spring type primary floats, make certain that piston fully extended so that float is positioned by stop tang on rear of float arm rather than by tang engaging vacuum piston stem). If this distance not correct as shown in table below, adjust as follows: **Primary Floats** - Bend tang at rear of float arm toward needle seat to decrease float drop, away from needle seat to increase float drop. **Secondary Floats** - Bend tang on rear of float arm toward balance spring to decrease float drop, away from balance spring to increase float drop.

Primary & Secondary Float Drop Adjustment (Chevrolet Carburetors) - With bowl cover and float assembly held upright, use a scale to measure from face of gasket to lowest portion of float (bottom of float at center). This distance should be 2¼" (Gauge BT-93). Adjust by bending tang at rear of float arm toward needle seat to decrease float drop, away from needle seat to increase float drop.

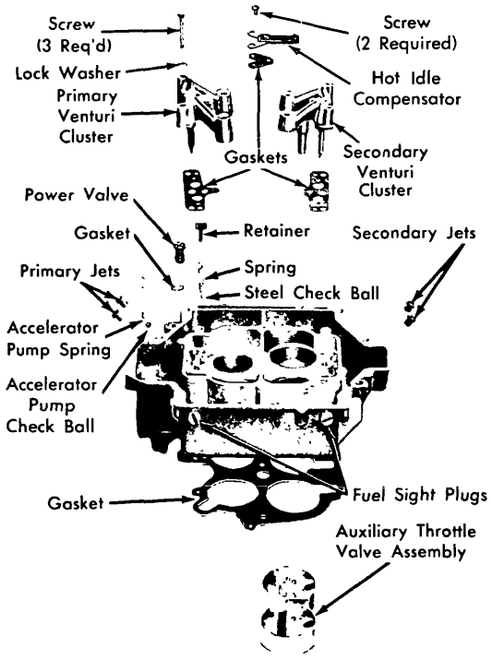
Float Drop Setting

Car Model	Primary Floats	Secondary Floats
1959 Buick (Early) ①	1 1/2"	1 5/16"
1959 Buick (Late) ①	1 7/16"	1 5/16"
1960 Buick	1 7/16"	1 5/16"
1959-60 Cadillac	1 1/2"	1 3/8"
1959-60 Chev. Pass. Cars	2 1/4"	2 1/4"
1959 Chevrolet Trucks	2 1/4"	2 1/4"
1959-60 Oldsmobile	1 1/2"	1 5/16"

① - *See "1958 Buick (Late) Primary Float Level Adjustment Change" above.*

Accelerating Pump Adjustment (Except Buick): *CAUTION - This is a linkage adjustment and is not a seasonal change recommendation.* Back out slow idle speed screw (and fast idle screw on Cadillac) until throttle valves are completely closed. On Oldsmobile, make certain that pump rod connected in **inner** hole of pump arm. Hold throttle valves in closed position and place correct gauge (see table below) on top of air horn next to pump plunger. End of pump plunger shaft should slide freely into hole on gauge marked "Pump". If height not correct (see table below), adjust by bending pump rod using bending tool BT-18

Buick - Back out slow idle speed screw and fast idle speed screw until throttle valves are completely closed. Make certain that pump rod is connected in center hole of pump arm. Hold throttle valves closed and use scale placed on top surface of air horn to measure distance to bottom of horizontal portion of pump plunger shaft. This distance should be 1 1/64". Adjust by bending pump rod.



Accelerating Pump Stroke Setting

Car Model	Gauge No.	Pump Shaft Height
Buick	Scale	① 1 1/64"
Cadillac	BT-146	29/32"
Chevrolet Cars	BT-145	1 1/16"
Chevrolet Trks	BT-145	1 1/16"
Oldsmobile	BT-166	② 1 1/64"

① - With pump rod in center hole of pump arm.
② - With pump rod in inner hole of pump arm.

Atmospheric Idle Vent Adjustment (Except Buick): Adjust pump rod (see above), then gradually open primary

CONTINUED ON NEXT PAGE

ROCHESTER 4GC FUEL BOWL ASSY. (TYPICAL)

1959-60 ROCHESTER 4G & 4GC 4-BARREL CARBURETOR (Cont.)

throttle valve to point where idle vent valve is just closed. Use a scale and measure distance between top of air horn and bottom of pump plunger shaft (same as checking pump stroke setting). This distance should be as indicated in table below. If a gauge is used (see table below), place the gauge on top of air horn with side marked "vent" next to pump plunger shaft. With throttle valve held in the position where vent is just closed, the hole marked "vent" on gauge should slide freely over pump plunger shaft. If adjustment not correct, adjust by bending tang on pump lever.

Idle Vent Setting

Car Model	Gauge No.	Height
Cadillac	BT-146	13/16"
Chev Pass	BT-145	31/32"
Chev. Truck	BT-145	31/32"
Oldsmobile	BT-166	29/32"

Intermediate Choke Rod Adjustment (Except Chev. Truck & Oldsmobile): *NOTE - This rod connects lever on choke shaft to choke lever on automatic choke housing.* Hold choke valve completely closed and bend intermediate choke rod as necessary so choke piston is flush with end of choke piston sleeve.

Oldsmobile - *CAUTION - Make Fast Idle Adjustment before adjusting intermediate choke rod (see below).* With fast idle properly adjusted, place fast idle screw on high step of fast idle cam and raise intermediate choke lever to its full up position. Make sure all lash is removed from rods in slots. Choke piston should be flush with end of choke piston sleeve. To adjust, bend intermediate rod to correctly position choke piston.

Automatic Choke Setting (All Models): Loosen three retaining screws and rotate thermostat cover until index mark is in line with correct mark on housing (see table below). Tighten cover retaining screws. *NOTE - "Centered" point on housing is indicated by a raised section on housing casting.*

Automatic Choke Setting

Car Model	Choke Setting
Buick	Centered (At Index)
Cadillac	Centered (At Index)
Chevrolet 7013004, 7013010	1 Point Lean
Chevrolet 7013006, 7013012	Centered (At Index)
Chevrolet 7015004, 7015010	1 Point Lean
Chevrolet 7015006, 7015012	Centered (At Index)
Oldsmobile	Centered (At Index)

Fast Idle Setting: *NOTE - Chevrolet Pass. Car fast idle adjustment will be correct after "slow idle" speed and choke rod adjustments have been made. On other models, the "On Engine" fast idle adjustment must be made after carburetor installed to insure proper warm-up performance.*

"Off Engine" Adjustment - Turn fast idle screw against high step of fast idle cam until throttle valve opening or clearance between edge of throttle valve and bore on side opposite idle mixture adjusting screws is correct as shown in table below.

Fast Idle Setting

Car Model	Throttle Valve Opening	Checking Gauge
Buick	.028"	BT-79
Cadillac	.024"	BT-90
Oldsmobile	.024"	BT-90

"On Engine" Adjustment - With engine at normal operating temperature, rotate fast idle cam so that the fast idle adjusting screw is on the high step of the cam. Start the engine and adjust the fast idle for correct engine RPM as shown in table below. *NOTE* - On Chevrolet, the fast idle engine RPM will be correct after the hot or slow idle speed has been correctly set.

Fast Idle Speed

Car Model	Engine RPM
Buick	1500
Cadillac	1700-1750
Oldsmobile	1600

Choke Rod Adjustment: *NOTE - On Buick, Cadillac & Chevrolet, this rod connects choke valve shaft to fast idle cam. On Oldsmobile, the rod connects intermediate choke lever to fast idle cam.* Rotate choke valve and fast idle cam until fast idle screw (slow idle screw on Chevrolet) is in contact with SECOND step of fast idle cam, then close choke valve until screw is against highest step of fast idle cam. On Oldsmobile, raise the intermediate choke lever to the full up position making sure the intermediate rod and choke rod are at upper limit of travel in the slots and that all lash is removed. On all models, bend choke rod to obtain specified clearance between choke valve and dividing wall of air horn. See table below.

Choke Rod Setting

Car Model	Choke Opening	Gauge No.
1959 Buick	.148"	BT-135
1960 Buick	.067"	BT-78
1959-60 Cadillac	.040"	BT-102
1959-60 Chevrolet Pass.	.043"	BT-131
1959-60 Oldsmobile	.052"	BT-68

Unloader Adjustment: After choke rod adjusted (see above), move throttle lever to wide open position and make sure that choke trip lever is in contact with choke counterweight. Measure choke valve clearance between upper edge of choke valve and dividing wall in air horn (see table below for gauge and clearance specifications). Adjust by bending tang on fast idle cam using Tool BT-69.

Unloader Setting

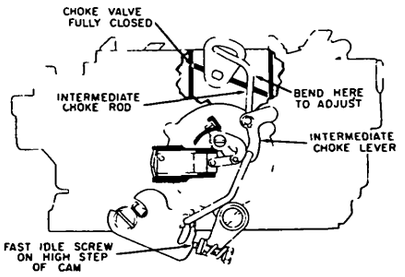
Car Model	Choke Opening	Gauge No.
Buick	.128"	BT-135
Cadillac	.125"	BT-102
Chev. Pass. Cars	.235"	BT-131
Oldsmobile	.115"	BT- 90

Secondary Throttle Lockout Adjustment: Close choke valve fully so that lockout lever tang is engaged in slot of fast idle cam. Measure clearance between side of lockout lever tang and edge of slot in cam (use feeler gauge). Clearance should be .015" (all models). Adjust by bending lockout lever tang sideways using bending tool BT-91A (except Oldsmobile), BT-69 (Oldsmobile).

Secondary Throttle Contour Adjustment: Open choke valve fully so that tang on lockout lever is positioned over contoured section of fast idle cam. Measure clearance between tang and edge of fast idle cam (use feeler gauge). If clearance not correct as shown in table below, adjust by bending tang up or down using bending tool BT-91A.

Secondary Contour Setting

Car Model	Tang Clearance
Buick	.030"
Cadillac & Chevrolet	.015"
Oldsmobile	.030"



Secondary Throttle Actuating Lever Adjustment (Oldsmobile): Install Throttle Return Check Clamp, Tool J-6342-01 on throttle return check (see "Throttle Return Check Clamp Rework" below). Back out fast idle adjusting screw until throttle valves are fully closed, and make sure screw is not resting against fast idle cam. Remove slack from linkage and insert a feeler gauge between actuating lever and primary throttle lever. Clearance should be .005-.025". To adjust, open throttle valve and bend actuating tang with Tool BT-18.

►*OLDSMOBILE THROTTLE RETURN CHECK CLAMP, TOOL J-6342-01 REWORK:* Grind or file off .015" of flat area of tool to allow tool to go between stopscrew and plunger shoulder of throttle return check assembly.

Buick Vacuum Starter Switch Timing Check (On Car): Place transmission lever in Park and apply parking brake. Back off throttle stopscrew so that throttle valves tightly closed (fast idle cam must be in hot or slow idling position). Place scale against flange on dashpot diaphragm and measure distance to nearest edge of dashpot arm on throttle lever. Turn ignition on, open throttle slowly and, at point where starter is energized, again measure distance to nearest edge of dashpot arm. The difference between the two measurements should be 1/2 - 13/16". If switch timing not correct, adjust by adding or removing square timing shims located under contact spring. Shims furnished in thicknesses of .006" and .018".

OVERHAUL: *CAUTION - When disassembling carburetor, be sure to keep PRIMARY and SECONDARY parts separate so they will not be interchanged when carburetor is assembled.*

CONTINUED ON NEXT PAGE

OLDSMOBILE CHOKE & FAST IDLE LINKAGE

1959-60 ROCHESTER 4G & 4GC 4-BARREL CARBURETOR (Cont.)

Disassembly: Carburetor consists of Air Horn (Bowl Cover), Throttle Body, and Bowl which can be overhauled separately as follows

Air Horn (Bowl Cover) - On Chevrolet truck carburetors, remove fast idle cam attaching screw then disconnect rod at fast idle cam and remove cam Remove choke rod from swivel, then remove choke valve screws and choke valve Disconnect choke spring from outer choke lever and shaft assembly and remove choke shaft assembly while depressing pump lever Remove swivel and spring from boss on bowl cover Disconnect accelerator pump rod from actuating lever On all models except Chevrolet truck, remove intermediate shaft from choke shaft lever, then remove idle vent guard and spring metal arm Push rubber valve out of arm *NOTE - Idle Vent Valve not used on all carburetors* Disconnect accelerator pump rod from pump actuating lever then remove choke counterweight lever and trip lever from choke shaft On all carburetors, remove bowl attaching screws *NOTE - On some carburetors, one of the inner bowl screws is located in counterbore just inside edge of air horn* Break bowl cover loose from bowl using finger pressure only, then lift bowl cover assembly straight up out of bowl, being careful not to bend float assemblies With bowl cover inverted remove float hinge pins, floats, and needles Remove and discard bowl cover gasket If necessary, remove vacuum power piston from bowl cover by depressing plunger and allowing it to snap back several times *NOTE - It may be necessary to remove burrs around power piston bore (caused by heavy staking)* Remove spring under piston, being careful not to damage vacuum assist spring and cup retainer on power piston stem (if so equipped) Remove primary and secondary needle seats and gaskets, then remove screens from inlet openings on primary and secondary sides *NOTE - If needle valves and seats are to be reused, keep the needle valves and seats matched with corresponding seats* Disengage accelerating pump plunger shaft from pump lever and pull pump plunger with rubber boot downward and out of bowl cover Remove pump lever and shaft from bowl cover boss On all models except Chevrolet truck, remove choke valve attaching screws and remove choke valve from shaft Remove choke shaft from housing Remove fuel inlet nut, screen and gasket **Float Bowl** - Remove accelerating pump spring, then invert carburetor and remove aluminum pump inlet ball from well *NOTE - When reassembling carburetor, do not confuse this aluminum ball with steel discharge ball check* Remove pump inlet screen and retainer Use a large screw driver and remove power valve and gasket, then remove both the primary and secondary main metering jets *CAUTION - Do not interchange these parts* Remove attaching screws from primary and secondary venturi clusters and break cluster loose with finger pressure only Discard gaskets *CAUTION - Do not remove idle tubes or main well tubes from venturi cluster* Remove hot idle compensator (if so equipped), being careful not to bend or distort bi-metal spring *NOTE - Idle compensator cannot be repaired, if damaged, replace the unit* Remove "T" shaped pump discharge check valve retainer from primary side with needle nose pliers, then remove copper spring and invert bowl and catch steel check ball *NOTE - It is not necessary to remove fuel sight plugs unless threads are damaged*

Throttle Body - If not previously done, disconnect choke rod and pump rod from throttle body Invert carburetor and remove large screw and lockwasher from counterbore in center of throttle body, then remove other throttle body-to-fuel bowl attaching screws and break throttle body loose from fuel bowl with finger pressure *NOTE - On some carburetors, one of the throttle body-to-fuel bowl screws is covered with an asbestos plug which must be removed* Remove and discard throttle body gasket, then remove auxiliary throttle assembly by sliding it out of fuel bowl Remove fast idle cam, and if necessary, remove throttle lever plate and other linkage Remove idle mixture screws keeping the two screws and springs separated in sets If so equipped, remove idle air bypass screw and spring *CAUTION - Do not disassemble throttle body further If any part of the throttle body is damaged or worn, replace the complete assembly*

Reassembly: Reverse disassembly procedure and note the following

Auxiliary Throttle Valves - Slide auxiliary valve assembly into lower side of fuel bowl so spring cavity in auxiliary valve assembly is toward top of bowl

Throttle Body-to-Fuel Bowl Gasket - This gasket is not reversible Largest projecting tab must be placed on primary side, surrounding vacuum passage to power piston

Accelerator Pump Inlet & Discharg Balls - Inlet ball is **aluminum.** Discharge ball is **steel.** If necessary, use a magnet to determine steel ball

Service Parts

Gasket Kit - Rochester No 7015940 (Buick), No 7015941 (Cadillac), No 7015947 (Chevrolet 7013004, 7013010, 7015004, 7015010), No 7015948 (Chevrolet 7013006, 7013012, 7015006, 7015012), No 7015842 (Chevrolet Truck), No 7013050 (Oldsmobile)

Overhaul Kit - Rochester No 7015920 (Buick), No 7015921 (Cadillac), No 7015927 (Chevrolet 7013004, 7013010), No 7015928 (Chevrolet 7013006, 7013012), No 7016030 (Chevrolet 7015004, 7015010), No 7016031 (Chevrolet 7015006, 7015012), No 7015922 (Chevrolet Truck), No 7015934 (Oldsmobile)

Off-Kar Kits - Rochester No FR-104 (Buick), FR-204 (Cadillac), No FR-305 (Chevrolet 7013004, 7013010, 7015004, 7015010), No FR-306 (Chevrolet 7013006, 7013012, 7015006, 7015012), No FR-504 (Oldsmobile)

►CHANGES, CAUTIONS, CORRECTIONS

►*1958 CADILLAC CHOKE ASSEMBLY & VACUUM SWITCH PRODUCTION CHANGE (To prevent richness and eliminate sag when end carburetors come into operation)* On cars before Engine No 032943 (Exc Air Cond), 031061 (Air Cond), install Kit, Part No 7012817 as follows Remove choke assembly and bowl cover (discard gasket), then remove choke valve, choke shaft, choke piston and choke housing Install new choke housing, choke shaft, thermostatic coil spring and cover and install choke valve Set choke pointer at index mark Insert end of vacuum restriction with chamfer around orifice into supply port of vacuum switch and tap into position Install new brass identification tag *NOTE* - Later carburetors (center) have the above changes made in production (see application table above)

►*1958 CADILLAC FPONT & REAR THROTTLE BODY CLEANING CAUTION* Carburetors having a letter "A" stamped on brass identification tag have been coated with a special protective coating to reduce the possibility of air entering the intake manifold past throttle valves Do not clean these throttle bodies in any cleaner stronger than cleaning solvent or gasoline

►*1958 CADILLAC FAILURE TO OBTAIN WIDE OPEN THROTTLE ON CENTER CARBURETOR CORRECTION* On cars before Engine No 012600, if interference exists between throttle lever and throttle control rod, file approximately ¼" from edge of throttle lever in area of interference

►*1958 CADILLAC CENTER CARBURETOR THROTTLE VALVE STICKING CORRECTION* Beginning with Engine No 067140, a new throttle valve spring, Part No 1471929, and vacuum control bracket, Part No 7012832 is being installed to prevent the possibility of throttle valves sticking slightly open with a resultant increase of as much as 100 RPM in idle speed On earlier cars, install the above parts and install lower end of spring at throttle control rod (remove existing cotter pin and hook spring through hole in throttle rod)

►*1958 CADILLAC SLOW OPENING THROTTLE VALVE CORRECTION (FRONT & REARCARBURETORS)* This condition may be caused by an over-restricted vacuum switch Check and correct switch as follows Disconnect vacuum inlet hose and check to see if brass restriction is visible in inlet port If there is no restriction, replace switch If the restriction is in place, disconnect both vacuum hoses from switch on center carburetor Set a Distributor Test Machine vacuum pump regulator to 20" on vacuum gauge with vacuum hose shut off Push sliding switch post on carburetor vacuum switch to full down position *NOTE - Switch will b fully open in this position* Install vacuum hose from Distributor Test Machine to vacuum apply side of switch If a reading of 4 5" or above is obtained, replace switch with a new switch, Part No 7013328 *NOTE - The new later type switch can be identified by having a tapered sliding post (previous switch had a square post)* When replacing the switch, make sure switch actuating tang is not cocked

►*1958 OLDSMOBILE & PONTIAC FRONT & REAR CARBURETOR THROTTLE VALVE 'HANGING UP CORRECTION* If this condition is caused by throttle closing spring becoming wedged between throttle lever and boss on throttle body, correct by bending straight end of spring, beginning at middle of coil, approximately 5/16" toward opposite end of spring

►*1958 PONTIAC CENTER CARBURETOR BINDING CORRECTION* If a binding condition exists between outer pump lever and the pump link, install a revised pump link and clip, Part No 7013192

►*1959 PONTIAC ENGINE CUTTING OUT AT WIDE OPEN THROTTLE CORRECTION* This condition may be caused by carburetor throttle linkage between front and rear carburetors contacting the ignition coil resistor terminal. To correct, remove resistor and coil, and straighten coil mounting bracket front tab to permit clearance between resistor and throttle linkage

DESCRIPTION: One Rochester 2GC (center) and two 2G (front & rear) are used, with the center carburetor having all the conventional carburetor systems (Float, Idle, Power, Pump, and Choke). The front and rear carburetors contain only Float, Pump, and Main Metering systems. Throttle valves in front and rear carburetors are operated by a vacuum diaphragm mounted on front carburetor (1958-60 Chev , 1957-58 Olds , & 1958-60 Pontiac) and on rear carburetor (1958-60 Cadillac & 1957 Pontiac) A vacuum switch on center carburetor controls operation of vacuum diaphragm *NOTE - On 1959-60 Pontiac models, a thermo-controlled vacuum valve mounted on front of engine manifold in water jacket is controlled by engine water temperature This valve closes off all vacuum to carburetor vacuum switch until engine temperature reaches approximately 145°* Front and rear carburetors are connected at throttle shafts so throttle valves and accelerating pump operate simultaneously An Idle Compensator is used on some models This unit is a bi-metal strip, valve and mounting bracket located in bowl casting and is enclosed by a cover and gasket Under hot idling conditions, this valve allows air to be drawn into carburetor bores below throttle valves

CONTINUED ON NEXT PAGE

ROCHESTER TRIPLE CARBURETORS (C nt.)

OPERATION: During idle and part throttle operation, the center carburetor feeds fuel while front and rear carburetors remain idle. On normal acceleration, center carburetor feeds air and fuel until throttle valves are opened approximately 60°, at which time the vacuum switch on center carburetor is operated by a tang on accelerator pump lever. With switch actuated, vacuum is applied to the diaphragm assembly which fully opens front and rear carburetor throttle valves simultaneously. On deceleration, throttle valves on center carburetor close causing the vacuum switch to close, cutting off all vacuum applied to diaphragm. Air is then bled from inside front carburetor air horn by another line through the vacuum switch to diaphragm unit, allowing diaphragm to return to its normal position under spring tension and close throttle valves on front and rear carburetors. Front and rear carburetors are locked out when center carburetor choke is on by means of a lockout lever on rear carburetor (Cadillac), front carburetor (Chevrolet, Oldsmobile, Pontiac).

ADJUSTMENTS: Idle Sp d & Mixture - *(CAUTION - Make sure that front and rear carburetor throttle valves are fully closed).* With engine at normal operating temperature, automatic choke not operating (choke valve wide open and fast idle inoperative so engine idles at hot or slow idle speed), and transmission selector lever in "D" (Drive) range on Automatic Transmission Cars, proceed as follows On Cadillac, loosen front and rear throttle valve rod jam nuts at center carburetor throttle lever trunnion. On all cars, set idle speed to correct engine RPM (see table below). Turn one idle mixture screw in or out to obtain highest vacuum and engine RPM, then repeat with other idle mixture screw. Reset engine idle speed, then readjust idle mixture screws until highest engine RPM and smoothest idle is obtained with the highest vacuum.

►*IDLE SPEED ADJUSTMENT NOTE (Carburetors with Idle Compensator)* **This valve must be closed when idl spe d adjusted** Press in on button located in idle compensator cover plate to hold valve closed during idle speed adjustment

Idle Sp ed Setting

Car M d l	Engine RPM S.M. Trans.	① Auto. Trans.
1958 Cadillac ②		450
1959-60 Cadillac ②		480
1958 Chevrolet	450-475	425
1959-60 Chevrolet ①③	475	450
1959-60 Chevrolet ①④	600	600
1957 Oldsmobile ⑤	460	460
1958 Oldsmobile ⑥	460	460
1957 Pontiac	630-670	430-450
1958 Pontiac ⑦	450-470	480-500
1959-60 Pontiac (No Air Cond)	480-500	480-500
1959-60 Pontiac (Air Cond)⑧	540-560	540-560

① - Transmission selector lever in "D" (Drive)
② - Air Conditioner turned ON
③ - Engines with hydraulic lifters
④ - Engines with mechanical lifters
⑤ - 540-560 RPM on Air Conditioned cars with temperature control lever at extreme right and "Maximum" button depressed
⑥ - On Air Conditioned cars, place controls in maximum cooling position
⑦ - 500-520 RPM on Air Conditioned cars with compressor OFF
⑧- With Air Conditioner turned OFF

Idle Speed-Up Control (Cadillac Air Conditioned Cars): *See Carburetor data under TUNE-UP on Cadillac car model pages*

Throttle Return Check Adjustment: *See Carburetor data under TUNE-UP on car model pages*

Float Level: *NOTE - Two separate adjustments (Float Level & Float Drop required) Float level adjusted differently on some carburetors as detailed below*
Float Level Setting (1958 Cadillac, 1958-60 Chevrolet, 1957-58 Oldsmobile & 1957-58 Pontiac) - Remove and invert bowl cover and float assembly but do not remove cover gasket Install correct float gauge (see table below) over float next to power piston stem Top of float should just clear top edge of gauge cutout and sides of float should be parallel to gauge legs Adjust by bending float hinge arm

Float Level Setting (1959-60 Cadillac & Pontiac) - Remove and invert bowl cover and float assembly but do not remove cover gasket Install correct float gauge (see table below) on cover gasket at free end of float with longer log of gauge "Tee" seating squarely on gasket Edge of seam on float should just clear upper edge of gauge Adjust by bending float hinge arm near pin

►*1959-60 CADILLAC GAUGE NOTE*· Same gauge used for all carburetors but side marked "center" should be used for center carburetor, and cutout section of side marked "end" should be used for both end carburetors

Float Level Setting

Car Model	Float Level	Checking Gauge
1958 Cadillac (All Carbs)	1 25/32"	BT-137
1959-60 Cadillac (Center Carb)	15/16"	BT-158
1959-60 Cadillac (End Carbs)	23/32"	BT-158
1958 Chevrolet (Center Carb)	1 1/4"	BT-129
1958 Chevrolet (End Carbs)	15/16"	BT-136
1959-60 Chevrolet (Center Carb)	1 21/64"	BT-153
1959-60 Chevrolet (End Carbs)	1 27/64"	BT-157
1957 Oldsmobile (Center Carb)	1 9/32"	BT-109
1957 Oldsmobile (End Carbs)	1 5/16"	BT-136
1958 Oldsmobile (All Carbs)	1 25/64"	BT-137
1957 Pontiac (Center Carb)	1 15/64"	BT-130
1957 Pontiac (End Carbs)	1 5/16"	BT-136
1958 Pontiac (Center Carb)	1 17/64"	BT-139
1958 Pontiac (End Carbs)	1 13/32"	BT-138
1959-60 Pontiac (All Carbs)	23/32"	BT-161

Float Drop Setting: 1 29/32" (Exc 1959-60 Pontiac), 1¾" (1959-60 Pontiac) Hold bowl cover and float assembly upright so that float hangs down at bottom of travel Measure distance from lower face of cover gasket to bottom of float at free end using a scale or the float level gauge *NOTE - Float l v l gauges are marked for float drop s tting (with end of longer leg of gauge against gasket, bottom of float should be even with scribed line on float gauge)* Adjust by bending tang on rear of float arm toward needle seat to decrease drop or away from needle seat to increase drop

►*1959-60 PONTIAC FLOAT DROP NOTE* The above setting of 1¾" supersedes previous setting of 1 29/32" This is minimum float drop

Accelerating Pump Rod: Pump rod gauge is used differently on some carburetors as detailed below *CAUTION - This is a linkage adjustment and is not a seasonal setting*
1958 Cadillac, 1958-60 Chevrolet, 1957-58 Oldsmobil & 1957-58 Pontiac - On Cadillac, loosen vacuum switch screws and push switch assembly to full up position, then hold in place by tightening one screw On all carburetors, back off fast and slow idle screw, then with throttle valves held completely closed, check distance from top of pump housing to top of pump rod with float level gauge (see below) by placing inverted float level gauge on top of pump housing on air horn with extended leg of gauge down toward pump connector rod End of gauge should just touch pump connector rod Adjust by bending pump connector rod
1959-60 Cadillac & Pontiac - Back off fast and slow idle screws, then with throttle valves held in completely closed position, check distance from top of air horn to top of pump connector rod with float level gauge (see below) as follows Place float gauge squarely across top edge of air cleaner ring on air horn with "pump" end of "Tee" down toward connector rod End of gauge should just touch pump connector rod (this will be end portion of gauge marked "center" or cutout portion marked "end" on corresponding carburetors) Adjust by bending pump connector rod

Accelerating Pump Rod Setting

Car Model	Pump Rod Setting	Checking Gauge
1958 Cadillac (All Carbs)	15/16"	BT-137
1959-60 Cadillac (Center Carb)	1 3/16"	BT-158
1959-60 Cadillac (End Carbs)	7/8"	BT-158
1958-60 Chevrolet (All Carbs)	15/16"	①
1957-58 Oldsmobile (All Carbs)	15/16"	BT-137
1957-58 Pontiac (Center Carb)	57/64"	BT-139
1957-58 Pontiac (End Carbs)	15/16"	BT-138
1959-60 Pontiac (Center Carb)	1 3/16"	②
1959-60 Pontiac (End Carbs)	55/64"	②

① BT-129, 136, 153 or 157 ② - BT-161 or 175

Idle Vent (Carburetors So Equipped): *Adjust only after Accelerating Pump Rod Setting has been checked and adjusted* Use same gauge installed in same manner as for accelerating pump rod setting check (above) except that gauge should be inverted so that leg marked "vent" is down toward connector rod Slowly open throttle valves to point where vent valve just closes (rubber valve seats on pump housing on air horn) At this point, top of connector rod should just touch end of gauge Adjust by bending tang on pump lever which contacts vent valve arm

Idle Vent Setting

Car Model	Vent Setting	Checking Gauge
1958 Cadillac (Center Carb)	13/16"	BT-137
1959-60 Cadillac (Center Carb)	1 1/16"	BT-158
1958 Oldsmobile (Center Carb)	13/16"	BT-137
1959 Pontiac (Center Carb)	1 9/64"	BT-161
1960 Pontiac (Center Carb)	1 1/32"	BT-175

CONTINUED ON NEXT PAGE

ROCHESTER TRIPLE CARBURETORS (C nt.)

Vacuum Switch Setting (Center Carb.): *Check and adjust each model as follows*

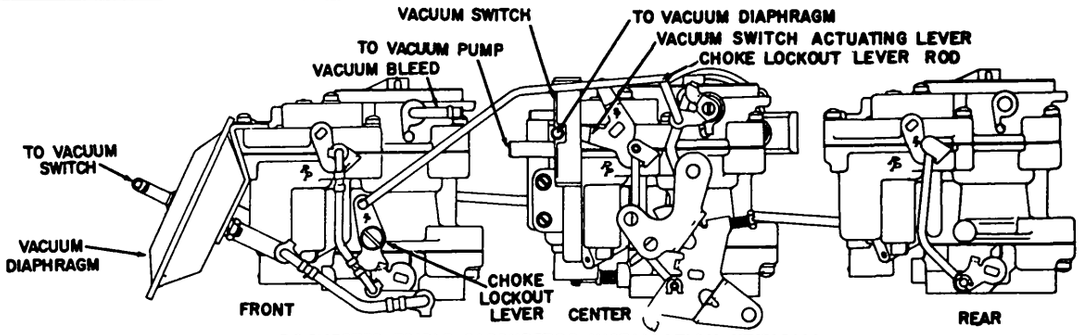
Cadillac - Check switch alignment as follows See that throttle valves completely closed and that sliding switch post is in the extreme "up" position Loosen switch retaining screws, move switch assembly up or down until bottom of switch post just contacts inside edge of return tang of pump lever, tighten retaining screws Check adjustment by opening throttle valves (with sliding post still in up position) and make certain tang on switch return lever clears side of sliding switch post If necessary, adjust by loosening switch retaining screws and moving switch away from tang on switch return lever Check switch setting as follows Hold throttle valves wide open, measure distance from top of switch housing to sliding switch post This distance should be 1 5/32" Adjust by bending tang on pump lever up or down as required

Chevrolet (1958-60), Oldsmobile (1957), Pontiac (1957-58) - With throttle valves completely closed and actuating post in vacuum switch in extreme "up" position, clearance between tang on pump lever and vacuum switch actuating post should be 1/32" Adjust by loosening switch retaining screws and moving switch assembly up or down as required Tighten retaining screws

Oldsmobile (1958) - Same as for Cadillac (see above)

Pontiac (1959-60) - With throttle valves wide open, measure distance from top of switch housing to top of sliding switch post This distance should be 1 5/32" To adjust, loosen retaining screws holding switch on bracket and move switch up or down as required Check adjustment by opening and closing throttle valves with sliding switch post in upward position Inside edge of switch closing tang must clear side of switch post

Automatic Choke (Except 1958 Cadillac): Loosen retaining screws and rotate coil cover counterclockwise until index mark on cover is aligned with correct mark on housing



Automatic Choke Setting	
All (Exc 1957-58 Oldsmobile)	Centered (At Index)
1957-58 Oldsmobile	2 Notches Lean

Automatic Choke Modifier (1958 Cadillac): With throttle valves fully closed, loosen center lockscrew on choke and rotate index pointer counterclockwise until choke valve closes and pointer is positioned 2 points rich from index on choke cover Tighten lockscrew securely

Fast Idle Setting: *NOTE - Chevrolet & Pontiac fast idle adjustment will be correct after "slow idle" speed and choke rod adjustments have been made (see below). On other models, the "On Engine" fast idle adjustment must be made after carburetor installed.*

"Off Engine" Adjustment (Cadillac & Oldsmobile) - With choke valve closed and fast idle screw resting on high step of fast idle cam, there should be .024" (Gauge BT-90 clearance between throttle valve and bore opposite the idle needles. Adjust fast idle screw until proper clearance is obtained.

"On Engine" Adjustment (Cadillac & Oldsmobile) - With engine at normal operating temperature, rotate fast idle cam so fast idle screw is on high step of cam. Adjust fast idle screw so engine operates at 1700-1750 RPM (Cadillac), 1500 RPM (Oldsmobile)

ROCHESTER TRIPLE CARBURETOR INSTALLATION (TYPICAL)

Choke Rod (Center Carburetor): Place idle screw on second step of fast idle cam next to high step With choke trip lever in contact with choke counterweight lever, clearance between upper edge of choke valve and air horn wall should be as indicated in table below To adjust, bend tang on choke counterweight

Choke Rod Setting		
Car Model	Clearance	Checking Gauge
1958-60 Cadillac	.061"	BT-128
1958-60 Chevrolet	089"	BT-108
1957-58 Oldsmobile	040"	BT-110
1957-58 Pontiac	061"	BT-134
1959-60 Pontiac	056"	BT-167

Unloader (Center Carb.): With throttle valves held wide open, clearance between upper edge of choke valve and side of air horn wall should be as indicated in table below. To adjust, bend tang on throttle lever as necessary to obtain correct clearance.

Unloader Setting		
Car Model	Clearance	Checking Gauge
1958-60 Cadillac	.163"	BT-128
1958-60 Chevrolet	360"	BT-108
1957-58 Oldsmobile	140"	BT-110
1957-59 Pontiac	163"	BT-134
1959-60 Pontiac	163"	BT-168

Choke Lockout: *NOTE - This adjustment not required on 1959-60 Pontiac (end carburetors locked out by temperature controlled vacuum valve)* With choke valve (center carburetor) wide open and throttle valves in rear carburetor (Cadillac), front carburetor (Chevrolet, Oldsmobile & 1957-58 Pontiac) slightly open, there should be 030" clearance between lockout lever and throttle lever tang on rear carburetor (Cadillac), front carburetor (Chevrolet, Oldsmobile & 1957-58 Pontiac) To adjust, bend lockout rod at center angle

Choke Lockout Lever Contour: *NOTE - This adjustment not required on 1959-60 Pontiac* Hold throttle valves in rear (Cadillac), front (Chevrolet, Oldsmobile & 1957-58 Pontiac) completely closed With choke valve on center carburetor completely closed and lockout lever rod connected, clearance between contoured portion of lockout lever and tang on throttle lever on rear carburetor (Cadillac), front carburetor (Chevrolet, Oldsmobile & 1957-58 Pontiac), should be 015" Adjust by bending tang on throttle lever up or down as required

Throttle Linkage (Front -Rear Carburetor) Disconnect throttle rod at rear carburetor throttle lever With front and rear carburetor throttle valves completely closed, throttle rod end should center in the slot in the throttle lever Adjust by bending rod at existing bend using bending tool BT-18 Connect rod

Vacuum Diaphragm Link: With end carburetor throttle valves completely closed and vacuum diaphragm stem fully extended, end of vacuum unit actuating link should fit freely in hole in throttle lever on rear carburetor (Cadillac), front carburetor (All others) Adjust by bending actuator link

OVERHAUL. *See 'Rochester 2G & 2GC Carburetors for complete data and note the following points*

►*CHEVROLET ACCELERATING PUMP NOTE* Fuel inlet for accelerating pump is provided by a slot in the pump cylinder wall No pump inlet check ball or filter screen is used

►*FRONT & REAR CARBURETOR THROTTLE VALVE SEALING & OVERHAUL CAUTION* Carburetor throttle valves are sealed in production with a protective DAG coating to minimize air leakage around valves in closed position If this coating chipped or removed when servicing carburetor throttle bodies, it can be restored by using DAG-213 coating solution

SERVICE PARTS: Gasket Sets - Rochester No 7015750 (7011500, 7011350), No 7015751 (7010960, 7010958, 7011712, 7011714), No 7015752, (7010959, 7011713, 7012913), No 7015753 (7011351, 7011352, 7011705, 7011703), No 7015840 (7012201, 7012901, 7012203, 7012903), No 7015841 (7012202, 7012902, 7012905), No 7015942 (7013034, 7013037), No 7015956 (7013026), No 7015957 (7013033, 7013035, 7013063, 7013065), No 7015962 (7011706, 7013067, 7011709, 7013064, 7015066, 7013076, 7015068), No 7015972 (7011951, 7012851, 7011952, 7012853, 7013015, 7013017), No 7015973 (7012503, 7013020, 7011952, 7013016)

Repair Kits - Rochester No 7015731 (7010958), No 7015732 (7010959), No 7015734 (7010960), No 7015735 (7011350), No 7015738 (7011500), No 7011739 (7011351, 7011352), No 7015825 (7011952, 7012503), No 7015826 (7011713, 7012913), No 7015829 (7011706), No 7015830 (7011709), No 7015832 (7011705, 7011707), No 7015837 (7012201, 7012203, 7012901, 7012903), No 7015838 (7012202, 7012205, 7012902, 7012905), No 7015850 (7011712, 7011714), No 7015923 (7013016, 7013020), No 7015930 (7013064), No 7015938 (7013034, 7013037), No 7015939 (7013063, 7013065), No 7015953 (7013026), No 7015961 (7013033, 7013035), No 7015971 (7011951, 7011953, 7012851, 7012853, 7013015, 7013017), No 7016024 (7015066, 7015076), No 7016025 (7015068)

►CHANGES, CAUTIONS, CORRECTIONS

►*1955 CHEVROLET V8 LEAN SURGE CONDITION AT 55-75 MPH. (All Cars with Early No. 7006825 & 7005810 Carburetors)* Correct by installing late type Venturi Cluster Assemblies & Main Metering Jets as listed below *NOTE*—These new parts are installed in production on later Nos 7008004 & 7008005 Carburetors

Late Type Carburetor Parts

Carburetor	No. 7006825	No. 7005810
Venturi Cluster Assy	7007990	7007989
Main Metering Jet (2)	7002952	7002951

►*1955 PONTIAC V8 ROCHESTER CARBURETOR INSTALLATION CAUTION (First 1000 ENGINES)* Intake manifold on these engines will not take Rochester carburetor without possibility of high vacuum leak at windshield wiper vacuum passage in carburetor flange (insufficient sealing area) These manifolds can be identified by curved section at rear edge of carburetor mounting flange and *only Carter carburetor should be used* On later manifolds, with nearly straight section at above point, *either Carter or Rochester Carburetors can be used*

►*1955 PONTIAC CARBURETOR FLOODING OR OVERLOADING May be caused by excessive fuel pump pressure (in excess of 5 lbs.) See Fuel Pump data on Pontiac V8 car model page*

►*PONTIAC HARD STARTING OR LOADING CORRECTION* New type choke piston Rochester No. 7009032 is used on late production carburetors. It is .041" shorter and has five grooves instead of six. This construction provides a greater initial choke opening and relieves complaints of hard starting or loading on early production cars.

►*1956 CHEVROLET V8 TRUCK ENGINE CARBURETOR-TO-MANIFOLD GASKET PRODUCTION CHANGE (To Eliminate Hard Hot Starting)* New intake manifold-to-carburetor gasket, Part No. 3733281, with better insulation characteristics, is now being used in production and should be used on all 2-barrel carburetor V8 Truck installations when replacement required. Former gasket, Part No. 3704952, will continue to be used on passenger cars.

►*1956 OLDSMOBILE STALLING DURING WARM-UP CORRECTION*· Carburetors with letter "B", "C" or higher stamped in carburetor identification tag incorporate changes in piston and thermostat housing to provide proper "pull off" of choke valve, and permit choke valve to remain at proper "pull off" position until engine is warm On earlier carburetors, drill 3/64" hole in end of choke piston which will reduce the amount of vacuum behind choke piston and eliminate the stalling condition. *NOTE* - When removing choke valve from choke shaft it will be necessary to file the staked choke valve screws. Use a small amount of grease on file to collect any brass chips that might fall into carburetor

►*1956 OLDSMOBILE SLOW IDLE SCREW PRODUCTION CHANGE & INSTALLATION* Slow idle screw spring has been replaced by locknut on later carburetors to obtain a more positive setting. TO INSTALL locknut on early carburetors, back off idle adjusting screw to remove spring (only), spin locknut No 7010819 on screw, turn screw in 6 turns and tighten locknut. Hold choke wide open, idle screw off fast idle cam, throttle closed, then turn idle screw in until throttle valves just begin to open. Turn screw in an additional turn, tighten locknut against throttle lever. Readjust idle speed with engine warm.

►*1956 PONTIAC UNLOADING CORRECTION (To Relieve Flooding)*: Interference between accelerator pedal and floor mat at "Hump" above transmission, prohibits opening of choke, necessary to relieve flooding condition. To correct, move top of pedal to left to obtain clearance for full pedal travel

►*1956 PONTIAC UNLOADER ADJUSTMENT CHANGE*· For complete "Unloader" adjustment, *see "Unloader Setting" below.*

►*1957 PONTIAC ROUGH IDLE OR SURGE CORRECTION:* This condition caused by excessive leanness and can be corrected by installing new Venturi Cluster Assembly as listed below.

NOTE - Revised cluster assemblies used in production on late cars Carburetors—with these new clusters may be identified by letter stamped on carburetor tag as follows· Synchro-mesh Cars - "D", Hydra-Matic Cars - "A"

Pontiac 2GC Venturi Cluster Change

Carburetor	First Type	Later Typ
7009831 (Hydra-Matic)	7010603	7011561
7009832 (Synchro-mesh)	7010575	① 7010575

① - Modified cluster has same part number

►*1957 FUEL FILTER CHANGE TO CORRECT CARBURETOR FLOODING* Carburetor flooding can be corrected by thoroughly cleaning carburetor and installing new type AC Fuel Filter Element No 854347 *NOTE* - This improved filter element can be identified by **heavy blue line** between type designation GF 124 and part no 854347 on package The "blue star" formerly printed behind the numbers has been eliminated

►*1958 PONTIAC CARBURETOR PRODUCTION CHANGE NOTE & IDLE ADJUSTMENT CAUTION (CARBURETORS NO 7012702 & 7012703)*· The above carburetors have a new idle air adjustment screw which is used for all idle speed adjustments, in place of the throttle stopscrew used for idle adjustment on earlier carburetors Adjustment procedures are different for the later type carburetor *See "Adjustments" below*

►*1958 PONTIAC PUMP LINK BINDING CORRECTION:* On early cars, binding between outer pump lever and pump link can be corrected by installing a new pump link and clip assembly, Part No. 7013192

►*1958 PONTIAC ROUGH IDLE & STALLING (CAUSED BY BUILD-UP OF GUM IN THROTTLE BORES) CORRECTION* Remove carburetor from engine *CAUTION - Do not remove gum deposits from throttle bores* Invert carburetor and drill a 1/8" diameter hole in each **primary** throttle plate at a point approximately centered

CONTINUED ON NEXT PAGE

1955-58 ROCHESTER 2G & 2GC (C nt.)

in half of the throttle plate located adjacent to outside edge of throttle body Remove clips and install carburetor Adjust hot idle speed to 500 RPM, then adjust throttle rod setting with gauge pin and adjust idle mixture screws

DESCRIPTION Dual downdraft type with Automatic Choke (2GC) or Manual Choke (2G) Standard Trans Truck These carburetors have Rochester Calibrated Cluster design "Venturi Cluster Assembly", vacuum controlled Power System throttle operated accelerating pump with double spring pump plunger All carburetors have an internal vent in the air horn and an external vent on the bowl cover (On Oldsmobile this vent is controlled by a tang on the pump lever and is opened at low idle only) All carburetors are similar in design exas follows

Chevrolet & Pontiac Atmospheric Idle Vent (1958) - Consists of a vent opening in bowl cover with vent cap actuated by a tang on pump lever Vent is opened at low idle but must be closed at all other throttle positions

Oldsmobile (1956) - Fuel bowl is "concentric" type and metering jets have been relocated toward center of carburetor

P ntiac Automatic Choke (1957 & Later) - Choke assembly is mounted on throttle body (to reduce overall height) and is linked to choke shaft lever by a connector rod An internal fuel bowl vent is also provided in the air horn

Pontiac Idle Air Bypass (1958) - An idle air bypass adjusting screw replaces the former throttle stopscrew All idle speed adjustments are made with this screw

ADJUSTMENT: *Make all adjustments exactly as detailed b low.*

Idling Adjustment: If preliminary adjustment required to warm up engine, turn both idle mixture screws in until lightly seated, then back each screw out 1½ turns. Set parking brake, place transmission selector lever in Neutral, run engine until normal operating temperature is reached (at least 15 minutes operation for cold engine) Connect tachometer and vacuum gauge, then adjust as follows

Idle Mixture - With engine at normal operating temperature and idling at correct idling speed (see below) with choke valve wide open and fast idle inoperative, adjust each mixture adjusting screw separately for smoothest engine performance (highest vacuum and engine RPM) Recheck idle speed

►*OLDSMOBILE NOTE* After setting idle adjusting screws as above, turn each screw out (rich) ¼ turn which will provide desired idle performance (manifold vacuum and RPM will drop off slightly) Check performance by opening throttle to 1000 RPM point and then snapping throttle closed If engine rolls due to richness turn each screw in (lean) not more than 1/8 turn

Idl Sp d (Exc pt 1958 P ntiac with Idl Air Bypass Adjusting Scr w): With engine at normal operating temperature, adjust throttle stopscrew for correct idling speed as indicated below *CAUTION - On Mod l 2GC carbur tors, stopscrew must be resting on low st st p of fast idle cam when adjustm nt b ing made.*

Idle Speed (1958 Pontiac with Idle Air Bypass Adjusting Screw): As preliminary setting, open idle bypass 2 turns from a lightly seated position, then with engine at normal operating temperature, choke fully open, adjust idle air screw to obtain proper engine RPM as indicated in table below Adjust idle mixture screws for highest engine RPM, then reset idle air screws for proper idle speed *NOTE* - Recheck idle mixture screw setting after adjusting idle air screws

Ⓒ - 540-560 RPM on Air Conditioned cars with air conditioner turned "OFF"

►*AUTOMATIC TRANSMISSION THROTTLE LINKAGE ADJUSTMENT* See Car Model pages for necessary adjustment following idle speed adjustment *OLDSMOBILE NOTE*—Carburetor has "Split-Throttle Lever" and linkage will not be disturbed by idle speed setting

Throttle Return Check Adjustment: *See "CARBURETOR" on car model pages.*

Float Level: *CAUTION - Two separate adjustments required as follows*

1) Float Level Setting - Invert bowl cover and float assembly but DO NOT remove cover gasket Install gauge (see table below) over float with one gauge leg against pump side of power piston and outer gauge leg in line with float center Float should just clear top edge of gauge cut-out and sides of float should be parallel to gauge legs Adjust by bending float hinge arm

Float Level Setting

Car Model	Checking Gauge	Float Level
1955 Chev (All)	BT-107	1 5/32"
1956-57 Chev (All)	BT-129	1 1/4"
1958 Chev (All)	BT-144	1 19/64"
1955 Oldsmobile	BT-109	1 9/32"

1958 Pontiac	Ⓓ BT-141	11/16"

Ⓒ - BT-130 may also be used
Ⓓ - BT-149 may also be used

Fl at Dr p—Hold bowl cover and float assembly upright so that float drops down to limit of travel Place combination Float & Pump Gauge against gasket on cover at free end of float (see Float Level Setting table above for gauge number) so that single leg of gauge extends downward Bottom of float at free end should be even with scribed line on gauge (1 29/32' on all carburetors except 1956 Oldsmobile, 2" on 1956 Oldsmobile carburetors) Adjust by bending float arm tang (behind needle seat) toward needle seat to decrease drop or away from needle seat to increase drop

Accelerating Pump Rod Setting: *NOTE - This is a linkage adjustment. Pump does not hav a s asonal setting.* With throttle stopscrew backed off so that throttle valves are completely closed, place gauge (see table below), or scale in position on top of air horn casting (except 1958 Pontiac), on top of air horn ring on 1958 Pontiac Leg on gauge should just contact top of pump rod If a scale is used, distance from scale to top of pump rod should be as indicated in table Adjust by bending lower end of pump rod with Tool BT-18

Pump Rod Setting

1957 Pontiac	BT-133	53/64"
1958 Pontiac	Ⓒ BT-141	Ⓒ 23/64"

Ⓒ - BT-149 may also be used

Atmospheric Idle Vent: Adjustment procedures are different as indicated below

1955 Oldsmobile - Back off fast idle screw until it clears highest step of cam, then insert a 020" gauge (BT-67) between throttle valve and bore opposite the idle adjusting needle Idle vent valve should just be closed To adjust, use Tool BT-69 and bend pump lever tang to obtain proper clearance

1956 Oldsmobile - With throttle valves completely closed, distance between seat in air horn to leading edge of valve should be 3/32" To adjust, bend tang with Tool BT-69

1958 Chevrolet, Oldsmobile & Pontiac - 49/64" (Chevrolet, All Models), 1 17/64" (Pontiac, without Idle Air Bypass Screw), 1 19/64"(Pontiac, with Idle Air Bypass Screw), 13/16" (Oldsmobile) With pump rod properly adjusted, place Gauge BT-144 (Chevrolet), BT-141 or BT-149 (Pontiac) BT-137 (Oldsmobile) on top of air horn ring, with leg of gauge marked "vent" pointing downward toward pump rod Slowly open throttle valve to point where vent valve closes on its seat Lower edge of gauge leg should just touch top of pump rod To adjust, bend tang on pump lever

Fast Idle Setting: Adjustment procedures are different as indicated below

1955-58 Ch vrol t, Pontiac (1958 P ntiac Carbur t rs With ut Idl Air Bypass) - No separate adjustment required Fast idle speed is automatically set when hot

CONTINUED ON NEXT PAGE

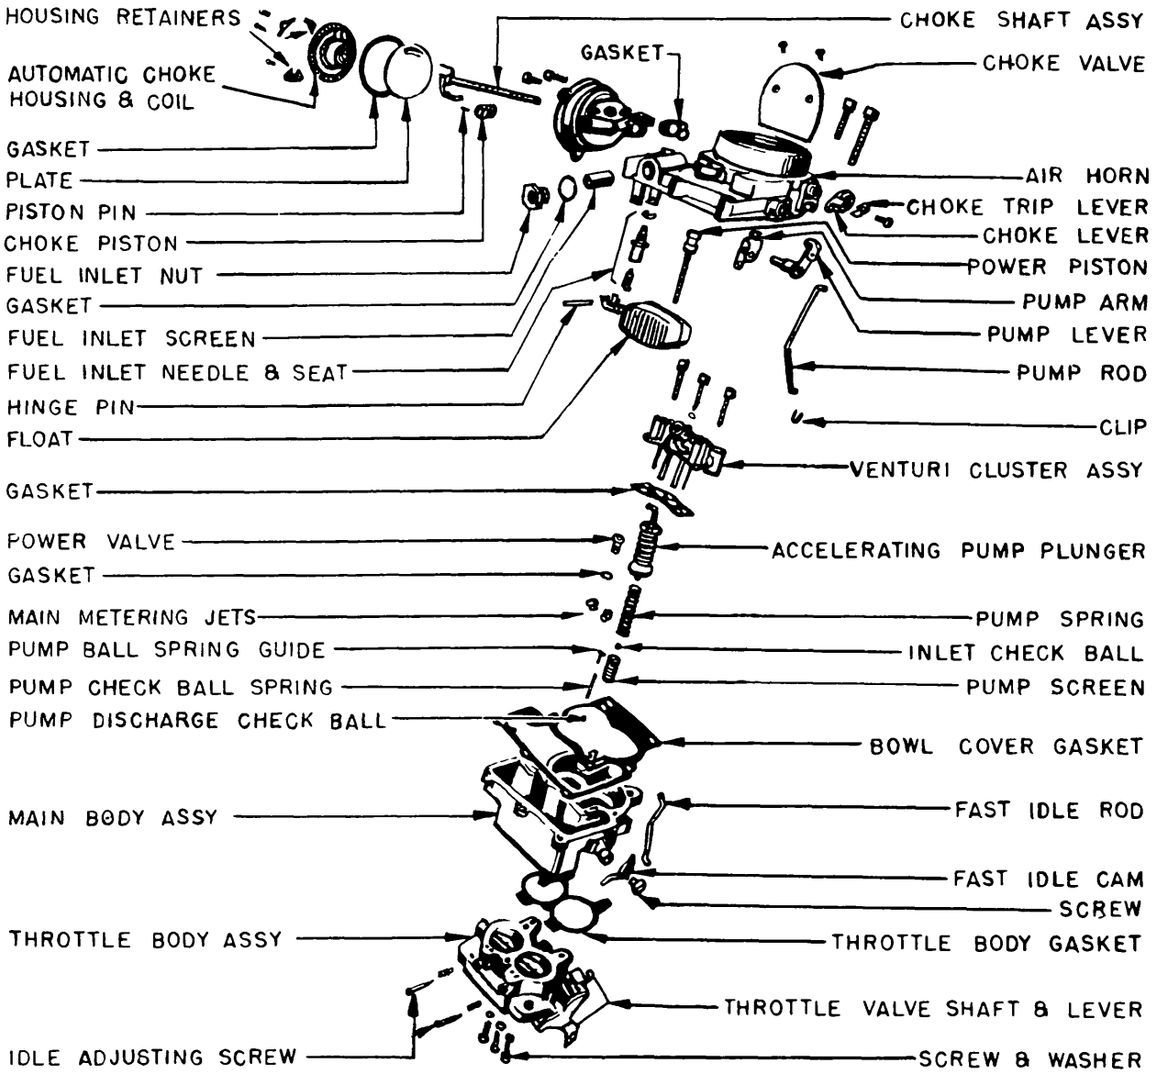
1955-58 ROCHESTER 2G & 2GC (C nt.)

(slow) idle speed is adjusted (same screw controls both settings).

1958 Pontiac (With Idle Air Bypass Adjusting Screw) - With hot idle speed and mixture properly set, move fast idle cam so **high st st p** is under end of fast idle screw. Adjust fast idle screw to obtain an engine speed of 2700 RPM. *NOTE - Fast idle screw position on* **highest** *st p of fast idl cam is for adjustment purposes only. Under normal p rating conditions (after fast idle has b n s t as indicat d above), fast idle speed will be 1500-1700 RPM.*

1955-58 Oldsm bil - As a preliminary adjustment (with carburetor off engine), close choke valve and place fast idle screw on high step of fast idle cam, then place .020" gauge, BT-67 (1955), .024" gauge, BT-90 (1956 & 1958) between throttle valve and bore opposite the idle needles. Turn fast idle screw until gauge just drops out. Make final adjustment on car with the engine running. Turn fast idle screw until engine speed is 1400-1500 RPM (1955), 1600-1700 RPM (1956), 1500 RPM (1958) with screw on high step of fast idle cam.

Unl ad r (2GC Carbur t rs): Move throttle valves to wide open position which will open choke valve slightly (see Pontiac Note below). Check choke valve opening or clearance between upper edge of choke and air horn wall using correct gauge (see table below). If clearance not correct, adjust by bending tang on throttle lever which contacts fast idle cam using bending tool BT-69.



Pontiac Not - If unloader checked with carburetor on engine, it is recommended that following procedure be followed· Open throttle valves by depressing accelerator pedal forcibly to floor. Make certain that pedal does not hit hump over transmission (Correct by moving upper end of pedal to left by enlarging left hand hole in pedal bracket and rotating pedal to the left). Check choke valve opening (above) and bend tang to secure valve opening of .143-.183" which will insure correct unloader action

►*1955-56 OLDSMOBILE NOTE* Before making unloader adjustment, the throttle stopscrew (slow idle speed screw) must be turned IN one turn from point where throttle valves are completely closed.

Car Model	Unl ader Setting Ch cking Gauge	Choke Opening
1955-58 Chev.Pass.Cars	BT-108	360"
1955 Oldsmobile	BT-110	140"

1957-58 Pontiac	BT-134	.163"

© - BT-128 may also be used.

Aut matic Ch k Setting: CENTERED with scribed index mark on cover in line with long cast mark on choke housing (all models) To adjust, loosen heat tube connection on cover, loosen three cover retainer screws *(CAUTION*–If one retainer is "toothed" type engaging notches in cover, screw must be backed off sufficiently so that retainer can be disengaged from cover notches), rotate cover to align marks

ROCHESTER 2GC DUAL CARBURETOR (2G SIMILAR EXC MANUAL CHOKE)

Intermediate Choke Rod (1958 Pontiac): Remove choke thermostat cover and coil assembly and inside baffle plate. Hold choke valve completely closed and bend intermediate rod as necessary so that end of choke piston is flush to 1/32" out of choke piston sleeve.

Choke Rod: Place idle adjusting screw (fast idle screw if so equipped) on second step of fast idle cam and against the high step, then bend tang on choke lever with Tool BT-69 as necessary to obtain a clearance as specified in table below, between upper edge of choke valve and air horn.

Car Model	Choke Rod Setting Checking Gauge	Choke Opening
1955-58 Chev.Pass.Cars	BT-108	.089"

1955 Pontiac	BT-106	063"
1956-58 Pontiac	BT-134	.061"

OVERHAUL: Adjustments may be made and various parts be serviced without completely disassembling the entire unit.

CONTINUED ON NEXT PAGE

1955-58 ROCHESTER 2G & 2GC (Cont.)

Disassembly: Major units of carburetor consist of Air Horn Assembly, Main Body, and Throttle Body.

Air Horn Assembly–Consists of Automatic Choke & Fuel Bowl Cover.

Automatic Choke (Exc. 1957 & Later Pontiac) - Remove choke cover and coil assembly, gasket and baffle plate. Remove choke trip lever, fast idle link and lever (rotate lever until slot in lever will pass over tang on link). Remove two choke valve screws and choke valve. Rotate choke shaft counterclockwise to free choke piston from housing, then pull piston and choke shaft from carburetor. Remove two choke housing attaching screws and remove choke housing and gasket from air horn.

Automatic Choke (1957 & Later Pontiac) - Remove cover and coil assembly, gasket and baffle plate. Remove choke piston lever attaching screw, then remove piston link and lever assembly. Remove choke housing to carburetor mounting screws and detach housing from throttle body. Remove intermediate choke shaft and lever from housing.

Fuel Bowl Cover–Disconnect pump link from throttle lever by rotating it until it clears pump lever. Remove eight cover screws and remove cover. Invert cover on flat surface, remove float hinge pin, float assembly and float needle. Remove float needle seat and gasket and remove filter screw. Depress power piston shaft allowing spring to snap, which forces piston from casting. Remove retainer on pump plunger shaft and plunger assembly from pump arm. Remove pump lever and shaft by loosening setscrew on inner arm and removing outer lever and shaft. Remove cover gasket.

Main Body–Remove pump plunger return spring from pump well main metering jets, and power valve. Remove three screws from top of cluster and remove cluster and gasket. With long nose pliers, remove pump discharge spring retainer, then the spring and check ball. Invert Main Body and remove three large bowl to throttle body attaching screws, remove throttle body.

Throttle Body–Remove fast idle cam, idle adjusting needles and springs. Throttle body should be replaced as an assembly to insure proper relation of valves.

Cleaning & Inspection: Thoroughly clean carburetor castings and metal parts in clean solvent. *CAUTION*–Choke coil and housing and pump plunger should not be immersed in solvent. Clean pump plunger in clean gasoline only. *DO NOT SOAK AIR HORN ASSEMBLY IN CLEANER OR SOLVENT FOR MORE THAN ONE HALF HOUR IF CHOKE PISTON HOUSING HAS NOT BEEN REMOVED.* Blow out all passages in casting until dry. *CAUTION*–Do not pass drills or wires through calibrated jets or passages as they may enlarge orifice and seriously affect carburetor calibration. Inspect all parts for wear damage, burrs or ridges. Inspect gaskets for being hard or brittle, pump leather for damage.

Reassembly: Throttle Body to Main Body–Install idling adjusting screws and springs in throttle body until finger tight and then back off 1½ turns for temporary adjustment, add throttle body gasket and attach throttle body to bowl. Install fast idle cam, drop pump discharge ball into discharge hole and replace spring and retainer. Install cluster with new gasket, tighten screws evenly, (center screw takes red fibre gasket). Replace main metering jets and power valve with new gasket.

Fuel Bowl Cover (Air Horn)–Replace pump lever assembly, install filter screen float needle seat and gasket. Replace power piston in vacuum cavity (check to see that piston travels freely). Lightly stake retainer in place. Attach plunger shaft with retainer shaft end pointing inward. Install cover gasket. Attach needle to float, position it carefully and insert float hinge pin. Adjust float (see table above for setting). Place cover in position making certain that accelerator pump plunger is positioned and will move freely.

Choke–Place new gasket in position, attach choke housing to cover and tighten screws securely. Place choke shaft in choke housing and rotate clockwise so that piston rides in bore in housing. Install choke valve on shaft with letters "RP" facing upward, center choke valve before tightening screws. Place baffle plate and choke housing gasket into position and install choke coil and cover. Rotate cover clockwise until index marks on cover and housing are aligned. Attach retaining screws and tighten securely. Replace link in fast idle cam and choke lever, place choke lever on cover with the tang facing outward and toward the pump lever. Install trip lever so that tang of trip lever is under tang of choke lever.

Chevrolet Governor Overhaul: Removal - Remove four governor cover attaching screws, remove cover and gasket. Detach and remove governor throttle spring. Remove diaphragm cover attaching screws, lift off cover. Hold throttle lever and loosen nut attaching governor lever and pin assembly to throttle shaft, free lever from throttle shaft and disengage it from diaphragm rod by rotating lever until tang on rod clears slot in lever. Remove diaphragm assembly from housing. Remove three governor housing mounting screws, remove seal retainer and leather seal. Detach governor housing from throttle body, remove housing gasket.

Cleaning & Inspection - DO NOT immerse throttle lever and bearing assembly in cleaning solution (will damage neoprene seal protecting ball bearings). Make certain that throttle bearings are completely dry (blow out with air) and lubricate with very light machine oil (*CAUTION* - Throttle shaft must rotate freely with no trace of any binding which would affect governor operation).

Installation - Install governor housing mounting gasket (narrower edge toward top of carburetor), install housing, leather seal, seal retainer, and mounting screws (DO NOT tighten screws). Check throttle shaft for free operation in seal, tighten mounting screws while holding throttle in closed position, recheck throttle shaft for free operation. Install diaphragm assembly in housing and align vacuum passage holes in diaphragm and housing. Assemble governor lever and pin assembly on end of diaphragm rod (in housing) and position lever on throttle shaft, install lockwasher and nut on shaft, tighten nut while holding throttle lever to prevent damage to valves. Align diaphragm with mounting screw holes in housing, install cover with cover restriction piloting through diaphragm and into vacuum passage in housing, install cover screws finger-tight. Hold throttle valves wide open (to provide maximum diaphragm travel), tighten cover screws to 25-28 in. lbs., install lockwire on screws. Install throttle spring over governor lever pin and stationary post in housing. Check for free operation of throttle shaft, then install governor cover and gasket, tighten attaching screws, install lockwire on screws.

ℂ - *See SEPARATE "Rochester Triple 2-Barrel Carburetor" data.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1959 CHEVROLET CARBURETOR THROTTLE BODY SCREWS LOOSENING IN SERVICE* Complaints of throttle body-to-float bowl screws loosening can be corrected by installation of new gasket with improved sealing and screw torque retention New gasket can be identified by BLACK color

►*1960 CHEVROLET PASS. (AUTOMATIC TRANSMISSION) HESITATION ON LOW SPEED ACCELERATION CORRECTION* Install new type accelerator pump and spring assembly, Part No. 7019742. Later carburetors having the new parts installed during production are identified by the letter "D" or later on identification tag

ROCHESTER 2GC 2-BARREL CARBURETOR (2G SIMILAR EXCEPT FOR MANUAL CHOKE)

►*1960 CHEVROLET TRUCK WITH 283" ENGINE (CARBS. NO. 7015015 & 7013011) ENGINE SURGE DURING PART THROTTLE OPERATION CORRECTION.* This condition can be corrected by installing Main Metering Jets, Part No. 7001860 (.055") to replace the former jets, Part No. 7002652 (.052"). Carburetors changed in production will be identified by the letter "A" (7015015) "B" (7013011) on brass identification tag.

►*1959 OLDSMOBILE IMPROVED COLD ENGINE OPERATION & CHOKE PERFORMANCE* Fast idle setting and throttle return check clearance setting have been changed *See data below*

►*1959 OLDSMOBILE STUMBLE ON LIGHT ACCELERATION (Carburetors without 'M8" stamped on Brass*

CONTINUED ON NEXT PAGE

1959-60 ROCHESTER 2G & 2GC (C nt.)

Identification Tag): Pump rod setting should be increased 1/16" to provide greater pump capacity. *See Accelerating Pump Setting below. NOTE* - Later carburetors (stamped "M8") have new shorter pump plunger with increased capacity and should be set to specifications.

►*1959 OLDSMOBILE CARBURETOR PRODUCTION CHANGES FOR IMPROVED PERFORMANCE:* Following parts and specification changes have been made in these carburetors for improved performance:

1) Pump Well Change - Carburetors marked "A" on identification tag have pump well wall extended to top of fuel bowl. This is a design change.

2) Idle Restriction Change - Carburetors marked "B" on identification tag have smaller .047" idle restriction hole (was .052"). This change not required on earlier carburetors.

3) Pump Plunger Change - Carburetors marked "M8" have (1 9/32") pump plunger for increased capacity to correct stumble on light acceleration. *See "Oldsmobile Stumble on Light Acceleration Correction" above.*

4) Choke Cover Assembly Change - New assembly with smaller heat inlet hole and larger diameter baffle plate used on later carburetors. Choke setting is unchanged.

5) Setting Changes for Improved Performance - See Fast Idle Setting and Throttle Return Check Setting below.

►***1960 OLDSMOBILE HESITATION & STUMBLE CORRECTION (EARLY CARS):*** **On cars with no letter stamped on identification tag, this condition can be corrected by installation of all parts in Parts Kit No. 7017980 (Std. Cars), new Accelerator Pump No. 7016475 only (Air Cond. Cars). New identification tag stamped "MOD" should be installed on carburetor when this change made. Kit No. 7017980 contains a venturi cluster, cluster gasket, cluster center attaching screw gasket, accelerator pump assembly, identification tag, and installation and adjustment instructions.**

►*1960 OLDSMOBILE CARBURETOR CHOKE STICKING CORRECTION (Carburetors Stamped "A" on Identification Tag):* **Caused by choke link going over center. Correct by installing new intermediate le ver and shaft furnished in Parts Kit 7017981 and installing new identification tag stamped "B" furnished with kit. Carburetors marked "B" or "C" on identification tag do not require this modification.**

►*1959 PONTIAC FLOAT PRODUCTION CHANGE & FLOAT LEVEL SETTING CAUTION (Rochester 2GC 7013060 & 7013061 Carburetors):* Later carburetors(with letter "K" punched in brass tag or code dated "B-9" or later) have floats with different buoyancy characteristics and require different float setting. *See Float Level data below.*

►*1959 PONTIAC MAIN METERING JET CALIBRATION PRODUCTION CHANGES (Rochester 2GC 7013069 & 7013075 Carburetors):* Different main metering jets have been used in production as follows: 1) .066", 2) .064", 3) .063". Jet furnished for service is .063" No. 7008663. *NOTE* - It is not recommended that jets on earlier carburetors be changed to later type as a fuel economy measure (gasoline mileage differences will be negligible).

►*1960 PONTIAC HIGH SPEED ACCELERATION STUMBLE CORRECTION:* **Stumble at speed of 50 MPH or above can be corrected by repositioning air cleaner intake tube 30-40° to right of engine centerline.** ***NOTE - On Air Cond. Cars, cleaner cannot be repositioned to this extent.***

►*1960 PONTIAC CARBURETOR STICKING CHOKE CORRECTION:* **Caused by burr at upper bend of fast idle link or burr around hole for link where it enters fast idle lever. To correct, remove link and dress down burrs to remove all bind.**

►*1960 PONTIAC CARBURETOR PRODUCTION CHANGE & SERVICE REPLACEMENT PARTS CAUTION (STD. ENGINE HYDRA-MATIC CARS):* **Beginning with Engine No. 279533, a new carburetor, Rochester No. 7015072 is used in production. The throttle body on this carburetor is designed with vertical milled slots in place of drilled idle discharge holes used on earlier carburetors. DO NOT interchange later slotted throttle bodies with earlier non-slotted throttle bodies.**

DESCRIPTION: Dual (2-Barrel) downdraft carburetor with manual choke control (2G), automatic choke (2GC). Carburetors are similar to previous models and have the following features.

Idle Compensator (Chevrolet 7013018 & Oldsmobile 7013058, 7015058 Carburetors. Air Conditioned Cars) - Consists of a thermostatically controlled idle air bypass which opens during prolonged hot idling to supply additional air at a point below the throttle valve to offset enrichening effects of high engine temperature. This idle compensator must be held closed when making idle speed adjustments.

Automatic Choke Assembly (All Oldsmobile Carbs. & Pontiac 7013060, 7013061, 7015070, 7015072) - Choke assembly is mounted on throttle body and linked to choke shaft lever by an intermediate choke rod. This intermediate choke rod must be adjusted for correct choke operation.

Idle Air Bypass (Pontiac 7013060, 7013061, 7015070, 7015072 Carburetors) - This idle bypass screw replaces conventional throttle stopscrew and is used to adjust the fuel mixture and engine idle speed. Special Idle Mixture & Speed Adjustment procedure is required for these models.

ADJUSTMENT: *Make all adjustment exactly as follows:*

Idling Adjustment (Except Pontiac 7015070 & 7015072

ADJUSTMENT: *Make all adjustments exactly as follows:*

Idling Adjustment (Exc. Carburetors With Idle Air Bypass) - If preliminary adjustment required to warm up engine, turn both idle mixture screws in until lightly seated, then back each screw out 1½ turns. Operate engine until normal operating temperature is reached with choke valve wide open and fast idle inoperative. Connect tachometer and vacuum gauge to engine, then adjust throttle stopscrew for correct engine idle speed (see table below). Adjust each idle mixture screw for smoothest idle performance with highest manifold vacuum and engine RPM (see special notes below). *CAUTION - On cars with Idle Air Compensator, hold compensator valve closed by pressing in on spring-load d button n sid f main body (Ch vrolet), removing air cl aner and pressing d wn n valv in air horn (Oldsm bile).* Recheck engine idle speed. *CHEVROLET NOTE* - Idle mixture adjustment can be made by leaning the mixture (turn screws in) for a moderate rough idle with slight vacuum and RPM loss, and then richening the mixture by turning the screws out ¼ turn.

OLDSMOBILE NOTE - After adjusting both idle mixture screws for highest manifold vacuum and engine RPM, turn each screw out ¼ turn for slightly richer mixture. Recheck idle mixture and idle speed after air cleaner installed.

Idling Adjustment (Carburetors With Idle Air Bypass) - If preliminary adjustment required to warm up engine, set both idle mixture adjusting screws 1½ turns open and idle air adjusting screw 2 turns open from a lightly seated position. With engine at normal operating temperature (choke valve wide open and fast idle inoperative), turn idle air in or out for correct idle speed (see table below), then adjust each idle mixture screw for smoothest idle performance with highest engine RPM. Recheck idle speed. *CAUTION - If necessary to r set idle air adjusting screw to corr ct idl sp d, r check idle mixture screw adjustm nt (idl mixtur adjustment must always be made last).*

Idle Speed Setting

Car Model	Synchro-mesh Trans.	Aut .Trans.
Chevrolet	475 RPM	ℂ 450 RPM
Oldsmobile (No A.C.)	460 RPM	ℂ 460 RPM
Oldsmobile (A.C.)②	520 RPM	ℂ 520 RPM
Pontiac (No A.C.)	480-500 RPM	ℂ 480-500 RPM
Pontiac (A.C.)③	540-560 RPM	ℂ 540-560 RPM

ℂ - With transmission in Drive "Dr" range.

② - With Air Conditioning turned "OFF" (Carburetors with Idle Compensator), "ON" (Carburetors without Idle Compensator).

③ - With Air Conditioning turned "OFF".

Throttle Return Check (Dashpot) Adjustm nt: Used on Chevrolet and Oldsmobile with automatic transmission. *See "Throttle Linkage Adjustm nt" und r CARBURETOR on each car model page for adjustm nt data.*

►*OLDSMOBILE SETTING CHANGE CAUTION:* Throttle return check clearance should be set at .050"

Float Level: *CAUTION - Two s parat adjustm nts (Float Level & Float Drop) r quir d. Float l v l adjusted differently on Chevrol t as d tail d b low.*

Float Level Setting (Chevrol t) - Remove and invert bowl cover and float assembly but DO NOT remove cover gasket. Install correct float gauge (see table below) over float with top of gauge against pump side of power piston stem. Float should just clear top edge of gauge cutout and sides of float should be parallel to gauge legs. Adjust by bending float hinge arm.

Float Level Setting (Oldsm bil & P ntiac) - Remove and invert bowl cover and float assembly but DO NOT remove cover gasket. Install correct float gauge (see table below) on bowl gasket at free end of float with longer leg of gauge "T" resting squarely on gasket. Edge of seam on float should just clear upper edge of gauge. Adjust by bending float hinge arm at rear of float.

CONTINUED ON NEXT PAGE

1959-60 ROCHESTER 2G & 2GC (Cont.)

Float Level

Car & Carb	Float Level	Checking Gauge
1959-60 Chevrolet (All)	1 23/64"	BT-152
1959-60 Oldsmobile (All)	11/16"	BT-179
1959 Pontiac 7013060,61 ℂ	11/16"	BT-160
1959 Pontiac 7013060,61 ②	5/8"	BT-173
1959 Pontiac 7013069,75	11/16"	BT-169
1960 Pontiac 7015062,73	11/16"	BT-176
1960 Pontiac 7015070,72	5/8"	BT-177

ℂ - Early carburetors.

② - Later carburetors identified by "K" punched in tag or code dated "B-9" or later.

Fl at Drop S tting (All Models) - Hold bowl cover and float assembly upright so that float hangs down at bottom of travel. Measure distance from lower face of cover gasket to bottom of float at free end (surface of flat topped floats will be parallel to bowl cover) using a scale or the float level gauge. On Chevrolet, place side of short leg against gasket, float should just touch extended portion of other leg. On Oldsmobile and Pontiac, invert gauge so that leg of "T" is against gasket, bottom of float should be in line with "Float Drop" line on gauge. Adjust by bending tang on rear of float hinge arm toward intake needle seat to decrease drop, or away from needle seat to increase drop.

Fl at Drop Setting

Car & Carb.	Float Drop	Checking Gauge
1959-60 Chevrolet (All)	1 29/32"	BT-152
1959-60 Oldsmobile (All)	1 29/32"	BT-151 or 179
1959-60 Pontiac (All) ℂ	1 3/4"	BT-176 or 177

ℂ - Supersedes previous 1959 specification of 1 29/32".

Acc l rating Pump R d: *CAUTION - This is a linkage adjustment (pump does not have seasonal setting).* With throttle stopscrew backed out so that throttle valves completely closed, check distance from top of air horn or pump housing to top of pump connector rod as follows: On Chevrolet, invert float gauge (see table below) and place gauge on top of pump housing on air horn with extended leg of gauge down toward pump connector rod. On Oldsmobile & Pontiac, place float gauge (see table below) on top edge of air cleaner ring on air horn with end of "T" marked "Pump" down toward connector rod. On all models, end of gauge should just touch top of connector rod. Adjust by bending pump connector rod using bending Tool BT-18.

Acc l rating Pump Rod Setting

Car & Carb.	Pump Setting	Checking Gauge
1959-60 Chevrolet (All)	57/64"	BT-152
1959-60 Oldsmobile (All)	1 7/16"	BT-151
1959 Pontiac 7013060,61	15/16"	BT-173
1959 Pontiac 7013069,75	1 3/16"	BT-169
1960 Pontiac 7015062,73	1 1/8"	BT-177
1960 Pontiac 7015070,72	1 21/64"	BT-176

Idl V nt: *Adjust only after Accelerating Pump Rod Setting has be n checked and adjusted.* Use same gauge installed in same manner as for pump rod setting check (above). *NOTE* - On Oldsmobile & Pontiac, invert gauge so that leg marked "Vent" is down toward pump connector rod. Slowly open throttle valve to point where vent valve just closes (rubber valve seats on pump housing on air horn). At this point, edge of cutout is gauge marked "Vent" (Chevrolet), or lower end of gauge marked "Vent" (Oldsmobile & Pontiac), should just touch top of pump connector rod. Adjust by bending tang on pump lever which contacts vent valve arm.

Idle Vent Setting

Car & Carb.	Vent Setting	Checking Gauge
1959-60 Chevrolet (All)	49/64"	BT-152
1959-60 Oldsmobile (All)	1 11/32"	BT-151 or 179
1959 Pontiac 7013060,61	1 9/32"	BT-173
1959 Pontiac 7013069,75	1 9/64"	BT-169
1960 Pontiac 7015062,73	1 5/64"	BT-176
1960 Pontiac 7015070,72	1 17/64"	BT-177

Intermediate Choke Rod Adjustment (1959 Oldsmobile & 1959-60 Pontiac): Remove choke cover and thermostatic coil assembly, gasket and baffle plate. Hold choke valve completely closed by lifting up on intermediate choke lever. In this position, inner end of vacuum piston should be flush with end of choke piston bore. Adjust by bending intermediate choke rod.

Intermediate Choke Rod Adjustment (1960 Oldsmobile): *ADJUSTMENT NOTE - Three different vacuum pistons and choke levers have been used in production. Adjustment procedures are different as indicated below.*

Type 1 - Carburetors with this type piston and lever are identified by the word "MOD" in first square of identification tag, or the square will be blank. The vacuum piston is plain on outer end. Adjust this type so vacuum piston is flush or 1/32" out of piston bore .

Type 2 - Carburetors with this type piston and lever are identified with the letter "A", "B", or "C" in first square of identification tag. Adjust this type so vacuum piston is out of piston bore so "V" groove in piston is flush with edge of bore. This vacuum piston has a single groove in outer end.

Type 3 - Carburetors with this type piston and lever are identified with the letter "B" or "C" in first square of identification tag. The vacuum piston has two grooves in outer end and choke shaft lever has three holes for installation of intermediate rod. Adjust as follows: With intermediate choke rod installed in inboard hole, piston must be flush or 1/32" out of piston bore. With intermediate rod in center hole, first "V" groove in piston must be flush with edge of piston bore. With intermediate rod in outboard hole, second "V" groove in piston must be flush with edge of piston bore. *NOTE - The type "3" assembly (three hole lever) choke setting may be tailored for climatic conditions by installing rod in other holes. See "Automatic Choke Setting" below.*

Automatic Choke Setting (All 2GC Carburetors): Adjust by loosening retainer screws on choke cover and rotating cover and coil assembly. Centered setting is with scribed index mark on cover in line with center (longest) mark on housing. *NOTE* - Choke valve should be lightly closed at room temperature (75°F).

Aut matic Ch ke Setting

Car Model	Chok S tting
1959-60 Chevrolet & Pontiac	Centered (At Index)
1959 Oldsmobile	Centered (At Index)
1960 (Early) Oldsmobile ℂ	1 Notch Rich
1960 (Later) Oldsmobile ②	Centered (At Index)

ℂ - Early carburetors with no letter or with "MOD" notation on brass identification tag.

② - Later carburetors marked by letter "A", "B", or "C" on identification tag.

►*1960 OLDSMOBILE CHOKE SETTING "TAILORING" FOR CLIMATIC CONDITIONS (Carburetors Mark d "B" or "C" on Identification Tag and with Three Hol s in Choke Shaft Lever):* Moving intermediate rod to next OUTER hole will provide richer mixture during warm-up for acceleration or load. Moving rod to next INNER hole will provide leaner mixture under same operating conditions.

Fast Idle (2GC Carburetors): *Adjust each model as follows:*

Chevrolet (All) & Pontiac 7013069, 7013075, 7015062 & 7015073) - No separate fast idle adjustment required as fast idle speed is automatically set when hot or slow idle speed is adjusted (same screw controls both settings).

Oldsmobile (All) & Pontiac 7013060, 7013061, 7015070 & 7015072) - As a preliminary adjustment (with carburetor off engine), close choke valve and see that fast idle screw is on high step of fast idle cam. Adjust fast idle screw for correct throttle valve opening or clearance between edge of valve and carburetor bore on side opposite idle adjusting screws as shown in table below. Make final adjustment with carburetor on engine as follows: Connect tachometer, place transmission selector in Neutral "N" position, rotate fast idle cam so fast idle screw is on high step of cam. With engine at normal operating temperature, adjust fast idle screw for correct engine speed as indicated in table below.

Fast Idle Setting
(Off Engine)

Car & Carb.	Throttle Opening	Checking Gaug
Oldsmobile (All)	.030"	BT-121
Pontiac 7013060, 61	.037"	BT-170
Pontiac 7015070, 72	.037"	BT-170

(On Engine)

Car Model	Engine Sp d
Oldsmobile	ℂ 1900 RPM
Pontiac	2700 RPM

ℂ - For sub-zero weather operation set fast idle speed to 2200 RPM.

Choke Rod (2GC Carburetors): Position fast idle screw on second step of fast idle cam, close choke valve until screw is against shoulder of high step on cam. On Oldsmobile, press up on intermediate choke lever and make certain that intermediate choke rod is at end of slot in intermediate lever. In this position, choke valve opening or clearance between upper edge of valve and air horn wall should be as shown in table below. Adjust by bending tang on fast idle lever on choke valve shaft (Chevrolet & Pontiac), or by bending lower choke rod (Oldsmobile).

CONTINUED ON NEXT PAGE

1959-60 ROCHESTER 2G & 2GC (C nt.)

Ch ke Rod Setting

Car & Carb.	Choke Valve Opening	Checking Gauge
1959-60 Chevrolet (All)	.089"	BT-108
1959-60 Oldsmobile (All)	.150"	BT-159
1959 Pontiac 7013060,61	.070"	BT-163
1959 Pontiac 7013069,75	.056"	BT-167
1960 Pontiac 7015062,73	.056"	BT-167
1960 Pontiac 7015070,72	.070"	BT-163

Unloader (2GC Carburetors): Move throttle valves to wide open position (see Pontiac Note below) so that choke valve is partially open. Measure the choke valve opening or clearance between upper edge of valve and air horn wall using correct gauge (see table below). If clearance not correct, adjust by bending tang on throttle lever using bending tool BT-69.

PONTIAC CHECKING NOTE - It is recommended that the throttle valves be opened by depressing accelerator pedal forcibly to the floor (by someone sitting in driver's seat) to simulate actual driving conditions. Make certain that pedal does not strike hump over transmission. Above procedure will eliminate all variances in linkage, floor mat, or pedal location.

Unloader Setting

Car & Carb.	Choke Valve Opening	Checking Gauge
1959-60 Chevrolet (All)	.360"	BT-108
1959-60 Oldsmobile (All)	.163"	BT-162
1959-60 Pontiac (All)	.163"	Ⓒ

Ⓒ - Use BT-168 (7013069,75, 7015062,73 Carburetors), BT-162 (Other carburetors).

OVERHAUL: It is recommended that a holding fixture be used to mount carburetor on bench for overhaul.

Disassembly: Air Horn - On carburetors with automatic choke mounted on air horn, see Automatic Choke data below for disassembly of automatic choke. On all models, remove fuel inlet fitting and gasket, remove filter screen. Take out idle vent valve retaining screw and remove vent and shield. Disconnect and remove pump rod and choke intermediate rod. Take out screw at end of choke shaft and remove choke trip lever and fast idle link and lever (link can be disconnected from fast idle cam by rotating link until it slips out through slot in cam). Remove eight cover screws, lift air horn and bowl cover straight up and off main body. Invert cover, remove float hinge pin, lift float and needle assembly out, disconnect intake needle from float. Remove intake needle seat and gasket, remove filter from needle seat bore. Remove power piston by depressing stem and allowing it to snap free (or hold stem and tap lightly on air horn). Remove pump plunger assembly from pump arm by freeing retainer on pump plunger shaft. Loosen setscrew on pump inner arm, remove pump outer lever and shaft. Lift off cover gasket. If choke valve being replaced, take out choke valve screws, remove choke valve, slide choke valve shaft out.

Main B dy (Float B wl) - Remove pump inlet filter screen, pump plunger return spring, and inlet check ball from bottom of pump cylinder. On carburetors with idle compensator valve, take out attaching screws and remove idle compensator and gasket. Remove main metering jets and power valve. Take out venturi cluster retaining screws and lift out venturi cluster, gasket, and main well inserts (Chevrolet only). *CAUTION* - Do not attempt to disassemble venturi cluster. Use needle nose pliers to lift out pump discharge spring guide, remove spring and pump discharge check ball. Invert float bowl assembly, remove three throttle body attaching screws, lift off throttle body and gasket.

Throttle Body - On carburetors with automatic choke mounted on throttle body, see Automatic Choke data below for disassembly of automatic choke. On all models, remove fast idle cam or fast idle lever, remove both idle mixture adjusting screws and springs. *DO NOT remove throttle valves or shaft (cannot be assembled correctly in relation to idle discharge ports).*

Automatic Choke (Type mounted on Air Horn) - Take out three choke cover attaching screws and retainers, remove choke cover and thermostatic coil assembly, cover gasket, and baffle plate. Take out retaining screw at end of choke shaft, carefully pry off choke trip lever and fast idle choke rod link and lever. Take out two choke valve screws, remove choke valve, rotate choke shaft counterclockwise to free choke piston from housing, then withdraw choke shaft and piston assembly from air horn. Take out two choke housing attaching screws, remove choke housing and gasket.

Automatic Choke (Type mounted on Throttle Body) - Take out three choke cover attaching screws and retainers, remove choke cover and thermostatic coil assembly, cover gasket, and baffle plate. Remove choke piston attaching screw, rotate link to withdraw piston from cylinder, lift out piston and link assembly. Take out two choke housing attaching screws, remove choke housing assembly and gasket. Remove gasket, remove choke lever and shaft with linkage from choke housing.

Cleaning & Inspection: Thoroughly clean all castings and metal parts in carburetor solvent *(CAUTION - Do not immerse choke coil and housing in solvent).* Use clean gasoline to clean the pump plunger. Blow out all passages and dry parts with air. *CAUTION* - DO NOT use drills or wire to clean out jets or calibrated passages. Inspect all parts for wear or damage and replace as necessary.

Reassembly: Assemble all parts in reverse order of disassembly procedure above and note the following:

Choke Valve Installation - Install valve with identifying mark "RP" upward, center choke valve before tightening screws *(NOTE* - Valve can be centered by installing fast idle lever and choke trip lever on end of shaft and maintaining .020" clearance between fast idle lever and air horn casting). Stake choke valve screws lightly after tightening.

Accelerating Pump Assembly - Lubricate pump shaft with Lubriplate or light grease when installing in bowl cover. Make certain that pump check balls are not interchanged. Inlet check ball is Aluminum, discharge check ball is Steel.

V nturi Clust r Installati n - Center cluster screw must have gasket (to prevent pump discharge leakage around screw). Tighten all cluster screws evenly.

P w r Pist n Installati n - Make certain piston travels freely in its cylinder. Stake retainer washer lightly to retain assembly in place.

Chevrolet Governor Overhaul: R moval - Remove four governor cover attaching screws, remove cover and gasket. Detach and remove governor throttle spring. Remove diaphragm cover attaching screws, lift off cover. Hold throttle lever and loosen nut attaching governor lever and pin assembly to throttle shaft, free lever from throttle shaft and disengage it from diaphragm rod by rotating lever until tang on rod clears slot in lever. Remove diaphragm assembly from housing. Remove three governor housing mounting screws, remove seal retainer and leather seal. Detach governor housing from throttle body, remove housing gasket.

Cleaning & Inspection - DO NOT immerse throttle lever and bearing assembly in cleaning solution (will damage neoprene seal protecting ball bearings). Make certain that throttle bearings are completely dry (blow out with air) and lubricate with very light machine oil *(CAUTION* - Throttle shaft must rotate freely with no trace of any binding which would affect governor operation).

Installation - Install governor housing mounting gasket (narrower edge toward top of carburetor), install housing, leather seal, seal retainer, and mounting screws (DO NOT tighten screws). Check throttle shaft for free operation in seal, tighten mounting screws while holding throttle in closed position, recheck throttle shaft for free operation. Install diaphragm assembly in housing and align vacuum passage holes in diaphragm and housing. Assemble governor lever and pin assembly on end of diaphragm rod (in housing) and position lever on throttle shaft, install lockwasher and nut on shaft, tighten nut while holding throttle lever to prevent damage to valves. Align diaphragm with mounting screw holes in housing, install cover with cover restriction piloting through diaphragm and into vacuum passage in housing, install cover screws finger-tight. Hold throttle valves wide open (to provide maximum diaphragm travel), tighten cover screws to 25-28 in. lbs., install lockwire on screws. Install throttle spring over governor lever pin and stationary post in housing. Check for free operation of throttle shaft, then install governor cover and gasket, tighten attaching screws, install lockwire on screws.

SERVICE PARTS: Gasket S ts - Rochester No. 7015952 (7013007, 7013008, 7013018, 7013082); No. 7015949 (7013009, 7015015, 7013011); No. 7015970 (7013013, 7015017); No. 7016040 (7013052, 7013058, 7015052, 7015058); No. 7016041 (7013060, 7013061); No. 7015962 (7013069, 7013075).

Overhaul Kits - Rochester No. 7015924 (7013007); No. 7015951 (7013008, 7013018, 7013082); No. 7015926 (7013009, 7015015, 7013011); No. 7015932 (7013013, 7015017); No. 7016020 (7013052, 7013058, 7015052, 7015058); No. 7016021 (7013061, 7013060), No. 7015949 (7013075, 7013069).

Off-Kar Kits - Rochester No. TR-304 (All Chev. Pass. Cars); No. TR-305 (7013009, 7015015, 7013011); No. TR-507 (All Oldsmobile); No. TR-605 (7013061, 7013060); No. TR-608 (7013075, 7013069).

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 METERING JET CHANGE FOR IMPROVED PART THROTTLE PERFORMANCE* See Rochester Single & Dual J t Specifications for latest jets.

►*1957 CHEVROLET 6 LOADING UP DURING WARM-UP CORRECTION (Cars with "BC" Carbs)* Caused by over rich condition Correct by setting automatic choke to new specifications See *Automatic Choke Setting b low*

►*1959 WARM ENGINE HARD START CORRECTION (Auto. Trans. Cars)* If engine tune-up does not correct this condition, set choke one notch lean

►*1959 CARBURETOR THROTTLE BODY TO FLOAT BOWL SEALING CORRECTION:* If throttle body to float bowl screws work loose, install later type gasket (black in color)

ROCHESTER BC CARBURETOR (MODEL B SIMILAR WITHOUT CHOKE)

DESCRIPTION: Plain tube, downdraft type with concentric bowl, double float, vacuum controlled power system, and fast idle assembly 1957 and later carburetors (Pass Cars) have a low air horn design and a new type power piston

►*1960 CHEVROLET TRUCK (235" ENG.) SURGE CORRECTION:* This condition which is noticeable in the 20-60 MPH speed range when accelerating can be corrected by installing a No. 55 main metering jet, Part No. 7001860 in place of the former No. 54 jet.

►*FUEL STRAINER NOTE:* Strainer screen (under fuel inlet fitting nut) can be removed for cleaning Replace filter every 15,000 miles or sooner if needed.

ADJUSTMENTS: Make all adjustments exactly as detailed below.

Idling Adjustm nt: If preliminary setting required to warm up engine, turn idle mixture screw in until it is lightly

CONTINUED ON NEXT PAGE

ROCHESTER "B" & "BC" (Continued)

seated, then back screw out correct number of turns (see table below). Set parking brake tight, place selector lever in "D" (Powerglide), start engine and allow it to idle until normal operating temperature is reached, then adjust as follows:

Idle Mixture - With engine at normal operating temperature and idling at correct speed (see below), turn idle mixture adjusting screw in or out until smoothest engine performance is secured. Recheck idle speed.

Idle Mixture Setting

Car Model	Idle Screw Opening
1954 Chev. Pass. Cars	1-2½ turns
1955-60 Pass. Cars	2½ turns
1954 Chev. Truck 235" Eng.	1½-2½ turns
1954 Chev. Truck 261" Eng.	1-1½ turns
1955-57 Chev. Truck ("BC" Carbs.)	2½ turns
1955-60 Chev. Truck ("B" Carbs.)	1½-2½ turns

Idle Speed - With engine at normal operating temperature, adjust throttle stopscrew for correct idling speed as listed below (*CAUTION* - On "BC" carburetors, stopscrew must be resting on lowest step of fast idle cam when adjustment being made).

Idle Speed Setting

Car Model	Synchro-mesh	Auto. Trans.
1954-57 Chev. Pass. Cars	475 RPM	①425 RPM
1958-60 Chev. Pass. Cars	475 RPM	①450 RPM
1954-57 Chev. Truck	450-500 RPM	②400-450 RPM
1958 Chev. Truck	475 RPM	②400-450 RPM
1959-60 Chev. Truck	475 RPM	①450 RPM

① - Transmission in "D" (Drive) Range.
② - Transmission in "N" (Neutral).

Float Level: *CAUTION - Two separate adjustments required as follows:*

1) Float Level Setting - *CAUTION - When removing air horn and bowl cover on "BC" carburetors, disconnect heat suction tube at upper coupling nut and use care not to disturb seal at lower end of tube.* Invert bowl cover and float assembly but DO NOT remove cover gasket. Install gauge (see table below) over floats with center tang on gauge in main discharge nozzle on cover. Bend float arms **vertically** so that each float just touches top of cut-out in gauge, bend arms **horizontally** so that each float is centered in gauge cut-out. Check setting by tilting assembly 90° to each side to make certain that floats do not touch gauge (*CAUTION* - This setting necessary to insure that floats will not rub on sides of float bowl).

Float Level Setting

Model	Checking Gauge	Float Setting
All Carbs.	① M-250	1 9/32"

① - Chevrolet No. 3696192.

2) Float Drop Setting - Hold bowl cover assembly upright so that floats drop down to limit of travel. Measure distance from lower face of gasket on cover to bottom of floats at center using a scale. This distance should be 1¾" (All Carburetors). Adjust by bending tang at rear of float assembly.

Fast Idle ("BC" Carburetors): *NOTE* - Fast idle speed is automatically set when hot or slow idle speed is adjusted (same screw controls both settings). Adjust fast idle cam position as follows:

Fast Idle Cam Position - Rotate fast idle cam until throttle stopscrew is on second (next to highest) step of cam and against the shoulder of the highest step. Check choke valve opening or clearance between lower edge of valve and air horn wall using correct gauge (see table below). If clearance not correct, adjust by bending choke connector rod at central angle using bending tool J-4552 (Rochester BT-18).

Fast Idle Cam Setting

Model	Choke Opening	Checking Gauge
1954-58 "BC" Carbs.	.076"	①BT-99
1959-60 "BC" Carbs.	.040"	BT-102

① - Chevrolet No. J-6838.

Unloader ("BC" Carburetors): Open throttle valves to wide open position which will open choke valve slightly. Check choke valve opening or clearance between lower edge of valve and air horn wall using correct gauge (see table below). If clearance not correct, adjust by bending tang on throttle lever which contacts fast idle cam using bending tool J-4552 (Rochester BT-69).

Unloader Setting

Model	Choke Opening	Checking Gauge
All Carbs.	.230"	①BT-99

① - Chevrolet No. J-6838.

Automatic Choke: Adjust by loosening three retainer screws on choke cover and rotating cover and coil assembly. Centered setting is with scribed index mark on cover in line with longest (center) cast mark of scale on housing.

Choke Setting

Model	Choke Setting
1954-56 Chevrolet (All Models)	Centered (At Index)
1957 Chev. Cars	①3 Notches Lean
1957 Chev. Trucks	Centered (At Index)
1958 Chev. Cars (Synchro-mesh)	1 Notch Lean
1958 Chev. Cars (Auto. Trans.)	Centered (At Index)
1959 Chev. Cars (Synchro-mesh)	1 Notch Lean
1959 Chev. Cars (Auto. Trans.)	②Centered (At Index)
1960 Chev. Cars (Synchro-mesh)	1 Notch Rich
1960 Chev. Cars (Auto. Trans.)	2 Notches Rich

① - Supersedes previous setting of 1 Notch Rich (Synchro-mesh); 1 Notch Lean (Auto. Trans.).
② - Set 1 Notch lean to correct warm hard start.

OVERHAUL: Disassembly - On manual choke carburetors, remove choke control bracket and air horn attaching screws, then hold throttle kicker in vertical position (free of fast idle cam) and lift bowl cover assembly off fuel bowl being careful not to damage floats. On automatic choke carburetors, disconnect choke heat suction tube at choke housing, then remove choke coil cover assembly, gasket and baffle plate. Remove fast idle connector rod, and retaining screw on opposite end of choke shaft, then remove choke trip lever, washer and counterweight. Remove choke valve screws and remove valve, then rotate shaft until vacuum piston clears housing bore and remove shaft assembly from air horn. Remove air horn to fuel bowl attaching screws and remove air horn, being careful not to damage floats. On manual choke carburetors, remove choke valve screws and valve, then remove retainer ring from groove in shaft boss and slide shaft, spring and lever assembly out of air horn. Remove throttle kicker, lever and spring. On all carburetors, hold pump plunger down in cylinder and remove retainer from pump link, then remove link from throttle lever and plunger and lift plunger from bowl. Remove plunger spring and ball check from bottom of pump cylinder. Turn pump discharge guide until it can be removed, then remove discharge spring and ball by inverting the assembly. Remove pump intake screen retainer and screen. Remove throttle body attaching screws and remove throttle body. Remove idle air mixture screw and spring. On automatic choke carburetors, remove fast idle cam. On all models, remove float hinge pin from air horn and remove float assembly, then remove needle seat and gasket. Remove main metering jet and power valve from main well support, being careful not to lose ball and spring when removing power valve. Remove main well support attaching screw, support, and gasket, then remove power piston and spring. *CAUTION - Do not remov idl tube which is pressed into air horn assembly.* If necessary, remove choke housing.

►*THROTTLE VALVE ASSEMBLY CAUTION: Do not remove throttle valve. If valve assembly is damaged or worn, replace complete throttle body ass mbly.*

Cleaning & Inspection: Wash all parts except choke coil housing and pump plunger in carburetor cleaning solvent and blow dry with air. Blow out all passages with air and inspect for carbon deposits. Inspect all parts for wear or damage.

Reassembly: Reverse disassembly procedure and note the following:

Choke Valve - Install choke valve with "RP" mark on valve toward top of carburetor.

Pump Intake Ball Check - On early carburetors with aluminum ball check, install ball in bottom of pump cylinder and see that it lifts freely from its seat.

►*HEAT SUCTION TUBE SERVICING NOTE:* If tightening of loose seal with Tool BT-45 (Rochester) J-4551 (Chevrolet), does not correct leakage, install new seal as follows: With carburetor fully assembled, loosen throttle body-to-bowl casting screws, then insert flared end of heat suction tube into hole in throttle body and tap seal down lightly into position with either of the two tools listed above. Rotate tube while tapping to insure starting uniformally into throttle body. Tighten coupling nut at upper end of tube finger tight, using new packing on tube. Use a light hammer and either of the two tools to spread seal securely in throttle body (rotate tool to secure uniform spreading of seal). Loosen coupling nut at upper end of tube and check tube tightness in throttle body (tube should not turn). Tighten coupling nut securely, then tighten throttle body-to-bowl casting screws. Check seal for leaks after carburetor installed on engine.

SERVICE PARTS: Gasket Sets - Rochester No. 7004085 (7005921, 7005922, 7007180, 7007181, 7009254, 7009255); No. 7015966 (7009656, 7009657, 7012127, 7011102, 7013000, 7013003, 7013005, 7013955, 7013956); No. 7015965 (7004468, 7013029, 7013953, 7015011, 7015021); No. 7006126 (7005140, 7015013).

Repair Kits - Rochester No. 7009311 (7005921, 7005922, 7007180, 7007181, 7009254, 7009255); No. 7015729 (7009656, 7009657, 7002127, 7011102); No. 7015936 (7013000, 7013003, 7013005); No. 7015976 (7013955, 7013956); No. 7015964 (7004468, 7013029, 7013953, 7015011, 7015031); No. 7009312 (7005140, 7015013).

On-Car Kits - Rochester No. SR-302 (7009656, 7009657, 7012127, 7011102, 7013000, 7013003, 7013005, 7013955, 7013956).

ROCHESTER "H" CORVAIR CARBURETOR

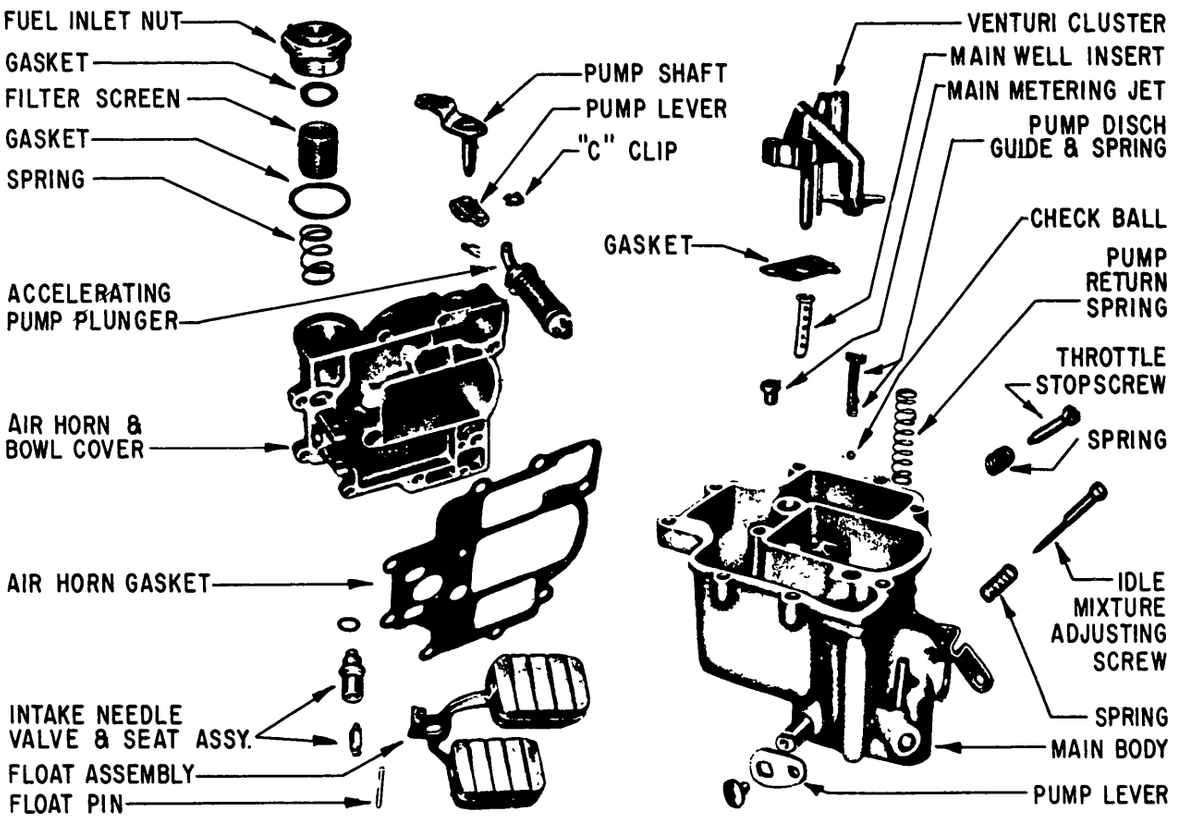
All Models (Early)	7015300
Powerglide (Late)	7015310
Powerglide (Limited Production)	7015312
Synchro-mesh (Late)	7015311
Synchro-mesh (Limited Production)	7015313
High Perf. Engine	7015319

►CHANGES, CAUTIONS, CORRECTIONS

►*1960 CORVAIR LIMITED PRODUCTION CARBURETORS (7015312 & 7015313) NOTE & FLOAT SETTING ADJUSTMENT CAUTION:* These two carburetors, with spring loaded needle valve and seat assembly, and with a special float (dimple embossed in side of float at toe end) were used in limited production. Float setting on these two carburetors is different than for carburetors with solid type needle valves. *See "Float Level" below.*



►*1960 CORVAIR CARBURETOR FLOAT ASSEMBLY & NEEDLE VALVE & SEAT ASSEMBLY SERVICE REPLACEMENT NOTE (Carburetors No. 7015312, 7015313 or Earlier Carburetors Stamped with an "A" on Metal Identification Tag):* It is recommended that needle & seat assembly, Part No. 7015789 and float assembly, Part No. 7015241 (without dimple) be used for service replacement on Carburetors No. 7015312 & 7015313. Use float assembly, Part No. 7015241 for service replacement on Carburetors No. 7015310 & 7015311 which have a letter "A" stamped on metal identification tag.

DESCRIPTION: Single barrel downdraft type of new design without choke assembly, fast idle or unloader mechanism. *NOTE – The automatic choke, fast idle and unloader are part of the separate air horn assembly which is centrally located between the right and left hand carburetors. See "Corvair Choke & Air Horn Assembly"*

ADJUSTMENT: *Make all adjustments in the order indicated below.*

Synchronizing Carburetors: *See "Carburetor" on car model page.*

Slow Idle Adjustment: With engine off and choke in full "Off" position, back both idle speed adjusting screws off until they clear throttle shaft lever on each carburetor. Adjust right carburetor idle screw until it just touches throttle shaft lever; then turn screw in an additional ½ turn. Repeat procedure on left carburetor.

ROCHESTER "H" CORVAIR CARBURETOR ASSEMBLY

NOTE - After idle mixture adjustment completed (below), adjust engine idle speed to specifications. See "Idle Speed" below.

Idle Mixture: Connect vacuum gauge to engine as follows: On automatic transmission cars, remove modulator line at "tee" fitting, then attach vacuum gauge hose. On synchro-mesh cars install an adapter "tee" connector and short piece of hose into choke vacuum hose line, then attach vacuum gauge to "tee". On all models, turn idle mixture screws on both carburetors in until lightly seated, then back off each screw 1½ turns. Adjust idle mixture screws to obtain peak vacuum and engine speed on each carburetor. After adjusting idle speed (below), remove vacuum gauge and fittings.

Idle Speed: 500 RPM (Automatic Trans. in Drive range). Adjust idle speed screws equally to obtain specified idle speeds.

Unloader: Adjust swivel on fast idle link to obtain ¼" clearance between top of choke valve and upper wall of air horn with wide open throttle (through detent on automatic transmission cars).

Fast Idle Speed: Rotate fast idle cam counterclockwise to high position and adjust fast idle screw to obtain 2200 engine RPM. *NOTE - If unable to obtain adequate fast idle, adjust swivel toward end on fast idle link, until specified fast idle speed is obtained.*

►*FLOAT LEVEL ADJUSTMENT CAUTION:* Spring loaded needle valve and seat assemblies were used in limited production on Carburetors No. 7015012 & 7015013 in conjunction with a new float assembly identified by a dimple embossed on side of float at toe end. Adjustment specifications and procedures for carburetors with these assemblies are different than for carburetors with solid type needle and seat assemblies. *See "Production Changes & Service Replacement Note" above.*

Float Level (Solid Needle Valve): With bowl cover inverted, gasket in place, distance from top of float (at highest point) should be 1 13/64" (Gauge J-8370).

CONTINUED ON NEXT PAGE

ROCHESTER "H" CORVAIR CARBURETOR (Cont.)

NOTE - Floats must be parallel within 1/32" and must be centered between gauge legs. To adjust, bend float tang.

Float Level (Spring Loaded Needle Valve): With bowl cover inverted, gasket in place, distance from gasket surface to "dimple" on side of float at "toe" end should be 7/16". To adjust, bend float tang.

Float Drop: With bowl cover held upright and float hanging free, distance between cover gasket and bottom of float (at free end) should be 1¾". To adjust, bend tang at end of float hinge arm.

Pump Rod: Back off idle speed screw until throttle valve is completely closed, then while holding throttle valve closed, check to see that scribe mark on accelerator pump lever is aligned with the mark cast into bowl cover. To adjust, bend pump rod at lower end.

►*CHOKE, FAST IDLE & UNLOADER ADJUSTMENTS: Th s adjustments ar mad on th s parat air horn assembly located between the two carburetors. See "Corvair Choke & Air Horn Assembly"*

OVERHAUL: Disassembly – Disconnect pump rod from pump lever, then remove fuel inlet nut, gasket, filter element, and spring. Remove bowl cover assembly and gasket (note location of the two longer screws on either side of accelerator pump). Remove floats and float needle. If necessary, needle seat and gasket may be removed with a large screwdriver. To remove accelerator pump, remove "C" clip, then remove shaft and lever. Remove two screws attaching venturi cluster to bowl assembly and lift out cluster, gasket and main well insert. Remove pump discharge valve, idle mixture adjusting screw and spring.

Inspection: Clean all parts in solvent or carburetor cleaner (do not immerse pump plunger or gaskets in carburetor cleaner). Blow out all passages with air. Check all parts for wear and replace as necessary. Check to see that main well tube is not bent. It should be exactly 90° from body.

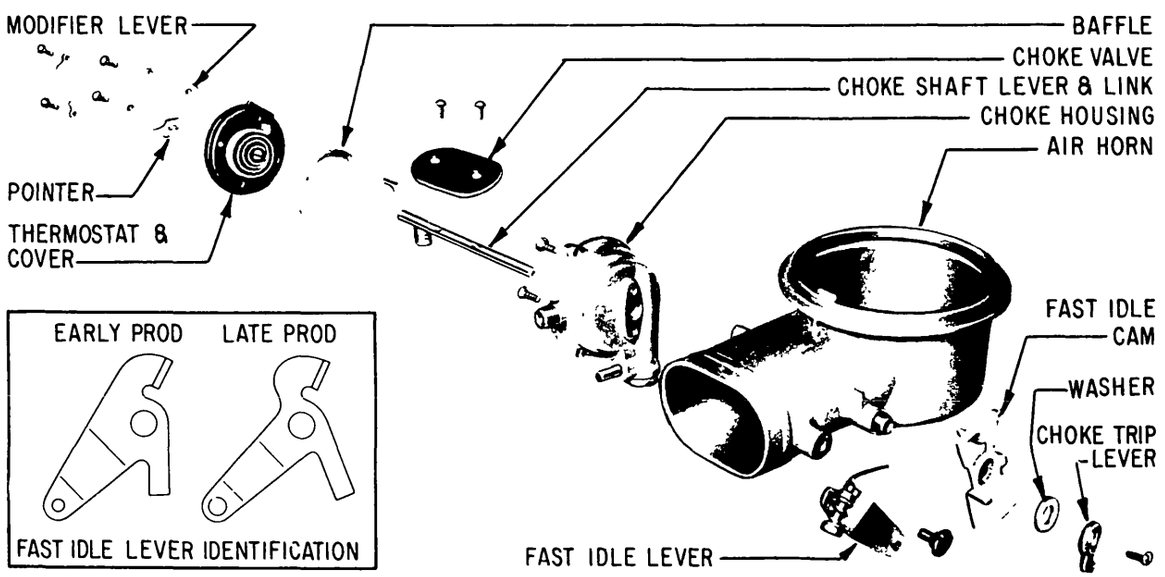
Assembly: Replace main well insert, venturi cluster, and gasket in bowl assembly, and install the two screws and lockwashers. *NOTE – Hol s in main w ll insert must be aligned with hol s in main w ll tub . Align tab and notch on lat r carburetors.* If accelerator pump has been removed, replace pump and "C" clip (make sure pump return spring is in place in bowl assembly). Install pump discharge valve. Replace needle seat and float needle, float, pin and new gasket, then adjust float level and float drop. Replace filter, gasket, and inlet nut. With a new gasket installed on bowl cover assembly, install cover assembly on bowl. Install six screws and lockwashers (install the two longer screws in original positions on either side of accelerator pump). Install pump rod into pump lever and secure with the clip.

SERVICE PARTS: Gasket Sets - Rochester No. 7016042 (7015300); No. 7016046 (7015310, 7015311, 7015312 7015313).

Repair Kit - Rochester No. 7016027 (all carburetors).

CORVAIR AUTOMATIC CHOKE & FAST IDLE

Corvair (1960)



DESCRIPTION: This assembly, which contains the automatic choke (fast idle & unloader), air horn, and air cleaner, is mounted on a tripod directly over the engine cooling blower between the two carburetors. Two tubes from the air cleaner direct filtered air to the top of each carburetor. The cross shaft between the two carburetors control the automatic choke, choke modifier, fast idle and unloader through linkage.

ADJUSTMENTS: The following adjustments are made on the choke & air horn assembly as follows:

Fast Idle: With idle speed and mixture adjustments completed, place a 1/8" spacer between throttle lever and adjusting screw at left hand carburetor, then remove the clip attaching fast idle link swivel to fast idle lever. Turn down fast idle adjusting screw until approximately 5/16" (early type lever); 3/16" (late type lever) of screw projects past fast idle lever. *NOTE – See illustration for identification of early and later type fast idle levers. On early type levers it will be necessary to extend the threads on fast idle link in order to turn swivel down far enough for proper adjustment.* Rotate fast idle cam counterclockwise (viewed from left of car) until fast idle screw can be brought to bear on highest point of cam. Hold fast idle screw in this position and turn swivel on fast idle link until swivel pin will just enter hole in fast idle lever. Clip swivel and link in position. Hold cam and lever in position. Hold cam and lever in slow idle position (screw on low side of cam) and carefully adjust fast idle screw to the 1/8" spacer installed between throttle lever and adjusting screw on left hand carburetor fits snugly but may be slipped out easily.

Automatic Choke (Choke Modifier): With fast idle cam in slow idle position and with modifier link connected to cross shaft lever, loosen lever and pointer screw and rotate pointer to index mark. *NOTE – Lever must point toward rear of car.* Tighten screw to lock lever and pointer in position.

Unloader: With throttle at wide open position, clearance between top of choke valve and adjacent wall of air horn should be ¼". Use Tool J–8370 to check distance. To adjust, bend unloader tang in center of fast idle cam.

CORVAIR AIR HORN WITH FAST IDLE & AUTOMATIC CHOKE

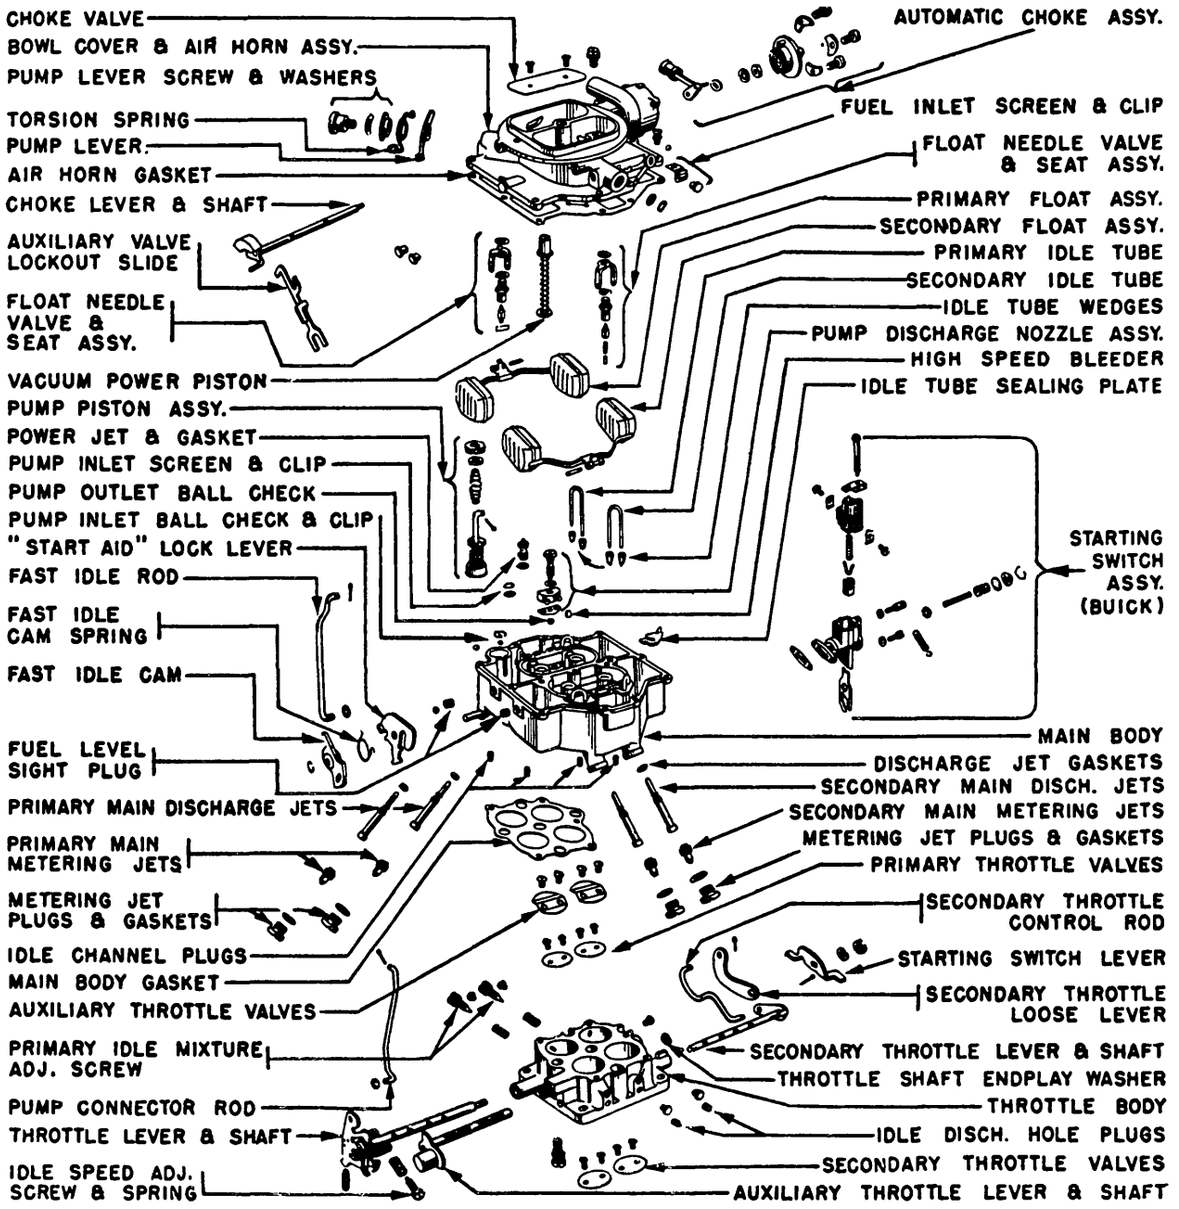
① - Use Metering Jet No. 7001860 (.055") to correct engine surge.

STROMBERG 4-BARREL 4A

BUICK **Stromberg Model & Code No.**
1954 Series 60, 70, M/100 Code 7-98



DESCRIPTION: These models are essentially double dual (two-barrel) carburetors with a conventional dual **primary** unit supplemented by a similar dual **secondary** unit for maximum engine performance. Both the primary and secondary units have separate fuel bowl and float systems, idle systems, main metering and discharge systems, and interconnected throttle valves as described below. Only the primary unit has an accelerating pump system and choke valve with an automatic choke control (the auxiliary throttle valves are locked closed for starting and warming up and remain closed during part-throttle operation). ***See Throttle Linkage data below.***

Fuel System: A single fuel inlet is used (located on secondary side of bowl cover) with a passage in the cover leading to the fuel inlet valve for each float chamber. Each bowl has a twin float assembly controlling the fuel inlet valve (secondary inlet valve is "spring-loaded" type). Bowls are vented to the air horn by vent tubes and have additional vent passages terminating at the air cleaner mounting flange (also have external vents in bowl cover). ***See also Idle Vent data below.***

Idling & Low Speed—Entire idle system is duplicated for both the primary and secondary sides of the carburetor except that idle mixture adjusting screws are provided only on the primary side (adjusting screw holes closed by plugs on secondary side). Fuel is discharged into each carburetor barrel and secondary idle system continues to function throughout the part-throttle range until the secondary throttle valves begin to open. Primary idle systems drop out as primary throttle valves open and main nozzles come into action and take over. Auxiliary throttle valves are locked out by the choke mechanism when the engine is cold and even when the engine is warm these valves do not begin to open until primary throttle valves are 50-60% open.

Driving Range (Less than 50-60% Throttle)—The primary throttle valves are directly connected to the accelerator pedal and open as the pedal is depressed (secondary throttle valves are linked to the primary throttle valves and remain closed until primary valves are 50-60% open). Opening of the primary throttle valves bring the main discharge nozzles into action and the primary idle systems drop out (the secondary idle systems continue to function as long as the secondary throttle valves remain closed). Fuel for these main nozzles is metered by the primary main metering jets. Under conditions of low manifold vacuum (hill-climbing, acceleration, etc.), main metering jets are supplemented by fuel by-passed through the power valve and metered by the power restriction (separate valves operated by a spring-loaded vacuum power piston). Power valve is used only for the primary side of the carburetor.

High Speed or Full Power (More than 50-60% Throttle)—At 50-60% throttle, the linkage between the primary and secondary throttle valve levers begins to open the secondary valves. These secondary valves open at a relatively greater rate so that both the primary and secondary valves reach the "wide open" position at the same time. In this range, fuel is discharged through all four carburetor barrels to provide maximum engine power. Secondary fuel is metered by secondary main metering jets and discharged through secondary main nozzles in exactly the same manner as on the primary side except that no power valve is used.

STROMBERG "4A" 4-BARREL CARBURETOR

Accelerating Pump—Used only on primary side of carburetor. Pump is conventional type with pump plunger linked to primary throttle valve lever so that the additional fuel needed for acceleration is discharged through the pump jets into the primary carburetor barrels when the primary throttle valves are opened for acceleration.

Primary & Secondary Throttle Linkage: Secondary throttle valve lever is linked to a secondary actuating lever on the primary throttle valve shaft with an overrun provision so that secondary valves do not begin to open until primary valves are 50-60% open. The linkage provides a more rapid opening of the secondary valves so that both the primary

CONTINUED N NEXT PAGE

STROMBERG 4-BARREL 4A (C ntinu d)

and secondary valves reach the wide open position at the same time. This linkage must be checked and adjusted to insure this synchronized opening. *Se Adjustment data.*

Auxiliary Throttle Valve Lock-out: A means is provided by which the choke mechanism locks the auxiliary throttle valves closed while the choke is in operation so that no choke valve is required on the secondary side of the carburetor. This lock-out mechanism must be checked and adjusted to insure unlocking of the secondary valves for normal operation. *See Adjustment data.*

ADJUSTMENT: *CAUTION—Adjustments must be made in exact sequence as given below (except for Idle Mixture and Idle Speed Tune-up adjustments).*

Idle Setting. *Adjust only with engine at normal operating temperature with automatic choke not operating* (choke valve wide open, fast idle inoperative so that engine idles at hot or slow idle speed). If initial adjustment required to enable engine to be started and warmed up, set each screw 1 turn open. With engine warm, adjust idle speed adjusting screw for correct idle speed shown in table below (use tachometer), turn each idle mixture adjusting screw (one screw for each primary carburetor barrel—two screws only) in until engine begins to miss or run unevenly, then turn screws out until engine begins to roll, finally set screws midway between these two points so that engine idles smoothly. Recheck idle speed.

IDLE SETTING

	Idle Screw Setting	Idle Speed
Buick 70	1 1/8 turns open	450 RPM.

Float Setting: *CAUTION—Primary and Secondary float assemblies must be checked and adjusted separately.* Fuel level can be checked without disassembling carburetor, float level setting requires removal of bowl cover and float assemblies.

Fuel Level—*CAUTION—Primary and Secondary fuel levels are different.* Fuel level in each bowl should be even with bottom of threads in fuel level inspection holes on sides of bowl casting with 5 lbs. fuel pump pressure. Fuel level distance below top edge (gasket seat) of bowl should be 11/16" (Primary), 5/8" (Secondary). See Float Level data for adjustment.

Float Level—*CAUTION—Secondary float intake needle is spring-loaded type and spring must not be compressed when checking float setting.* Remove air horn and bowl cover assembly but DO NOT remove bowl gasket from bowl cover. Invert bowl cover, install Float Setting Gauge No. T-25489 on bowl cover gasket under floats with locating buttons on gauge fitting into two holes along center line of gasket and air horn *(CAUTION*—gauge must seat flat and solidly on gasket). Inner side of each float should just clear upright guide on gauge and be parallel to the guides (floats should move freely with gauge in place). This will insure floats not dragging on sides of bowl in service. Adjust by bending float arm. Check height of each float by using correct size drill rod (see table below) to gauge distance between top of float at center and face of gasket. Adjust by bending float lever. *CAUTION—Both floats of each set must be adjusted exactly alike.*

FLOAT SETTING

Primary Floats

Carb. Code	Float Level	Drill Size
7-98	5/64"	#47

Secondary Floats

Carb. Code	Float Level	Drill Size
7-98	1/16"	#52

►*FLOAT ASSEMBLY CAUTION*—Different float assemblies and intake needle valve and seat assemblies used on primary and secondary sides af carburetor. Floats can be identified by "marking" figure on float lever as follows:

	Float Assy. Marking	Float Assy. Part No.	Intake Valve & Seat Size	Intake Valve & Seat Part No.
Primary	522	385959	.101"	P-22499
Secondary	520	385998	.076"	③385945

③—SPRING-LOADED type needle valve.

Accelerating Pump: Recommended setting is Short Stroke (pump rod connected in inner hole in throttle lever). Not necessary to check pump stroke.

Automatic Choke: Centered (inverted "V" mark on cover in line with end of projection on cover). Thermostat and Cover Assembly stamped "23" (1952-53), "30" (1954). Do not use any other number.

►*ADJUSTMENT CAUTION*—Heat tube connection and cover retainer screws must be loosened for adjustment. Use extreme care not to rotate or distort cover when tightening heat tube connection.

Fast Idle: *CAUTION*—Fast Idle Cam Setting should be checked first before making regular fast idle adjustment (Loose Lever & Lock Lever Clearance).

Fast Idle Cam—Remove air cleaner for access to choke valve. Close the choke valve against correct size drill rod (see table for sizes and changes) placed between center of upper edge of choke valve and air horn wall, hold choke valve firmly against drill. Make certain that fast idle cam spring holds cam up against end of fast idle rod, close throttle until stopscrew contacts fast idle cam. Stopscrew should just clear edge of highest step on cam and come up against second step. Adjust as required by bending fast idle rod at the large curve.

Fast Idle Setting

Carb. Code	Drill Size & Choke Clearance
7-98	#51 (.067")

Loose Lever & Lock Lever Clearance—After adjusting fast idle rod above, substitute a #53 drill for the drill used in making the rod adjustment. Hold choke valve firmly against the #53 drill, open and close primary throttle valve and note clearance between start-aid lock lever on throttle shaft and loose lever behind fast idle cam. This clearance should be just enough to permit the levers to clear. Adjust by bending end of lock lever up or down.

CAUTION—Use care not to distort fast idle cam return spring or cause bind between rod and slot in cam.

Unloader (Wide-open Kick & Deflooder): Move throttle valves to wide open position, measure choke valve opening (clearance between upper edge of choke valve at center and air horn wall). This clearance should be .221" (use No. 2 drill rod). Adjust as required by bending tongue on throttle lever which contacts arm on fast idle cam. Close both choke valve and throttle valve, then open the throttle against the tension of the start-aid loose lever spring. Lock lever should release the loose lever and the spring tension before stop arm on throttle lever contacts stop boss on throttle body.

Secondary Throttle: *Secondary throttle linkage should be checked and adjusted at two points:*

Wide-open Throttle—Move primary throttle valves to wide-open position. If secondary throttle valves are not wide open, or if secondary shaft lever comes up against its stop before primary throttle valves are wide open, adjust vacuum switch lever as follows: Hold switch lever by applying wrench to flat surface below loose lever, then bend curved end of switch lever up or down as required with pliers so that primary throttle valves are wide open (parallel with walls) and secondary throttle valves are also wide open with inner end of secondary throttle shaft lever bearing against stop boss on body.

Part Throttle—With secondary throttle valves closed, open primary throttle valves just enough to take up all slack in linkage so that secondary valves are ready to open. Check primary throttle valve opening (clearance between lower edge of valves and carburetor wall). This clearance must be .125" minimum, .180" maximum. Adjust as required by bending the throttle control rod at the large curve back of the loose lever. Rod ends should measure 2 11/16" plus or minus 1/32" between centers.

Auxiliary Throttle: *Auxiliary throttle valve closed position, and lock-out action must be checked and adjusted:*

Valve Position—With auxiliary throttle valves closed, clearance between edge of valve and carburetor wall should be .015" measured on longer side of valve at dividing wall between primary and secondary barrels. Adjust by loosening valve attaching screws and shifting valve. Check valves for free operation without binding through entire travel except for lock-out action in closed position.

Lock-out Slide Clearance—*Two separate adjustments required as follows:*

Locked Clearance—With auxiliary throttle valves in closed position, close choke valve fully so that locking slide engages auxiliary valve counterweight lever. Check clearance between ear on slide and edge of lever with a feeler gauge. This clearance should be .025" minimum, .060" maximum. Adjust by bending ear on slide.

Unlocked Clearance—With choke valve wide open, move auxiliary throttle valves to wide open position. Clearance between end of locking ear on slide and edge of auxiliary valve counterweight lever should be 3/64" minimum, 5/64" maximum. Adjust by bending choke lever slide actuating arm.

STARTING SWITCH: *See "Carter Car Starter" in Electrical Section. Switch setting can be checked as follows:*

Switch Setting (Carburetor on Engine)—On Dynaflow cars, make certain Dashpot and throttle linkage correctly adjusted, place transmission selector lever in neutral and set hand brake firmly to hold car With engine not running, insert a pin through felt filter and screen to operate vacuum piston, push vacuum piston in and hold it while opening throttle (this will allow slide to engage groove in piston and prevent slide dropping down to complete contact), **hold throttle open,** remove pin Place 5/64" spacer between fast idle stopscrew and fast idle cam with fast idle cam in **cold idle position.** Close throttle so that spacer holds cam in cold idle positon Turn ignition on, hold spacer, depress accelerator to start

CONTINUED ON NEXT PAGE

STROMBERG 4-BARREL 4A (Continued)

engine. **Engine should not crank.** Repeat above test with 3/64" spacer between stopscrew and fast idle cam. **Engine should crank.** If engine cranks with 5/64" spacer, bend tang on switch operating lever downward slightly and recheck switch timing. If engine does not crank with 3/64" spacer, bend tang on operating lever upward slightly and recheck switch timing.

OVERHAUL: ***CAUTION—When disassembling carburetor, be sure to keep PRIMARY and SECONDARY side parts separate so they will not be confused or interchanged when carburetor reassembled.***

Disassembly: Carburetor consists of three main subassemblies (Air Horn & Bowl Cover, Main Body, and Throttle Body) which can be overhauled separately as follows:

Air Horn & Bowl Cover—First disconnect spring from secondary throttle shaft lever and remove accelerator vacuum switch and gasket by taking out two attaching screws in throttle body. Disconnect fast idle rod from choke shaft lever and pump rod from pump lever. Remove pump lever fulcrum screw (left-hand thread), anti-rattle washer, and torsion spring washer, then disconnect pump lever from pump piston stem and remove lever. Take out all air horn and bowl cover attaching screws, lift air horn just far enough to free lock-out slide, remove slide, then lift air horn straight up *(CAUTION*—use extreme care not to damage floats, pump piston, or vacuum power piston). Invert air horn and remove pump piston assembly. Remove float hinge pins (tap plain end of pin to force serrated end out of hanger), remove float and intake needle assemblies, use wrench T-20140 to remove needle seats and gaskets *(CAUTION*—keep each float assembly, intake needle, and needle seat together, DO NOT mix primary and secondary side parts). Remove float hangers and bowl cover gasket. Remove vacuum power piston (compress spring to obtain grip on outer end of piston stem with pliers, then pull piston straight out to avoid bending piston stem). Remove choke cover and coil assembly by taking out screws and removing retainers. Use wrench T-25047 to remove nut on end of choke shaft, remove lockwashers and serrated washer. Remove choke valve attaching screws, remove valve. Remove choke shaft and vacuum piston and lever assembly.

Main Body—Remove four idle tube sealing plates to avoid losing them during overhaul but DO NOT remove Idle Tubes unless replacement required (see special Idle Tube Installation data below). Take out pump discharge nozzle screw, remove nozzle and gaskets, then invert body and catch valve ball which will fall out of pump discharge passage. Take out retainer clip in bottom of pump cylinder and remove inlet check valve ball located in cylinder below retainer. Take out attaching screws and remove throttle body from main body, remove gasket. Pry snap ring from fast idle cam post, remove cam, lock lever, and spacer washer. Take out main discharge jet plugs (tool T-19099), remove copper gaskets, remove main metering jets (Socket wrench tool T-24924), remove main discharge jets (Jet Remover tool T-24967—screw tool into base of jet and then pull jets straight out of main body). *CAUTION*—Lead gasket at discharge jet seat in main body must be completely removed. Take out small plugs on bottom of main body directly below end of tubes (will allow idle tubes and passages to be cleaned without disturbing tubes).

Throttle Body—Remove both idle adjusting screws and springs. Take out attaching screws and remove auxiliary throttle valve from shaft, pry washer off end of shaft, remove shaft and lever assembly. **Mark all throttle valves** by lightly scribing line on valve along both sides of shaft and also indicate location to insure re-installing valve in same barrel, take out attaching screws and slide valves out. Disconnect control rod from secondary throttle shaft lever, remove shaft from body. Remove nut, lockwasher, switch lever and loose lever from end of primary throttle shaft, remove shaft and lever assembly from body.

Cleaning & Inspection: Thoroughly clean all parts using Bendix Metalclene or equivalent cleaning solvent, rinse with clear gasoline and dry with air. Blow out all passages in casting with air (pay particular attention to idle tubes and passages—if tubes require removal, see special removal and installation data below), make certain all gum and carbon deposits removed. Check choke shaft and throttle shafts for wear in bearings. Inspect choke thermostatic coil for distortion or damage, see that vacuum piston and cylinder are clean and free of burrs or scores. Replace fuel inlet strainer and pump strainer if clogged or damaged. Check pump piston leather for cracked, creased or turned edges or other damage, make certain relief valve in piston is tight (blow on lower end of piston). Inspect all check ball seats in castings (if seats rough, reface by placing ball on seat and tapping ball lightly, then DISCARD balls after such use). Inspect all jets for wear or damage. Replace all worn or damaged parts.

Idle Tube Removal & Installation: If tubes require removal for any reason, always install NEW tubes as directed below:

Removal—Pry old tube out using a screwdriver blade placed under tube loop *(CAUTION*—use piece of wood under screwdriver blade to avoid marring top edge of main body. DISCARD old tube and wedges.

Installation—Place tool T-25525 on top surface of main body with flat surfaces vertical, place NEW idle tube and wedges in position over tool (tube should loop over tool which will position the tube properly). *CAUTION*—Small diameter end of tube should be inserted in hole which is directly above main discharge jet passage. Hold tube loop down against positioning tool, slide wedges down into holes in main body, use Wedge Driver T-25488 and light hammer to seat wedges snugly in place. Remove positioning tool T-25525 using care not to disturb tube seals.

Reassembly: Use all NEW gaskets. Install all parts in reverse order of disassembly procedure (above) and pay particular attention to the following:

Throttle Valve Installation—Install each valve in same carburetor barrel from which removed (as marked before removal) with dash mark on primary valves and crescent mark on secondary valves toward top of body and on same side as idle ports. Install new valve screws loosely, align scribe marks carefully, then tighten screws. Check valves by sighting through barrel and shifting valves as required until least amount of light visible around edge of valve. After valves properly set, tighten screws securely and stake ends lightly *(CAUTION*—support screw heads on steel block while staking to prevent bending of shaft).

Auxiliary Throttle Valve Installation—Use new screws to attach valves, position valves so that clearance between inner edge of valve and middle wall of carburetor is .015" (measure with a wire gauge). After valves correctly positioned, tighten screws securely and stake ends in same manner as other throttle valve screws above.

Idle Adjusting Screws & Springs—Turn both screws in until lightly seated, then back screws out 1⅛ turns for preliminary adjustment which will allow engine to be started and warmed up (see ADJUSTMENT data for final setting).

Main Discharge Jets—Use new lead gasket on upper end of jet, install by using Remover Tool T-24967 to seat jet in main body. Flat surface of all jets must be parallel to air flow when installed in carburetor *(CAUTION*—Secondary jets only are notched on this upper flat surface).

Main Metering Jets—Make certain that primary and secondary jets are not interchanged (Secondary jets have groove on shank—primary jets not grooved).

Main Discharge Jet Plugs—Use new copper gasket on plugs. Plugs must be tight.

Choke Valve Installation—Use new screws to attach choke valve and position valve so that clearance uniform between valve edges and air horn. After tightening screws, make certain that valve operates freely and falls open of own weight without binding at any point, then stake ends of screws lightly (support screw heads on steel block to avoid bending shaft).

Choke Piston Installation (1954)—Install vacuum piston in cylinder *(CAUTION*—do not use any kind of lubricant on piston or cylinder), engage lever on end of choke shaft, install lockwasher and nut. Tighten nut with wrench T-25047.

Vacuum Power Piston Installation—When installing piston in air horn DO NOT use any kind of lubricant on piston. Stake edge of cylinder at three points to retain piston. Make certain that piston operates freely in cylinder.

Float & Intake Needle Valve Installation—When installing float hangers and needle seats, use new gaskets above and below hanger. Make certain that corect float, intake needle, and seat used on primary and secondary sides (see Float data under ADJUSTMENTS above). Intake needle must be clipped to float arm properly and float assemblies must operate freely on fulcrum pins. Adjust float height and float alignment (see Float Level under ADJUSTMENTS above).

Accelerator Vacuum Switch Installation & Adjustment—Use new gasket when installing switch and place long grooved mounting screw on primary side, hook secondary throttle shaft lever return spring on this screw). After all linkage assembled, adjust switch as follows: Close primary throttle valve against a No. 41 drill rod, bend tang on switch operating lever until it just touches switch slide. This is an approximate setting only and should be rechecked after carburetor installed on engine.

Carburetor Adjustments—Make all adjustments as listed under ADJUSTMENTS above.

SERVICE PARTS: Gasket Set—Stromberg No. 382361. **Repair Parts Kit**—Stromberg No. RK-182

STROMBERG AAVB DUAL

BUICK	Stromberg Model & No.
1954 Series 40 & 50	⑫AAVB-267 No. 380245
1955 Series 40	⑬AAVB-267 No. 380372

⑫—Code No. 7-96.
⑬—Code No. 7-102 & 7-102A.

DESCRIPTION: Dual or Double Barrel Downdraft Carburetors with automatic choke. Buick carburetors have two types of Starting Switch assemblies. See Starter Switch below. Similar in design to "AAV" carburetors used previously.

ADJUSTMENT: Set these carburetors to the following specifications:

IDLING ADJUSTMENT

Idle Screw Setting—Adjust both screws equally with engine warmed up to normal operating temperature so that choke valve wide open and fast idle inoperative. Set throttle stopscrew for correct idle speed, turn each idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in until engine runs smoothly. Recheck idle speed. See car model page for complete Tune-Up instructions.

Idle Setting

Buick (All Models) Approx. 1½ turns open

Idle Speed (Buick)—450 RPM. (all cars).

Idle Speed (Studebak r)—550-600 RPM. (Synchromesh Trans. Cars), 500-550 RPM. (Automatic Trans. Cars with selector lever in Neutral "N").

ACCELERATING PUMP

Car Model	Pump Capacity	Pump Setting
Buick 70	...10-14 cc(F), 15-19 cc(S).....	Medium

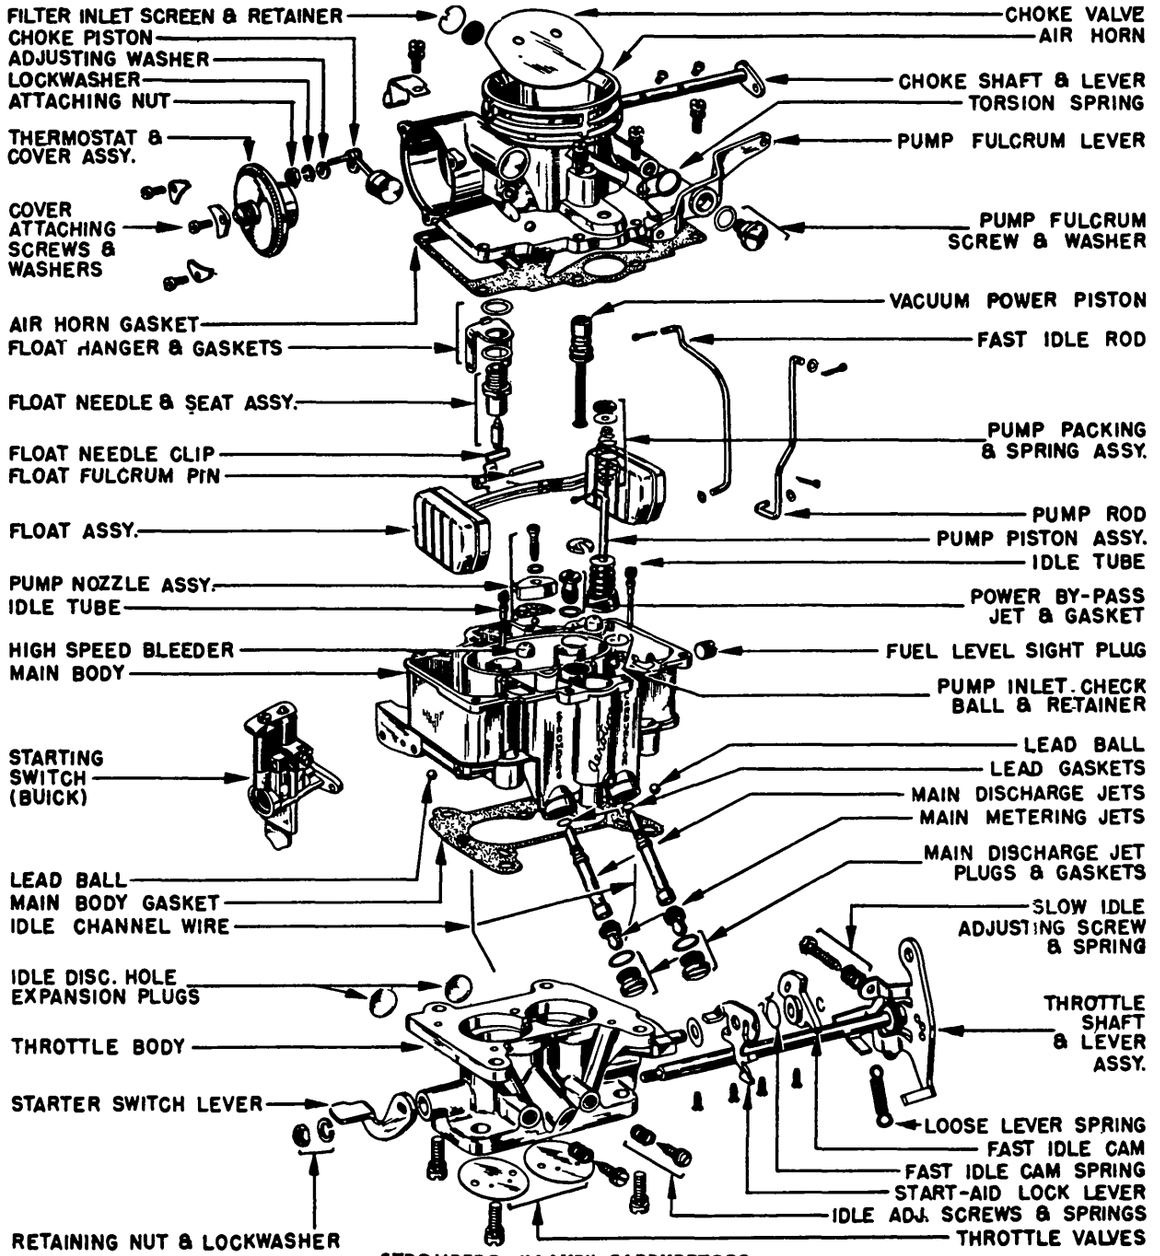
NOTE—Pump capacity is for 10 strokes, Fast (F), Slow (S) with pump stroke setting as indicated.

Recommended Pump Setting—Buick—Center Hole (medium stroke).

ECONOMIZER SETTING

No adjustment required. Valve opens when manifold vacuum drops to 4-6" (or 65-70 MPH.).

FLOAT LEVEL



Float Setting—5/64" projection **above** top edge of Checking Gauge T-24971 (all models). To check float level, invert bowl cover and float assembly, place checking gauge on cover gasket (DO NOT remove gasket) with lugs on gauge seated in holes in bowl cover. Adjust both floats **vertically** so that tops of floats are 5/64" above gauge guides, adjust floats **laterally** so that they are parallel to gauge guides without binding (necessary to prevent floats dragging on sides of bowl).

Fuel L vel—21/32" below top edge of bowl with pressure of 5 lbs. (all models) or even with bottom of threads in inspection hole on side of bowl.

FAST IDLE SETTING

Buick Fast Idle: *TWO settings required:*

1) **Fast Idle Cam**—Close choke valve against correct size drill rod (see table below), see that fast idle cam spring holds cam upward against end of fast idle rod (rod in lower end of slot in cam). Close throttle until stopscrew contacts fast idle cam. If screw does not just clear edge of highest step on cam and bear against second (short) step, adjust by bending fast idle rod at upper curve See that rod does not bind on cam or in choke lever.

STROMBERG "AAVB" CARBURETORS

Buick Fast Idle Cam Setting

Car & Carburetor	Checking Drill Size
Buick 40, 50 (1954)	#51 (.067").
Buick 40 (1955)	#54 (.055").

①—Supersedes #26 (see Improved Warm-up and Stalling Elimination Change).

2) **Lever Clearance.** Close choke valve against #53 drill, adjust clearance between ear on locking lever on throttle valve shaft and lug on loose lever on fast idle cam stud so that these levers just clear as throttle valve opened and close. Adjust by bending end of loose lever up or down.

CONTINUED ON NEXT PAGE

STROMBERG AAVB DUAL (C nt.)

UNLOADER (CHOKE RELEASE)

Setting—.151-.121" or #29 drill (Exc. 1955 Buick), .086" or #44 drill (1955 Buick), choke valve opening with throttle valve wide open. To check open throttle valve wide, measure choke valve opening or clearance between edge of valve and air horn wall using correct size drill rod. Adjust by bending throttle lever ear which contacts fast idle cam.

►***BUICK NOTE***—After making above adjustment, close throttle and choke valve, then open throttle **against tension of the start-aid lever spring.** The lock lever should release the loose lever and the spring tension before stop arm on throttle lever contacts stop boss on throttle body.

AUTOMATIC CHOKE

Car Model	①Choke Setting
Buick (All Models)	Centered

①—Reference point is left end of boss on choke housing.

CHOKE ADJUSTMENT CAUTION—**Use extreme care when tightening heat tube connection not to rotate or distort choke cover.**

STARTING SWITCH

(1954 Buick Carburetors)

Switch Setting (Carburetor on Engine)—On Dynaflow cars, make certain Dashpot and throttle linkage correctly adjusted, place transmission selector lever in neutral and set hand brake firmly to hold car. With engine not running, insert a pin through felt filter and screen to operate vacuum piston, push vacuum piston in and hold it while opening throttle (this will allow slide to engage groove in piston and prevent slide dropping down to complete contact), **hold throttle open,** remove pin. Place 5/64" spacer between fast idle stopscrew and fast idle cam with fast idle cam in **cold idle position.** Close throttle so that spacer holds cam in cold idle position. Turn ignition on, hold spacer, depress accelerator to start engine. **Engine should not crank.** Repeat above test with 3/64" spacer between stopscrew and fast idle cam. **Engine should crank.** If engine cranks with 5/64" spacer, bend tang on switch operating lever downward slightly and recheck switch timing. If engine does not crank with 3/64" spacer, bend tang on operating lever upward slightly and recheck switch timing. *See "Stromberg Starter Switch" in Electrical Equipment Section for complete data.*

(1955 Buick Carburetor)

Switch Setting (Carburetor on Engine)—On Dynaflow cars make certain Dashpot and throttle linkage are correctly adjusted, and transmission selector lever is in Neutral and parking brake fully applied. Back off throttle stop screw, rotate fast idle cam to slow idle position if necessary, and fully close throttle valve. Hold a stiff 6" scale or straight edge against rear face of lower arm of throttle lever which contacts Dashpot, with scale resting on rocker arm cover. With throttle valve fully closed, scribe pencil mark on cover at front edge of scale Turn ignition switch and open throttle slowly Scribe a second mark on rocker arm cover at point where starting motor is energized. The switch is correctly timed when distance between marks on rocker arm cover is 29/32"-1 7/16". To retime switch, change timing shims in switch assembly. Reset engine idle speed to 450 RPM and recheck throttle linkage and Dashpot adjustments. *See "Carter Car Starter" in Electrical Section.*

OVERHAUL: On Buick carburetors, first remove vacuum switch assembly and gasket. Disconnect and remove accelerating pump rod and fast idle rod. Disconnect pump lever from pump piston stem, then take out pump lever fulcrum screw (this screw has left-hand thread), remove lever. Take out air horn attaching screws and lockwashers, lift air horn assembly straight up and off main body. Remove pump spring from pump cylinder and pump piston assembly from air horn. Take out throttle body retaining screws and lockwashers, then lift main body straight up and off. Remove gasket, lift idle channel wires out of throttle body.

Air Horn Disassembly—Tap float hinge pin out (push pin out toward serrated end), remove float and intake needle assembly, free needle from float lever clip, lift off air horn gasket. Unscrew needle valve seat (Wrench T-20140), remove seat, float hanger, and gaskets. Remove staking from around edges of vacuum piston cylinder, remove piston assembly (piston can be removed by gripping upper end of stem directly above the spring with pliers and using 1" block of wood as a fulcrum so that piston can be pulled straight out). Take out thermostat cover screws, remove thermostat cover assembly. Use wrench T-25047 to remove locknut on end of choke shaft, remove lockwasher and serrated washer (Buick carburetors). Take out choke valve attaching screws, remove valve, slide choke shaft out, remove choke piston and lever assembly.

Main Body Disassembly—Remove power by-pass jet and gasket, remove both idle tubes. Remove main discharge jet plugs and copper gaskets, use special socket wrench T-24924 to remove main metering jets. Use Jet Remover T-24967 to remove main discharge jets (screw tool into end of jet and pull jet from main body—threads formed by tool will not affect metering characteristics of jet), make certain that discharge jet lead gaskets removed from body recess. Take out pump discharge nozzle screw, remove nozzle assembly and gaskets, invert body to drop discharge check ball from discharge passage. Remove intake check ball retainer from bottom of pump cylinder, invert body to drop out intake check ball. Remove pump inlet strainer screen (not used on all carburetors).

Throttle Body Disassembly—Hold down on vacuum switch terminal cap while removing hold-down clip. Remove terminal cap and switch return spring, then lift out switch guide block with contact spring and shims. Do not lose timing shims and the spring washer on contact spring. Turn throttle body over to allow plunger rod ball to drop into hand. Mark throttle valves so they may be reinstalled in original positions in barrel of throttle body (Scribe valve, stem and bore to insure accurate repositioning). Remove screws, slide valves out of stem, remove retainer washer, then remove throttle lever and stem assembly, from throttle body. Remove idle needle valves & springs, pry ring from post which supports fast idle cam and remove fast idle cam, lock lever, and spacer washer.

Cleaning & Inspection: Clean all parts thoroughly in Bendix Metalclene or similar cleaning solution, rinse in solvent. Make certain that all carbon and gum deposits removed, blow out all passages and dry parts with air *(NOTE*—If necessary to remove lead plugs, use Tool T-25052. Install new plugs with Plug Set T-25053. Inspect all parts for wear.

Air Horn & Choke Parts—Vacuum piston and cylinder in air horn must be clean and free of burrs or scores. DO NOT use any abrasive material for cleaning these parts.

Vacuum Power Piston & By-Pass Jet—Surface of piston must be thoroughly cleaned. DO NOT use any abrasive material for polishing the surface of piston. Test by-pass jet for tight seating by sucking on upper end. Replace as necessary.

Main Body—Main body must be thoroughly clean and all passages free of foreign material. Check high speed and idle air bleeders for correct sizes. Use drill size #70 for checking high speed bleeder, and #56 for idle air speed bleeder.

Main Discharge Jets & Idle Tubes—Inspect main discharge jets to insure that tips are not damaged or walls distorted so as to deform holes. Test idle tubes by blowing or sucking to make sure metering holes are clear, be sure small ends are not damaged so as to deform metering holes.

Pump Piston, Discharge Nozzle and Related Parts—Pump piston leather must be free of cracks, creases, turned edges or other damage. Relief valve in piston must seat (test by blowing on lower end of piston). Suck or blow on discharge nozzle to be sure holes are clear and always replace pump inlet and discharge channel check valve balls. Replace check valve ball seats if strong light reveals that they are rough or loose in seat. To replace seat, use a steel ball and tap lightly, then discard ball.

Throttle Valves, Throttle Lever & Stem Assembly—Check throttle stem bearing for wear. Air leaks will affect performance if wear is in excess of .006". Replace throttle valves that show sharp edges, burrs, or are bent.

Reassembly: Use all NEW gaskets, install parts in reverse of disassembly procedure. Note following:

Throttle Shaft & Lever Assembly—Attach fast idle rod to fast idle cam with washer and hook cam spring into groove in rod. Install spacer washer, loose lever lock lever, and fast idle cam on post in throttle body, then snap ring in groove in post. Install lever and stem assembly in throttle body and retainer in end of stem.

Throttle Valve Installation—After throttle shaft and lever assembly installed in body, install each throttle valve in same barrel from which removed, install new valve screws loosely, then close valves, carefully align marks made before disassembly and tighten screws securely. Check valves by holding throttle body up toward a light, shift valves as necessary until least amount of light visible around valve edge, finally stake valve screws (support screw head on steel block while staking opposite end).

Accelerator Vacuum Switch—Lubricate contact surfaces of terminal cap with Beacon M-285 lubricant, or petroleum jelly if Beacon Lubricant not available, by working lubricant into a piece of clean cloth and lightly swabbing inside of cap. ***CAUTION***—Do not use ordinary lubricants or lubricate ball or plunger as poor switch contact will occur during cold weather. Place plunger in position with groove up so that ball rests on lip at inner end of plunger.

CONTINUED ON NEXT PAGE

STROMBERG AAVB DUAL (C nt.)

NOTE—If plunger not correctly installed, poor switch action with resulting gear clashing will occur. Make sure all timing washers, contact spring, and return spring washer are in proper position before installing return spring and terminal cap. Be sure terminal cap is properly seated. ***For switch timing, see "Switch Setting (Carburetor on Engine)" above.***

Main Discharge Jet Assemblies—Place new lead gasket over beveled end of main discharge jet, use remover tool T-24967 to seat jets in main body *(CAUTION*—flat surface on end of jet must be parallel to air flow), install main metering jets and plugs with new copper gaskets.

Idle Channel Wires—When installing throttle body on main body, make certain that idle channel wires installed with **short** end in throttle body and guide opposite end into idle channel in main body. ***CAUTION—use care not to bend channel wires.***

Choke Valve Installation—After choke shaft installed in air horn, install valve with dash mark on valve toward top of air horn, install new screws loosely, close valve and make certain clearance around valve uniform, then tighten screws securely. Check for free operation (valve should drop freely of own weight and should not bind at any position),

Choke Piston Setting (Buick)—After choke piston and lever assembly installed in cylinder, install adjusting washer with serrated side toward piston lever, install lockwasher and nut and tighten nut finger-tight. Install Gauge T-25046 in choke housing with the outer flange piloting in the housing and the small hole in the gauge fitting over the pin on the choke lever. Turn gauge until two indicator lines on face are centered on left end of indicator boss on housing. Close choke valve against #29 drill rod (insert drill between upper edge of valve and air horn wall), tighten piston lever locknut lightly. Remove drill and gauge, close choke valve, tighten locknut securely, recheck setting. *NOTE*—This adjustment not required on Studebaker.

Thermostatic Coil Installation—Place coil assembly on housing with coil hook downward, rotate assembly in direction of arrow until "V" mark on cover in line with left edge of indicator boss on housing, tighten retainer screws securely.

Vacuum Power Piston Installation—Make certain that piston operates freely in cylinder but DO NOT lubricate piston, seat retaining washer in body recess and stake edge of cylinder at three points

Float & Intake Valve Installation—Use new gasket on each side of float hanger, tighten intake needle seat securely. Install new gasket on air horn before installing float assembly, clip intake needle to float arm, install assembly and tap float fulcrum pin in so that serrated end locks in hanger leg. Adjust float level (see ADJUSTMENTS). Make certain that float lever moves freely in hanger and that intake needle has 1/16" travel in closed position (adjust by bending float lever stop).

Carburetor Adjustment—See ADJUSTMENTS.

STROMBERG DUAL "AAVB" & 4-BARREL "4A" TYPES

DESCRIPTION

DESCRIPTION & OPERATION: Thermostatic coil and vacuum piston type. **Thermostatic coil and vacuum piston are mounted on carburetor and linked directly to choke valve lever (no external linkage). Vacuum passage (for piston operation) is drilled in carburetor casting and opens into manifold below throttle valve. Hot air tube (for thermostatic coil operation) is connected between choke housing and hot air stove on exhaust manifold. When engine is cold, thermostatic coil winds up and tends to close choke valve (valve cannot close until throttle opened momentarily to release fast idle screw from cam; but is snapped closed as soon as throttle opened). When engine begins to fire, manifold vacuum causes vacuum piston to be drawn into cylinder which opens choke valve slightly against the thermostatic coil tension to provide proper air mixture for continued running. As engine warms up, thermostatic coil tends to unwind, releasing choke valve and allowing it to open (valves are offset).**

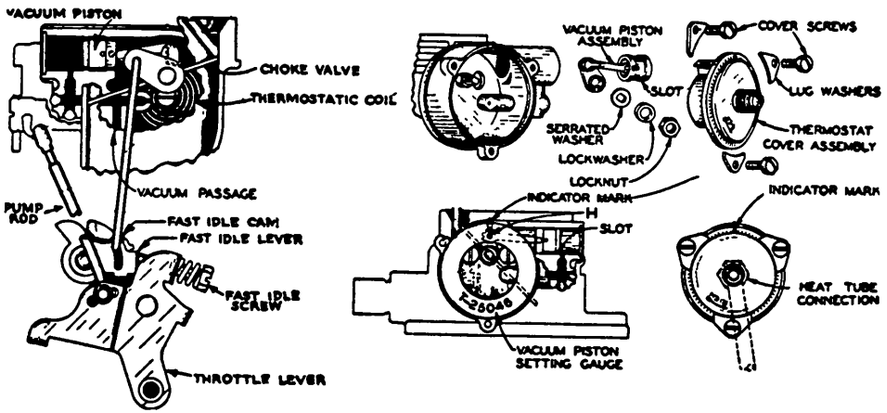
►*BUICK 70 "4A" 4-BARREL NOTE:* Automatic choke and fast idle mechanism is similar to design used on other Buick dual or 2-barrel carburetors and is adjusted in same manner. Choke valve is located on primary side of air horn and controls primary barrels only (Auxiliary Throttle Valves on secondary side are locked closed by the choke valve while choke is in operation so that no choke mechanism is required on the secondary side).

Fast Idle:—Consists of a stepped cam linked to the choke valve. When choke valve closed by thermostatic coil for cold starting, cam is revolved so that the throttle stopscrew rests on highest step of the cam and throttle is held open in fast idle position. As engine warms up and choke valve opens, cam is revolved and throttle allowed to close, until with the engine warm and choke valve wide open, throttle is closed to hot or slow idle position.

ADJUSTMENT & OVERHAUL

►***CAUTION—When reassembling all models except Studebaker AAV-26 & AAUVB-26, special ring gauge must be used to adjust vacuum piston assembly position on choke shaft (see Reassembly data below).***

DISASSEMBLY: Disconnect heat tube from thermostat housing cover, remove carburetor from manifold. Remove thermostat cover retaining screws and lug washers, remove thermostat cover assembly by rotating it clockwise to disengage coil hook from lever prong and then lifting it off the housing. Remove locknut on end of choke valve shaft (use socket wrench T-25047), remove lockwasher and serrated washer (serrated washer not used on Studebaker models). Remove vacuum piston assembly from the housing.



CLEANING & INSPECTION: Clean vacuum cylinder and piston with a clean cloth saturated with acetone or alcohol (CAUTION—do not use abrasives to clean cylinder or piston). Blow out all channels with compressed air. Clean the screen on the inside of the cover by blowing through heat tube connection and around inside cover (CAUTION—when using compressed air, use care not to distort screen or thermostatic coil). Do not attempt to remove thermostatic coil from cover (these parts furnished as an assembly).

REASSEMBLY: ***Do not lubricate piston or cylinder.*** Install vacuum piston assembly in cylinder, assemble lever on choke valve shaft. Install serrated washer (not used on Studebaker), lockwasher, and locknut. On all models except Studebaker, adjust vacuum piston assembly before tightening locknut (see Adjustment below). Tighten locknut securely, recheck choke valve opening to make certain setting not disturbed by tightening the nut. Install thermostat cover assembly with coil hook at the bottom, then rotate cover in "Rich" direction (counterclockwise) until inverted "V" mark on cover is in line with center graduation of scale on housing. Install lug washers and tighten retainer screws securely. NOTE—This procedure will provide "Centered" setting. See Choke Setting data for special settings used on some models.

Vacuum Piston Assembly Adjustment (Not required on Studebaker AAV-26 and AAUVB-26). With locknut tightened loosely (do not tighten fully until piston adjusted), install ring gauge (see Note below) with hole in tool fitting over pin on choke lever and indicator line on rim of tool in line with reference mark on choke housing. Hold choke valve closed against drill or gauge (see table), tighten locknut lightly with wrench T-25047, remove the gauge ring and then tighten the locknut securely. Recheck the choke valve to make certain that setting not changed by tightening of locknut. See that choke valve operates freely. This adjustment is extremely important to properly position vacuum piston and thermostatic coil prong.

►**Buick Ring Gauge Note:** Gauge No. T-25046 used on all Buick models with dual (2-barrel) carburetors EXCEPT Models AAUVB-267 & AAVB-267 for which NEW Gauge No. T-25367 should be used **or T-25046 gauge modified** to permit its use on these models.

►**Buick Series 70 (4-Barrel Carburetor) Ring Gauge Note:** Use Gauge No. T-25367 on these models. Reference point on this gauge consists of two lines and reference point on housing (left end of boss) should be centered between the two lines.

Fast Idle Connector Rod Installation: When reassembling the fast idle connector rod, install bushing (washer—Buick), on lower end of rod after rod has been assembled to lever. See that fast idle cam torsional spring is assembled with end of spring hook against ear of lever. See that cam operates freely and make certain that rod does not bind in slot in cam. This is very important.

Auxiliary Throttle Valve Lockout Slide Clearance (Buick 4A Carburetors): ***The Lockout Slide is operated by the choke mechanism and must be checked and adjusted after the choke mechanism has been reassembled. Two separate adjustments are required:***

Locked Clearance—With auxiliary throttle valves in closed position, close choke valve fully so that lock slide engages auxiliary valve counterweight lever. Check clearance between ear on slide and edge of lever with a feeler gauge. This clearance should be .025" minimum, .060" maximum. Adjust by bending ear on slide.

Unlocked Clearance—With choke valve wide open, move auxiliary throttle valves to wide open position. Clearance between end of locking ear on slide and edge of auxiliary valve counterweight lever should be 3/64" minimum, 5/64" maximum. Adjust by bending choke lever slide actuating arm.

1955-58 STROMBERG "WW" BUICK CARBURETOR

BUICK	Stromberg Code No.
1955 Series 40	WW 7-104
1956 Series 40	WW 7-105, A
1957 Series 40 (Auto. Trans.)	WW 7-106, A, B, C
1958 Series 40 (Auto. Trans.)	WW 7-109, A

►CHANGES, CAUTIONS, CORRECTIONS

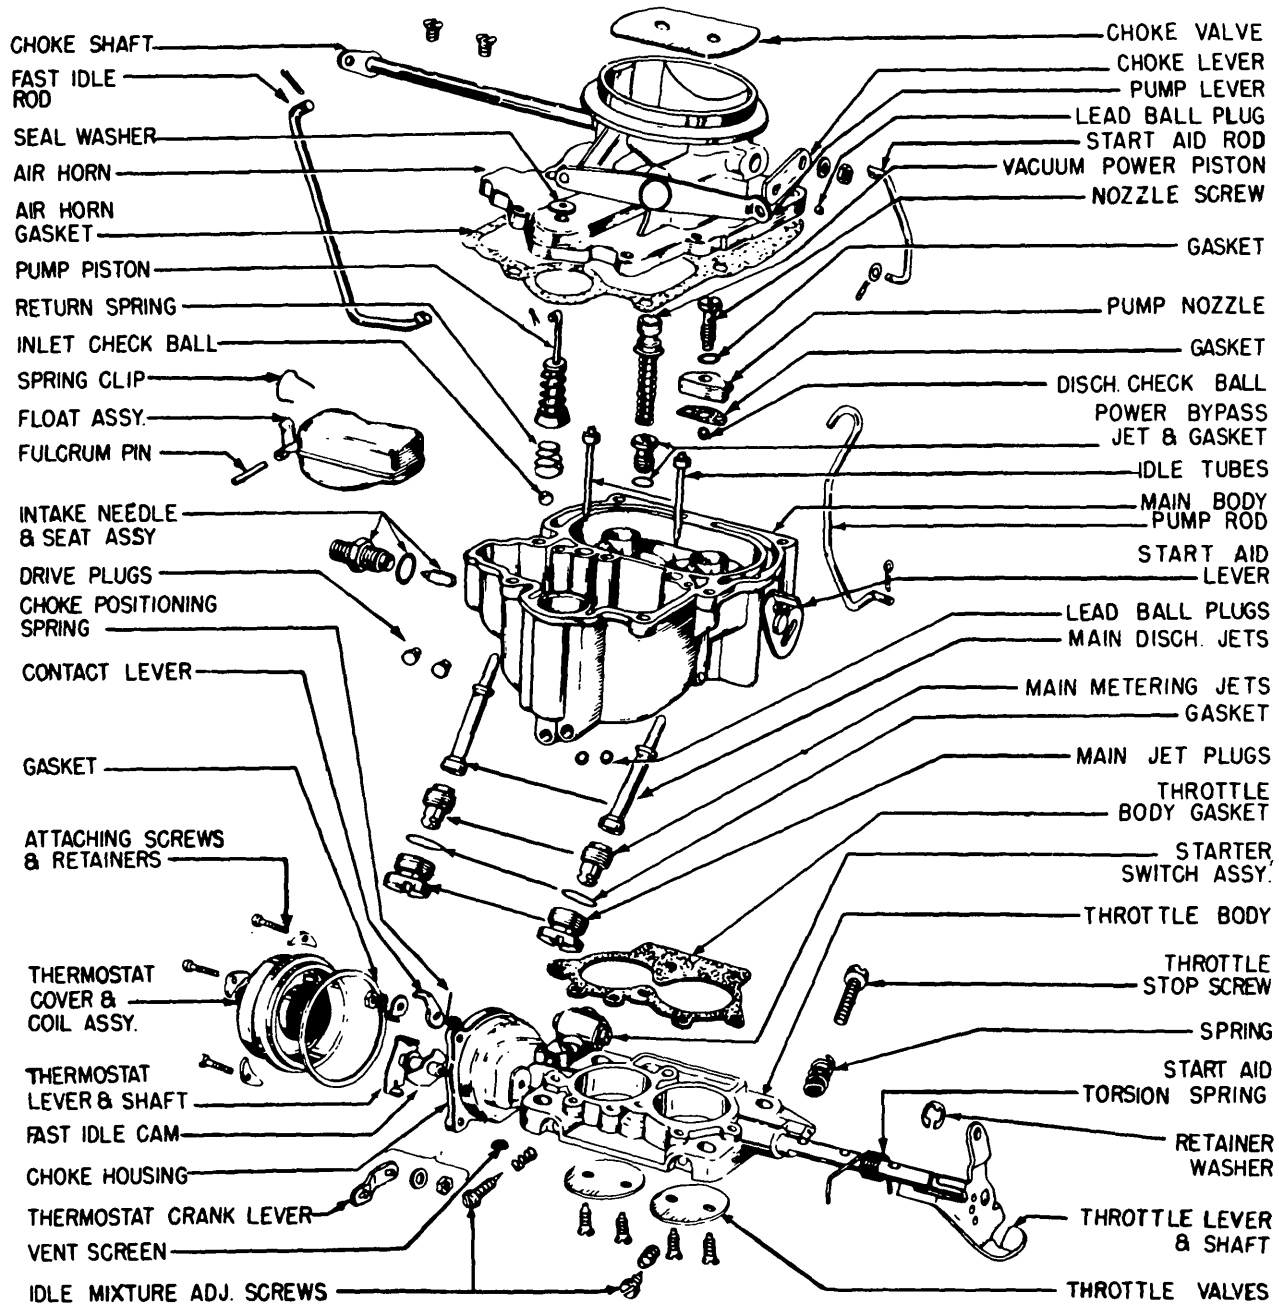
►*LEAN MIXTURE ON MODERATE ACCELERATION CORRECTION (7-105 CARB.):* To eliminate this condition, install repair kit Buick Part No. 1392722, consisting of idle tubes, main metering jets and main discharge jets. After installation completed, scribe letter "A" to change carburetor code number from 7-105 to 7-105A. *Carburetors with Code 7-105A have these changes mad in production.*

►*1957 BUICK CARBURETOR PRODUCTION CHANGES:* Production changes designated by the letter suffix of the carburetor code number are as follows:

C d 7 - 106A - This carburetor has blunt ended float inlet needle valve to improve anti-vapor lock characteristic of the carburetor.

C d 7 - 106B - Choke positioning setting was changed to correct loading during warm-up period. *See "Adjustm nts" below.*

C d 7 - 106C - Filter screen added at intake needle valve seat fitting. This screen should be removed after first 1000 miles of operation.



►*ENGINE LOADING DURING WARM-UP PERIOD (Cars with Code 7-106 & 7-106A): See Production Change Not abov for Chok Positioning Setting change. Adjust th s carbur tors as directed in "Adjustments" b low.*

►*1958 BUICK SERIES 40 (AIR COND. CARS) LAG IN THROTTLE RESPONSE CORRECTION:* This condition may exist on some cars and is apparent after deceleration with closed throttle at road speeds. To improve this condition, install a deflector 2½" x 3½" which should be located with its centerline on centerline of the air cleaner snorkel, and attach to fan shroud with two self-tapping screws. When the above change is made, also install high altitude main metering jets (.054") in carburetor.

DESCRIPTION: These carburetors are dual barrel type with each barrel having its own idle system, main metering system and throttle valve. Automatic choke housing with fast idle cam is located on throttle body on opposite side from throttle lever. Two holes drilled in intake manifold into exhaust gas cross-over permit exhaust gas heat to enter passages around throttles to prevent ice formation around throttle area.

ADJUSTMENT: Make all adjustments exactly as outlined below. *NOTE* - Choke setting has been changed (see Production Note above) and should be adjusted as detailed.

IDLING ADJUSTMENT: If initial adjustment required to warm up engine, turn each idle mixture adjusting screw in until lightly seated, then back each screw out exactly 1¾ turns (1955-56), 1 turn (1957-58), then back off throttle stopscrew until throttle valves fully seated. Turn throttle stopscrew in until it contacts throttle lever, then turn screw in **one additional turn.** Run engine until it reaches normal operating temperature (choke valve wide open and fast idle inoperative). Recheck idle speed.

STROMBERG "WW" (BUICK) DOWNDRAFT CARBURETOR

Idl Mixtur - With engine idling at 485 RPM in neutral or park, adjust each idle mixture screw in turn by turning screw in until engine begins to run irregularly due to lean mixture, then turn screw out until engine begins to roll due to rich mixture, finally turn screw in just enough to provide smoothest engine performance. Recheck idle speed.

Idle Speed - 450 RPM (1955-56), 485 RPM (1957-58) with selector lever in Neutral or Park.

Acc l rating Pump: Three holes provided in throttle lever for pump rod engagement to provide seasonal adjustment as listed below.

CONTINUED ON NEXT PAGE

1955-58 STROMBERG "WW" BUICK CARBURETOR (Cont.)

Pump Seasonal Setting - Set pump rod in long stroke hole (1955), in middle (medium) hole (1956-58) for normal setting. *NOTE - Inner hole provides minimum pump stroke, outer hole provides maximum pump stroke.*

Pump Stroke Adjustment - With throttle stopscrew backed out so that throttle valves fully closed, and with pump connector rod engaged in center hole of throttle lever, measure vertical distance from top of bowl cover to top surface of pump plunger offset. This distance should be 1" (1955), 7/8" (1956-58). Adjust by bending pump connector rod at lower bend. Pump arm must clear top of bowl cover by at least 1/32". Check setting by opening throttle to wide open position.

Fl at Level: With air horn and bowl cover assembly removed from carburetor, place Gauge T-25569 (3/16") (1955-56); Gauge 6646 (7/32") (1957) Gauge 7294 (5/32") (1958) squarely on top edge of bowl at center of float. Hold float arm tang against needle. Top edge of float should just contact lower edge of gauge. Adjust by bending float arm tang. Make certain that float is centered in bowl and does not touch sides.

Fast Idle, Choke, Unloader & Starter Aid Adjustment: *CAUTION* - To prevent incorrect fast idle setting, unloader operation, or fuel mixture at idle and low speeds, **all of the following adjustments must be made in the rder indicated.** Remove air cleaner, thermostat cover, throttle stop screw and spring, then proceed as follows:

Fast Idle Setting - Replace throttle stop screw without the spring, then with throttle valves held fully closed, turn stop screw in just enough to contact throttle lever. At this point, **turn stopscrew in 5 full turns (1955-56), 6 full turns (1957), 7¼ full turns (1958).** With choke valve fully closed and throttle lever held against its stopscrew, the distance between fast idle lever and high step of fast idle cam should be .076" (No. 48 drill) (1955), .052" (No. 55 drill) (1956-57), .076" (No. 48 drill) (1958). To adjust, bend fast idle lever using Tool J-5197. *CAUTION - Fast idle lever must be parallel to carburetor mounting surface after bending.*

Choke Pickup Lever Adjustment - Turn throttle stopscrew **in 2 additional turns (1955-56), 1 additional turn (1957), out ¼ turn (1958)** *(total of 7 turns from a closed throttle position).* With throttle in this position, choke positioning spring pick-up lever should just contact choke positioning spring. Adjust as necessary by bending pick-up lever with needle nose pliers.

Fast Idle Cam Adjustment - Remove throttle stop screw, then open throttle enough to clear fast idle cam and fully close choke valve by pushing up on thermostat spring lever. Close throttle until fast idle lever rests on high step of fast idle cam. The side of fast idle lever should just clear upper index lug on fast idle cam and rest in the corner formed by index lug and high step of cam. Bend choke rod as required for fast idle lever to just clear index lug on cam.

Start Aid Adjustm nt - Reinstall throttle stop screw and spring. Hold choke valve closed on a No. 53 drill (.60"). As throttle valve is opened, start aid spring should just clear tang on choke unloader plate. To adjust, bend unloader link (side opposite choke thermostat housing).

Unl ad r Adjustm nt - Hold choke valve closed with light pressure. then fully open throttle so unloader arm on throttle lever kicks choke partially open. Clearance between upper edge of choke valve and wall of air horn should be .144" (No. 27 drill). To adjust, bend unloader arm on throttle lever.

Choke Positioning Lever Adjustment - Close choke valve with light pressure upward on thermostatic spring lever until positioning spring lever just contacts choke positioning spring. Clearance between upper edge of choke valve and wall of air horn should be .159" (No. 21 drill (1955-56), .209" (No. 4 drill) (1957-58). To adjust, bend choke positioning lever with needle nose pliers. Install choke cover and gasket. Rotate cover counterclockwise until index mark is aligned with correct mark on housing. See "Choke Adjustment" below.

Automatic Choke Setting: Centered (at index) (1955-56-57) 1 notch lean (1958).

Car Starter (Carburetor Vacuum Switch): Switch timing can be checked with carburetor on engine on Dynaflow Cars only. On all cars, switch can be timed with carburetor off engine as detailed below.

1955-58 MODELS

Switch Timing (Off Engine) - Connect battery and test lamp across switch terminals so that lamp will light when switch contact made. See that choke valve is wide open and fast idle cam is in hot or slow idle position. Close throttle valve against 1/4" drill rod inserted between lower edge of valve and carburetor wall at center. Lamp should light indicating that switch contacts are closed. Repeat test with 7/64" drill rod. Lamp should not light. If switch does not operate within above limits, adjust by adding or removing square timing shims located under contact spring. Shims furnished in thicknesses of .006" and .018".

1955-56 MODELS

Starting Switch Setting (On Car): With transmission in neutral and parking brake applied, back off throttle stop screw, rotate fast idle cam to slow idle position, and fully close throttle valve. *NOTE* - On Dynaflow cars, make certain Dashpot will not prevent full closing of throttle valve. Remove left oil filler cap, hold straight edge against rear face of lower arm of throttle lever which contacts Dashpot, so that scale rests on rocker arm cover. With throttle valve fully closed, mark cover at front edge of scale. Turn ignition switch on, slowly open throttle while holding scale in position against throttle lever, mark point on rocker arm cover at which cranking motor is energized. Distance between pencil marks or rocker arm cover should be 3/4-1 1/8". To adjust switch timing, add or remove shims.

1957-58 MODELS

Switch Timing (On Engine - Dynaflow Cars) - Place transmission selector lever in Park and apply brakes. Back off throttle stop screw so that throttle valves tightly closed (fast idle cam must be in hot or slow idle position). Place scale against flange on dashpot diaphragm and measure distance to nearest edge of dashpot arm on throttle lever. The difference between two measurements should be 13/16-1 3/16" (1957), 1-1 7/16" (1958). If switch timing not correct, adjust as for "off engine" timing above.

OVERHAUL: Remove choke rod, unloader link, and unloader arm. Proceed with disassembly as follows:

Air Horn Disassembly: File off staked ends of choke valve screws, then remove choke valve and shaft. *(NOTE - The choke valve is mad with a slight b nd in it. Do nor straighten this valv).* Remove air horn screws, air horn and gasket *(NOTE* - Tip air horn to disengage pump lever from upper end of pump rod). Remove pump plunger assembly from air horn. Remove power piston assembly by compressing spring and letting it snap repeatedly until hammering action of piston drives staked retaining disc from air horn. *(NOTE* - If heavy staking is encountered, remove burrs).

Main Body Disassembly: Remove pump nozzle with screw, washer, and gasket, then remove idle jet tubes and lower pump spring. Remove float needle seat and connector fitting together with gasket and float needle. Remove float retainer, float, and hinge pin. Remove power valve and gasket, then invert carburetor and catch the large pump inlet check ball and small pump outlet check ball. With main body inverted, remove main well plugs and gaskets using Tool T-19099. Remove main metering jets using wrench T-24924. Remove main discharge nozzles by screwing remover, Tool T-24967 (R. H. thread) into nozzle, then pulling nozzle from main body. *(NOTE - There ar no lead gask ts under nozzles in this carburetor).* Remove throttle body screws, throttle body, and gasket from main body

Throttle Body Disassembly: Remove starter switch screws, terminal cap, return spring and guide block assembly. Tilt throttle body and catch plunger and ball. *(NOTE - If starter switch screen is not visibly damaged r plugged, it need not be removed.* Remove choke cover, gasket, screws and retainers. Remove choke housing shaft outside nut; then remove lockwasher, arm, choke housing shaft and lever assembly, spacer washer, and fast idle cam. Remove idle needles, idle stop screw, and springs. *(NOTE* - Throttle valves and shaft should not be disassembled for normal cleaning and inspection).

Cleaning & Inspection: Use Bendix Metalclene or comparable cleaner to soak all parts for cleaning, then follow cleaning operation by rinsing parts in clean solvent to remove all gummy deposits. Remove lead plugs, if necessary, to clean passages in main body. Remove plugs with remover, Tool T-25052; replace plugs with Tool T-25054 to prevent damage to plug seats. Inspect all parts for excessive wear or damage which might affect their usage, and replace all parts that are questionable. Check all passages for restrictions and check all nozzles and jets to make sure they are clear. Maximum allowance for throttle shaft bearing is .006". Replace throttle valves if bent or damaged. Clean and inspect vacuum switch parts.

Throttle Body Reassembly: Install throttle stop screw and spring and idle needles and springs. Seat idle needles lightly, then back each needle out 1 turn for initial setting. *(CAUTION - Do not forc needl against its s at).* Install fast idle cam, spacer washer, choke housing shaft and lever assembly arm, lock washer and nut. Install starter switch ball, plunger. guide block assembly, return spring, terminal cap, clip, and screws.

CONTINUED ON NEXT PAGE

1955-58 STROMBERG "WW" BUICK CARBURETOR (Cont.)

Main Body Reassembly: Invert main body and install throttle body and a new gasket. Install main discharge nozzles using Tool T-24967. *(CAUTION - Make sure that nozzles are positioned so flat surface is parallel with direction of air flow).* Install main metering jets using Tool T-24924, then install main metering well plugs using new copper gaskets if available; otherwise make sure the plugs and seats are clean to insure a tight joint. Tighten plugs with Tool T-19099. Install power valve with a new gasket, then install float and hinge pin and float retainer clip, using needle nose pliers. Install float needle seat and connector fitting together with gasket and float needle. Hold float arm tang against needle, then check and adjust float setting (see above). Make sure that float is centered and does not rub on walls of bowl. Install idle jet tubes. Install accelerator pump check balls (use new balls if available); place large ball in plunger well and place small ball in discharge well. Install lower pump spring in plunger well. Install pump discharge nozzle and screw using a new washer and gasket.

Air Horn Reassembly: Install choke shaft in air horn with attached lever toward choke housing, then install choke valve with identification mark up. Install new choke valve screws loosely, then center valve by pressing up and endwise on choke shaft lever. Tighten screws and check with valve in closed position for uniform clearance and freedom from sticking. If necessary, loosen screws and adjust choke valve position. With valve in correct position and screws tight, check to make sure that choke valve will drop freely of its own weight. Support screw heads on a suitable steel block and stake opposite ends of screws. Install power piston assembly in air horn and carefully stake in three places. Piston must operate freely in cylinder *(CAUTION - Do not apply any lubricant).* Lay a new air horn gasket on inverted air horn, then install pump plunger assembly in air horn with washer on top side of air horn hole and attach to pump arm with a new cotter pin. Slide pump lever on upper end of pump rod and install air horn assembly on main body making certain that pump plunger leather does not have any curled edges when it is inserted in cylinder in main body. Install air horn screws. Make sure lower end of pump rod is in the medium stroke hole. Install choke unloader arm, unloader link, and choke rod. Adjust carburetor *(see "Adjustment" above)*, then install choke cover and gasket.

SERVICE PARTS: Gasket Set - Buick No. 1172374. **Repair Kit** - Buick No. 1173056 (1955-56), No. 1170000 (1957), No. 1185701 (1958).

1954 STROMBERG "WW" (DODGE)

DODGE V8 1954	①Stromberg Model & Code
Synchro-mesh Trans.	WW, 3-108A
Overdrive	③WW, 3-109A
Gyromatic Trans.	④WW, 3-106A
PowerFlite	②WW, 3-105A

①—Code No. stamped on bowl cover above fuel inlet connection.
②—Has Slow-Closing Throttle Dashpot without magnetic control.
③—Has Overdrive Kick-down Switch mounted on bracket on main body.
④—Has Slow-Closing Throttle Dashpot with magnetic control and Transmission Kick-down Limit Switch mounted on main body.

DESCRIPTION: "WW" carburetors are dual barrel, downdraft type of new design with vertical air intake. Fuel system is similar to other Stromberg carburetors with usual Float System (single float), Idle System, Main Metering System, Power System (with vacuum piston operated power by-pass jet), and Accelerating System (pump operated by horizontal fulcrum lever with duration spring type pump piston). Carburetor has automatic choke and Fast Idle. ***All models are alike except for added units for each type service as listed above.***

ADJUSTMENTS: ***CAUTION—Make all adjustments exactly as listed below. Kick-down Switches and Dashpot not used on all models (see listing above).***

Idle Setting: First synchronize both idle mixture adjusting screws by turning each screw in until it is lightly seated, then back each screw out exactly one turn. Start engine and run it until it is thoroughly warmed up (water temperature 160°F. or higher) with choke valve wide open and fast idle inoperative. Then adjust idle mixture and idle speed as follows:

Idle Mixture—First check and adjust idle speed (see below). Make trial adjustment by turning BOTH idle adjusting screws in ⅛ turn to lean the mixture and note effect this has on performance. **If engine speed increases** and engine is smoother, turn both screws in additional ⅛ turn. If performance improved, reset engine idle speed and make a fine adjustment by turning EACH idle adjusting screw in ⅛ turn and out ⅛ turn to find exact best setting for each screw. Finally reset idle speed. **If engine speed decreases** and engine is rougher, turn both screws out ⅛ turn for richer mixture. If performance improved, reset engine idle speed and make a fine adjustment by turning EACH idle adjusting screw in ⅛ turn and out ⅛ turn to find exact best setting for each screw. Finally reset engine idle speed.

►***CAUTION—BOTH idle adjusting screws must be set exactly alike (plus or minus ⅛ turn to allow for final exact setting of each screw).***

Idle Speed—Adjust only with engine at normal operating temperature with choke valve wide open and fast idle inoperative. Turn throttle stopscrew in or out for correct idle speed as measured with tachometer with shift lever in neutral.

IDLE SETTING

	Idle Mixture	Idle Speed
Dodge V8 (All)..	¾-1¼ turns open	475-500 RPM.

Accelerating Pump: ***NOTE***—Pump Seasonal Setting can be changed as required, Pump Stroke Setting should be checked and adjusted whenever carburetor overhauled.

Pump Seasonal Setting—Throttle lever has three holes for pump connector rod engagement:
Center Hole—Normal operating conditions.
Inner Hole—Min. stroke for less discharge.
Outer Hole—Max. stroke for greater discharge.

Pump Stroke Setting—To check pump stroke, back out throttle stopscrew so that throttle valves tightly closed, use scale to measure distance from top of bowl cover at side of pump plunger to top of plunger. This distance should be ¾". Adjust by bending pump connector rod using tool T109-213.

Float Level: To check float level, remove air horn and bowl cover and air horn gasket. Hold lip of float lever firmly against intake needle valve so that float held up in closed-valve position. Use Float Gauge T-25569 placed squarely on top edge of bowl at center of float. Float should just contact step on gauge. To adjust float level, bend lip on float lever as required using bending tool T-24733.

FLOAT LEVEL

Dodge V8 (All)	3/16"①

①—Top of float below top edge of bowl.

Fast Idle: To check fast idle setting, first remove fast idle cam housing to expose fast idle cam on end of choke valve shaft. Open throttle valve, close choke valve against FIRST STEP of Gauge T-25570 (second step of gauge used for Unloader setting) placing gauge between upper edge of choke valve and air horn wall, then move throttle valve toward closed position. Top of fast idle lever should just enter the first step on the fast idle cam. To adjust, bend lever on fast idle cam. *CAUTION*—hold fast idle counterweight while bending the lever.

Unloader: To check unloader setting, close choke valve, open throttle valves to wide-open position, check choke valve opening by inserting Gauge T-25570 between upper edge of choke valve and air horn wall. Choke valve opening should be equal to SECOND STEP on gauge (first step is used for Fast Idle setting). To adjust, bend choke lever on choke shaft which contacts ear on fast idle lever. Reinstall cam housing after completing adjustment.

Choke Setting: Centered (indicator mark on edge of thermostatic coil cover lined up with projection on top of choke housing). To adjust, loosen heat tube connection on cover and three screws in cover retainer, rotate cover and coil assembly.

►***CAUTION—Hold heat tube fitting on cover with a wrench while loosening or tightening heat tube connection to avoid damaging or rotating coil assembly.***

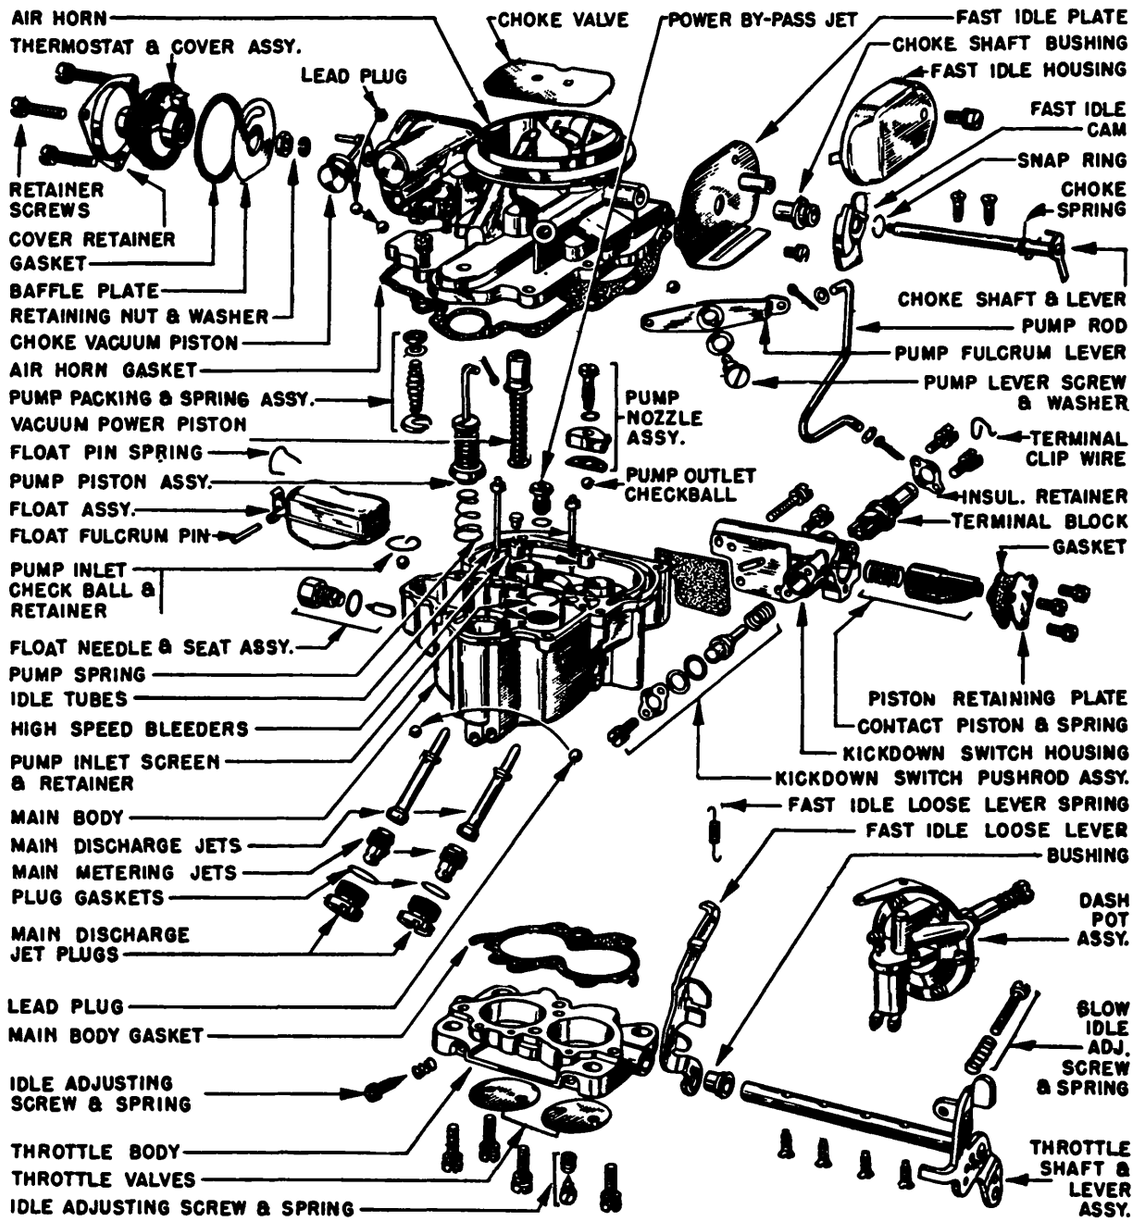
Kick-down Switch (Code 3-109 Carb.): Adjust switch position on bracket by backing off one locknut on mounting stem and tightening opposite nut until switch "B" contacts (terminals on opposite end of switch from plunger) are closed with the throttle valves wide open (use test lamp connected to switch terminals to check operation).

Kick-down Limit Switch (Code 3-106 Carb.): Check operation by road-testing car as follows. With car running at 30 MPH. accelerate with approximately ¾ throttle and when car speed reaches 40 MPH., push accelerator pedal to kick-down position. Re-

CONTINUED ON NEXT PAGE

1954 STROMBERG "WW" DODGE (C nt.)

peat this test at 45 MPH. and at 50 MPH. ***Kick-down should operate below 40 MPH. and should not operate above 45 MPH.***



Dashpot (Code 3-105 & 3-106 Carb.): Check operation by running engine and holding car with the brakes. Shift to driving range and rapidly accelerate and decelerate engine. Engine should not stall when accelerator pedal released quickly. If engine stalls, adjust dashpot for maximum action by turning adjusting screw out until overtravel of plunger (possible inward movement of plunger) is only 1/16" with throttle valves in closed position.

OVERHAUL: ***NOTE—Carburetor should be mounted on repair block, Tool C-3225, which will prevent damage to throttle valves while working on carburetor.***

Disassembly: On carburetors so equipped, first remove Dashpot and gasket (two screws in mounting bracket), Kick-down Switch and gasket (two screws in mounting bracket), or Kick-down Limit Switch (three screws and lockwashers in housing). Disconnect pump operating rod from throttle lever, disconnect pump plunger stem from pump rocker arm, take out rocker arm fulcrum screw and spring washer (screw has left-hand thread), remove rocker arm and rod assembly. Remove fast idle cam housing dust cover, disengage fast idle lever return spring from housing and lever. Take out four air horn attaching screws, lift air horn assembly straight up while disengaging fast idle lever from slot in housing by pushing outward.

Air Horn Disassembly—Remove pump compression spring from bottom of pump plunger, slide plunger assembly out of air horn, discard plunger rod felt washer, remove and discard air horn gasket. Remove vacuum power piston by hooking end of small open end wrench under head on piston stem and using wood block on air horn as a fulcrum so that piston assembly can be pulled straight out (*CAUTION*—this assembly is staked in air horn and will be damaged unless removed in this manner). Take out screws in choke housing retainer ring, remove retaining ring, thermostatic coil housing assembly, gasket, and baffle plate. Remove nut attaching choke piston link on choke shaft, take out choke valve attaching screws, remove choke valve. Withdraw choke shaft and lever from air horn and disengage choke piston link, lift out choke piston and link assembly. Disengage spring from choke shaft lever and slide spring off choke shaft. Pry out fast idle cam retaining snap ring, remove fast idle cam. Take out screw and lockwasher attaching fast idle backing plate to air horn, use open end wrench inserted between backing plate and air horn and over choke shaft boss to pry backing plate loose, remove backing plate and choke shaft bushing. Remove lead plug from lower side of choke piston cylinder so that passage can be blown out (plug can be drilled out using No. 44 drill). Remove thermostatic coil and heat retainer plate from choke housing by rapping assembly sharply on palm of hand with coil side down (*CAUTION*—do not attempt to remove coil from heat retainer plate).

Main Body Disassembly—Lift both idle tubes out. Remove attaching screw and gasket in pump discharge cluster, remove cluster and gasket, invert body to drop discharge check ball from discharge passage. Remove fuel inlet needle seat and gasket,

STROMBERG "WW" (DODGE) DOWNDRAFT CARBURETOR

lift out inlet needle. Pry out float fulcrum pin retaining spring (*CAUTION*—do not allow spring to fly out), lift out float and fulcrum pin assembly. Remove power by-pass jet and gasket. Pry out snap ring in bottom of pump cylinder, remove strainer screen, remove snap ring retaining intake check ball, invert body to drop out the check ball. Remove both main jet plugs, discard gaskets. Use tool T-24924 to remove main metering jets. Use tool T-24967 to remove main discharge jets by screwing tool into jet and then pulling jet out of the body (threads formed by tool will not damage jet). Take out screws attaching main body to throttle body, lift main body off and discard gasket.

Throttle Body Disassembly—Remove both idle adjusting screws and springs. DO NOT disturb

CONTINUED ON NEXT PAGE

1954 STROMBERG "WW" DODGE (Cont.)

throttle valve and shaft assembly unless new parts must be installed (Manufacturer recommends replacement of Throttle Body Assembly if shaft or shaft hole in body worn). To remove throttle valves, first mark each valve to insure re-installation in same barrel, take out valve attaching screws, slide valves out of shaft slots, withdraw throttle shaft and lever assembly from throttle body.

Cleaning & Inspection: Clean all metal parts thoroughly in suitable cleaning solution. Make certain all carbon and gum deposits removed. Blow out all passages and dry parts with air. Inspect all parts for wear or damage.

Reassembly: Use all NEW gaskets. Install all parts in reverse order of disassembly procedure above and note the following important points:

Throttle Valve Installation—After throttle shaft inserted in throttle body, slide valves in place in throttle shaft lining up marks made before disassembly and with dash stamped on valve toward idle port and visible from top of throttle body, install new screws loosely. Centralize valves by closing valves tightly (throttle stopscrew must be backed off), tap valves lightly and hold them in place by pressing on high side of valves while tightening screws securely. Stake screws by squeezing with pliers.

Main Discharge Jet Assemblies—Engage remover tool T-24967 securely in end of main discharge jet, seat jet firmly in main body with nozzle opening (diagonal end) facing opposite wall of small venturi. Install main metering jet and tighten securely with tool T-24924. Install metering jet plug with new copper gasket and tighten securely.

Accelerating Pump Assembly & Testing—Drop 3/16" intake check ball into recess in bottom of pump cylinder, use tool T-25568 to seat check ball retainer, install new pump strainer, use tool T-25568 to install screen retainer. Drop 1/8" discharge check ball in pump discharge passage in main body, install pump plunger assembly temporarily in pump cylinder, fill carburetor bowl approximately 1/2" deep with clean gasoline. Press lightly on plunger shaft to expel air from pump system, then hold discharge check ball down on seat firmly using a small brass rod, raise pump plunger to fill cylinder and press downward on plunger. No gasoline should pass either the discharge check ball or intake check ball. If check balls are not tight, thoroughly clean pump passages and install new check balls. Install pump discharge cluster with new gasket and tighten screw securely. Check pump action. Identical clear straight streams should be emitted from each pump jet. If either stream diverted or restricted, install new pump discharge cluster. After tests completed, remove pump plunger and pour out the gasoline. Before finally installing pump plunger, flex leather several times and replace assembly if leather hard, cracked or worn. After pump plunger installed in cylinder (with compression spring under plunger), install air horn gasket, then place new metal and felt washer on pump plunger stem before installing air horn.

Vacuum Power Piston Installation—After vacuum piston installed in air horn, lock assembly in place by prick-punching rim at several points. Check piston for free operation and replace if any binding or sticking noted.

Automatic Choke & Fast Idle Assembly—Make certain thermostatic coil and heat retainer plate correctly installed in choke housing with notch in plate aligned with lug in housing and retaining spring seated in groove *(CAUTION*—spring must clear notch in plate). Install choke shaft bushing in backing plate, position backing plate on air horn, use tool T-25570 to drive bushing in place in air horn, slide fast idle lever into backing plate slot, install screw and lockwasher. Install fast idle cam on shoulder of choke bushing and secure with snap ring. Slide choke piston into cylinder, slide choke shaft and lever into position *(CAUTION*—make certain spring properly installed on shaft), hook long end of spring in notch of fast idle cam lever. Install choke valve (see below), engage piston link on choke shaft, install lockwasher and nut and tighten nut securely with tool T-25047. Install baffle plate with dimpled side out *(CAUTION*—lever must clear baffle at full travel). Check choke assembly for free operation (valve must open freely of own weight). Install coil housing gasket, coil housing assembly, and retainer ring with indicator mark on housing straight down, turn assembly counter-clockwise until indicator mark on housing in line with projection on air horn, tighten retainer screws securely. Install fast idle lever return spring with long loop hooked to lever and short loop hooked in backing plate. Adjust fast idle and unloader before installing fast idle housing cover.

Choke Valve Installation—Slide valve in position in shaft, install new screws loosely, close valve and center it by tapping lightly with a screwdriver, then tighten screws securely and stake screws by squeezing with pliers.

Carburetor Adjustments—See ADJUSTMENT above.

SERVICE PARTS: Gasket Set—Stromberg No. 382363 (Code 3-105, A; 3-108, A; 3-109, A). No. 382364 (Code 3-106, A).

Repair Kit Pkg.—Stromberg No. RK-173 (Code 3-108, A; 3-109, A). No. RK-172 (Code 3-106, A).

►CHANGES, CAUTIONS, CORRECTIONS

►*1955 HARD STARTING AFTER WARM-UP OR FLOODING CAUTION:* Use of other than mounting gaskets, Dodge Nos. 1615860 or 1634701, can result in restriction or blocking off of hot air passages to choke as well as the vacuum passage to the piston that operates the power by-pass or economizer jet. Incorrect choke setting or incorrect mounting gasket will cause hard starting after normal start and affect economy of operation.

►*1958 DODGE HARD STARTING & STALLING WITH COLD ENGINE CORRECTION: May be due to improper adjustment of choke or fast idle. See "Adjustments" below.*

DESCRIPTION: Dual barrel downdraft type of new design with vertical air intake. All 1955-56 models and 1957-58 Six Cyl. models have an "Integral" type automatic choke assembly which is mounted on the throttle body and connected to choke valve shaft by a rod. With this type automatic choke, the fast idle cam is located within the automatic choke housing. 1957-58 V8 models use a "Cross-Over" type automatic choke which is a separate unit mounted in a well in intake manifold (at exhaust crossover passage) and is linked to choke valve lever by a connector rod. The choke vacuum piston is located in a cylinder on carburetor air horn and is linked directly to choke valve. The fast idle cam assembly is located on opposite side of carburetor and is operated by a separate rod from choke valve

CONTINUED ON NEXT PAGE

STROMBERG "WW" DOWNDRAFT CARBURETOR (INTEGRAL AUTOMATIC CHOKE)

1955-58 STROMBERG "WW" DE SOTO, DODGE, PLYMOUTH (Cont.)

shaft and by lever on throttle valve shaft. Fuel system is similar to other Stromberg carburetors with the usual Float System (single float), Idle System, Main Metering System, Power System (with vacuum piston operated power bypass jet), and Accelerating System (pump operated by horizontal lever). All models are alike except for added units for added service as listed above.

►*"CROSS-OVER" AUTOMATIC CHOKE NOTE: See "Stromberg Cross-Over Type Automatic Choke".*

ADJUSTMENTS: *Make all adjustments exactly as listed below.*

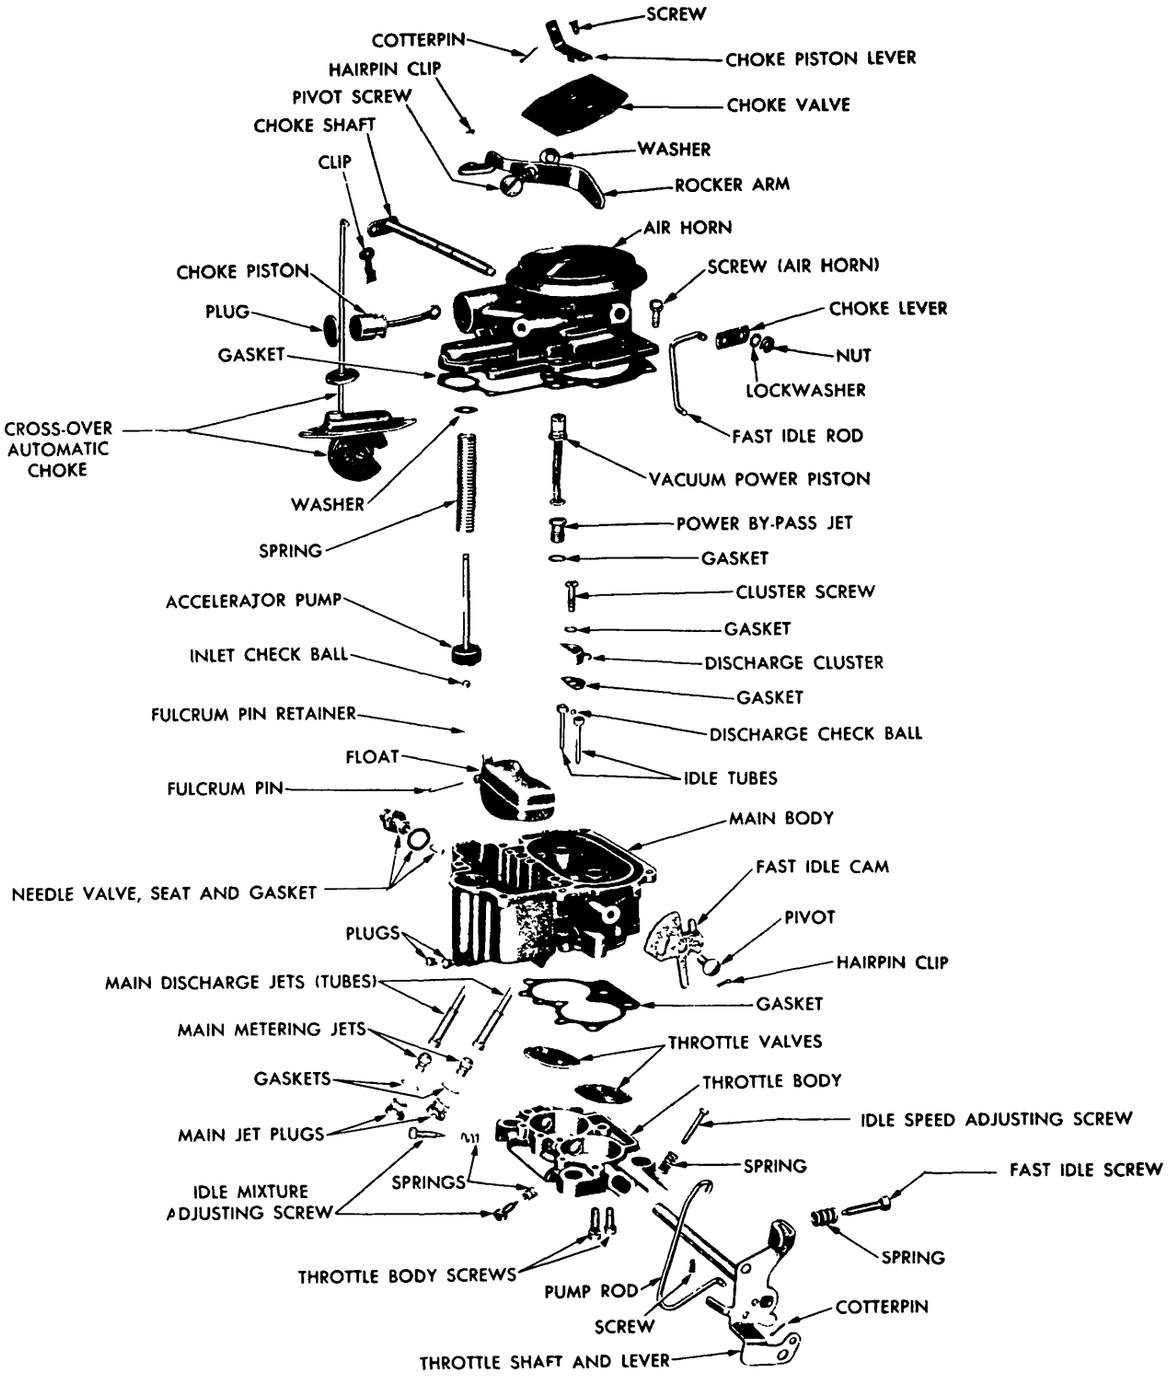
Idle Adjustment: Make a preliminary setting of both idle adjusting screws by turning them in until lightly seated and then turn screws out exactly 1 turn. Warm up engine to normal operating temperature so that choke valve wide open and fast idle inoperative. Set engine idle speed to correct figure, then adjust idle mixture as follows:

Idle Mixture - With engine warmed up and idling at correct idle speed, turn each idle mixture adjusting screw in or out until highest engine speed and smoothest running is secured. Recheck idle speed.

Idle Speed - 450-500 RPM. *NOTE* - On Auto. Trans. Cars, Neutral selector button must be pressed in.

Accelerating Pump: Three holes provided in throttle lever for pump connector rod engagement to provide seasonal pump setting is listed below.

Pump Stroke Adjustment - Back off throttle stopscrew so that throttle valves fully closed. Make certain that pump connector rod engaged in **Center** hole in throttle lever. Use scale on bowl cover to measure height of top edge of pump arm at pump plunger, open throttle wide, again measure height of pump arm. The **difference** in the two measurements is **pump travel or stroke** and should agree with table below. Adjust by bending connector rod at lower angle using bending tool T109-213.



Pump Travel Setting

Car Model	Pump Travel
1955-56 Dodge Six	13/64-15/64"
1955-56 Dodge V8	7/32-1/4"
1957-58 Dodge Six	3/16-7/32"
1957 DeSoto, Dodge, Plymouth V8	9/32-5/16"
1958 Dodge V8	9/32-5/16"
1958 Plymouth V8	1/4-9/32"

Pump Seasonal Setting - Std. setting is with connector rod engaged in **center** hole of throttle lever (medium stroke). **Outer** hole in throttle lever will provide maximum stroke (greater discharge), **Inner** hole minimum stroke (less discharge).

Float Level: To check float level, remove air horn and bowl cover assembly, and gasket. Place gauge (see table below) squarely on top edge of bowl at center of float (on far side and adjacent to slot in top of pump cylinder). Hold float arm lip firmly against seated needle valve. Top of float should just touch step on gauge. Adjust by bending float lip using bending tool T-24733.

CONTINUED ON NEXT PAGE

STROMBERG "WW" DOWNDRAFT CARBURETOR (CROSS-OVER CHOKE)

1955-58 STROMBERG "WW" DE SOTO, DODGE, PLYMOUTH (C nt.)

Float Level Setting

Car Model	Gauge No.	Float Level
1955-56 Dodge 6 & V8	T-25569	3/16"
1957 DeSoto	T-26019	7/32"
1957-58 Dodge 6	T-25569	3/16"
1957-58 Dodge V8	T-26019	7/32"
1957-58 Plymouth V8	T-26019	7/32"
1956 Plymouth 6	T-25569	3/16"

►*ADJUSTMENT CAUTION: All Fast Idle Adjustments including Unloader Adjustment must be made in the s quence given below.*

Fast Idle (1955-58 Dodge Six, 1956 Plymouth Six, 1955-56 Dodge V8): Fast idle mechanism is located in choke housing on throttle body and thermostatic coil housing and gasket must be removed before making fast idle adjustments. Three different adjustments required on 1955-58 6 Cyl. and on 1955 V8 models; two different adjustments required on 1956 V8 models as indicated below. *NOTE - Special calibrated spring must be installed (to take place of thermostatic coil) while adjustments being made. Install this spring as follows:*

Calibrated Spring Installation - With thermostatic coil housing removed, install calibrated spring, Tool T-25906 (1955-56 Models), T-73656 (1957-58 Models) by inserting one cover screw through loop at one end of spring and installing screw in right hand upper mounting screw hole in housing and hooking opposite end of spring over long tang of thermostatic lever. Leave this spring in position while making all Fast Idle and Unloader adjustments.

1) Fast Idle Speed (Throttle Opening) Adjustment - Remove spring from throttle stopscrew, reinstall screw and turn screw in until it just touches throttle lever with throttle valves held closed, then **turn screw in an additional 5 1/8 turns (1955-58 6 Cyl. Models), 4½ turns (1956-58 V8 Models).** *NOTE - This will position throttle valves in correct fast idle position.* Hold choke valve closed and hold throttle lever against stopscrew, then check clearance between tang on contact lever on throttle shaft and **first step** of fast idle cam with a No. 48 drill rod (.076"). If clearance not correct, adjust by bending tang on contact lever toward or away from cam using Bending Tool T-25863. *CAUTION - Tang must be parallel to throttle shaft after adjustment. Reinstall spring on throttle stopscrew and reset idle speed.*

2) Fast Idle Cam Position Adjustment - Open throttle valve to clear fast idle cam, close choke valve tightly, then close throttle valves fully against tension of choke positioning spring. In this position, tang on cam contact lever should just clear **high step** of fast idle cam, but clearance at this point should not exceed .020" (measure with feeler gauge). Adjust by bending fast idle connector rod at upper angle near choke lever using bending tool T109-213.

3) Choke Positioning Spring Adjustment (1955-58 6 Cyl. & 1955 V8) - With carburetor in vertical position, install slide weight T-25864 (1955-57 6 Cyl. Models & 1955 V8 Models); T-73655 (1958 Models) over choke lever (between choke shaft and connector rod). Close throttle valve to make sure that cam contact lever tang is resting on high step of fast idle cam (rotate cam as necessary to obtain this position). Lightly close throttle valves which should cause slight opening of choke valve (choke positioning spring acting against slide weight on choke lever). Measure choke valve opening by inserting correct size drill rod (see table below) between upper edge of choke valve and air horn wall. Adjust by bending tang on thermostat lever that contacts choke positioning spring using long nosed pliers. Remove slide weight. Adjust UNLOADER before removing calibrated spring and reassembling choke.

Choke Positioning Spring Setting

Carb. Code No.	Drill Rod	Spring Color
WW3-120	#30	Copper
WW3-120 A,B	#24	Copper
WW3-121	#30	Copper
WW3-121A,B	#24	Copper
WW3-122	#28	Silver
WW3-122A,B,C	#24	Copper
WW3-124, 125	#31	Black
WW3-126	#37	Copper
WW3-131,A	#24	Copper
WW3-132,A	#24	Copper
WW3-133	#24	Silver
WW3-133 A, B	#24	Copper
WW3-159	#31	Black
WW3-160	#37	Copper

►*SPRING NOTE:* Springs are calibrated and can be identified by color as indicated above.

Fast Idle (1957 DeSoto, 1957-58 Dodge & Plymouth V8): Fast Idle cam is mounted on main body (above throttle lever) and is linked to the choke shaft lever by a connector rod. A separate fast idle screw on throttle lever contacts the fast idle cam. Two separate adjustments are required as follows:

1) Fast Idle Speed - Back off throttle stopscrew so that throttle valves tightly closed. Turn fast idle screw out to clear cam, then position cam so that fast idle screw is in line with **first step** of cam and against shoulder of highest step and turn screw in until it just contacts cam. **Turn screw in an additional 5½ turns (1957 DeSoto, Dodge & Plymouth), 8 turns (1958 Dodge), 7½ turns (1958 Plymouth)** which will provide correct fast idle speed. *NOTE - Throttle stopscrew must be adjusted for correct hot or slow idle speed after fast idle adjustments made.*

2) Fast Idle Cam Position - After adjusting fast idle speed, and with fast idle screw in same position as for fast idle speed adjustment (above), close choke valve as far as possible, measure choke valve opening or clearance between top edge of valve and air horn wall using correct size drill rod (see table below). If clearance not correct, adjust by bending fast idle rod at upper angle using bending tool T109-213.

Fast Idle Cam Setting

Car & Carb.	Checking Drill	Choke Opening
DeSoto & Dodge 3-149	#12	.189"
DeSoto & Dodge 3-150	#24	.152"
Plymouth (All)	#12	.189"
Dodge 3-163 & 3-164	"J"	.277"
Plymouth V8 (All)	1/4"	.250"

Unl ader (1955-58 Dodg 6 Cyl., 1955-56 D dg V8 & 1956 Plym uth 6 Cyl.): After completing fast idle adjustment and with calibrating spring in place, close choke valve, opening throttle valves wide which will open choke valve slightly. Check choke valve opening or clearance between upper edge of valve and air horn wall using a No. 19 drill (.150-.180" valve opening). If clearance not correct, adjust by bending tang on cam contact lever using long nosed pliers. After adjustment completed, remove calibrated spring and reassemble automatic choke (see choke data below).

Unloader (1957 DeSoto, 1957-58 Dodg & Plym uth V8): Two different adjustments required as listed below. *NOTE - Vacuum piston (Vacuum Kickdown Adjustment) is located in cylinder in air horn and is linked dir ctly to an ear on the choke valve.*

Unloader (Wide Open Kick) Adjustm nt - Hold choke valve closed lightly, open throttle valves to wide open position which will open choke valve slightly. Measure choke valve opening or clearance between upper edge of valve and air horn wall using a No. 19 drill (.180-.150" valve opening). If clearance not correct, adjust by bending tang on throttle lever using bending tool T109-214.

Vacuum Kick Adjustment - Make up a wire gauge by bending .040" diameter wire (paper clip) as shown in illustration. With choke valve open, insert wire gauge in vacuum cylinder and engage hooked end in slot at bottom of cylinder, close choke valve until inner end of piston grips wire gauge at inner end of slot. Measure choke valve opening or clearance between upper edge of valve and air horn wall using correct size drill rod (see table below). If clearance not correct, adjust by bending choke piston lever ear as required.

Vacuum Kick Setting

Car & Carb.	Drill Rod	Ch k Op ning
DeSoto & Dodge 3-149	"B"	.238" (¼")
DeSoto & Dodge 3-150	#7	.201"
Plymouth (All)	"B"	.238" (¼")
Dodge 3-163	.31/64"	31/64"
Dodge 3-164	29/64"	29/64"
Plymouth 15-26, 15-27	31/64"	31/64"
Plymouth 15-28	29/64"	29/64"

Automatic Choke (Integral Typ): Code number on thermostatic coil cover determines automatic choke setting (see table below). *NOTE - C rr ct c ver ass mbly must be used with right carburetor as indicated in tabl .* Rotate cover counter-clockwise to correct setting and tighten retaining screws. Hold choke open, then open and close throttle valves. Failure to obtain full throttle operation indicates faulty assembly or improper adjustment. Hold throttle wide open, then open choke slowly to wide open position. There should be no bind through entire travel of choke mechanism.

CONTINUED ON NEXT PAGE

1955-58 STROMBERG "WW" DE SOTO, DODGE, PLYMOUTH (C nt.)

Ch k Cover Setting

Carb. Cod N .	Cover	Setting
120, A,B	#31	2 points lean
121, A,B	#31	2 points lean
122, A,B	#33	2 points lean
122C	#31	2 points lean
124,125	#32	Centered (At Index)
126	#33	Centered (At Index)
131, A	#31	2 points lean
132, A	#31	2 points lean
133	#33	Centered (At Index)
133A, B	#31	2 points lean
159	#32	Centered (At Index)
160	#33	Centered (At Index)

Aut matic Ch k ("Cr ss-Over" Type): Automatic choke is separate "Cross-Over" type mounted in well in intake manifold (at exhaust crossover passage) and linked to choke valve lever by a connector rod. Choke vacuum piston is located in a cylinder in air horn and linked directly to choke valve. This type choke ordinarily does not require adjustment. *See "Stromberg Cross-Over Typ Aut matic Choke" for complete data.*

Ov rdriv Kickdown Switch: With throttle valves wide open, clearance between kickdown lever and switch stem guide should be 1/64-1/32" (1955-56), 1/64-3/64" (1957-58).

Sl w-Cl sing Throttl Dashpot (Used on some cars with Automatic Trans.): With throttle valves fully closed, it should be possible to move dashpot plunger shaft inward 3/32". Adjust by loosening locknut and screwing dashpot in or out of mounting bracket.

OVERHAUL: With carburetor off engine, proceed as detailed below. *NOTE* - It is recommended that carburetor be mounted on stand, Tool C-3225, to protect throttle valves from damage while carburetor is on the bench.

Disass mbly: If dashpot used, remove two screws in mounting bracket and lift dashpot assembly off. Disconnect and remove pump connector rod and fast idle connector rod. Take out air horn and bowl cover attaching screws, lift assembly straight up and off main body. Remove hairpin clip in upper end of pump plunger, remove plunger assembly from air horn, slide seal washer and spring off plunger rod. Remove vacuum power piston from air horn *(CAUTION* - Edges of cylinder are staked and piston must be removed as follows: Place wood block on air horn as a fulcrum, use open end wrench hooked under end of power piston stem as a pry to force piston out). Remove staking of choke valve screws, remove screws, slide choke valve out allowing piston link and bracket to hang in air horn *(CAUTION* - Do not attempt to remove vacuum piston from air horn cylinder - welsh plug retaining piston and link is factory sealed), withdraw choke shaft and lever from air horn. Lift idle tubes out of main body, invert main body to drop out pump inlet check ball. Remove screw and gasket from pump discharge cluster, lift off cluster and gasket, invert main body to drop out pump discharge check ball. Remove fuel inlet needle valve seat, gasket, and needle valve. Pry out float fulcrum pin retaining spring, lift out float and fulcrum pin. Remove power bypass jet and gasket. *CAUTION* - Do not attempt to remove high speed bleeders from main body. Take out screws attaching throttle body, lift off main body and discard gasket. Invert main body and remove main jet plugs using Tools T-19099, T-24968, & T-25184, discard plug gaskets. Remove main metering jets using Tool T-24924. Remove main discharge jets using Tool T-24967 *(NOTE* - tool has right hand thread and should be screwed into jet - threads formed by tool will not damage the jet). Remove idle mixture adjusting screws and springs. Do not remove throttle valves or shaft unless new parts are to be installed (see Reassembly for removal and installation data).

Automatic Choke Disassembly (Integral Type) - Remove retaining screws and lift off the thermostatic coil assembly and gasket. Remove nut on end of throttle shaft retaining cam contact lever using Tool T-25047 *(CAUTION - This nut has LEFT HAND threads),* remove lockwasher, slide cam contact lever and choke positioning spring off shaft *(NOTE* - Lever engages flats on shaft). Remove nut and lockwasher retaining thermostat crank lever on shaft on rear side of housing, remove lever *(NOTE* - Lever engages flats on shaft). Slide thermostat lever, shaft, and washer out of housing. Lift fast idle cam off shoulder in housing.

Cleaning & Inspection: Clean parts with denatured alcohol or cleaning solvent and dry with air. Blow out all passages with air. Do not use wire or drills to clean jets. Clean all parts of choke mechanism thoroughly *(CAUTION* - Do not attempt to separate thermostatic coil from heat retainer plate - coil, plate, and housing are serviced as an assembly).

Reassembly: Use all new gaskets. Reassemble carburetor by reversing disassembly procedure and note the following:

Throttle Valve Removal & Installation - If new shaft being installed, scribe mark both throttle valves before removal (to insure reinstallation in same position), remove valve screws (screws are staked), slide valves and shaft out. When installing valves, make certain that scribe marks (or dash stamped on valve) is upward and toward idle port and that notch in edge of valve is centered over idle discharge port. Install new screws lightly, then close valves completely (back out stopscrew to insure valves seating), press on high side of valves and tap lightly to seat them in bores, tighten screws securely and stake by squeezing with pliers

Choke Valve Installation - Install choke shaft with lever end toward pump end of air horn. Install choke valve, position choke piston bracket on shaft and install new screws loosely. Hold valve in closed position and tap lightly to seat it in bore, tighten screws securely and stake by squeezing with pliers. Make certain that valve opens and closes freely.

Automatic Choke Assembly (Dodge 6) - Install fast idle cam on hub in choke housing with fast idle steps down and toward throttle shaft (weighted portion against stop). Assemble cam retaining washer on thermostat lever shaft with shoulder against thermostat lever, install assembly in choke housing with choke positioning tang between fast idle steps and weight on fast idle cam. Install thermostat crank lever on end of lever shaft at rear of choke housing (lever must engage flats on shaft), install lockwasher and nut and tighten securely. Install choke positioning spring on end of throttle shaft with coiled portion inward and against thermostat lever shaft housing. Slide cam contact lever over end of throttle shaft with lever tang against fast idle cam, install lockwasher and nut, tighten nut securely *(CAUTION* - This nut has left hand thread). Install thermostatic coil housing *(see Automatic Choke above).*

Main Discharge Jets & Metering Jets - Place main discharge jets firmly on Tool T-24967, seat jets firmly in main body with opening in end of jets (diagonal cut) facing opposite side of main venturi. Install main metering jets and tighten securely with Tool T-24924. Use new copper gaskets on main jet plugs and tighten plugs securely.

Accelerating Pump Assembly & Test - Install pump discharge check ball in discharge passage, fill bowl with clean gasoline to depth of ½", install pump plunger temporarily in cylinder, depress plunger to expel air from discharge passage. Hold discharge check ball down on seat with a small brass rod, operate pump plunger. No fuel should be emitted from intake or discharge passages. If fuel noted, clean passages thoroughly and inspect check balls and seats for damage. Reseat ball by using rod to tap ball down on seat *(CAUTION* - Install new check ball after using ball in seating operation). Recheck pump operation. Install discharge cluster using new gasket. Check pump operation. Discharge from each cluster jet should be a clear straight stream. If stream deflected or restricted, install new cluster. Remove pump plunger and install it in air horn.

Carburetor Adjustments - *Make all adjustments listed under ADJUSTMENTS above.*

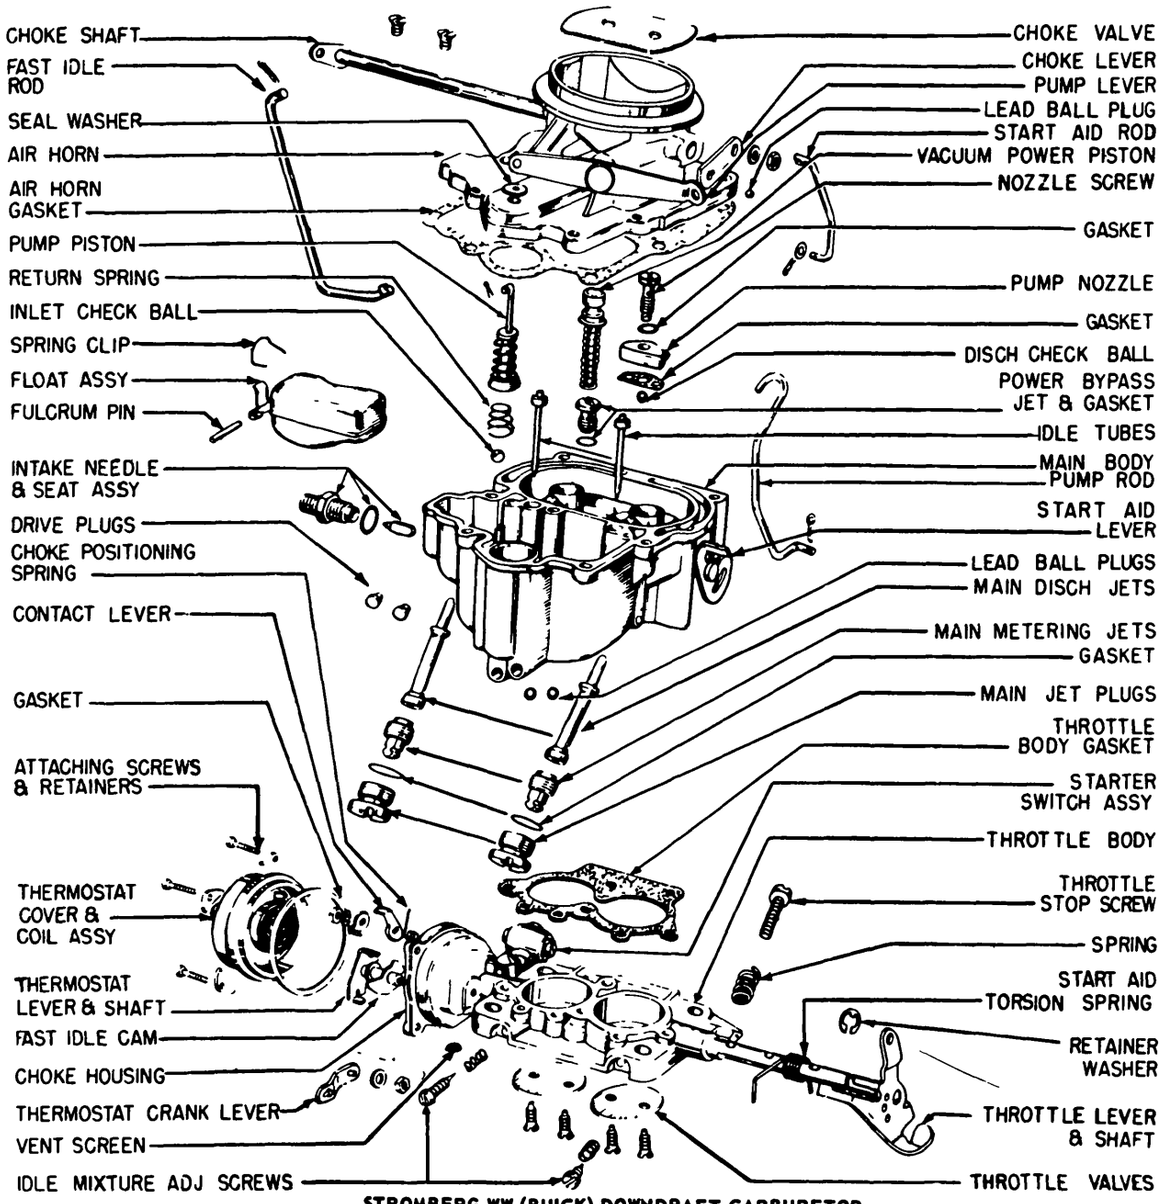
►CHANGES, CAUTIONS, CORRECTIONS

►*1959 DODGE & PLYMOUTH COLD ENGINE STALLING CORRECTION:* On Plymouth, carburetors code dated 15-40A (stamped on air horn above fuel inlet) have improved choke piston to correct condition. For correction on early Plymouth and all Dodge carburetors proceed as follows

1) Remove air cleaner, vacuum cylinder plug and piston with link assembly.

2) Enlarge bleed hole in vacuum piston groove to No. 50 drill (.070"). Replace assembly, install new vacuum cylinder plug (Stromberg No. 387166). Piston must operate freely in cylinder.

3) Place .040" wire gauge in front end of cylinder slot and move choke valve toward closed position. With piston against wire, choke valve opening should be 13/32" (Dodge), 3/8" (Plymouth) Correct by bending arm on choke shaft. *PLYMOUTH NOTE - If excessive loading results during warm-up, increase setting to 13/32". If above correction does not provide satisfactory start, set automatic choke 2 notches rich*



4) Remove wire, check choke shaft for binding and valve for proper seating without binding

►*1960 BUICK CARBURETOR CHANGES FOR IMPROVED HOT WEATHER OPERATION (Code 7-113A):* **This carburetor has baffle in float chamber and air horn gasket with solid section over float chamber.**

►*1960 DODGE & PLYMOUTH CODE 15-42 CARBURETOR HESITATION OR STUMBLE ON LIGHT ACCELERATION (ENGINE NOT COMPLETELY WARMED UP) CORRECTION:* **Install Main Metering Jets, Part No. 386208 (.052"), and Main Discharge Nozzle, Part No. 386949.**

DESCRIPTION: Dual downdraft type of same design used previously. On Buick, integral type automatic choke is mounted on throttle body along with carburetor starter switch. On Dodge and Plymouth, automatic choke is of "Cross-Over" type mounted in well in intake manifold. However, all chokes are linked directly to choke shaft. Se *"Stromberg Cross-Over Automatic Ch k ".*

ADJUSTMENTS: Make all adjustments exactly as outlined below.

STROMBERG WW (BUICK) DOWNDRAFT CARBURETOR

Idle Adjustment: For initial setting, set idle mixture adjusting screws 1 turn (Buick); 1 1/8 turns (1959 Plymouth); 1¼ turns (1959-60 Dodge & 1960 Plymouth) out from a lightly seated position. Bring engine to normal operating temperature with choke valve wide open and fast idle inoperative. Set engine idle speed to correct figure (see below), then adjust idle mixture as follows:

Idl Mixtur - Turn both idle mixture adjusting screws in equally until engine begins to run roughly from lean mixture. Then turn screws out until engine rolls from rich mixture. Now set screws about halfway between these positions where smoothest possible idle is obtained. On Buick, favor a slightly rich mixture. Recheck idle speed.

Idl Sp d - Adjust by turning throttle stopscrew located on boss on throttle body for desired speed as follows:

CONTINUED ON NEXT PAGE

1959-60 STROMBERG "WW" (Cont.) BUICK, DODGE, PLYMOUTH

Idle Speed Setting

Car Model	Setting
1959-60 Buick	①②485 RPM
1959 Dodge & Plymouth	①②450-500 RPM
1959 Dodge & Plymouth (Auto. Trans.)	①②475-500 RPM
1960 Dodge & Plymouth (All Models)	①②550 RPM

① - Transmission in "N" or "P".
② - 550 RPM on Air Cond. Cars.

Accel rating Pump: Three holes provided in throttle lever for pump rod engagement to provide seasonal adjustment as listed below.

Pump Sea sonal Setting - For normal operation engage connector rod in **cent r** hole (medium stroke). **Upper hole** - Shorter stroke (less discharge). **Lower hole** - Longer stroke (greater discharge).

Pump Str k Adjustment - With throttle stopscrew backed out so throttle valves are fully closed, and with pump connector rod in **cent r** hole of throttle lever, proceed as follows:

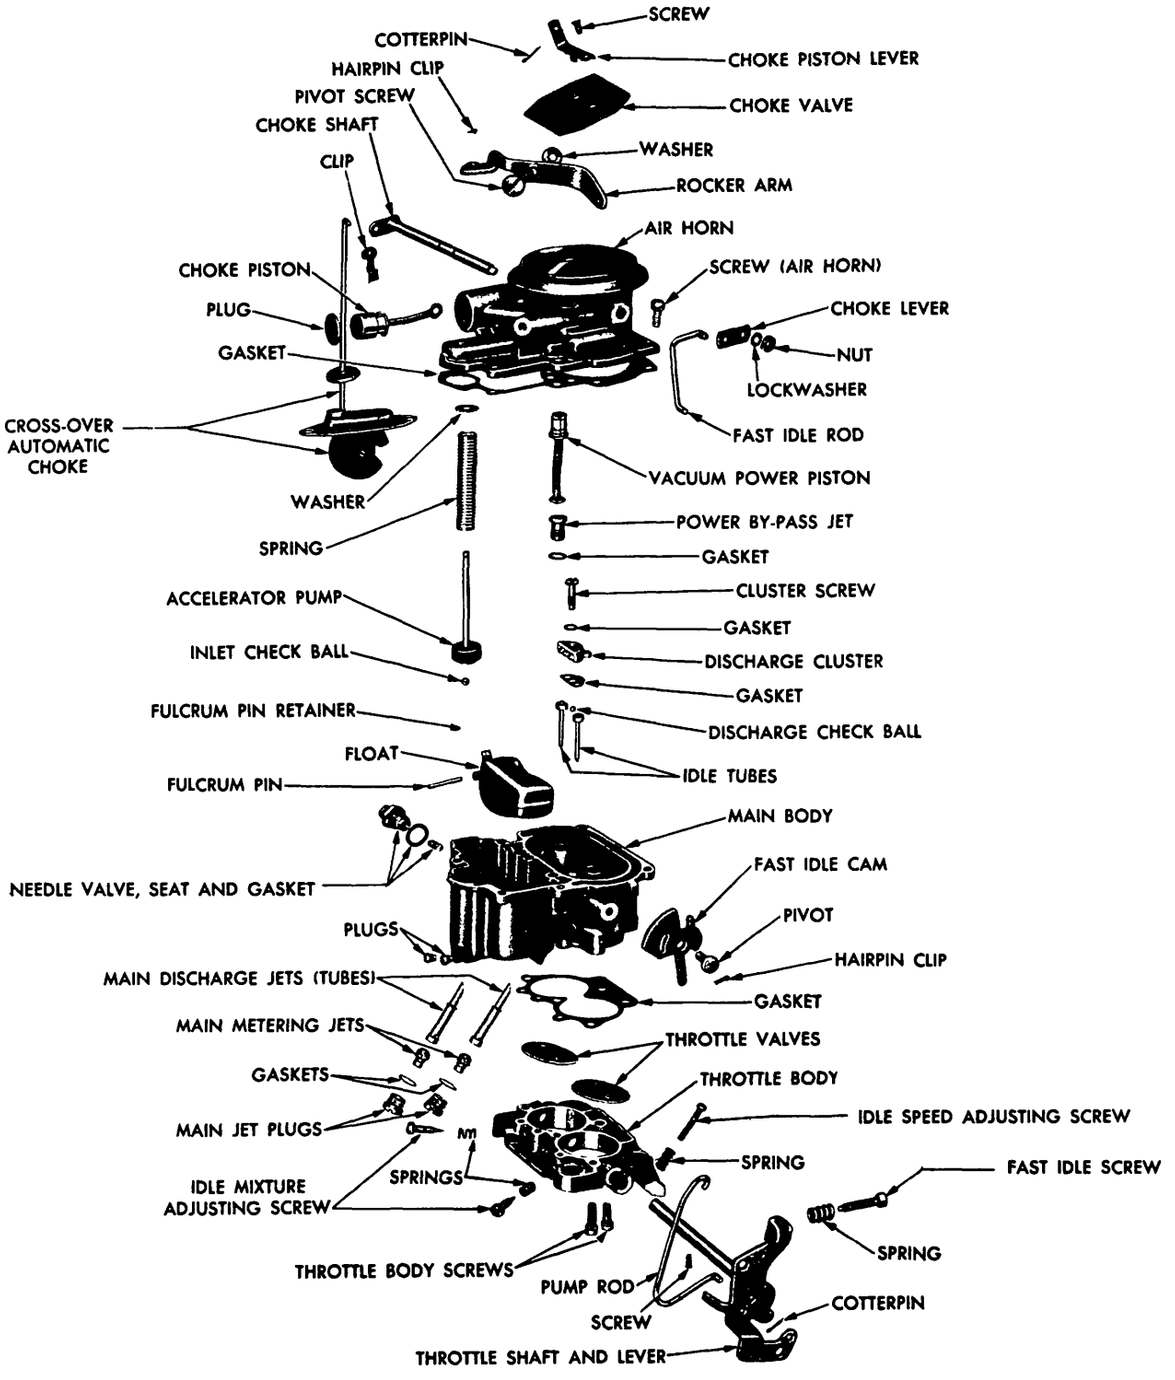
Buick - Measure vertical distance from upper side of pump plunger offset to air horn casting. Distance should be as in table below. To adjust, bend connector rod at lower angle.

D dg & Plym uth - Measure pump travel as throttle valves are moved from fully closed to wide open position. Distance should be as in table below. To adjust, bend connector rod at lower angle.

Car Model	Pump Setting Bending Tool	Pump Setting
1959-60 Buick	J-4552	7/8"
1959-60 Dodge	T109-213	9/32-5/16"
1959 Plymouth	T109-213	1/4"
1960 Plymouth	T109-213	9/32-5/16"

Fl at Level: With air horn and gasket removed and float lip held against float needle, place checking gauge across top of main body. Float should just touch gauge at center. Distance should be as in table below. To adjust, bend float lip. Make sure float hangs freely and does not touch sides of casting.

Float L vel Setting



Car Model	Checking Gauge	Float Level
Buick	J-7394	5/32"
Dodge & Plymouth	① 73519	7/32"

① - Stromberg, Dodge & Plymouth tool number.

Fast Idl , Ch k , Unl ader & Start Aid Adjustments (Buick): *CAUTION - T prevent incorrect fast idle s tting, unload r p ration, or fuel mixture at idle and l w speeds, all f the following adjustments must b mad in th ord r indicated.* Remove thermostat cover, throttle stopscrew and spring and replace stopscrew without spring. Proceed as follows:

1) Hold throttle valves fully closed and turn throttle stopscrew in **xactly** 7 turns from point of contact with throttle lever. Choke positioning spring pickup lever

CONTINUED ON NEXT PAGE

STROMBERG WW (DODGE & PLYMOUTH) DOWNDRAFT CARBURETOR WITH CROSS-OVER CHOKE

1959-60 STROMBERG "WW" (Cont.) BUICK, DODGE, PLYMOUTH

should just contact choke positioning spring. Adjust by bending lever. Reinstall stopscrew and spring.

2) Hold choke valve closed and measure distance from upper thermostat cover hole to top of thermostat lever. Distance should be 1 3/32". Adjust by bending choke rod with Tool J-5197.

3) Partially close choke valve by applying light pressure upward on thermostat spring lever until choke positioning spring lever just contacts spring. Opening between upper edge of choke valve and wall of air horn should be .204" (No. 6 drill). To adjust bend choke positioning spring lever.

4) Install choke cover and gasket, set choke **1 notch lean** (1959); **at index** (1960) and tighten screws and retainers.

5) Open throttle enough to clear fast idle cam so choke is in idle choke kick position. Then close throttle so fast idle screw rests on high step of fast idle cam. Side of screw should line up with drop-off to next lower step of cam. To adjust, bend unloader link with Tool J-5197.

6) Hold choke valve closed on a .061" (No. 53) drill. Start aid spring should just clear start aid tang on fast idle cam as throttle valve is opened. To adjust, bend start aid tang.

7) With choke closed with light pressure, fully open throttle so unloader arm on throttle lever kicks choke open partially. Distance between upper edge of choke valve and wall of air horn should be .146" (No. 27 drill). To adjust, bend unloader arm.

8) After carburetor installed on engine (engine at normal operating temperature), position fast idle cam so fast idle screw rests on high step of cam with side of screw lined up with drop-off to next lower step. Adjust fast idle screw so engine is running at 1500 RPM.

Fast Idle (Dodge & Plymouth): Fast idle cam is mounted on main body (above throttle lever) and is linked to choke shaft lever by a connector rod. A separate **Fast Idle Screw** on throttle lever contacts fast idle cam. Two Separate adjustments are required as follows: 1) **Fast Idle Speed** - Back off throttle stopscrew so that throttle valves are tightly closed. Turn fast idle screw out to clear fast idle cam, then position cam so that fast idle screw is in line with **first step** of cam (and against shoulder of highest step). Turn screw in until it just contacts cam, then turn screw in an additional **8 turns (1959-60 Dodge & 1960 Plymouth); 7½ turns (1959 Plymouth)** which will provide correct idle speed of 1300 RPM (1959 Models); 1375-1425 RPM (1960 Models), after carburetor is installed on engine. *NOTE - Throttle stopscrew must be adjusted for correct hot (slow) idle after fast idle adjustments completed.*

2) **Fast Idle Cam Position** - With fast idle screw held the same position as above, close choke valve lightly as far as possible and measure choke valve opening or clearance between top edge of valve and air horn wall using correct size drill rod (see table below). If clearance not correct. adjust by bending fast idle rod at upper angle using Bending Tool T109-213.

Fast Idle Cam Setting

Car Model	Checking Drill	Choke Opening
1959 Dodge	"J" (9/32")	.281"
1959 Plymouth	1/4"	.250"
1960 Dodge & Plymouth	13/64"	.203"

Unloader (Dodge & Plymouth): Two different adjustments required as listed below. *NOTE* - Vacuum piston (Vacuum Kick Adjustment) is located in cylinder in air horn and is linked directly to an ear on choke valve.

Unloader (Wide Open Kick) Adjustment - Hold choke valve closed lightly, open throttle valves to wide open position which will open throttle valves slightly. Measure choke valve opening or clearance between upper edge of valve and air horn using a 15/64" drill. To adjust, bend tang on throttle lever with Tool T109-214.

Vacuum Kick Adjustment - Make a wire gauge from .040" diameter wire (paper clip) with a right angle bend on one end so it will engage in slot at bottom of vacuum cylinder. With gauge in place, close choke valve until inner end of piston grips gauge at end of slot. Measure choke valve opening or clearance between upper edge of valve and air horn wall using correct size drill rod (see table below). Adjust the bending choke piston lever ear.

Vacuum Kick Setting

Car Model	Choke Opening
1959-60 All (Synchro-mesh)	31/64"
1959 All (Auto. Trans.)	29/64"
1960 All (Auto. Trans.)	11/32"

Automatic Choke (Buick): Integral type mounted on throttle body. Set 1 notch lean (1959), At index (1960).

Automatic Choke (Dodge & Plymouth): "Cross-Over" type mounted in well in intake manifold. *See "Stromberg Cross-Over Automatic Choke".*

Car Starter (Carburetor Vacuum Switch): Switch timing can be checked with carburetor on engine on Dynaflow Cars only. On all cars, switch can be timed with carburetor off engine as detailed below.

Switch Timing (Off Engine) - Connect battery and test lamp across switch terminals so that lamp will light when switch contact made. See that choke valve is wide open and fast idle cam is in hot or slow idle position. Close throttle valve against 1/4" drill rod inserted between lower edge of valve and carburetor wall at center. Lamp should light indicating that switch contacts are closed. Repeat test with 7/64" drill rod. Lamp should not light. If switch does not operate within above limits, adjust by adding or removing square timing shims located under contact spring. Shims furnished in thicknesses of .006" and .018".

Switch Timing (On Engine - Dynaflow Cars) - Place transmission selector lever in "P" (Park) and apply brakes. Back off throttle stopscrew so that throttle valves are tightly closed (fast idle cam must be in hot or slow idle position). Place scale against flange on dashpot diaphragm and measure distance to nearest edge of dashpot arm on throttle lever. With ignition turned on, slowly open throttle while holding scale in position against flange of dashpot. When cranking motor is energized, note the distance from flange of dashpot to near edge of dashpot arm. The difference between the two measurements should be 3/4-1 1/8". If switch timing not correct, adjust as for "off-engine" timing above.

Anti-stall Dashpot (Buick with Auto. Trans.): *For adjustment, see "Throttle Linkage Adjustment" under CARBURETOR on car model page.*

OVERHAUL: *See "1955-58 Stromberg (Buick) Carburetors" and "1955-58 Stromberg (Dodge & Plymouth) Carburetors".*

SERVICE PARTS: Gasket Set - Buick No. 1190922 (7-112 & 7-113); MoPar No. 1631368 (3-164, 3-181, 3-182, 3-183, 15-38, 15-39, 15-40, 15-41, 15-42).
Repair Kit - Buick No. 1190921 (7-112), No. 1195309 (7-113 & 7-113A); MoPar No. 1826541 (15-38, 15-39, 15-40). No. 1826540 (3-164, 3-182), No 1826850 (3-181, 3-183), No. 2084726 (15-41, A). No. 2084727 (15-42).

1960 STROMBERG "WWC" (DODGE) CARBURETORS

DODGE	Stromberg Carburetor No.
V8 Matador	WWC 3-188

DESCRIPTION: 2-Barrel downdraft type of new design having an idle system vent (operated from the throttle linkage) and a double venturi cluster which contains the small venturi, discharge nozzles, main discharge tubes and idle tubes. A separate "Cross-Over" type automatic choke assembly is located in a well in intake manifold (at exhaust crossover passage) and linked to choke valve lever by a connecting rod. Choke vacuum piston is located in a cylinder in carburetor air horn and is linked directly to choke valve.

ADJUSTMENT: *Make all adjustments exactly as indicated below.*

Idle Setting: For initial setting, set idle mixture screws (located in throttle body below float chamber) ½ to 5/8 turn open from a lightly seated position, then bring engine to normal operating temperature with choke fully open and carburetor off fast idle.

Idle Speed – 500 RPM with transmission in "N" (Neutral). *NOTE – 550 RPM with air conditioning compressor operating (if equipped).* Adjust idle speed with throttle stop screw on throttle body casting.

Idle Mixture – Turn both idle mixture screws in equally until engine begins to run rough, then turn screws out until engine rolls (from rich mixture). Now turn screws in to a point about halfway between these two positions where smoothest idle is obtained. *NOTE – Both screws must turn equally.* Recheck idle speed.

Fast Idle Cam Position Setting: Turn throttle stop screw (idle speed screw) out far enough to clear throttle lever tang when throttle valves are closed. Hold throttle valves in closed position and back out fast idle adjusting screw so it can be positioned on high step and against shoulder of fast idle cam. Turn fast idle screw in until it just contacts step of cam, **then turn screw in 3½ turns.** Hold fast idle screw in this positions and close choke valve as far as it will go with light pressure. Clearance between top of choke valve and air horn wall should be ¼" (use a ¼" drill to measure). To adjust, bend fast idle rod at upper bend (where it connects to choke shaft lever).

Fast Idle Speed: 1375–1425 RPM with fast idle adjusting screw resting on high step (against shoulder) of fast idle cam.

Unloader: With choke valve held lightly closed, open throttle valves to wide open position. Clearance between top edge of choke valve and wall of air horn should be ¼" (use ¼" drill to measure). To adjust, bend tang (long narrow extension) on throttle lever with Tool T109–214. Make sure throttle valves fully open and close when choke valve is wide open.

Accelerating Pump: With throttle valves fully closed, pump travel from the fully closed to fully open throttle positions should be 7/16", measured at small raised boss near connecting rod end of pump lever. To adjust, bend pump rod at right angle bend. *NOTE – Pump rod must be installed in center slot of pump arm.*

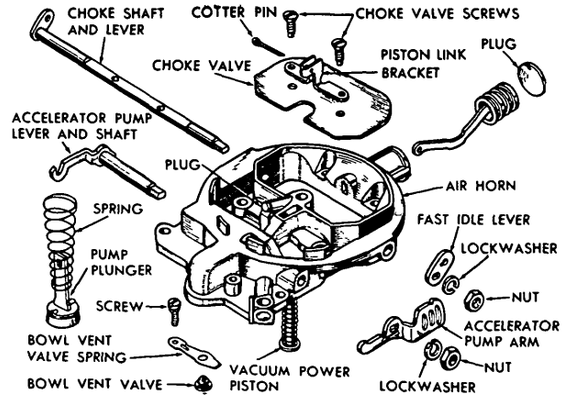
Bowl Vent Valve: With idle speed screw in hot (slow) idle position, hold throttle valve in closed position with choke valve wide open. Opening of vent valve at center of hole, with rubber valve hanging free, should be .062–.094". To adjust, bend bowl vent lever (extension of accelerator pump lever) with Tool T109–214.

►*CAUTION – Make sure the vent valve is not distorted and that it properly seals the bowl vent hole when throttle valve is open.*

Choke Vacuum Piston: With bowl cover removed, insert a No. 59 drill (.041") through vacuum passage on underside of choke piston cylinder and engage the top groove of vacuum piston. Apply a light pressure against choke valve to take up slack, then measure clearance between top of choke valve and wall of air horn which should be .182" (No. 14 drill). To adjust, bend ear on choke connector rod bracket on choke valve.

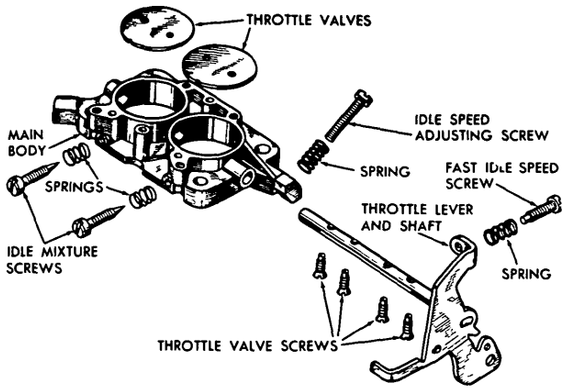
Float Level: With float installed in float bowl and lip of float held against inlet needle, distance from top of float at center to top of float bowl (gasket removed) should be 1/8". Use Gauge 73725 or "T" scale. To adjust, bend lip of float with Tool 73605.

►*FLOAT LEVEL CHECKING NOTE:* With carburetor installed on engine, the air horn can be removed as follows: Remove three short air horn-to-main body attaching screws, then remove one long air horn-to-throttle body screw next to fuel bowl. Assemble a short screw through main body flange and thread into throttle body. Remove long screw from side away from fuel bowl and on opposite side, then assemble a short screw through main body flange. Securely tighten the short screws, then remove remaining two long screws and lift off air horn. Assemble air horn to main body by reversing removal procedure.



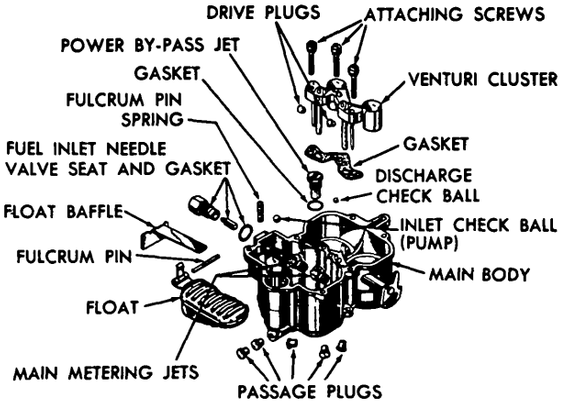
Automatic Choke: Automatic choke is a separate "Cross-Over" type mounted in a well in intake manifold. *See "Cross-Over Choke" in 1957 Annual Data or later Manual edition.*
Setting – 1 notch rich.

OVERHAUL: With carburetor removed from engine, proceed as follows:



Disassembly: Remove hairpin from fast idle rod and from pump rod, then remove rods. Remove three air horn attaching screws, four main body-to-throttle body screws, then lift off air horn assembly and gasket. Remove main body and gasket from throttle body.

Air Horn - Remove accelerating pump piston and spring from air horn, then remove spring from pump piston. Remove vacuum power piston using a block of wood and small open end wrench as a pry. Remove choke lever attaching nut and lockwasher and remove lever. Remove vacuum piston link cotter pin, then remove



CONTINUED ON NEXT PAGE

AIR HORN (EXPLODED VIEW)

THROTTLE BODY (EXPLODED VIEW)

MAIN BODY (EXPLODED VIEW)

1960 STROMBERG "WWC" (DODGE) (C ntinued)

choke valve plate, choke valve, and choke shaft. Remove welch plug and choke piston. Remove pump lever, external vent attaching screw, external vent spring and grommet.

Main Body - Remove baffle, fulcrum pin spring, float, and fulcrum pin. Remove needle valve, seat and gasket. Invert carburetor and catch pump inlet ball check. Remove venturi cluster attaching screws, cluster assembly, and gasket. Remove power bypass jet and gasket, then use Tool T109-173 and remove the two main metering jets.

Throttle Body - Remove idle mixture screws and springs from throttle body. *NOTE - It is not advisable to remove throttle shaft or valves unless necessary to install new parts.* If these parts must be removed, scribe throttle valves along side of throttle shaft and mark valves and throttle body to assure reassembly in same position and barrel, then remove screws, throttle valves, throttle shaft and lever.

Cleaning & Inspection: Clean all metal parts in Bendix Metaclean. *CAUTION - Do not use metaclean to clean non-metallic parts.* Blow out drilled passages and parts with air. Inspect housing for damage, wear, burrs or warpage. Check throttle shaft for excessive wear in throttle body. If wear is extreme, it is recommended that throttle body be replaced rather than installing a new shaft in throttle body.

Reassembly: Throttle Body - If throttle shaft and valves were removed, insert throttle shaft in throttle body and assemble throttle valves in same position and barrel that valves were removed from, leaving screws loose. Close throttle, align valves to scribe marks and check for best closing before tightening screws. *NOTE - Throttle valves must be installed with notch toward idle discharge holes.* Replace idle mixture screws and springs. Turn each needle valve in lightly against its seat, then back out each valve one full turn. If removed, replace slow idle stop screw, fast idle stop screw, and springs.

Main Body - Replace drive plugs and lead plugs if removed, then assemble main metering jets in main body and tighten securely with Tool T109-173. Install power bypass jet and new gasket and tighten securely. Install accelerator pump inlet check ball (1/8") in pump well, and discharge check ball (3/8") in discharge passage.

Air Horn - Slide choke shaft and lever into air horn with choke lever pointing down and away from air horn, then slide choke valve down into slot in shaft. Hold choke valve closed, then position choke piston bracket and install new screws (do not tighten). Hold valve in a closed position and tap gently with a screwdriver to center and locate the valve. Tighten attaching screws securely, then stake in place by squeezing with pliers. Install fast idle lever and secure with lockwasher and nut. Check accelerator pump leather for cracks or wear and hardness. If necessary, install a new pump plunger. *NOTE - If a new pump plunger is installed, flex leather several times before installing in air horn.* Slide compression spring over plunger shaft, then slide plunger over hook and into position. Install a new air horn gasket, then install vacuum power piston in air horn. Lock in position by prick punching on retaining rim. Compress piston plunger to make sure no binding exists. If piston sticks or binds enough to cause rough operation, install a new piston assembly.

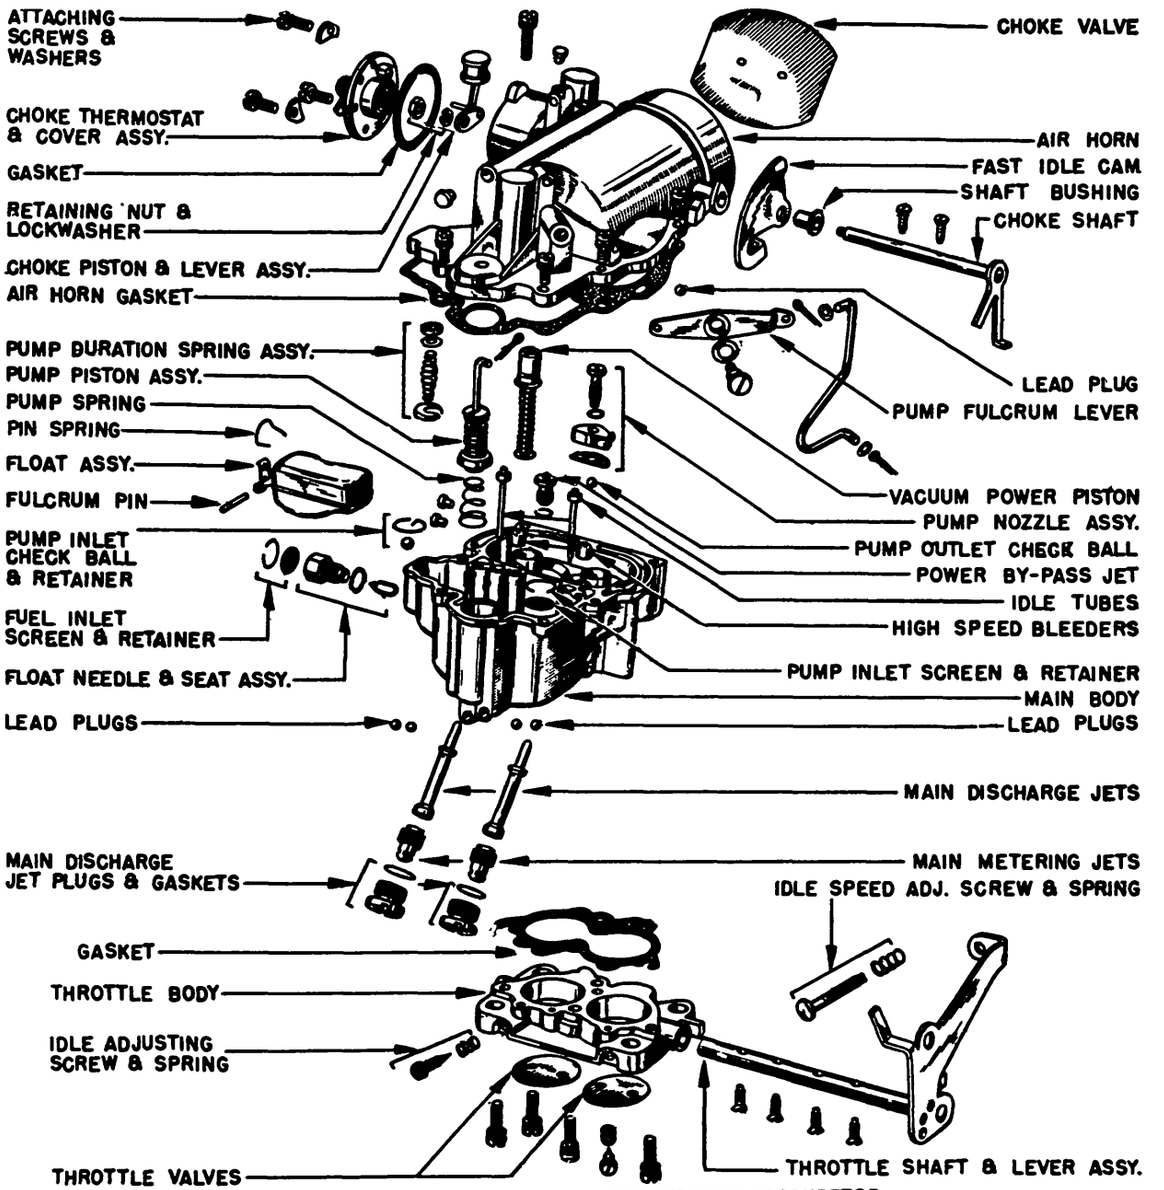
►CHANGES & CORRECTIONS

►*1955 CARBURETOR PRODUCTION CHANGES & REPLACEMENT NOTE:* Starting with carburetor 6-112D, these carburetors have a different air flow system requiring different jet calibration and design has been changed to eliminate such parts as: Pump Inlet Screen & Retaining Clip, Pump Plunger Link Felt Washer, Pump Inlet Ball Check Retainer Clip. *See Stromberg Jet Specifications for complete jet data.*



►*1956 CARBURETOR INSTALLATION CAUTION:* Use only Manifold-to-Carburetor Gasket Part No. 684059 for WW6-115 or No. 154006 for WW6-117 carburetors. DO NOT USE Gasket No. 684059 on WW6-117 Carburetors as choke vacuum passage will be shut off by gasket.

►*1956 CHOKE THERMOSTAT COVER (Code WW6-117) PRODUCTION CHANGE (To Improve Cover Seal):* Inner gasket was eliminated and air horn housing revised to offset use of only one gasket. Revised carburetors (Using only one gasket) are identified by Stromberg Model No. WW6-117A. *See "Carburetor Installation Caution"* above for correct Manifold-to-Carburetor Gasket for proper choke operation.

►*1957-58 ALTITUDE CARBURETOR MAIN METERING JET CAUTION:* These jets have different flow characteristics than same size jets used on Studebaker Supercharged models and must not be interchanged. Correct type jets may be identified by groove around wrench end. *See Stromberg Jet Specifications for all jet sizes.*

►*1958 ENGINE CUTTING OUT ON LEFT TURN CORRECTION (WW 6-117B CARBS.)* Caused by gasoline foam being injected into air horn through fuel bowl vent due to float dropping on left turns and allowing hot gasoline to enter fuel bowl. Correct by installing Air Horn Gasket, Part No. 1543362 (vent hole in gasket is not in line with vent tube), and Baffle, Part No. 1543363 (install between float and float needle valve).

DESCRIPTION: Dual downdraft type with side air intake. Fuel System is similar to other Stromberg with usual Float System (single float), Idle System, Main Metering System, Power System (with vacuum piston operated power bypass jet) and Accelerating System (pump operated by horizontal lever with duration spring type pump piston). Carburetor has automatic choke and a fast idle feature.

STROMBERG "WW" (STUDEBAKER) DOWNDRAFT CARBURETOR

CARBURETOR ADJUSTMENT: ***Make all adjustments exactly as follows:***

Idle Setting: Turn both idle mixture adjusting screws in until they are lightly seated, then back each screw out exactly 1¾ turns. Start engine and allow it to run until normal operating temperature is reached. With engine at normal operating temperature (choke valve wide open, fast idle inoperative) and with air cleaner in place, adjust idle speed and mixture as follows:

Idle Mixture—First check and adjust idle speed. Turn BOTH idle mixture adjusting screws in evenly and slowly until engine begins to run unevenly, then turn screws out evenly and slowly until engine again runs unevenly, finally set both screws approximately halfway between these two points where smoothest idling performance is secured. Recheck engine idle speed. *CAUTION*—BOTH adjusting screws must be turned equally and in the same direction when making above adjustment.

CONTINUED ON NEXT PAGE

1954-58 STROMBERG "WW" STUDEBAKER CARBURETOR (C nt.)

Idle Speed—With engine at normal operating temperature and fast idle cam in slow idle position so that idle adjusting button contacts lowest step of cam, adjust screw for correct idle speed:

Idle Speed

Model	Synchro-mesh	Auto. Trans.
1954	Ⓒ 550 RPM	Ⓒ 550 RPM
1955-56	Ⓒ 550-600 RPM	Ⓒ 550-600 RPM

1958	Ⓒ 550-575 RPM	Ⓒ 575-600 RPM

①—With selector lever in "N" position.

Accelerating Pump: Three holes provided in throttle lever for pump connector rod engagement:
Center Hole—Normal operating conditions.
Inner Hole—Shorter stroke, less fuel discharge.
Outer Hole—Longer stroke, more fuel discharge.

Float Level: To check float setting, remove air horn and bowl cover and gasket, hold float lever lip firmly against intake needle valve to place float in closed-valve position. Measure float height by placing Float Level Gauge T-25569 (Studebaker No. J-5475) squarely on top edge of float bowl at center of float. If float not even with step on gauge, bend float lever lip next to float pin as required using bending tool T-24733 (Studebaker KMO-269-S5).

FLOAT SETTING

Studebaker WW	Ⓒ 3/16"

①—Top of float below top edge of bowl.

Fast Idle Cam Setting: Check with fast idle cam in fast idle position with choke valve fully closed. In this position, one-half of diameter of button on throttle stopscrew should rest on highest step of fast idle cam (button should hang over so that half-diameter travel of fast idle cam will cause screw to drop down on to next-lower step of cam). If button and cam contact not correct, bend ear on choke lever which contacts fast idle cam up or down as required using bending tool KMO-478. *NOTE—Throttle stopscrew is adjusted as part of Idle Setting.*

Unloader (Dechoke) Setting: To check setting, hold choke valve closed tightly, open throttle valves to point where stop on throttle lever rests against stop on carburetor throttle body and choke valve is opened slightly. Check choke valve opening by inserting #1 drill rod (.228") between lower edge of choke valve and air horn wall. If opening not correct (.203-.265"), adjust by bending ear on choke lever which contacts throttle lever using bending tool KMO-478.

Automatic Choke Setting: Centered, with arrow on choke cover aligned with index mark on housing (WW 6-112, 6-113, 6-115, 6-116); one point lean (WW 6-117, A,B,C).

Throttle Return Check (Cars with Automatic Transmission): Consists of a dashpot unit mounted on the carburetor with the dashpot plunger contacting the throttle lever during the last 3/16" of throttle movement toward closed throttle position. Dashpot will prevent too-rapid closing of throttle and keep engine from stalling. *See Throttle Linkage Adjustment under CARBURETOR on car model page.*

OVERHAUL: Disconnect pump operating rod from throttle lever and pump operating lever and remove rod. Take out air horn attaching screws, lift air horn assembly straight up and off main body, remove spring from end of pump plunger (spring may remain in pump cylinder and can be lifted out). Lift off air horn gasket.

Air Horn Disassembly—Disconnect pump plunger stem from pump operating lever, remove pump assembly. Take out pump lever fulcrum screw (screw has left-hand thread), remove spring washer and lift lever off. Remove felt washer, plain washer and retainer spring from pump plunger stem (duration spring can also be removed by compressing spring and sliding retainer out of groove in stem). Clean up staking around vacuum piston cylinder edge, pull vacuum piston assembly out of cylinder. Take out choke cover retainer screws, remove cover and coil assembly and gasket. Use tool T-25047 to remove nut and lockwasher from end of choke shaft, disengage choke piston link from shaft, remove piston and link assembly. Take out choke valve retaining screws, remove valve, slide choke shaft and lever assembly out of air horn.

Main Body Disassembly—Lift both idle tubes out, invert body and take out four throttle body attaching screws (recessed in bottom face of throttle body), lift throttle body off and remove gasket. Remove both main metering jet plugs and gaskets, use tool T-24924 to remove main metering jets, use tool T-24967 to remove main discharge jets (screw tool into base of jets, pull jets out of body recess). Take out pump discharge nozzle screw and gasket, lift discharge nozzle and gasket off, invert body to drop out discharge check ball. Unscrew fuel inlet fitting on side of bowl, remove retainer and fuel strainer from within fitting. Take out float hinge pin spring clip, remove float and hinge pin assembly, tip casting to remove fuel intake needle. Remove power by-pass jet and gasket. Remove pump intake strainer screen retainer and strainer screen from intake passage at side of pump cylinder. Remove pump intake check ball retainer from bottom of pump cylinder, invert body to drop out the intake check ball. *CAUTION*—Retainer not used on later carburetors and care must be used not to lose ball which will drop out whenever carburetor inverted.

Throttle Body Disassembly—Remove both idle adjusting screws and springs. Do not disturb throttle valve and shaft assembly unless required for replacement of parts. If necessary to remove valves, first mark each valve and mark throttle body correspondingly to insure re-installing valves in same barrel, take out valve attaching screws, slide valves out, slide throttle shaft and lever assembly out of throttle body.

Reassembly: Use all NEW gaskets. Re-install parts in reverse order of disassembly procedure above and note following important points:

Accelerating Pump Discharge Nozzle—Install discharge check ball in discharge passage, then install nozzle assembly with new gasket, use new gasket on attaching screw and tighten screw securely.

Accelerating Pump Intake Check & Strainer—Install intake check ball in recess in bottom of pump cylinder, use tool T-25360 to seat the ball retainer clip. Install strainer screen retainer clip

Main Metering Jet Assemblies—Use remover tool T-24967 to seat main discharge jets firmly in main body, tighten main metering jets securely using tool T-24924. Use new gaskets on main metering jet plugs and tighten plugs securely.

Automatic Choke Assembly—Install thermostatic coil assembly and gasket with coil hook downward, rotate cover counter-clcokwise in direction of arrow on cover until reference mark on cover is aligned with boss on housing, tighten retainer screws securely.

1957-58 STROMBERG "WW" STUDEBAKER & PACKARD SUPERCHARGED

PACKARD	Stromberg Code No.
1957 Clipper Model 57L	Ⓒ WW 6-121
1958 Packard Hawk	Ⓒ WW 6-122A
STUDEBAKER	
1957 Golden Hawk Model 57H-K	Ⓒ WW 6-121
1958 Golden Hawk	Ⓒ WW 6-122A

Ⓒ - Used with McCulloch Supercharger.

►CHANGES, CAUTIONS, CORRECTIONS

►*ALTITUDE MAIN METERING JET CAUTION:* These jets have different flow characteristics than same size jets used on other Studebaker models and must not be interchanged. They may be identified by unmarked end (Jets for other models have groove around wrench end). *See Stromberg Jet Specification Tabl for all jet sizes.*

►*1957 HARD STARTING OR PROLONGED CRANKING WITH HOT ENGINE CORRECTION:* Modify carburetor and Supercharger Air Chamber as detailed below. *NOTE*- Carburetor must be removed from engine but need not be disassembled if care is taken to prevent metal chips entering carburetor.

1) Carburetor Vents - Drill a 7/64" hole through side of air horn casting into vertical section of balance vent passage (locate this hole to right and below end of choke vacuum piston cylinder and adjacent to the right hand edge of the passage wall). Drill two 5/64" holes in throttle body (locate holes in small bosses directly above mounting flange and at ends of square section of casting when viewing side of carburetor with automatic choke housing toward right side).

2) Air Chamber Cover Vent Valve - If air chamber cover does not have a vent valve, install valve as follows: Drill a 1" valve hole in cover (When facing air intake hole side of cover, locate this hole 3" to left of right hand cover mounting hole and 3¼" up from mounting flange edge of cover), drill two 5/32" valve mounting holes on a line drawn 45° down and to the left of the valve hole center, drill first hole 2" from valve hole center and second hole 5/8" beyond this point. Instali vent valve assembly, No. 1542765, in cover with two small flat washers between spring and cover, use self-tapping screws, No. G453113, to attach valve. Adjust valve by bending spring for opening of ¼" between cover and highest point at outer edge of valve. Reinstall carburetor and adjust as directed below

CONTINUED ON NEXT PAGE

1957-58 STROMBERG "WW" STUDEBAKER & PACKARD SUPERCHARGED (C nt.)

►*1957 STUDEBAKER GOLDEN HAWK CARBURETOR ADJUSTMENT NOTE* On early cars, Air Chamber Cover and Base provided with adjusting holes (closed by pipe plugs) for idle mixture and idle speed adjustments On later cars (and all Packard), extensions are provided on the idle mixture adjusting screws (extending through air chamber base), and the idle speed adjusting screw is located on the external throttle lever, so that all adjustments can be made without disturbing the air chamber cover

►*1957 STUDEBAKER GOLDEN HAWK & PACKARD CARBURETOR CHANGES TO PREVENT STALLING AND IMPROVE PERFORMANCE & ECONOMY* Following changes have been made in production and can be made on earlier cars

1) Engin Stalling n L ft Turn Correction - Due to gasoline foam entering air stream through bowl vent tube caused by float dropping on left turn. Correct by installing new Air Horn Gasket, Studebaker No. 1543362 (with vent hole in gasket moved out of line with bowl vent tube), and Float Bowl Baffle, Studebaker No. 1543363 (installed between float and needle valve to prevent fuel surging in bowl). *NOTE* - When installing these parts, check cover for flatness and correct by filing cover or body casting as necessary to insure good seal along vacuum passage to choke and vacuum power piston

2) Ov r-rich C nditi n After Starting (Cold Engine) - A ¼" hole should be drilled in the center of the choke valve on the wide side. Automatic choke should be set at Index (Centered). This setting supersedes 1 Notch Lean setting used on cars with first type carburetor

3) Lean Condition Aft r Starting - Correct by shortening choke stove-to-carburetor pipe 1¼". See also Over-rich Condition correction (preceding).

4) Improv d Fu l Ec n my - Install new Power Piston Assembly, Studebaker No 1543290. This assembly has different spring tension which allows power jet to come in at higher speed for improved gasoline mileage.

►*1957 STUDEBAKER GOLDEN HAWK AIR CHAMBER VENT VALVE FLUTTER & NOISE (Eng. Idling)* If not corrected by engine idle speed adjustment (when due to insufficient supercharger output or too slow engine speed), check and adjust vent valve as follows Remove air chamber cover, check distance from tip of valve to base or cover (depending on valve mounting location) which should be ¼". Adjust by bending the valve flat spring *See Air Chamber Production Change (following)*

►*1957 STUDEBAKER GOLDEN HAWK AIR CHAMBER PRODUCTION CHANGES* **See Carburetor Adjustment Note (above) for changes affecting carburetor adjustment.** Other changes have been made as follows Beginning Engine No PS-2375, vent valves in base and cover were removed and holes were plugged. At the same time a vent pipe was installed in the base (extending forward from base and down in front of engine) to provide a vent and drain for the air chamber. These new parts are Drain Pipe Assy No. 1543107, Pipe Nipple (Base End) No. 1543108, Drain Pipe-to-Timing Gear Cover Clip No. 182317. *NOTE* - Vent Valve Assy. No. 1542765 is continued for service on first type air chamber.

►*1957 STUDEBAKER GOLDEN HAWK & PACKARD CLIPPER HIGH FUEL CONSUMPTION OR POOR ENGINE PERFORMANCE.* **May be due to fuel leakage within air chamber (not visible from outside) caused by loose fuel line connections or porous base casting. Check these points when correcting above complaints.**

DESCRIPTION: Dual downdraft type similar to design used on other Studebaker models except for straight air horn (vertical air intake) and fast idle cam mounted on main body above throttle lever and linked to choke valve lever Carburetor is mounted on an Air Chamber Base (on manifold) and is completely enclosed by a cover so that the entire carburetor is supercharged All carburetor connections are made to fittings in the base (fuel line, choke hot air stove pipe, and distributor vacuum line) *See Carburetor Adjustment Note above for other features*

ADJUSTMENT: Make all adjustments exactly as detailed below

Idle Setting: With engine at normal operating temperature and idling at correct idling speed, adjust idle mixture, then recheck idle speed and readjust as necessary

Idle Mixture - See Note below for early Studebaker cars with adjusting screws within air chamber Turn both idle mixture adjusting screws (extensions on forward edge of air chamber base) in slowly until engine begins to run unevenly, then turn screws out until engine again runs unevenly, finally set both screws approximately midway between these two points where smoothest idling performance is secured *CAUTION* - Both screws must be turned equally and in same direction when making this adjustment

►*EARLY STUDEBAKER NOTE* On these cars, idle mixture adjusting screw extensions are not used. To adjust, remove pipe plugs (on forward edge of air chamber base) and insert flexible shanked screwdriver through holes to engage slotted adjusting screws on carburetor.

Idle Speed - 550-575 RPM (with selector lever in "N", Neutral, position on Flightomatic cars) Adjust idle speed by turning throttle lever stopscrew located on bracket on left side of air chamber cover This screw serves as a stop for throttle outer arm

Throttle Return Check (Flightomatic Cars): Consists of a dashpot unit mounted on the carburetor within the air chamber cover *See Throttle Linkage Adjustment under CARBURETOR on car model page.*

Float Level: Air chamber cover must be removed and air horn and bowl cover assembly taken off for this adjustment With gasket removed, hold float lever lip firmly against intake needle valve to hold float in closed-valve position Place gauge, Studebaker No J-6646 squarely on top edge of bowl at center of float. If float not even with step on gauge, bend float lever lip next to float pin as required

Float Setting	
Packard & Studebaker	① 7/32"

① - Top of float below top edge of bowl

Fast Idle - This adjustment can be made with the carburetor on the bench (Off Engine) or On Engine as detailed below *NOTE* - If carburetor on engine, it will be necessary to remove air chamber cover for access to fast idle adjusting screw.

Off Engin Adjustm nt - Manually close choke valve so that fast idle adjusting screw rests on highest part of fast idle cam. Adjust fast idle screw so that throttle opening is 030" Check by inserting 030" wire gauge between edge of throttle valve and carburetor wall.

On Engine Adjustment - After adjusting hot or slow idle speed to 550-575 RPM, manually close choke valve so that fast idle adjusting screw rests on highest part of fast idle cam *(CAUTION - Fast idle screw is located on inner throttle arm, within air chamber cover, and can be reached by removing plug on rear face of air chamber cover and inserting a short shanked screwdriver)* Back fast idle screw out until slow idle speed stopscrew just touches the stop, then turn fast idle screw in exactly 7½ turns This will provide correct throttle valve opening of 030- 031"

Unloader (Dechoker) - To check setting, open throttle valves fully, check choke valve opening by inserting No. 1 drill rod (.228") between lower edge of choke valve and air horn wall. If opening not correct (203-.265"), adjust by bending ear on throttle lever which contacts lug on fast idle cam

Automatic Choke: 1 Point Lean with arrow on cover 1 point toward lean side from boss on housing.

Kickdown Switch (Supercharger Control) - Switch is mounted on bracket at auxiliary throttle outer lever and can be adjusted without disturbing air chamber cover. To adjust, loosen switch mounting nuts in bracket, position switch so that plunger is fully depressed and throttle outer lever rests against threaded sleeve of switch in wide open throttle position. Tighten mounting nuts after adjustment completed.

CARBURETOR REMOVAL & INSTALLATION: Removal - Loosen supercharger-to-carburetor air chamber hose clamps, remove air chamber mounting stud nuts and lockwashers Lift cover and disengage studs on right side, then continue to lift and rotate cover to disengage studs on left side and slip hose off supercharger outlet. Disconnect and remove distributor vacuum line, choke heat tube, and fuel line (at carburetor and air chamber base connections). Remove idle mixture screw extensions by unscrewing plugs from base. Remove carburetor mounting nuts Hold auxiliary throttle outer lever so that slot in inner lever is vertical, lift carburetor assembly straight up.

Installation - Use new carburetor-to-manifold gasket on air chamber base. Install carburetor by reversing removal procedure.

AIR CHAMBER BASE REMOVAL & INSTALLATION: Removal - After carburetor removed, disconnect throttle return spring and throttle rod from throttle outer arm, disconnect kickdown switch wires. Disconnect fuel line and distributor vacuum line from base fittings. Remove oil filter bracket screws. Lift air chamber base from manifold.

Installation - Use new gasket between base and manifold. Install base by reversing removal procedure.

CARBURETOR OVERHAUL: *See "Stromberg WW (Studebaker) Carburetors".*

SUPERCHARGER OVERHAUL: *See "McCulloch (Studebaker) Supercharger"*

1959-60 STROMBERG "WW" STUDEBAKER CARBURETOR

STUDEBAKER	Stromberg Carb. No.
1959 V8 Lark & Hawk (Std.)	WW 6-123
1960 V8 Lark & Hawk (Std.)	WW 6-123 & 123A

DESCRIPTION: Dual downdraft type with straight air Horn (vertical air intake) and fast idle cam mounted on main body above throttle lever and linked to choke valve lever. Automatic choke housing mounted on air horn and linked directly to choke shaft. Carburetor contains conventional single float, idle system, main metering system, power system, accelerating system and automatic choke.

ADJUSTMENT: Make all adjustments exactly as detailed below.

Idle Setting: For initial setting, set idle adjusting screws (located in throttle body below float chamber) 1¼ turns out from a lightly seated position. Bring engine to normal operating temperature with carburetor air cleaner in place, choke fully open, and carburetor off fast idle.

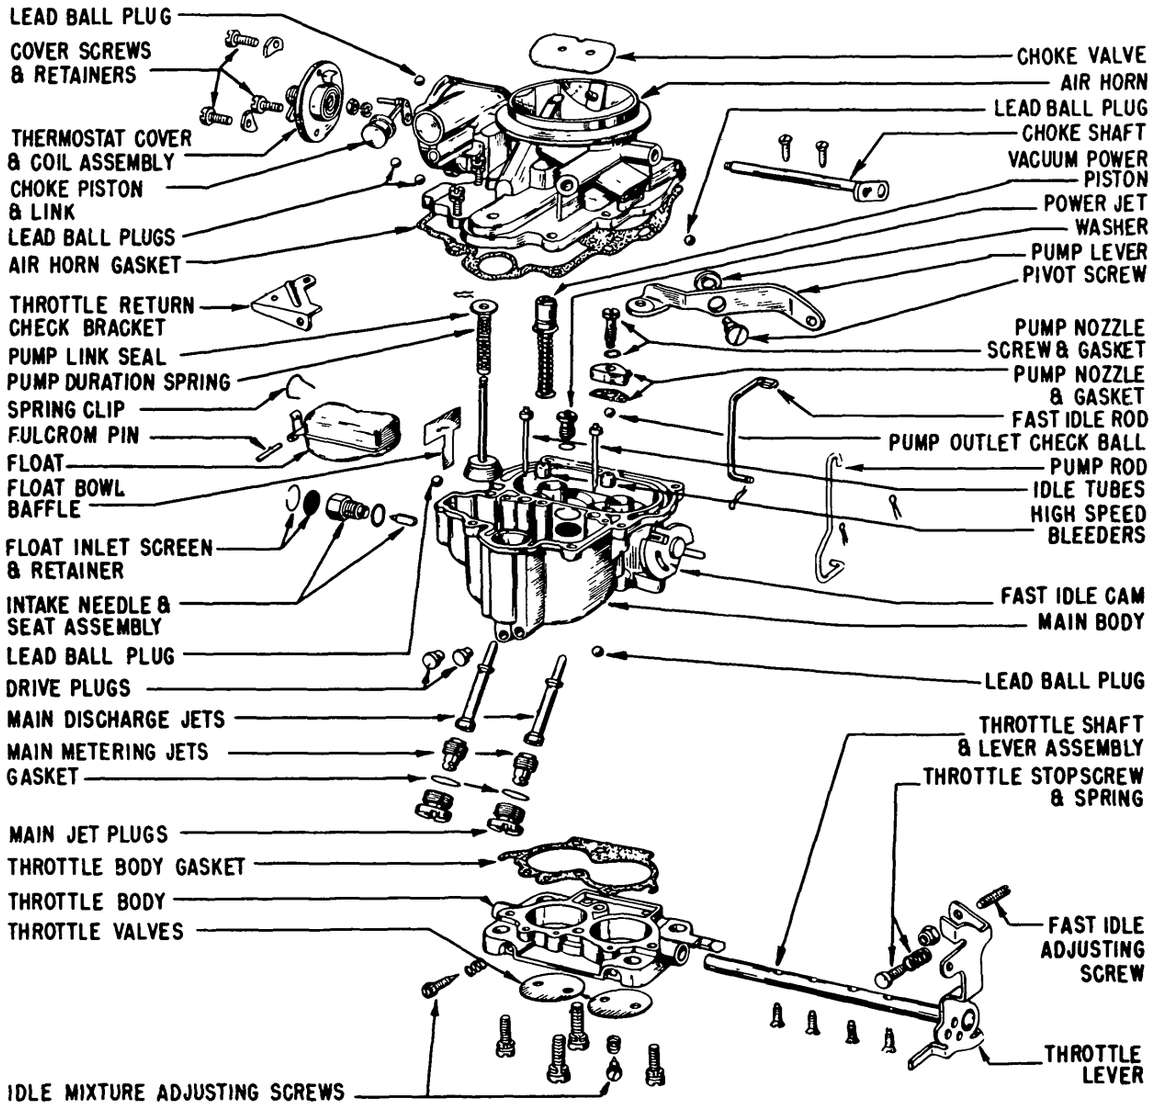
Idle Speed – 550–600 RPM with selector lever in "N" on Flightomatic cars. Set idle speed by turning throttle stopscrew located on boss on throttle body until correct speed is obtained.

Idle Mixture – Turn both screws in equally until engine begins to run roughly from lean mixture. Then turn screws out until engine rolls from rich mixture. Now set screws about halfway between these positions where smoothest idle is obtained. Both screws must be turned equally. Recheck idle speed.

Accelerating Pump: No seasonal adjustment. Three holes provided in throttle lever for pump connector rod engagement.

Center Hole – Normal operating conditions.
Upper Hole – Shorter stroke, less fuel discharge.
Lower Hole – Longer stroke, more fuel discharge.

Fl at Level: 3/16" from top of float to top of main body with air horn and gasket removed. Use Gauge J–7477. Top of float should just touch gauge. To adjust, bend float lip.



Fast Idle: Off Car - With choke valve closed and high step of fast idle cam touching fast idle screw, adjust fast idle screw so .025" wire gauge can be inserted freely between throttle valves and throttle body on idle port side. *NOTE - This setting supersedes previous setting of .030".*

On Car - With engine running at normal operating temperature, back out fast idle screw a few turns and set engine idle speed to 550 RPM with idle speed screw. Turn fast idle screw in until setscrew just touches low step of fast idle cam, then turn fast idle screw back ½ turn.

Unloader (Dechoke) Setting: To check setting, hold choke valve closed lightly. Open throttle valve to wide open position so throttle lever stop rests on throttle body stop. Choke valve should now be open enough to allow .192" gauge of Tool J–7477 to be inserted between choke valve and inner wall of air horn. To adjust, bend throttle lever ear.

Automatic Choke: Centered at index. To change setting, loosen cover screws and rotate housing as required.

Thr ttl R turn Ch ck (Flight matic Cars): Consists of a dashpot unit mounted on carburetor with dashpot plunger contacting throttle lever. Will prevent too-rapid closing of throttle and keep engine from stalling. *See "Throttle Linkage Adjustment" under CARBURETOR on car model page.*

STROMBERG WW (STUDEBAKER) CARBURETOR

OVERHAUL: With carburetor off engine, proceed as follows:

Disassembly: Air H rn – Disconnect accelerating pump rod from pump lever and remove lever from air horn. Remove pump rod from throttle shaft lever. Remove fast idle rod. Remove air horn assembly from main body. Remove accelerating pump spring from end of pump plunger and remove pump piston from air horn and disassemble. Remove staking over vacuum piston retaining washer and remove vacuum piston. Remove choke cover assembly. With Tool KMO–269–S–10, remove nut and lockwasher from choke shaft, then remove piston and lever assembly. Remove choke valve and shaft.

Main B dy – Remove idle tubes and tip main body to remove inlet check ball from accelerating pump well. Invert main body and remove throttle body and gasket. Remove main metering jet plugs. With Tool J–1561,

CONTINUED ON NEXT PAGE

1959-60 STROMBERG "WW" STUDEBAKER CARBURETOR (Cont.)

remove metering jets. Use Tool KMO—269—S—4 to remove main discharge jets. Remove pump discharge nozzle and invert body so pump outlet check ball will fall out. Remove inlet pipe fitting and remove strainer with Tool J—4498, then remove needle valve and seat. Remove main body baffle, float and pivot pin. Take out power bypass jet.

Throttle Body – Remove idle mixture adjusting screws. Scribe a mark on throttle valves and body (to aid in reassembly) and remove valves. Pull shaft and lever from body, remove idle speed and fast idle adjusting screws. *NOTE – Unnecessary to remove throttle valves and shaft unless damaged.*

Cleaning & Inspection: Wash all parts thoroughly in cleaning solvent and blow dry with air. Replace all worn or damaged parts and use all new gaskets.

Reassembly: Throttle Body – Install fast idle screw in throttle shaft lever and install assembly in throttle body along with throttle valves using scribe marks made at disassembly. Install throttle valve screws but do not tighten. Close throttle and align valves to provide best closing action. Tighten screws securely and upset ends. Install idle mixture screws until they seat lightly, then back out 1¼ turns for initial idle setting. Install idle speed screw.

Main Body – Install power jet and main discharge nozzles. Install main discharge jets (Tool KMO—269—S—4). Install new gaskets and main discharge jet plugs. Install float, pivot pin and retaining clip. Install screen in needle valve seat and retainer with Tool J—4498. Install needle valve and seat. Install baffle and check float for proper alignment. Float must operate freely and not rub on sides of casting. Make float level adjustment (see "*Adjustment*" above). Install throttle body. Install inlet check ball in accelerating pump well. Install idle tubes. Drop accelerating pump discharge ball into body and install pump discharge nozzle.

Air Horn – Install choke shaft and valve (tighten screws finger tight). Make sure choke valve aligned and closes properly, then tighten screws and upset ends. Install choke piston and link assembly and hook link to choke shaft. Install choke link retaining washer and nut (Tool KMO—269—S—10). Install main body vent tube, automatic choke assembly and cover. Install vacuum piston and stake air horn metal to hold piston. Assemble accelerating pump and install in air horn. Install small end of pump spring on piston and install fast idle link. Install pump link in center hole of throttle shaft lever, and pump link and rod in pump lever. Install lever (flat washer installed between air horn and lever).

Carburetor Adjustments – *Make all adjustments as listed under "Adjustments" above.*

SERVICE PARTS: Gasket Set – Stromberg No. 382349 (Studebaker No. 1543055).

Repair Kit – Stromberg No. RK—257 (Studebaker No. 1548817).

ZENITH MODEL 228BV10C

Check r Sup rba, M d l 10L (1959-60)

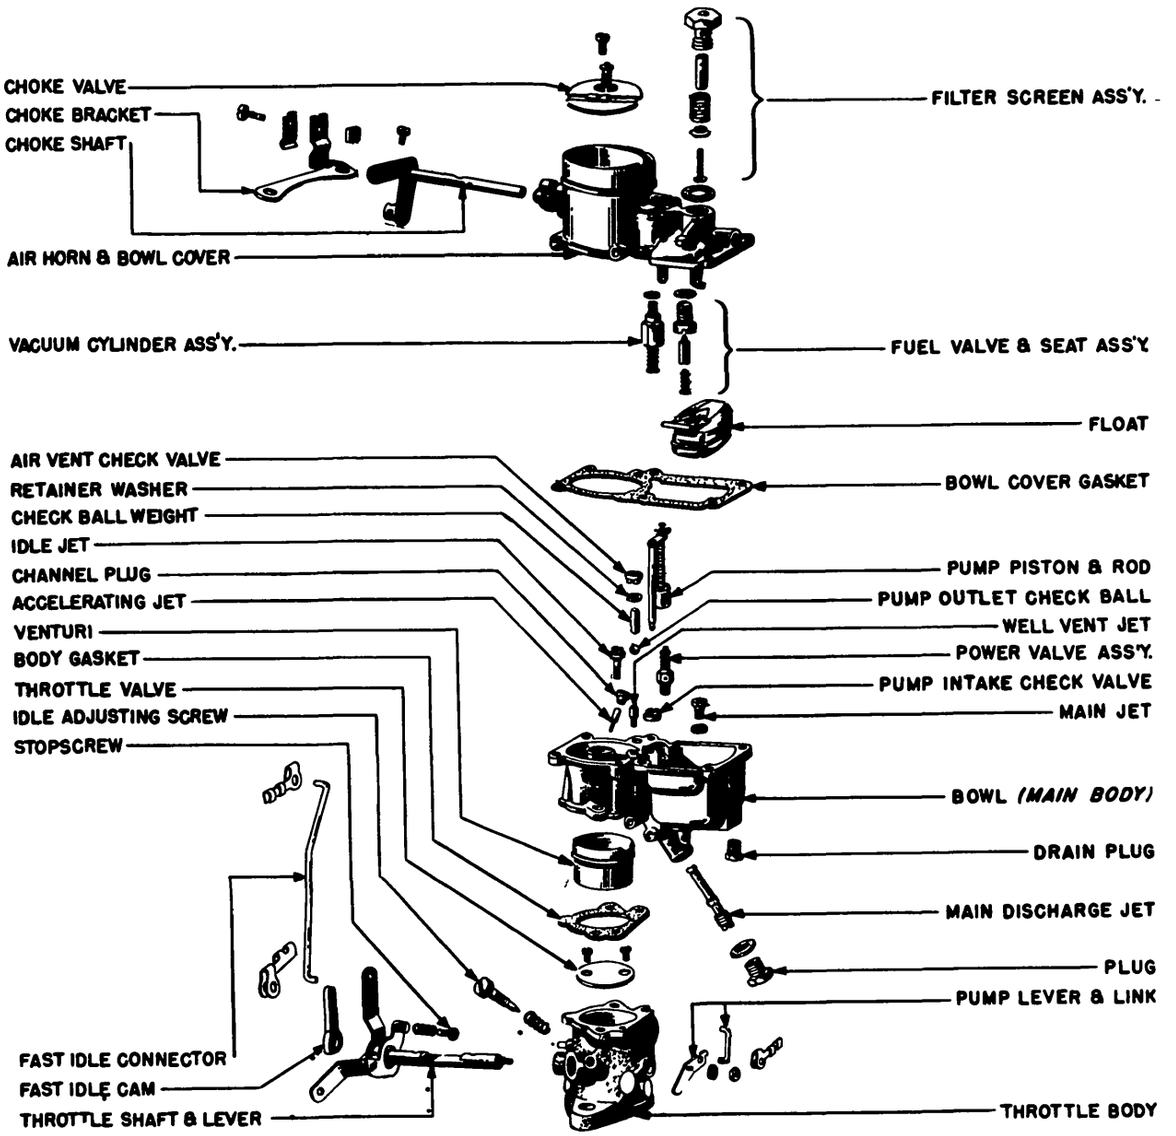
DESCRIPTION: Single barrel downdraft type with electrically heated automatic choke, vacuum controlled power jet valve and mechanically operated accelerating pump.

ADJUSTMENT: Idle Setting - ¾-1½ turns open from a lightly seated position (initial setting). Turn screw out for richer mixture.

Idle Speed: 375 RPM (Automatic transmission in "N"). *NOTE* - For an initial setting, turn throttle stopscrew in 1½ turns from a point where stopscrew contacts stop on throttle body.

Fl at L vel: 1 1/2"±1/32" from machined surface on air horn casting to top of float. To adjust, bend float lever.

Accelerating Pump: Install hairpin clip in proper groove in pump guide rod as follows: Bottom groove for full stroke (Winter); middle groove for ¾ stroke (Normal); upper groove for ½ stroke (Summer).



Fast Idl : No adjustment. Fast idle speed will be correct when slow idle properly set.

Unl ader: Not adjustable.

Automatic Ch k Setting: 15 notches rich from index mark.

Ch cking Aut matic Ch k Thermostat - Remove cover plate screws and cover plate and allow thermostat to cool (or warm) until it reaches 70°F. With thermostat at 70°F., inside of eye on end of thermostat should coincide with "zero" marking on outside of cover. When installing a new thermostat, or other parts, check "zero" location at 70°F. and change location if necessary. *NOTE - Each 5° variation in temperature is quival nt to ne graduation on thermostat cover.*

OVERHAUL: Disassembly - Remove large hex plug from top of air horn, then take out attaching screws and remove air horn from fuel bowl. Remove gasket, then use a screw driver on float pin and press against it at slotted side of bracket, forcing pin through bracket. Remove float pin (with fingers) from opposite side and and remove float. Remove needle valve, seat, and fibre washer with Tool C161-85. Use Tool C161-10 and remove vacuum cylinder assembly. Remove idle adjusting screw and spring. If necessary to remove choke valve and shaft, file off riveted end of screws and remove screws, then remove choke valve shaft and lever assembly. Remove large hex plug and fibre washer from bottom of fuel bowl assembly, then remove accelerating pump link retainer and remove link. Remove accelerating pump and rod as an assembly. Remove two screws and lockwasher attaching fuel bowl to throttle body and remove fuel bowl, then remove venturi and gasket. Remove idling jet from top surface of fuel bowl with a screwdriver, then remove well vent jet with Tool C161-80. Remove main jet and fibre washer, then remove power jet valve assembly from inside bottom of fuel bowl with Tool C161-9. Remove main discharge jet from passage on outside bottom of fuel bowl with Tool C161-1. Remove check valves as follows: Turn back ears of pump check valve in pump cylinder and invert bowl so disc will drop out. Use Tool C161-5 to remove check valve body. Remove air vent valve from passage in top surface of fuel bowl with Tool C161-5. Turn fuel bowl over and allow pump refill check valve ball, weight, retainer, and washer to drop out. *CAUTION - Do not remove idle channel bushing or nozzle bushing.* Do not remove throttle valve or shaft unless necessary to replace parts. If necessary to remove these parts follow same procedure as for choke valve and shaft.

ZENITH MODEL 228BV10 CARBURETOR (AUTOMATIC CHOKE NOT SHOWN)

Reassembly: Reverse disassembly procedures and note the following:

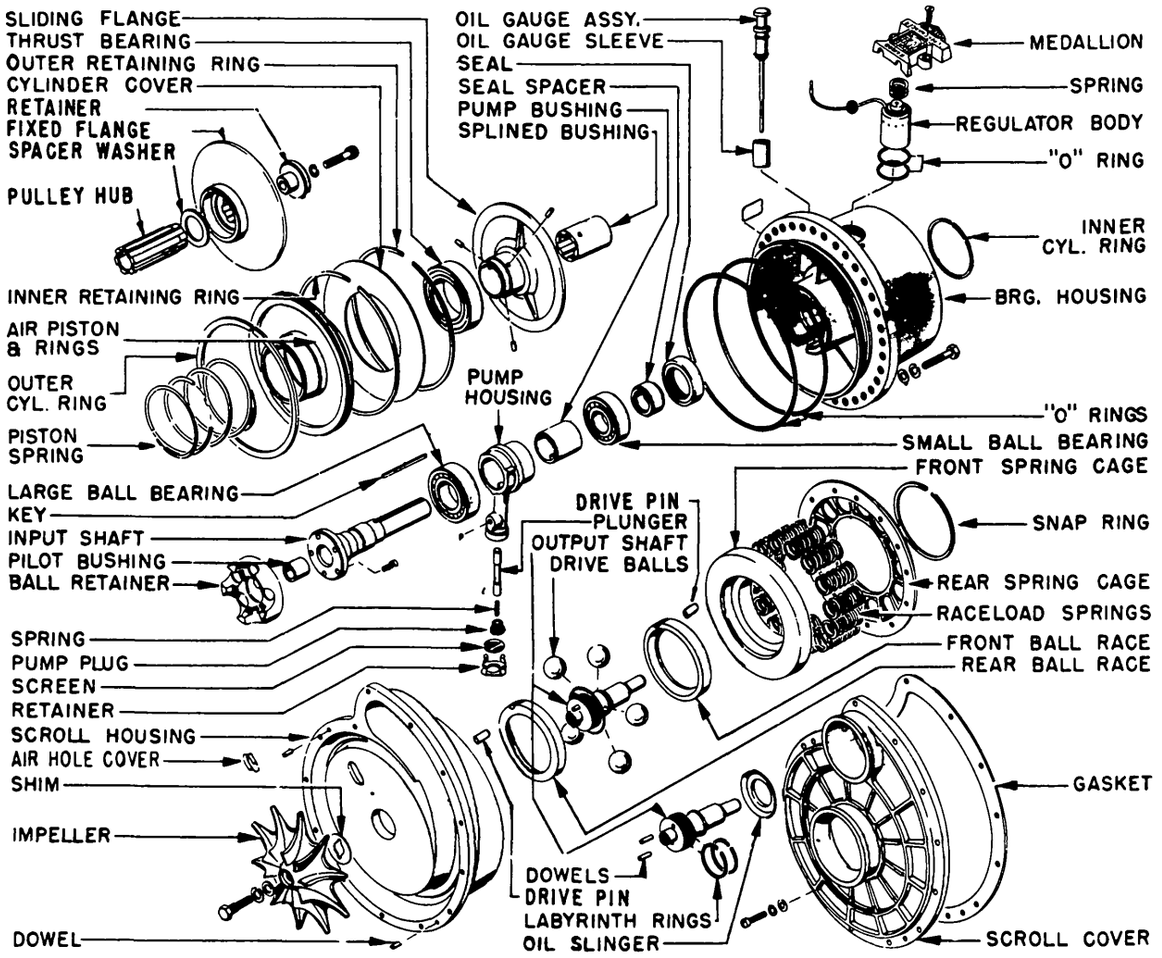
Choke Valve & Throttle Valve - Do not rivet screws attaching valves to shafts.

Float Assembly - Insert tapered end of float pin into float bracket on side opposite slot and push through to other side. Press pin into slotted side until pin is centered in bracket.

MC CULLOCH SUPERCHARGER

F rd, 300 HP High P rformanc Eng. (1957). See Note below.
Packard Clipper (1957)
Packard Hawk (1958)
Studebaker Golden Hawk (1957-58)

►*1957 FORD SUPERCHARGER NOTE:* Service procedures for the supercharger used on early 1957 production cars are similar to the procedures outlined below.



DESCRIPTION & OPERATION: Supercharger is a centrifugal type mounted on engine and belt driven from the crankshaft. Supercharger has two step-up speeds: (1) Variable ratio drive pulley with belt tensioner, and (2) Planetary drive system between input and output shaft. A control system governs shift from LOW BLOWER to HIGH BLOWER and limits HIGH BLOWER boost output by governing the sliding flange of variable ratio pulley. LOW BLOWER step-up speed ratio is 1-5.7 and HIGH BLOWER 1-10 in relation to crankshaft speed. Planetary drive system consists of front and rear outer ball races, five steel balls, ball retainer and inner race which is milled in the output shaft. Drive is from input shaft to ball retainer, to steel balls, to output shaft with a ratio of 1-4.44. Spring tension from race load assembly applies pressure (from assembly) to front race, reducing space between front and rear outer races, forcing ball pressure on output shaft. Balls are forced to rotate around output shaft as well as on own axis causing output shaft to turn. The impeller fits on hub of output shaft and is driven by two dowel pins.

Lubricating System—Oil supply is contained in oil sump. A piston type oil pump driven off camway ground in input shaft supplies lubrication direct to input shaft bushing and to output shaft pilot bushing in rear end of input shaft. Seepage past these bushings supplies lubricant to input shaft roller bearings, air piston and air chamber, and to planetary drive balls and races. A dipstick is provided to check oil level and the oil level should be checked every 1000 miles. *See LUBRICATION below.*

Control System—Consists of an air pressure valve affected by spring pressure and a Solenoid Regulator. The electric switch for the Solenoid Regulator circuit can be operated either by intake manifold vacuum or by accelerator pedal (kickdown). A spring loaded diaphragm limits air pressure build-up by permitting valve to open at adjusted spring pressure.

Solenoid Regulator Operation—There are three phases:
1) Low air pressure, no circuit to Solenoid Regulator, spring between valve head and Solenoid Armature forces valve open permitting air pressure to enter air chamber forcing air piston and floating pulley flange forward causing shift to Low Blower.

2) Low air pressure, Solenoid energized, forcing Armature up, compressing valve spring and sealing off air passage to air piston resulting in shift to High Blower by the belt tensioner.

MC CULLOCH SUPERCHARGER ASSEMBLY (TYPICAL)

3) High air pressure against diaphragm offsets diaphragm spring pressure forcing diaphragm away from valve head. With Solenoid Armature in up position (energized), valve is now permitted to raise sufficiently to open air passage partially. Air piston moves forward reducing input shaft speed ratio and impeller speed, controlling pressure build-up.

LUBRICATION: Check oil level by means of dipstick on left side of housing every 1000 miles. Drain and refill sump at 25,000 mile intervals. Dipstick is marked to indicate "safe" oil level and "add oil" points.
Capacity & Recommended Lubricant—8 ozs. Use Mobiloil ATF200 or Type A Automatic Transmission fluid.

OVERHAUL: *Supercharger is a precision unit with microfinish d surfaces and all pr cautions list d b low must b follow d when disassembling unit and handling parts.*

►*CAUTION:* Remove unit from engine before disassembling. Clean exterior thoroughly with solvent, wiping dry with rags or industrial wipers. DO NOT immerse unit in the solvent and avoid use of compressed air during cleaning operation. Work on clean surface with clean tools, using clean solvent and oils. Proper tools eliminate possible damage to precision built parts. Do not handle micro-finished drive line parts with bare hands (output shaft, drive balls, and ball races) to avoid rust and oxidation on these parts. Use clean dry cloth gloves or oiled patches of clean cloth (lint free paper wiping towels such as Scott Industrial Wipers etc. may be used).

1) Remove dipstick gauge and drain oil sump. Remove scroll cover and gasket by first removing retainer screws and then lifting, **not twisting,** the cover from housing and dowels. *(CAUTION - Impell r wh l is a balanc d unit and chipping, scratches or goug s will d stroy the balance. DO NOT use pli rs or scr w-*

CONTINUED ON NEXT PAGE

MC CULLOCH SUPERCHARGER (C ntinued)

drivers while removing r tain r scr w. If impeller is chipped or gouged, replac the part).

2) Install Impeller Holder, Tool J-6684 and remove retaining capscrew and washer. Insert Impeller Puller, Tool J-6690 into the impeller and turn it clockwise until impeller is lifted clear of output shaft boss, then remove impeller wheel shim or shims. Mount supercharger assembly in holding fixture, Tool J-6689, and using a suitable rubber hose or fan belt to hold the pulley, loosen pulley retaining screw and remove the screw, lockwasher, and retainer. Pull the fixed flange of pulley and splined hub off shaft. *(NOTE* - If splined hub remains on the shaft, use Puller, Tool J-6693 to remove it from input shaft).

3) Remove sealed bearing (ball thrust) from sliding flange using Puller Plate, Tool J-1298, and Puller, Tool HM-925 together with Puller Centering Button, Tool J-6685.

4) *(CAUTION - When r moving retainer rings, and air piston cover, the air piston must be held down constantly).* Push in on hub of air piston to compress piston spring and remove pressure from piston cover. Insert a screwdriver in notch at bottom of bearing housing and snap out the outer retainer ring. Remove air piston cover, then snap out the inner retainer ring. Lift air piston and spring from air chamber then remove large oil seal ring from piston.

5) Remove medallion and solenoid regulator spring. Remove solenoid regulator from housing by grasping top shoulder of regulator with vise-grip pliers and then pulling straight out. Remove two seal rings from solenoid regulator well. Scribe an index mark on the scroll and regulator housings for correct reassembly. Remove hex-head screws, lockwashers, and flat washers retaining bearing housing to scroll housing, then remove bearing housing by twisting it free of scroll housing. After housings are separated, remove the two sealing rings from bearing housing. *(CAUTION - Do not use a t l t pry housings apart which may caus damag to housings or mating surfaces).* Remove inner air piston seal from housing.

6) Remove input shaft and oil pump assembly. *(NOTE-* If shaft and pump assembly remained in bearing housing when it was lifted free of scroll housing, tap pulley end of input shaft with a rubber mallet to drive assembly out of housing). Press the input shaft oil seal out of bearing housing. Remove race load assembly from scroll housing. *(CAUTION - DO NOT at t mpt to disass mble rac load assembly without the use of an arb r press. Internal springs will cause damag if releas d sudd nly).*

7) Remove drive balls of planetary system by lifting the output shaft until balls are free of rear ball race. Output shaft can then be removed by pulling it free of scroll housing. Remove ball races by lifting or tapping them from their seats in race load assembly and scroll housing. *NOTE* - Use Anvil, Tool J-6687 to pry against when removing race from scroll housing.

8) Remove hub key and shaft spacer from shaft using Puller, HM-925; Plate, J-1298; Collets, J-6729; and Centering Button, J-6686. Spring the screen retainer off lower end of oil pump and then remove the screen. Screw out slotted head plunger spring retainer and shake the coil spring out of pump body. *(NOTE* - If pump plunger will not shake out, hold pump body steady and rotate shaft until plunger is at high point of the cam. Pump body will now be free to slide off input shaft. DO NOT force pump body off shaft).

9) Remove bushing from body by pushing it out in direction of the staking tang. *(NOTE* - The small ball at foot of pump is staked in place and serves only to seal the drilled passageway). Remove the large ball bearing on input shaft using Puller, HM-925; Plate, J-1298; Collets, J-1298-3; and Centering Button, J-6686. Remove the ball driver by removing the five centering screws.

► *SOLENOID REGULATOR NOTE:* This unit must not be disassembled. If faulty, replace the unit.

REASSEMBLY: *CAUTION–A clean area for assembly is important. All parts must be thoroughly cleaned and well oiled. Lint and dust must be held to absolute minimum when assembling internal drive parts.*

1) Place a race pin in recess in side of ball race housing, then place a ball race in position in scroll housing. Ball race should be a light tap fit with a plastic hammer. Make sure that race is bottomed in scroll housing. Before installing output shaft, check to see that rings are in the first and third grooves of the shaft, and that chamfer on top ring is toward impeller end of shaft. Turn seal rings on output end of shaft so that gaps are 180° apart, and insert the shaft (dowel pins down) into center opening of scroll housing. Angle the shaft slightly away from gap in each ring as shaft moves down, and straighten it to vertical as top ring slides into place inside the bore. *(NOTE* - A slight taper is provided in face of the opening to compress rings as output shaft seats.

2) Place five drive balls around output shaft, then push down gently on one at a time to seat each in its proper place on the ball race. *(CAUTION - Balls are furnished in matched sets. Never install less than a complete set).* Place another race pin in recess in side of race load assembly and install the remaining race. Place race load assembly into position, ball race down, over the drive balls.

3) Install ball retainer or driver, on end of input shaft and tighten retaining screws to 30 inch-pounds, minimum. Using Tool J-6688, press the large ball bearing onto output shaft until it is seated against the shoulder *(NOTE - Lettering on bearing should face away from oil pump).*

4) Slide oil pump, with bushing insert onto the shaft. When installing the pump body, make sure the pump is not upside down before installing the outer ball bearing. *(NOTE* - When pump is correctly installed, the bore in pump body will align with camway ground on input shaft). Using Tool J-6688, press small bearing into place on shaft with the letters up away from oil pump.

5) Install oil pump plunger (spring opening toward the plug), plunger spring, and the pump plug in oil pump body, and secure the screen to end of pump body with the retainer. Install inner air piston ring on boss of bearing housing, and lock ends of ring together. Press input shaft seal into position inside bearing housing with the lips of the seal facing rearward or toward impeller.

6) Install "O" rings (two required) in the inside and outside grooves of housing shoulder (do not install ring in center groove). Lightly oil the two small "O" rings and install them in channels within regulator well. Oil the sides of solenoid regulator and push it down past the two "O" rings until it is firmly seated. Install outer air piston spring in nose section of bearing housing, then slide air piston into place. Oil liberally, then push in on the piston, depressing the spring, and install rear retaining ring on inside of the air chamber.

7) Install dust shield, and retain in place with the outer retainer ring. Fill bore of oil pump (through the screen), using Automatic Transmission Fluid Type A, and then rotate output shaft while holding pump body until oil can be seen pulsating just under the screen. Install input shaft assembly in bearing housing, then place shaft sealing spacer over pulley end of input shaft and push it down into position in shaft seal.

8) Lubricate all moving parts with Automatic Transmission Fluid Type "A". Install bearing housing onto scroll housing, aligning the marks made at disassembly. Secure in place with capscrews, lockwashers, and flat washers. Tighten capscrews evenly to 100 inch-pounds. Press the thrust bearing onto rear of sliding flange of pulley, then insert special washer into rear of the front (fixed) flange of pulley, with chamfered inner edge of special washer facing rear of pulley flange. Press splined pulley hub into place in front (fixed) flange of pulley. Position sliding flange of pulley on the splined hub. *(NOTE* - Sliding flange should fit splines closely but slide easily). Slide key into shaft keyway, then push pulley assembly down into position on end of output shaft and secure with retainer, lockwasher, and screw. Tighten screw to 200 inch-pounds, using a rubber hose or belt to hold pulley assembly.

9) Place retaining spring on top of solenoid regulator and install supercharger medallion. *(NOTE* - The retaining spring must be in place as it serves to ground the solenoid case to supercharger). Wipe face of diffuser, then measure depth of face of output shaft below face of diffuser. This measurement should be .015". Select shims .050" thick and assemble impeller and shims to boss of output shaft. Secure with a flat washer, lockwasher, and capscrew. Tighten to 200 inch-pounds, using Impeller Holding Tool, J-6684. Check clearance between impeller and diffuser at several points around the impeller using a feeler gauge. The allowable clearance is .046-.051". If not within these limits, add or remove shims as necessary. Assemble scroll cover and gasket to housing and tighten retaining screws securely.

BENDIX ELECTROJECTOR FUEL INJECTION

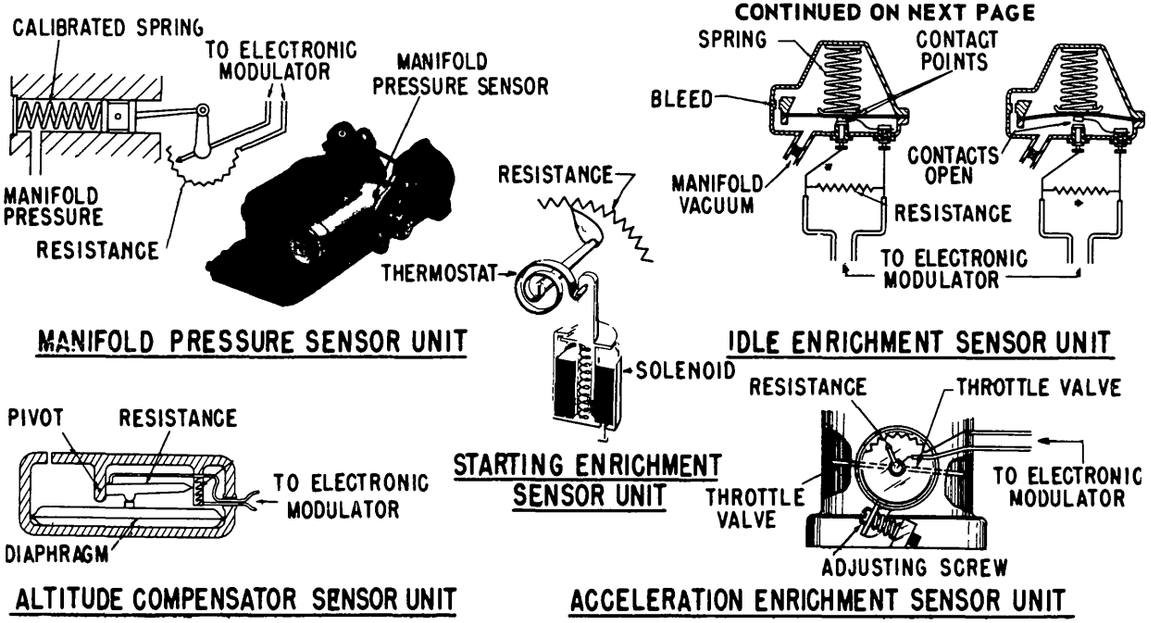
DESCRIPTION: The Bendix "Electrojector" fuel injection system is electrically controlled and actuated by the "Triggering Selector Unit" located in the engine ignition distributor and by the "Electronic Modulator Unit" enclosed in a separate container attached to the engine. The fuel supply to engine cylinders is a "common rail" type using an electric fuel pump to circulate fuel under approximately 20 lbs. pressure to a solenoid injector valve located in the intake valve port of each of the engine's cylinders. Fuel injector valves are electronically timed by the "Triggering Selector Unit" and the amount of fuel delivered to each injector valve is controlled by the "Electronic Modulator Unit" in relation to engine requirements. Controls are employed to make the system responsive to engine speed, air pressure, temperature, and manifold vacuum.

►*NOTE:* Actual installation may differ in detail from units described below.

OPERATION: General operation of the fuel injection system and controls are as follows:

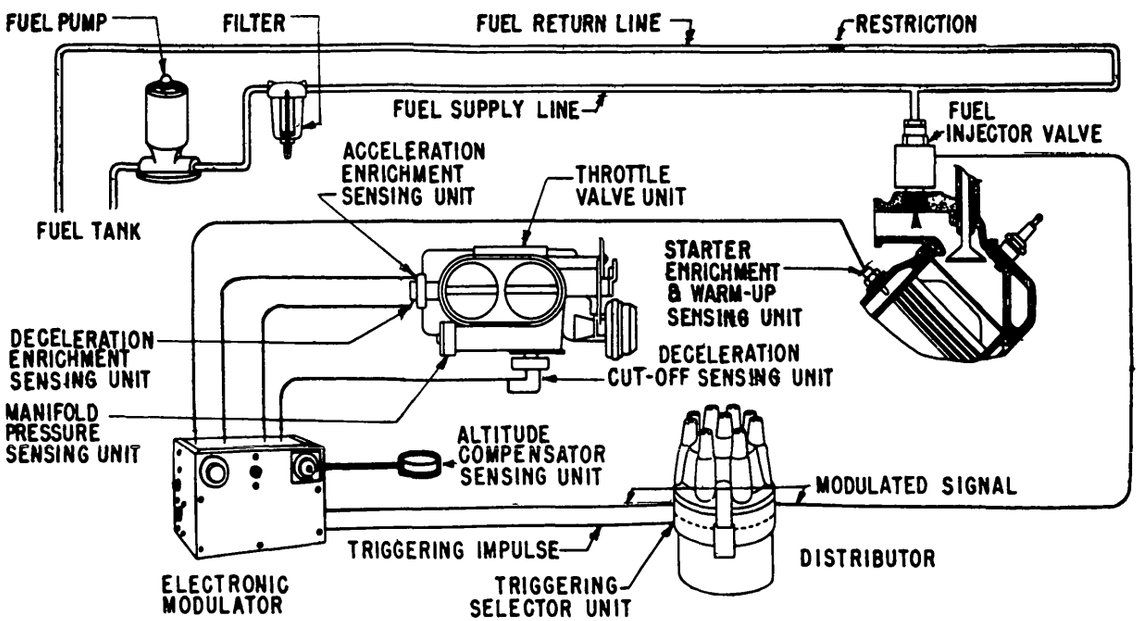
Throttle Body: This unit, in addition to containing the throttle valves also contains the Manifold Pressure Sensor and the Idle Enrichment Unit.

Fuel Supply: An electric, non-metering fuel pump delivers fuel at approximately 20 lbs. pressure through a fuel filter into the "common rail" fuel supply line which connects to all of the fuel injector valves. A fuel return line to the gas tank allows a continuous circulation of fuel in the system continually purging the fuel supply of air and fuel vapors.



Fuel Injector Valve: This unit is a high speed solenoid operated injector valve and nozzle screwed into the cylinder head so that discharged fuel is directed at the head of the intake valve when the valve is off its seat.

Triggering Selector Unit: Engine speed and injection timing are "sensed" in this unit which consists of a set of breaker points and a distributing commutator having a commutator segment for each of the solenoid injection valves. This assembly is inserted between distributor main body and cap and is actuated by the same cam operating the regular engine ignition points. Each time the fuel injector breaker points make contact, a triggering impulse is transmitted to the modulator where the signal is modified to control the length of time the fuel injector valve is to remain open (depending on engine fuel requirements). The modified signal is then returned to the selector portion of the assembly where it is distributed to the correct injector valve.



Electronic Modulator: The modulator is an electrical unit employing transistors to transform signals received from the triggering selector unit into an electrical pulse of a given standard width. Simultaneously, signals indicating engine operating conditions are also received by the modulator from sensing units located on various parts of the engine. By integrating these external sensing signals into the standard pulse width circuit of the control system, the standard pulse width is modified to reflect engine conditions. This modified electrical pulse is then transmitted to selector portion of the triggering selector unit which in turn distributes the pulse to the correct fuel injector.

External Sensing Units: In all external sensing units, added resistance is introduced into the fundemental circuit to modulate the pulse width of the electrical impulse that is transmitted to the solenoid injector valves. As the sensing circuits resistances increase, the pulse widths increase and the length of time the injector valves are held off their seats likewise increase, resulting in additional fuel flow. Operation of the various sensing units are as follows:

CONTINUED ON NEXT PAGE

BENDIX "ELECTROJECTOR" FUEL INJECTION SYSTEM SENSING UNITS

BENDIX "ELECTR JECTOR" FUEL INJECTION SYSTEM (SCHEMATIC)

BENDIX ELECTROJECTOR FUEL INJECTION (C nt.)

Manif ld Pressur S ns r - This unit is mounted on the throttle body and transmits a signal to the modulator control, indicating the relative density of the air charge entering the engine.

Acc l rati n Enrichm nt - In order to supply the added amount of fuel required for smooth engine operation when the engine is accelerated, an acceleration enrichment unit controlled by manifold vacuum, is used. This unit, connected to the intake manifold contains a diaphragm and spring assembly, contact points and a resistance circuit. In operation, a rapid decrease in manifold vacuum will cause the points to separate and introduce an additional resistance in the control system thus increasing the operating pulse width of the electrical signal for the length of time necessary to equalize the pressure in the chamber on both sides of the diaphragm. A bleed hole connecting both sides of the diaphragm allows a time interval for the points to close and eliminate the resistance. The added pulse width, during the time the points are open, will increase the fuel flow from each injector as the injectors will be energized for a longer period of time.

Idle Enrichment - This is controlled by a rheostat connected to the throttle shaft to interject a variable resistance in the control circuit when the throttle valve is in an idle position. The idle adjustment is obtained by adjusting this resistance instead of the conventional idle mixture adjusting needle.

Starting Enrichment - Starting and warm-up enrichment is controlled by a thermostatic coil spring which is connected on one end to a solenoid unit, and on the other end to a variable resistance rheostat. During engine cranking the solenoid is energized causing maximum resistance thereby increasing fuel flow during the cranking period. During the warm-up period (solenoid not energized) the thermostatic coil spring maintains a resistance which decreases as engine temperature rises. Enrichment is decreased accordingly. A conventional fast idle cam on the throttle shaft which is linked to the thermostat provides the necessary fast idle speed during the warm-up period.

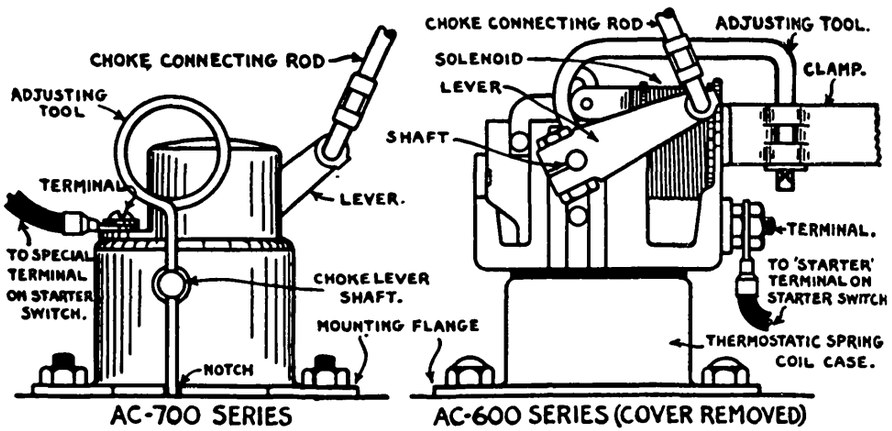
Altitude Compensator - This sensing unit is connected to the modulator box and consists of a small aneroid connected to a variable resistance unit that transmits its signal to the modulator. As altitude is increased the aneroid expands causing the resistance to be decreased and thereby decreasing the fuel flow.

Fuel Cut-off During Deceleration: As the piston in the manifold pressure sensing device reaches the extreme position during deceleration, fuel is automatically cut off.

SISSON AUTOMATIC CHOKE

DESCRIPTION: The Sisson Automatic Choke is a separate unit mounted on exhaust manifold and connected to the carburetor choke valve lever by a connector rod. A solenoid within the choke case is connected to the starter side of the starting switch so that the solenoid is energized while the starter is operating. A thermostat is also mounted within the choke case and the solenoid and thermostat operate together to close the choke valve for cold starting and to control the choke valve during the warming up period. The AC-700 Series (AC-751, AC-751B, AC-758B) and AC-600 Series operate in the same manner.

ADJUSTMENT: Model AC758B. Remove air cleaner, open throttle approximately ¼. Move choke lever until hole in automatic choke shaft (opposite end from lever) lines up with slot in bearings, insert special tool, Sisson No. C-723, through hole in shaft and push tool down so that lower end engages slot in choke base mounting flange. Loosen clampscrew on choke lever, press up on lever until choke valve is closed tight (sight down air horn), hold lever in this position and tighten clampscrew. Remove tool.



Model AC-600—Remove air cleaner, open throttle approximately ¼, take off automatic choke cover. Clamp special adjusting tool, Sisson No. AC-620, in place on choke so that end of tool enters and lines up hole in armature and hole in magnet core, move flat bar on tool so that armature is locked tightly against magnet core. Loosen clampscrew on choke lever, move lever until choke valve is closed tight (sight down air horn), hold lever in this position and tighten clampscrew. Remove tool and replace automatic choke cover.

SERVICING: If Trouble Shooting data below does not correct faulty operation, remove Automatic Choke Unit and test operation on test fixture such as Sisson Model AC-753. Replace units which are defective. Do not oil any part of choke mechanism. When installing choke, make certain that heat insulating gasket is in place between exhaust manifold and choke case. Do not use a terminal screw on AC-758B models which is longer than original screw (Caution—a longer terminal screw will interefere with correct operation).

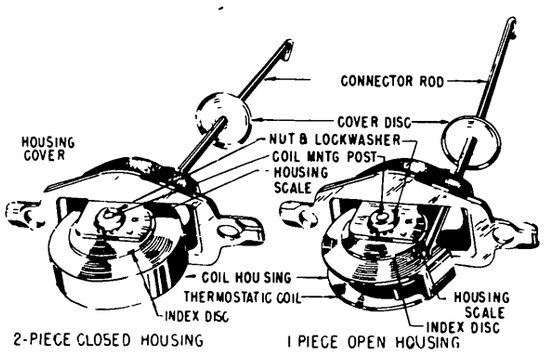
TROUBLE SHOOTING: If engine does not start or warm up properly, and for hard starting complants due to faulty choke operation, check following points

Hard Starting with Cold Engine:

1. Check fast idle mechanism to see that it is free and not binding at any point (fast idle connector rod usually connected to choke valve lever).
2. See that choke rod connecting Automatic Choke lever and choke valve lever does not bind in levers.
3. Examine carburetor choke lever, Automatic Choke lever, and fast idle mechanism and remove all paint, grease, or dirt which might cause binding.
4. Check carburetor choke valve, see that edges are smooth and that valve does not rub against air horn walls or bind in any position. See that air cleaner does not interfere with choke valve and that mounting screw is not tightened excessively which will distort air horn and bind choke valve (check choke valve operation with air cleaner in place).
5. Check electrical connections at Automatic Choke and starter switch. Examine wire for short-circuits and breaks.
6. Check Automatic Choke ground (unit grounded through case). See that mounting screws are tight and that manifold under mounting flange is clean.
7. Check throttle cracking linkage (see Tune up instructions on car model page). This is important to insure correct throttle opening for starting and to place automatic choke in operation (on some cars with fast idles, fast idle will prevent choke closing until throttle valve opened to free fast idle cam.
8. Check Automatic Choke adjustment (see instructions above). If Automatic Choke does not function after above points checked, replace the unit.

Hard Starting with Hot Engine:

1. Check for rich mixture or flooding caused by percolating discharge of carburetor when engine stopped. To check, remove air cleaner immediately after stopping engine, note whether gasoline dripping into manifold from carburetor nozzle (this overflow should show up within 3-5 minutes after engine is stopped). Correct by installing special size Float Valve Needle and Seat Assembly and checking float level.
2. Check carburetor for High Float Level.



Engine Stalls while Cold:

1. Check Manifold Heat Control Valve. See Manifold Heat Control data on car model page for directions.
2. Check carburetor Fast Idle setting.

DESCRIPTION: These "Cross-over" type automatic choke controls are separate units mounted in a well in the intake manifold (at the exhaust "cross-over" passage) and linked to the choke valve lever by a connector rod. *See illustration.*

OPERATION: Cross-over type automatic choke operates in the same manner as other thermostatic coil types. The vacuum piston is located in the carburetor air horn and is linked directly to the choke valve shaft (not part of automatic choke assembly).

ADJUSTMENT & CHECKING: No adjustment is required and choke must be removed from manifold well to check the setting. Operation can be checked as follows:
Operation Check - With choke mounted on engine and connected to carburetor, lift cover disc and open and close choke valve manually to make certain connector rod does not bind on sides of hole in housing cover. If connector rod does not clear the hole, replace assembly *(CAUTION - Bending rod will change calibration).* Move rod up and down to check for free movement of the coil housing on the pivot. If internal bind noted, replace assembly.
Setting Check - With choke assembly removed from manifold well, index mark on disc should be midway between "L" and "R" marks of scale on housing (Std. setting - see individual car model pages for specific settings). To adjust setting, loosen mounting post locknut and turn mounting post with a screwdriver to align index mark on disc with correct mark on scale. Hold post from turning while tightening locknut.

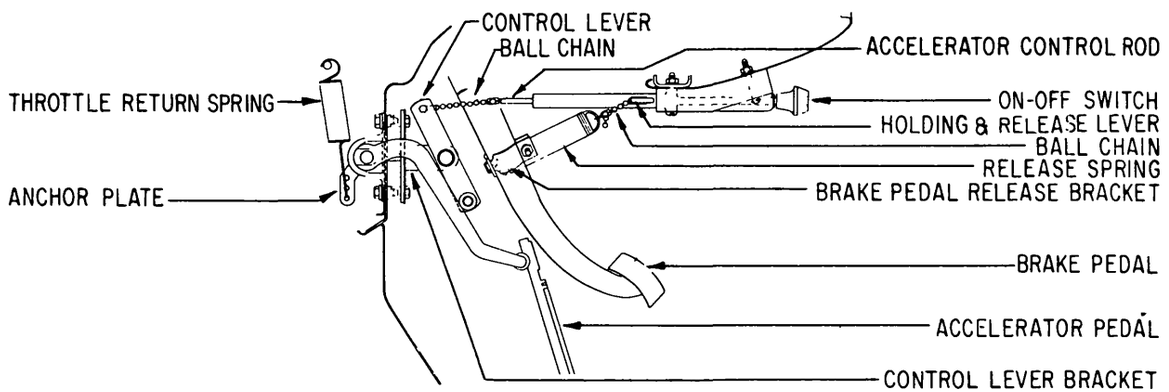
"CROSS-OVER" TYPE CHOKE ASSY.

CLEANING & INSPECTION: Entire housing and rod assembly can be cleaned with carburetor parts cleaner without disassembly. After cleaning, rinse in solvent and blow out inside of housing with compressed air. Check to make certain that housing revolves freely on mounting post without binding. If necessary, unit can be disassembled for thorough cleaning and should be reassembled as follows:

REASSEMBLY (After Disassembly for Cleaning): *NOTE - Two types of choke assembly have been used: 1) One Piece Open Housing, 2) Two Piece Closed Housing. See illustration. Assemble each type as follows:*

One Piece Open Housing: Insert thermostatic coil in housing with hook on coil pointing toward web on edge of housing approximately 120° below straight upper edge of housing. Insert mounting post through housing and coil with index mark toward hook on coil, secure mounting post with washer and pin spring. Install cover disc on connector rod and install rod through housing cover into housing toward split end of mounting post, secure rod with washer and pin spring (spring eye outward). Assemble housing cover to mounting post with lockwasher and nut, rotate mounting post counterclockwise until hook on coil picks up connector rod, tighten nut. Check for positive spring action by pushing connector rod down through housing cover. Adjust choke setting (see Adjustment above).

Two Piece Closed Housing: Place coil mounting post in one of the coil housing halves, install thermostatic coil on mounting post with hook facing clockwise. Assemble other half of housing with holes in both halves aligned, secure with washer and hairpin. Install connector rod with hairpin end extending through hole in housing toward split end of mounting post, secure with washer and hairpin (hairpin eye outward). Install index disc on mounting post with flat on disc and post aligned, rotate disc and post counterclockwise until hook on coil engages connector rod. *(CAUTION* - Index mark on disc should be approximately 60° to right of connector rod with housing held so that rod points straight up - if mark not in correct position, turn disc over). Assemble housing cover on mounting post and install lockwasher and nut. Install cover disc on rod. Adjust choke setting (see Adjustment above).



PONTIAC MAGI-CRUISE CONTROL

Pontiac (1959-60) - Optional

DESCRIPTION: Unit is a throttle holding device designed to relieve driver of constant attention to accelerator pedal. Consists of a manual "On-Off" knob on instrument panel and a linkage arrangement connected between brake and accelerator pedals.

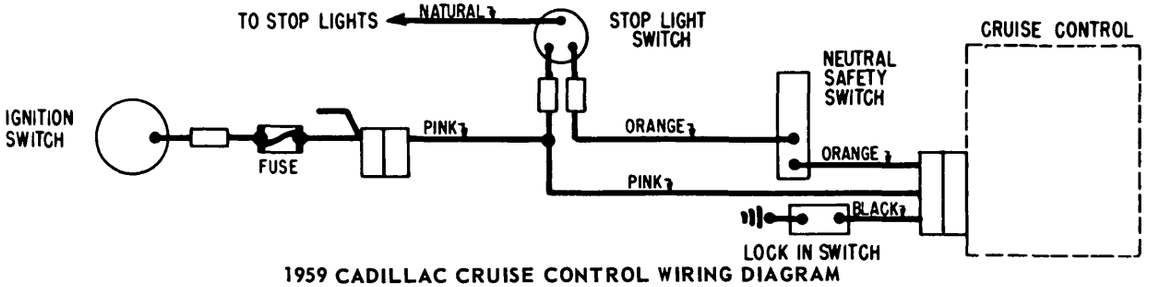
OPERATION: The accelerator control rod is connected to accelerator pedal linkage by a chain. Locking lever is connected to brake pedal by a chain and spring. To set throttle, knob must be "ON". When accelerator pedal depressed, chain on accelerator rod becomes slack until brake is tapped, actuating locking lever and releasing spring-loaded accelerator rod so that it seeks its inner-most position governed by chain. Thus accelerator pedal is held in the position it was in when brake was tapped. Unit is released simply by tapping brake pedal or applying brakes, both without holding accelerator pedal down. Unit can also be released by turning knob to "OFF".

ADJUSTMENTS: With carburetor in normal hot idle position, turn knob to "ON" and make sure accelerator control rod extended 1¼" and locked. Chain must be installed without slack. *NOTE - On cars with 4-barr l carburetor, throttle return spring should be moved to bottom hole in anchor plate.* Install release spring in front hole of brake pedal release bracket (engine running on power brake cars). Chain between release spring and locking lever should have about 2 beads of slack. Manually lock throttle open. Now depress brake pedal slowly. Accelerator pedal must release before brakes actually are applied. To adjust, move spring to rear hole of bracket and adjust chain 1 bead shorter. If more adjustment needed, move spring to front hole. Brake pedal must move ½" or more before control rod released. *CAUTION - If chain too tight, unit will slip on rough roads. Release spring must be installed with hook ends down and connector end towards r ar of car.*

PONTIAC MAGI-CRUISE ASSEMBLY

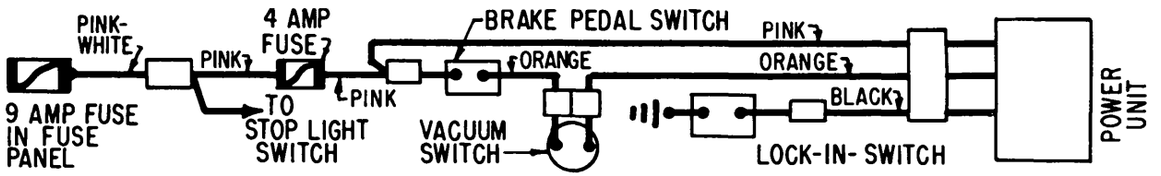
CADILLAC CHEVROLET LINCOLN CRUISE CONTROL

Cadillac (1959–60)
Chevrolet (1960)
Lincoln (1960)



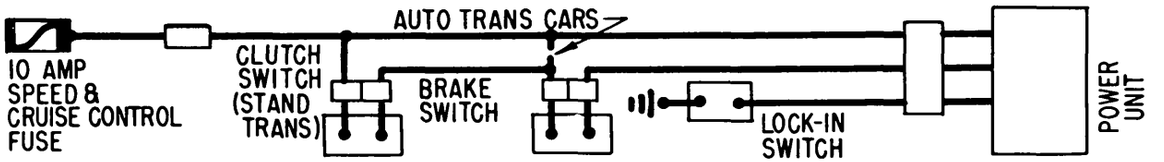
►CHANGES, CAUTIONS, CORRECTIONS

►*1959 CADILLAC CRUISE CONTROL FUSE FAILURE & CONTACT POINT SPECIFICATION CHANGE:* On early models before Engine No. 049525, metal build-up on Cruise Control main contact points, bridging the gap, would cause fuse to blow. *NOTE – This fuse is the same 9 amp. fuse used to protect directional signal circuit, and as a result of it blowing out, the direction signal would also be inoperative. See "1959 Cadillac Control Fuse Production Change" below.* To correct this condition, clean and adjust contact points as follows: Remove control unit from engine and pull green motor wire terminal off terminal blade (do not straighten terminal blade). Inspect points for burrs or metal build-up and clean with distributor point file or flex stone. Install unit, then put transmission in "DR" and turn on ignition. With throttle in wide open position, "latch-in" unit by pulling out dash control knob momentarily or by moving throttle linkage and depressing armature plate on magnet assembly. Loosen contact point locknut on No. 1 contact (point set nearest terminal connector) and hold center contact arm against No. 2 contact point. Back out No. 1 point until total point clearance is .050–.070" (supersedes previous setting of .018–.022" on early cars), then tighten locknut. *CAUTION – DO NOT adjust contact point No. 2 which is pre-set.*



►*1959 CADILLAC CRUISE CONTROL CONTACT POINT ADJUSTMENT CHANGE: On early cars before Engine No. 49525, adjust contact points to .050–.070". This setting supersedes previous setting of .018–.022".*

►*1959 CADILLAC CRUISE CONTROL FUSE PRODUCTION CHANGE:* Beginning with Engine No. 077640, a separate 4 amp. fuse has been added for Cruise Control unit. Fuse is located in separate holder in feed wire to stop light switch.



►*1959 CADILLAC CRUISE CONTROL TAPPING NOISE & COVER INTERFERENCE CORRECTION:* May be caused by governor spring pulldown yoke tapping against Cruise Control cover. Correct by placing a rubber or plastic tape inside cover on circular side of yoke cavity. If noise is caused by endplay of magnet assembly pivot bushing on its shaft, lubricate bushing with Lubriplate. *CAUTION – Cover must be centrally positioned when installed so there is no interference between inside of cover and upper section of locking arm plate assembly.*

1959 CADILLAC CRUISE CONTROL WIRING DIAGRAM

1960 CADILLAC CRUISE CONTROL WIRING DIAGRAM

1960 CHEVROLET CRUISE CONTROL WIRING DIAGRAM

DESCRIPTION: This electrically controlled unit acts both as a speed warning device and as an automatic speed control which eliminates the need for manual accelerator operation. Control is by a selector dial mounted on instrument panel. When used as a speed warning, the selector dial is set at desired position and when car reaches this speed a reaction pressure of 5-7 lbs. is felt at accelerator pedal. Driver may exceed this speed by overcoming the pressure and depressing accelerator. When used as an automatic speed control, procedure for setting is the same except when pre-set speed is reached, the button in center of control knob is pushed in. The unit will now maintain pre-set speed without foot pressure on accelerator pedal until brake pedal is depressed sufficiently (with freeplay movement of brake pedal) to actuate stop light switch, or when ignition key is turned off or transmission selector lever is placed in neutral position. Car will then return to manual control. *NOTE - Speed in excess of 85 MPH will also return Cruise Control to manual operation.*

OPERATION: Unit consists of a spring loaded governor driven by a cable connected to transmission speedometer pinion gear. Governor controlled by selector knob which operates a rack and pinion gear attached to a control cable. A speedometer cable connects Auto Pilot to speedometer and indicates car speed in usual manner. Governor is connected by a contact arm to a magnet assembly which actuates a 12-volt reversible motor. This motor, coupled with foot pressure, depresses accelerator pedal by rotating a worm and nut attached to magnet armature shaft and turns entire assembly to increase speed, until pre-set speed is reached. Then governor spring tension will make motor directional contact points break causing a back pressure of 5-7 lbs. on accelerator pedal. If car goes faster, as in descending a hill, opposite motor directional points will close, and motor will reverse operation and make corrections to maintain desired speed.

Automatic Operation - Cycle is same with additional units actuated as follows. When desired speed is reached and button on selector knob is pushed in an electromagnetic coil in center of magnet assembly is actuated. This causes magnet to lock with pintle assembly and unit now operates without foot pressure on accelerator pedal. Selector knob can be moved to any other desired position during automatic operation. When a brake application is made, the combination stop light-Cruise Control opens causing the magnet to release and return car to normal operation.

TROUBLE SHOOTING & DIAGNOSIS

NO PRESSURE ON ACCELERATOR PEDAL: Drive cable from transmission broken. Electrical circuits faulty. Incorrect linkage adjustment.

AUTOMATIC CONTROL DOES NOT ENGAGE: Driver riding brake pedal. Brake pedal does not release. Faulty brake switches. Faulty electrical circuits.

BRAKE APPLICATION REQUIRED TO DISENGAGE AUTOMATIC CONTROL: Stop light switch not adjusted properly (must disengage unit during pedal freeplay movement).

CONTINUED ON NEXT PAGE

CADILLAC CHEVROLET LINCOLN CRUISE CONTROL (Cont.)

AUTOMATIC CONTROL REMAINS ENGAGED: Stop light switch faulty or not adjusted properly. Electrical short circuit.

AUTOMATIC CONTROL ENGAGES WITHOUT PULLING SELECTOR KNOB: Electrical circuit grounded to body or chassis Control assembly faulty.

PULSATING THROTTLE: Drive and speedometer cables binding or tight. Speedometer pinion faulty. Linkage binding

SPEEDOMETER POINTER FLUTTER: Drive and speedometer cables binding or tight. Speedometer pinion and/or head faulty.

CARBURETOR WILL NOT RETURN TO NORMAL IDLE: Linkage adjustments incorrect or linkage binding.

TESTING

ELECTRICAL CIRCUITS: *NOTE - Terminal No. 1 should be hot when ignition switch is turned "On". Terminal No. 2 should be hot if stop light and neutral safety switches are properly adjusted.*

No. 2 Terminal: With ignition switch in accessory position and Hydra-Matic in Drive, raise female plug and touch test lamp lead to terminal No. 2. Ground other end of test lamp. Circuit is normal when lamp lights. If lamp fails to light, check for loose connections at stop light switch and terminal block. Make sure switch is not touching brake pedal. If stop light switch operating correctly, check operation of neutral safety switch.

No. 3 Terminal: Again raise female plug, then connect test lamp lead to No. 2 terminal and the other end to No. 3 terminal. Pull out automatic knob. If test lamp lights, the circuit and controls are satisfactory. If it does not light, check for loose wire connections at terminal on rear of control switch on instrument panel. Install new control assembly if no loose connections are found.

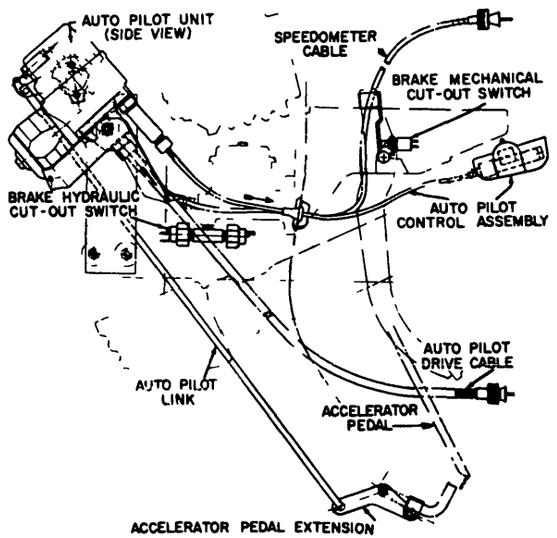
ADJUSTMENTS

Linkage (Cadillac): With transmission throttle control rod properly adjusted (see "Carburetor" on Car Model pages), start engine and operate at slow idle speed with transmission in "N" (Neutral) or "P" (Park). Remove cotter pin securing accelerator linkage trunnion on locking arm plate, then remove washers and separate linkage from locking arm. Insert Locking Arm Gauge J-7652 over stop stud and hold locking arm plate securely against gauge. Turn trunnion on accelerator linkage until it aligns with and enters hole in locking arm plate freely, then install washers on trunnion and correct trunnion to locking arm plate. Install cotter pin and remove gauge.

Chevrolet & Lincoln – Remove cotter pin from swivel and remove swivel from regulator lever, then start engine and run at slow idle speed. Insert gauge pin (NOTE – This is a hollow tube with .0625" wall thickness furnished with accessory package) over gauge bolt (located on housing adjacent to regulator lever) and hold regulator lever securely against gauge pin. Adjust swivel on long regulator rod until it will assemble to regulator lever. Replace swivel and cotter pin, then remove gauge pin.

Control Cable (All Models): Rotate selector knob counterclockwise as far as it will go without forcing, then hold dust shield so it will not rotate and unscrew clamp nut. Let clamp nut slide down cable. *NOTE – This nut holds control cable in bottom of dust shield.* Pull control cable out of dust shield until ferrule at end of cable is free from bottom of dust shield. *NOTE – If ferrule is tight in dust shield, carefully pry the fingers apart until ferrule slides out freely. In some cases it may be necessary to unscrew the dust shield from unit in order to pry the fingers apart. Hold hex fitting at top of dust shield as it cannot turn when unscrewing dust shield.* Reinsert ferrule in dust shield and push in slightly on control cable until it stops. *CAUTION – Do not force cable beyond this point.* Fingers of dust shield must clamp ferrule on its largest diameter. Again try to rotate selector knob counterclockwise in order to make sure it is at its lowest setting, which will position dust shield. Tighten clamp nut on bottom of dust shield securely.

OVERHAUL: Unit is serviced by replacement only.



CHRYSLER & DE SOTO AUTO-PILOT SPEED CONTROL

Chrysler & Imperial (1958–60)
DeSoto (1960)

►CHANGES, CAUTIONS, CORRECTIONS

►*1960 CHRYSLER & IMPERIAL AUTO-PILOT HYDRAULIC BRAKE SWITCH PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE:* The Auto-Pilot hydraulic brake switch and "tee" at hydraulic brake master cylinder has been eliminated on later cars. The hydraulic brake switch is now mounted directly on master cylinder. On earlier cars, if the Auto-Pilot hydraulic brake switch requires replacement, it is recommended that the switch be removed and discarded. Also remove the "tee" and mount the hydraulic brake stop light switch directly on master cylinder. Connect the two leads which were connected to Auto-Pilot hydraulic switch, together, using a blade type connector, or solder them together and wrap the connection with tape.

DESCRIPTION: This electrically controlled unit acts both as a speed warning device and as an automatic speed control which eliminates the need for manual accelerator operation. Control is by a selector dial mounted on steering column (1958–59); instrument panel (All Others). When used as a speed warning, the selector knob is set at desired position and when car

CHRYSLER AUTO-PILOT SPEED CONTROL ASSEMBLY

reaches this speed a reaction pressure of 5–7 lbs. is felt from accelerator pedal. Driver may exceed this speed by overcoming pressure of accelerator pedal. When used as an automatic speed control, procedures are the same except when pre-set speed is reached. At this point, the button in center of control knob is pushed in to engage automatic speed control. The unit will now maintain pre-set speed without foot pressure on accelerator pedal until a brake application is made. Beginning with 1960 models, a new automatic lock-in feature has been incorporated which maintains the automatic speed control until pressure is exerted on brake pedal or when knob in center of speed selector is pushed in, however, depressing the brake pedal will not cancel the automatic lock-in feature. To cancel the automatic lock-in feature, it is necessary to push in knob on speed selector.

OPERATION: Unit consists of a spring loaded governor driven by a cable connected to transmission speedometer pinion gear. Governor controlled by selector knob which operates a rack and pinion gear attached to a control cable. A speedometer cable connects Auto Pilot to speedometer and indicates car speed in usual manner. Governor is connected by a contact arm to a

CONTINUED ON NEXT PAGE

CHRYSLER & DE SOTO AUTO-PILOT SPEED CONTROL (C nt.)

magnet assembly which actuates a 12-volt reversible motor. This motor, coupled with foot pressure, depresses accelerator pedal by rotating a worm and nut attached to magnet armature shaft and turns entire assembly to increase speed, until pre-set speed is reached. Then governor spring tension will make motor directional contact points break causing a back pressure of 5-7 lbs. on accelerator pedal. If car goes faster, as in descending a hill, opposite motor directional points will close, and motor will reverse operation and make corrections to maintain desired speed.

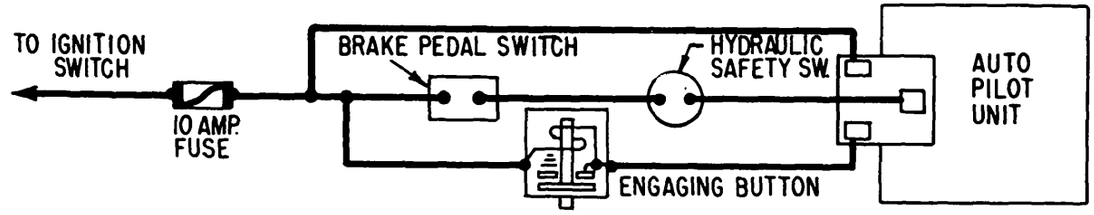
Aut matic Op rati n - Cycle is same with additional units actuated as follows: When desired speed is reached and button on selector knob is pushed in an electromagnetic coil in center of magnet assembly is actuated. This causes magnet to lock with pintle assembly and unit now operates without foot pressure on accelerator pedal. Selector knob can be moved to any other desired position during automatic operation. On 1958–59 models when a brake application is made, a mechanical switch on pedal bracket and a hydraulic switch on master cylinder causes magnet to release and return car to manual control. On 1960 models, car can be returned to manual control only by depressing knob in center of speed selector as car is returned to automatic control after a brake application by the new lock-in feature.

TROUBLE SHOOTING & DIAGNOSIS

NO PRESSURE ON ACCELERATOR PEDAL: Drive cable from transmission broken. Electrical circuits faulty. Incorrect linkage adjustment.

AUTOMATIC CONTROL DOES NOT ENGAGE: Driver riding brake pedal. Brake pedal does not release. Faulty brake switches. Faulty electrical circuits.

BRAKE APPLICATION REQUIRED TO DISENGAGE AUTOMATIC CONTROL: Brake mechanical switch not adjusted properly (must disengage unit during pedal freeplay movement).



AUTOMATIC CONTROL REMAINS ENGAGED: Brake mechanical and/or hydraulic switches faulty or not adjusted. Electrical short circuit.

AUTOMATIC CONTROL ENGAGES WITHOUT PUSHING SELECTOR BUTTON: Electrical circuit grounded to body or chassis. Control assembly faulty. Auto Pilot faulty.

AUTOMATIC CONTROL DISENGAGES WHEN ASCENDING HILLS OR WHEN SELECTOR KNOB ADVANCED: Linkage adjustment incorrect. Loose electrical connection. Auto Pilot unit faulty.

PULSATING THROTTLE: Drive and speedometer cables binding or tight. Speedometer pinion faulty. Linkage binding.

SPEEDOMETER POINTER FLUTTER: Drive and speedometer cables binding or tight. Speedometer pinion and/or head faulty.

1960 CHRYSLER, IMPERIAL & DE SOTO AUTO-PILOT WIRING DIAGRAM

MOTOR RUNS CONSTANTLY: Linkage adjustment incorrect. Auto Pilot unit faulty.

CARBURETOR WILL NOT RETURN TO NORMAL IDLE: Linkage adjustments incorrect or linkage binding. Improper carburetor accelerator spring (Yellow - LC1; Aluminum - Others).

SELECTOR SETTING DOES NOT AGREE WITH SPEEDOMETER READING: Selector control not properly adjusted.

MINIMUM REGULATING SPEED ABOVE 25 MPH: Improper control cable adjustment.

SELECTOR KNOB HARD TO ROTATE: Control cable kinked or improperly routed. Spring compressor shaft in unit faulty (install new Auto Pilot unit).

TESTING

►*CAUTION: Disconnect ignition coil cable when making electrical tests to prevent starting engine accidentally.*

ELECTRICAL CIRCUITS: No. 1 Terminal - Connect one test lamp lead to No. 1 terminal on Auto Pilot. Ground other lead. Turn ignition switch ON. If lamp lights circuit is normal. If light does not light, fuse burned out, a connector is loose or a wire broken.

No. 2 Terminal - Connect test lamp between No. 2 terminal and ground. If test lamp lights circuit is normal. If lamp does not light some part of circuit is faulty or brake switches faulty.

Brake Switches - Connect test lamp between No. 2 terminal and ground. Depress brake pedal within freeplay distance. Test lamp should not light. If lamp does not light when brakes applied, mechanical switch is faulty or out of adjustment. *NOTE - Switches are normally in closed position.* If lamp lights even after brakes applied both brake switches are at fault, or a short circuit exists between both leads of mechanical switch and opposite connections.

Pushbutton Circuit - Connect one lead of test lamp to No. 3 terminal and other to positive (ungrounded) terminal of battery. Push control button. If lamp lights circuit is normal. If lamp does not light control assembly improperly connected or ungrounded.

Control Assembly - Connect one lead of test lamp to control terminal (Imperial), pigtail lead terminal (Chrysler) of selector control, and other lead to positive terminal of battery. Push control button. If lamp does not light control unit faulty and should be replaced.

ADJUSTMENTS

Selector Control (To make selector speed conform t speedometer reading): Chrysler - Loosen setscrew on plastic collar with calibration numbers. Drive car at 40 MPH and rotate control knob until reaction pressure is felt. Rotate collar on knob until No. 4 on collar lines up with pointer. Tighten setscrew and recheck at 30 and 50 MPH. Readjust as necessary

Imperial - Pry pushbutton off shaft. Remove knob by loosening setscrew. Loosen bezel retaining nut so bezel can be rotated by fingers. Install knob. Drive car at 40 MPH and adjust control knob until reaction pressure is felt. Then adjust bezel until No. 4 on bezel lines up with knob pointer. Recheck at 30 and 50 MPH and readjust as necessary. Reinstall parts properly.

Control Cable Adjustment: Turn selector knob counterclockwise as far as it will go without forcing, then hold dust shield so it will not rotate and unscrew clamp nut. Let clamp nut slide down cable. *NOTE – This nut holds cable in bottom of dust shield.* Pull control cable out of dust shield until ferrule at end of cable is free from bottom of dust shield. *NOTE – If ferrule is tight in dust shield, carefully pry the four fingers apart until ferrule slides out freely. In som cases it may be necessary to unscrew the dust shield from unit in order to pry the fingers apart.* Hold hex fitting at top of dust shield so it cannot turn when unscrewing dust shield. Reinsert ferrule in dust shield and push in lightly on control cable until it stops. *CAUTION – Do not force cable beyond this point.* Fingers of dust shield must clamp ferrule on its largest diameter. Again try to rotate selector knob counterclockwise to place it at low setting and position cable. Tighten clamp nut on dust shield securely.

Linkage Adjustment: Disconnect Auto Pilot link at ball joint end on unit. Bring engine to operating temperature and make sure all carburetor and transmission linkage adjustments are correct. **Choke must be open and engine on slow idle.** Insert a .060" sleeve gauge (make from 5/16" I.D. tubing with .060" wall thickness) or a .060" feeler gauge between stop stud and lockplate on mounting bracket. Hold lockplate securely against gauge. Adjust link ball joint so it will enter hole in lever freely (engine still on slow idle). Tighten ball joint to lever. Recheck linkage for possible binding. Remove gauge.

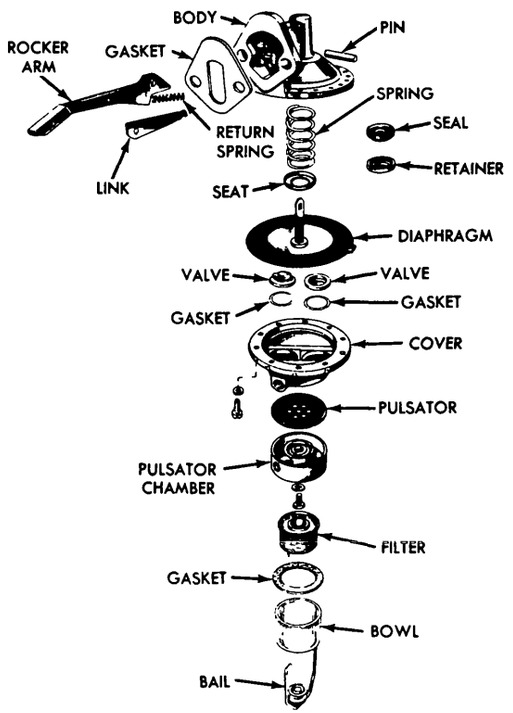
AC FUEL PUMPS

►*FUEL PUMP PULSATOR NOTE:* Later type fuel and combination fuel & vacuum pumps have a built-in air dome with a diaphragm to dampen out pulsations in the fuel stream.

DESCRIPTION: All AC fuel pumps are mechanically operated, diaphragm type, and operate on the same basic principle. Pumps are driven by a special cam built into the engine camshaft. A rocker arm built into the pump rides the cam, or on some engines a push rod rides the cam which in turn operates pump rocker arm. Pump diaphragm is fastened to a pull rod which is connected to the rocker arm by a linkage. Various linkage types are used. Movement of the diaphragm is controlled by the rocker arm travel on inlet stroke, and by a drive spring on the return stroke. Pumps are equipped with a sediment bowl or built-in sediment chamber and filter screen. On early type pumps the diaphragm was fastened to the pull rod by a nut and washer, later types use one-piece diaphragm and pull rod assembly. Fuel pump pressures range from 2½ lbs. to 5½ lbs. depending on the type of pump used.

OPERATION: Operation of pumps is similar although different types of bodies, valves, linkage are used. In all pumps the down stroke of the diaphragm is positive, being pulled down by the operation of the rocker arm, through the linkage. On the down stroke a vacuum is created above the diaphragm and fuel is drawn into the pump chamber through the pump inlet, sediment chamber, filter screen, and inlet valve. On the return stroke the driving spring forces the diaphragm up, the pressure closing the inlet valve and the fuel is forced out through the outlet valve to the carburetor. The rocker arm is forced to follow the cam at all times by means of the rocker arm spring. The amount of fuel delivered by the pump is governed by the carburetor float needle valve. The pressure is controlled by the drive spring forcing the diaphragm up on the return stroke. The diaphragm can move up on the return stroke only when fuel is flowing out of the pump.

AC COMBINATION FUEL & VACUUM PUMPS



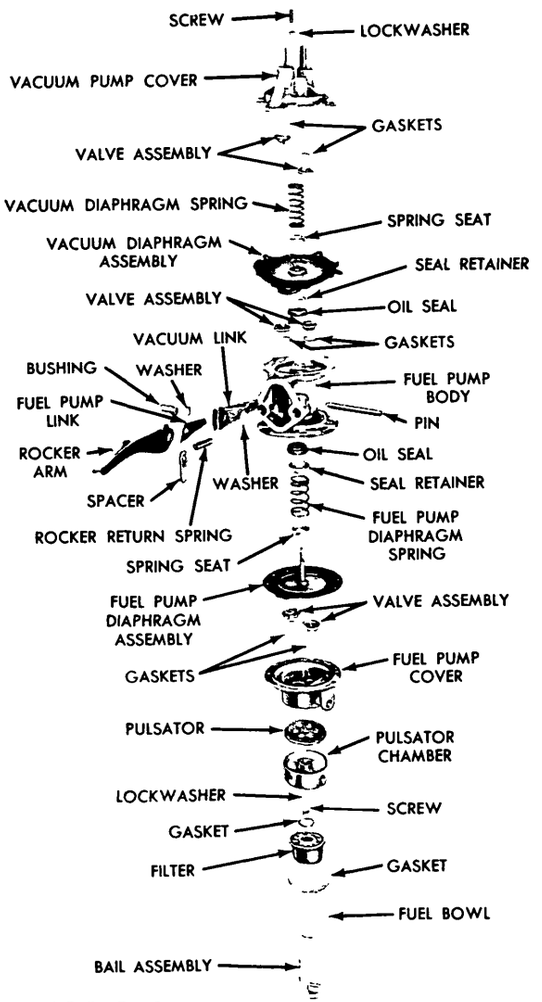
DESCRIPTION: A fuel and vacuum pump are combined in one unit on combination pumps. A single rocker arm operates both pumps. The fuel pump section is similar to the single unit type fuel pump. The vacuum pump is diaphragm type and is used to furnish vacuum for windshield wiper operation when manifold vacuum is low.

►*DOUBLE ACTING VACUUM PUMP NOTE:* Double acting type vacuum pumps used on some models have an inlet and outlet valve on both sides of the vacuum diaphragm assembly in place of the single inlet and outlet valve above the diaphragm as found on single acting vacuum pumps.

OPERATION OF VACUUM PUMP: The vacuum pump consists of a vacuum chamber containing the inlet and outlet valves and is closed at the upper end by the pump diaphragm. A spring is assembled in the center of the pump under the diaphragm. The operating shaft on the upper surface of the diaphragm assembly is connected to the pump rocker arm through the linkage. In operation when the rocker arm is actuated by the eccentric on the camshaft the vacuum pump diaphragm is forced down, expelling any air in the pump chamber through the outlet valve into the manifold. When the rocker arm moves back (freeing the pump linkage), the driving spring under the diaphragm forces the diaphragm upward, creating a vacuum in the chamber, opening the inlet valve, and operating the windshield wiper. Whenever the engine is operated with the windshield wiper turned off the vacuum in the vacuum chamber will hold the diaphragm at its lowest position (with the driving spring compressed) and the vacuum pump will not operate. Whenever the manifold vacuum is higher than the pump vacuum the pump will likewise be inoperative and the windshield wiper will be operated by the manifold vacuum straight through the pump with both valves open. At other times pump acts as a booster to operate windshield wiper.

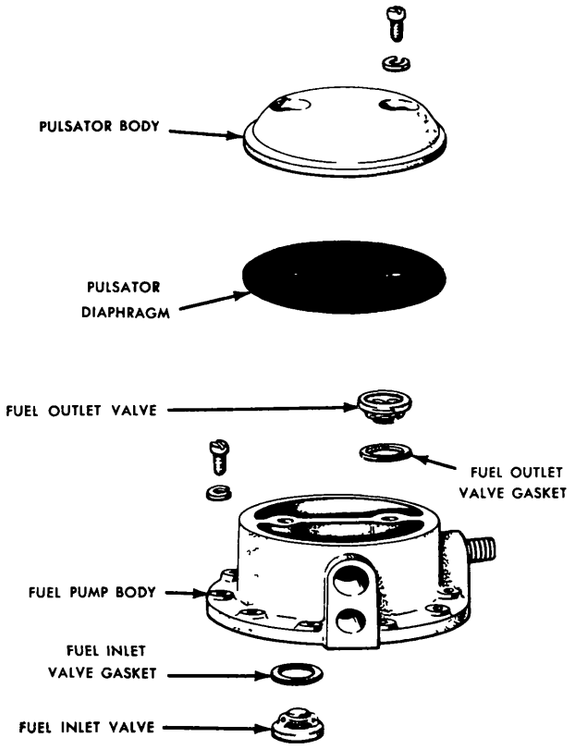
FUEL PUMP TESTING

TESTING: Static Pressure Test—Disconnect the carburetor fuel line at the pump. Connect Pressure Gauge to pump outlet using adapter fitting. Start engine on fuel remaining in carburetor and run engine to 30 MPH speed. Pressure reading on gauge should be within specified limits.

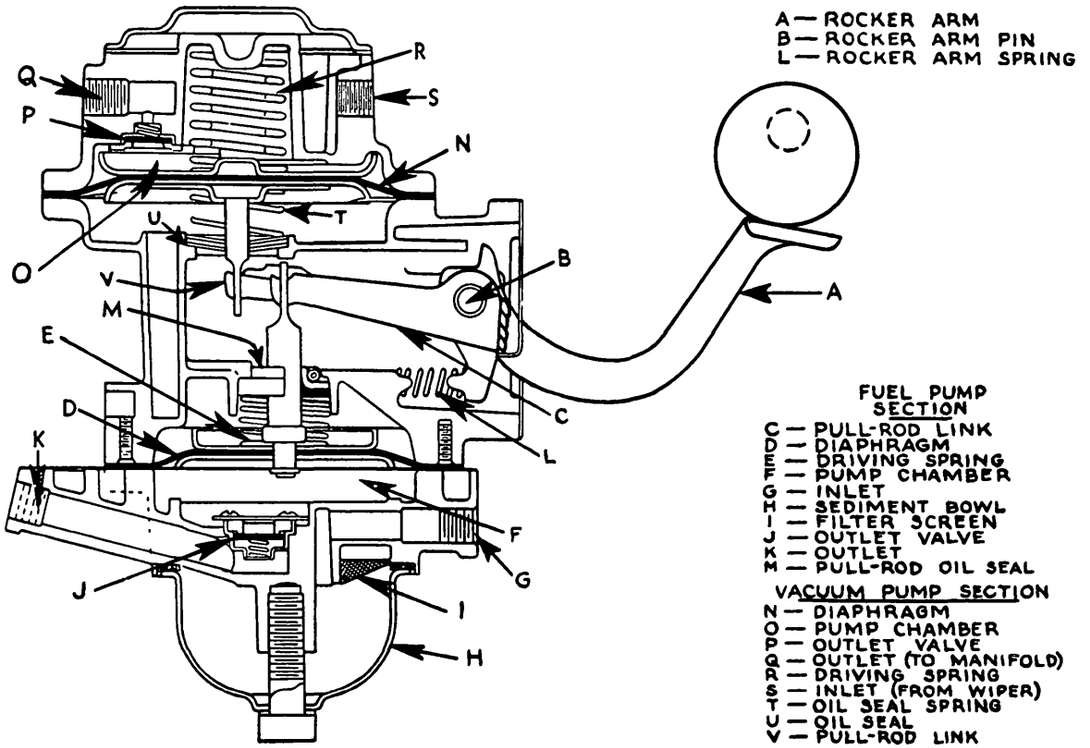


AC FUEL PUMP (WITH PULSATOR)

Capacity Test—Note: Pressure must be within specified limits before making a capacity test. To test capacity, disconnect carburetor fuel line at pump. Insert a Tee fitting in pump. Connect carburetor fuel line to one Tee outlet and a length of hose to the other outlet. Start engine and run at 450 RPM. Hold a one-pint measure approximately the height of the carburetor bowl and fill the measure from the hose on the Tee.



NOTE: Adequate fuel delivery is available when the pint measure is filled in the time shown below according to engine size:



1 Minute—engine under 225 cu. ins. displacement.
45 seconds—engine 225 to 400 cu. ins. displacem't.
30 seconds—engines over 400 cu. ins. displacement.
See car page for displacement under Engine Specifications.

AC FUEL & SINGLE-ACTING VACUUM PUMP

AC FUEL PUMP (WITH PULSATOR)

AC FUEL PUMPS (Cont.)

FUEL PUMP TROUBLE SHOOTING

TROUBLE SHOOTING: If the pump action is not satisfactory, check in accordance with the following:

No Fuel or Insufficient Fuel at Carburetor:

(1) Gasoline tank empty.
(2) Plugged fuel line. (Disconnect line at tank and blow out line from pump end, otherwise dirt will be blown back into tank).
(3) Bent, kinked, leaky tubing or connections. Tighten all connections. Check condition of tubing. Replace if necessary.
(4) Clogged filter screen or leaky cork bowl gasket in pump. Remove bowl or sediment chamber cover and remove screen. Always use a new cork gasket when bowl or sediment chamber cover is removed. A leaky gasket will cause loss of pump vacuum.
(5) Dirty or warped valve, broken valve springs, or loose valve cages. Remove pump for inspection.
(6) Worn pump linkage, which cuts down pump pressure and capacity. (Check capacity and pressure).

CONTINUED ON NEXT PAGE

AC FUEL PUMPS (C nt.)

Fuel Leakage through Vent in Pump Body:

(1) Worn or punctured diaphragm. Replace diaphragm.

(2) On early models a loose diaphragm nut or gasket on pull rod will cause leakage.

Carburetor Flooding:

(1) Carburetor needle valve not seating. Check for worn valve or seat, sediment or other obstruction preventing seating of valve, or wrong needle valve and seat assembly. Check float level.

(2) Excessive pump pressure. Check pressure. Too high pump pressure can be caused by wrong diaphragm driving spring (too strong).

VACUUM PUMP TESTING

CHECKING WITH VACUUM GAUGE: Due to the strength of the spring used in the vacuum pump unit, it is not practical to check the pump off the engine.

(a) Disconnect both inlet and outlet lines at pump.

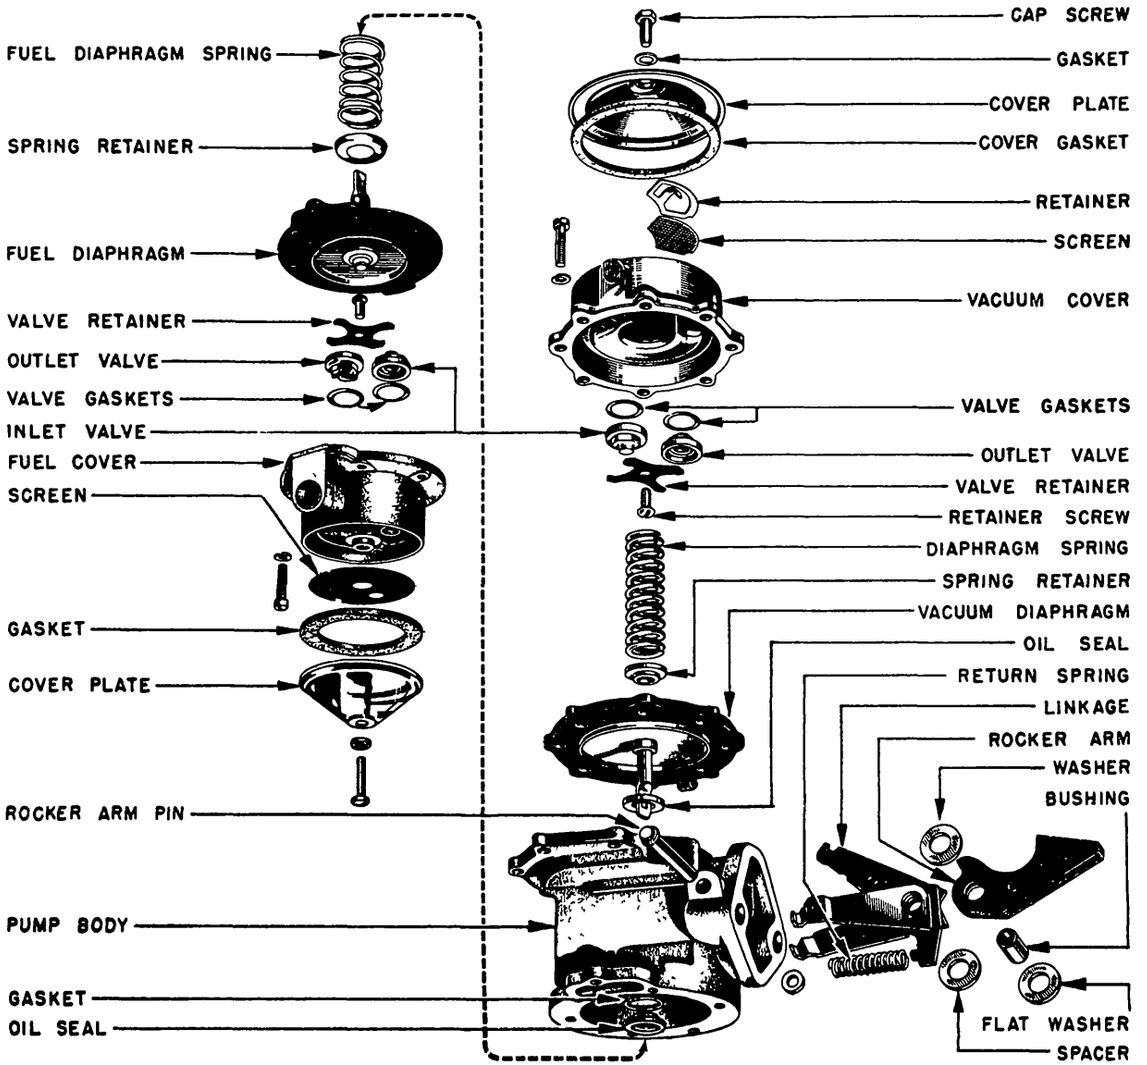
(b) Attach vacuum gauge to inlet port (side attached to wiper line).

(c) Operate engine at equivalent of 20 MPH road speed and the gauge should show 7 to 12 inches of vacuum.

(d) If less than 7 inches of vacuum are produced, the vacuum section of the pump is inoperative.

(e) Always test the vacuum pump with the outlet open because internal pressure due to closing the outlet will damage the mechanism.

CHECKING WITHOUT VACUUM GAUGE:



(a) Disconnect manifold line from pump.

(b) Operate engine from idle, through slow acceleration to about 40 MPH.

(c) The wiper should start operating on pump vacuum at about 15 MPH engine speed and reach full speed at about 40 MPH. This indicates the vacuum section is operating correctly.

(d) If wiper does not operate, detach windshield wiper line at pump and join it to the already detached manifold line with a piece of rubber hose.

(e) SLOWLY operate engine from idle to about 25 MPH and the wiper should run at full speed, operating on the engine vacuum only. If it does not, the wiper motor or tubing is defective. The pump vacuum section is inoperative if the windshield wiper operates on engine vacuum, but not on pump vacuum.

AC FUEL & SINGLE-ACTING VACUUM PUMP

VACUUM PUMP TROUBLE SHOOTING

Excessive Oil Consumption: May be caused by a punctured vacuum pump diaphragm. The intake manifold line will suck oil through the punctured diaphragm from the linkage housing. Test vacuum pump to determine if pump is operating properly. A check can also be made before removing pump, by disconnecting the line bteween the pump and manifold, operating the pump, and holding a piece of paper over the pump outlet. Oil spray from the pump outlet onto the paper indicates a punctured diaphragm.

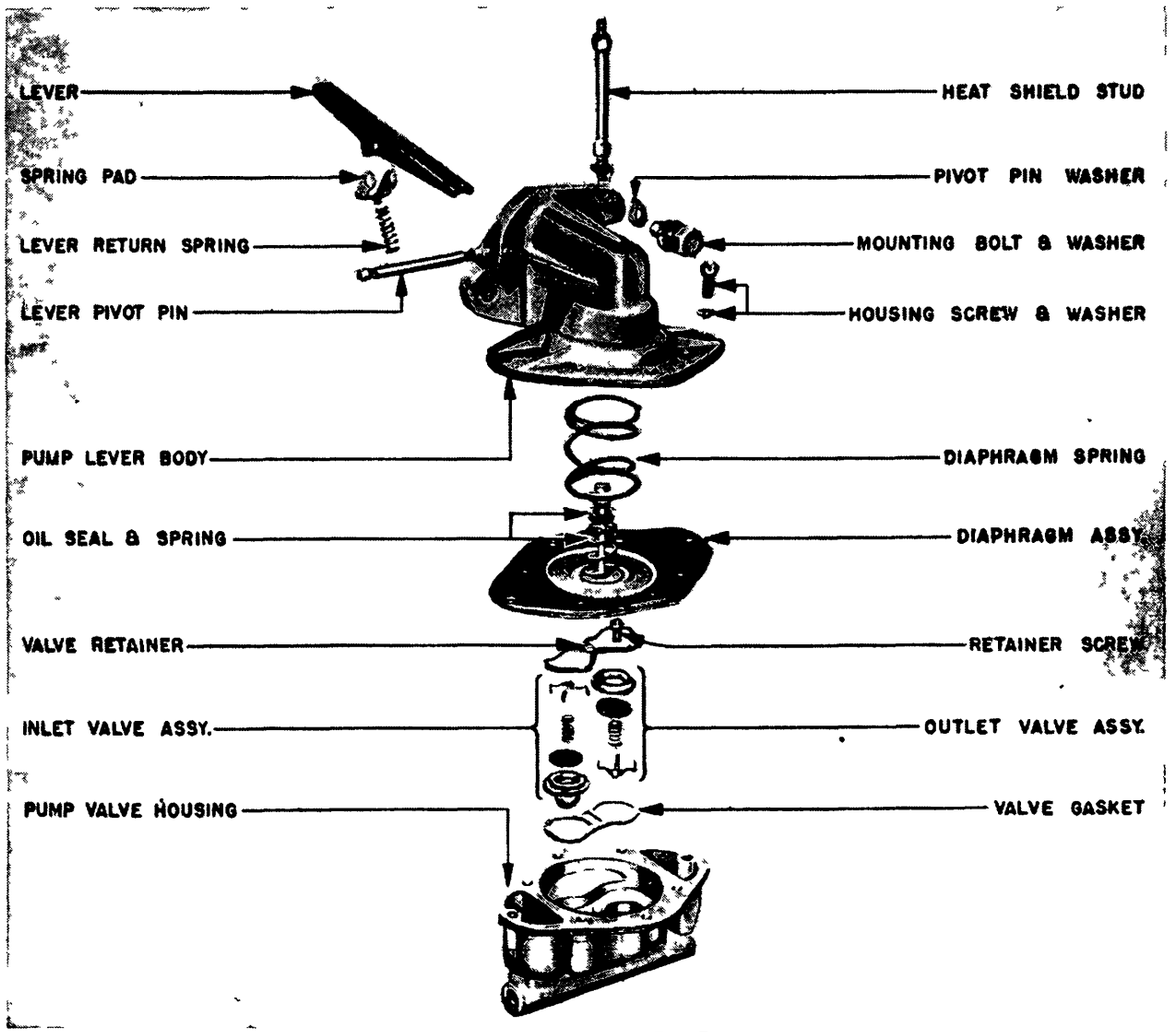
Poor Idle Due to Defective Vacuum Pump: In case the diaphragm of the vacuum pump is punctured it will allow air to be sucked in from the crankcase through the diaphragm and into the intake manifold. This will cause the two cylinders (nearest the manifold leg where the vacuum line connects) to miss when idling.

AUTO-LITE MECHANICAL PUMP

DESCRIPTION: The Auto-Lite fuel pump is a mechanically operated diaphragm type pump, driven by a special cam on the engine camshaft. Operating principle is similar to the AC type pumps. Pump has one piece cam lever (rocker arm), one piece diaphragm and pull rod assembly. "Cage type" valves are used and a filter screen is incorporated in the inlet valve unit.

OPERATION: Suction stroke of pump is positive (eccentric on camshaft causes cam lever to pull up on diaphragm assembly), delivery stroke is powered by a spring on diaphragm shaft which is compressed back during suction stroke. Fuel delivery is controlled by a back pressure in the line and, whenever carburetor float needle valve is closed, the diaphragm assembly remains at the end of its stroke with the spring compressed. Under these conditions the cam lever slides up and down on the diaphragm shaft (lever return spring keeps cam lever in contact with eccentric on camshaft).

DISASSEMBLY & INSPECTION: Mark cover and housing to insure correct location when re-assembling pump. Remove all cover screws. Drive the rocker arm pivot pin through the retaining washer with a center punch. Remove washer and drive pin back to its original position. Remove burrs from pin and drive pin out. With the pin out the rocker arm, arm spring and pad can be removed. Diaphragm can now be removed from the housing. Inspect lever housing for cracks, make sure housing diaphragm flanges are smooth and flat. Inspect diaphragm for cracks around screw holes. Inspect pull rod oil seal and examine rubber carefully by pinching with fingers to determine if it is cracked or punctured. Inspect rocker arm pin for wear and for snug fit in housing. A loose fitting pin will cause an oil leak at that point.



Installing New Diaphragm: Hold diaphragm assembly and diaphragm spring in position in the housing with oil seal and seal spring properly placed. Insert lever and lever spring pad, install a loose dummy pin through lever and housing as a guide to hold parts in place. Drive in new pin, install washer and stake end of pin. Install lever return spring.

Valves: Remove and clean valves in gasoline and allow to dry. **Do not blow off valves with air.** Inspect valve seats and discs. These should be smooth and flat. Inspect valve disc springs for good seating of the discs. When installing valves use new gaskets. The inlet valve screen should be down and be on the "in" side of the housing. The outlet valve should be installed with the spring and disc down. Install valve retainer. Be sure retainer is bearing on both sides of each valve.

REASSEMBLY: Install valve housing in place on lever housing so that the untapped hole in the valve housing lines up with the tapped hole in the lever housing directly under the lever. Install flange screws loose. Mount pump in vise and press rocker arm down beyond normal stroke and tighten all screws.

CAPACITY TEST: Install pump on engine, connect fuel lines. Install a Tee connection in fuel line at the carburetor and connect a line to the Tee. Install a #44 carburetor float seat orifice on the end of the line with a shut-off valve between the Tee and the orifice. Start the engine and operate at idle speed. Open the shut-off valve and measure the amount of fuel which flows from the orifice in a quart measure. If the amount of fuel is 1½ pints or more in one minute the pump capacity is sufficient.

PRESSURE TEST: Connect a pressure gauge to Tee, operate engine at idle. Pressure should be 3 to 5 pounds. Repeat test at 40 MPH speed. If pressure is low use a stiffer diaphragm spring. If pressure is high, remove pump and loosen all diaphragm cover screws and press operating lever beyond normal stroke and retighten screws. If pressure is still too high, disassemble pump and install a weaker diaphragm spring.

AUTO-LITE FUEL PUMP

CARTER MECHANICAL FUEL PUMP
COMBINATION (FUEL & VACUUM) & SINGLE (FUEL) PUMPS

DESCRIPTION: Mechanically operated, diaphragm type fuel pump driven by engine camshaft through an eccentric cam lever. Vacuum pumps used in combination with these fuel pumps are either diaphragm or piston type operated by the same eccentric lever used to operate fuel pump. Valve assemblies used in some units are enclosed in pump body and are not replaceable.

TESTING: Fuel Pump – Connect a tee in fuel line at carburetor for use when making following tests.

Capacity: Connect a short piece of hose to tee in fuel line, then operate engine at 500 RPM allowing fuel to flow into a container. Pump should fill one quart measure in one minute or less.

Pressure: Connect pressure gauge to tee in fuel line. With engine operating at 500 RPM, pressure should be 3½–5 lbs.

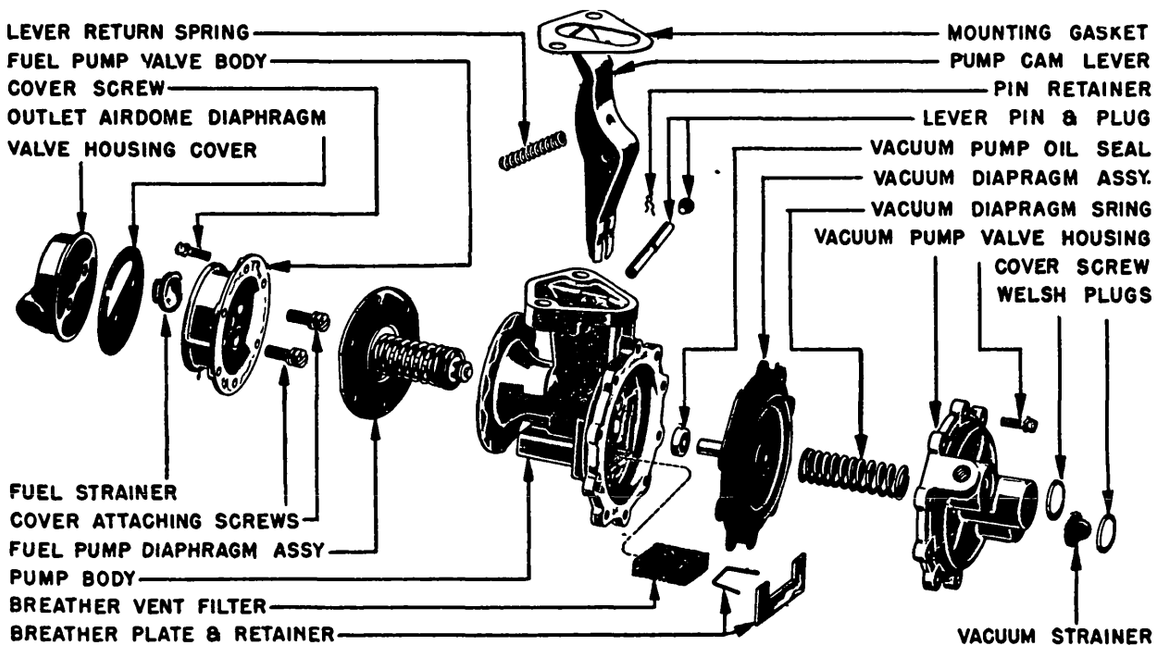
Vacuum: Disconnect fuel line from inlet side of pump and connect vacuum gauge at pump inlet connection. Vacuum should be 10" (minimum) at 500 RPM engine speed.

TESTING: Vacuum Pump – Disconnect line to vacuum pump at intake manifold and plug the opening in manifold. With engine running, windshield wipers should operate (wipers may slow down slightly but not stop).

OVERHAUL: Disassembly – File an index mark on fuel and vacuum valve housings and on pump body, then proceed as follows:

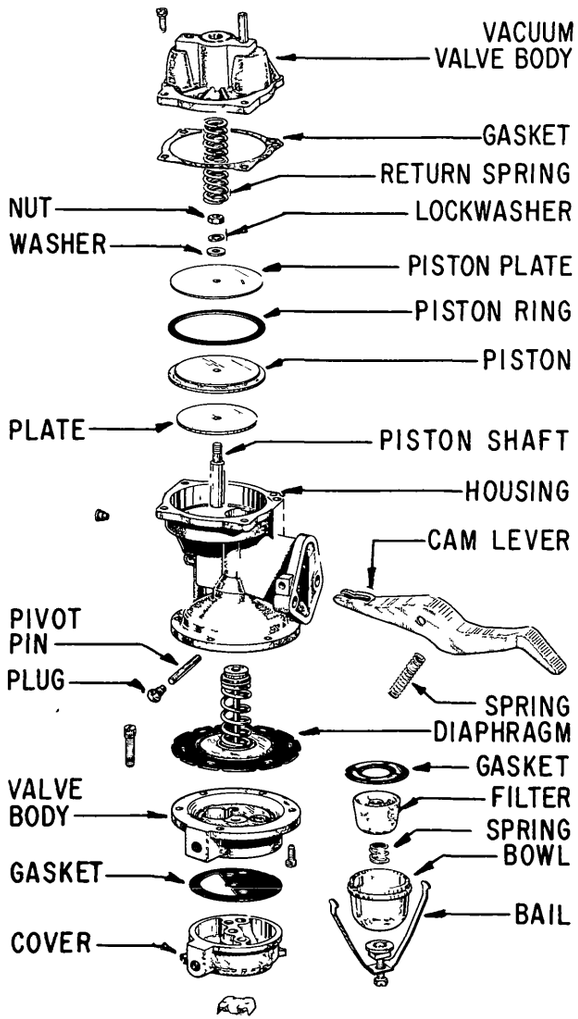
Fuel Pump – *NOTE – If combination-type pump, disassemble vacuum unit before disassembling fuel pump (see below).* Remove pivot pin plug with Tool T109–211 or T109–43, then remove eccentric lever spring. Remove pivot pin and disengage eccentric lever from diaphragm pull rod. Remove valve body-to-housing screws, then separate body and housing and lift out diaphragm and pull rod assembly.

Vacuum Unit (Diaphragm Type) – Remove vacuum valve body-to-pump housing screws and remove valve body and diaphragm spring. Take out diaphragm assembly, then remove breather vent filter, plate, retainer, and diaphragm shaft oil seal.



Vacuum Unit (Piston Type) – Remove vacuum valve body-to-pump housing screws and remove valve body, gasket and piston return spring. Operate eccentric lever until piston is as high in cylinder as possible, then grasp nut in center of piston and turn piston slightly while pulling upward. *NOTE – Some engine oil may be found on both sides of piston and in cylinder and valve housing. This is normal as some oil is admitted for lubrication.*

Reassembly: Reverse disassembly procedure and note the following:



All Units – Align marks made at disassembly to insure correct relationship of valve bodies and housings. Lubricate eccentric arm at point of contact with diashaft and lubricate diaphragm shaft oil seals.

Vacuum Unit (Diaphragm Type) – Use Diaphragm Flexing Tool, T109–192 to hold diaphragm flexed at end of stroke while tightening screws around flange.

Vacuum Unit (Piston Type) – To replace rubber piston ring, do not disassemble piston. Slip old ring off and the new one into place, stretching the ring just enough to slip it over the piston plates. To install piston and ring assembly into cylinder, use a piece of thin feeler stock to work ring into piston.

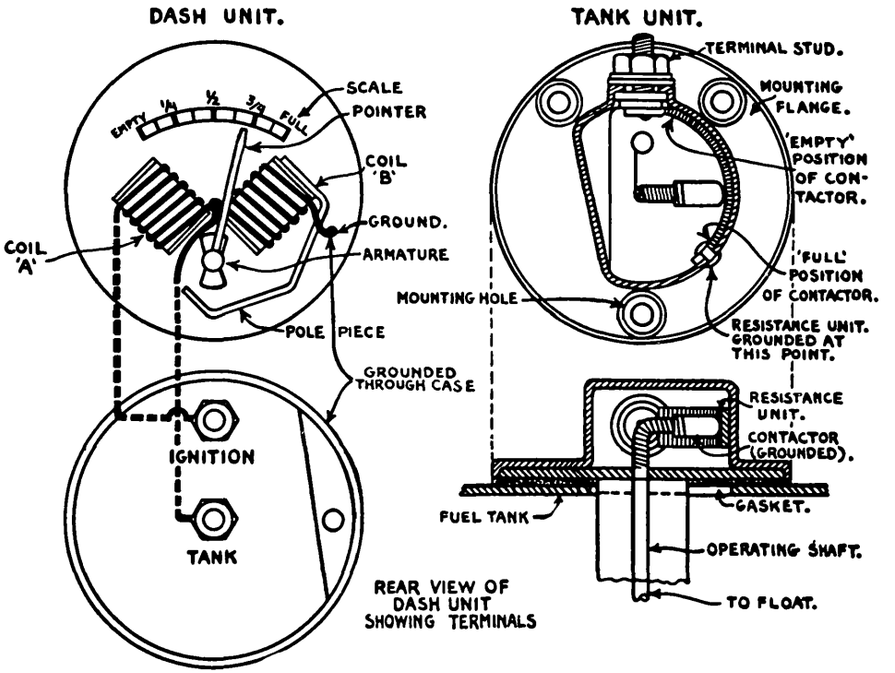
CARTER COMBINATION FUEL & VACUUM PUMP
(SINGLE FUEL PUMP SIMILAR)

CARTER PISTON TYPE
(FUEL & VACUUM PUMP)

AC TYPES

DESCRIPTION: AC Electric Gasoline Gauge is of the balanced coil type and consists of two units, a dash unit or recording gauge and a tank unit or measuring device mounted on top of the gasoline tank. The dash unit mounted on the instrument panel consists of two coils mounted at an angle of 90 degrees. The gauge pointer is attached to an armature which is pivoted at the intersection of the coil axes. The dash unit is connected to the coil side of the ignition switch and to the tank unit through insulated wires. The dash unit is grounded through the mounting screws to the instrument board and car frame.

Tank Unit:—Gearless type with integral float arm and contactor arm (rheostat ground brush). Float arm is pivoted in lower end of tank unit case so that movement of the arm (with the rise and fall of the float in the tank) causes the upper end of the arm to sweep across the tank unit resistance coil. Except for this float arm construction and separately mounted fuel outlet pipe (some models), all types are similar. NOTE—On first type gauges, float mechanism in tank unit is 'geared' type with float arm clamped to gear pivoted on tank unit bracket so as to mesh with gear on contactor operating shaft. Both types of gauges operate in the same manner.



OPERATION: The upper terminal of dash unit marked "Ignition" is connected to the coil side of the ignition switch (or to the 'auxiliary' terminal of lock switch coils) so that the gauge is operative whenever the ignition switch is turned on. Current flows through coil 'A' of the dash unit to the center terminal marked 'Tank'. The second coil 'B' is connected to this terminal. The other end of this coil winding is grounded to the gauge case. The 'Tank' terminal of the gauge is connected to the terminal on the tank unit and circuit is completed to ground through the tank unit resistance winding. This resistance winding in the tank unit is grounded through the movable contactor so that the resistance is cut in or out of the dash unit coil circuits as the float rises and falls with the gasoline level in the tank.

INSTALLATION: Both dash unit and tank unit are grounded and care must be taken whenever the units are installed or replaced that a ground is provided. On the tank unit it will be sufficient to remove paint and carefully clean the tank under the tank unit flange.

TROUBLE SHOOTING: Defective units should be replaced and service operations will be confined to locating trouble in dash unit or tank unit. Check gauge operation from following table:

1. **Pointer does not move when ignition is turned 'on'.**
   The line from the ignition switch to the dash unit is open. Check connections and supply new lead from switch to 'IGN' terminal on gauge.
2. **Gauge indicates 'Full' at all times.**
   The line between dash unit and tank unit is open. Check connections and replace line with insulated wire.
   Tank unit burned out. Replace tank unit.
   Tank unit not grounded. Check by supplying new ground from tank unit to car frame.
3. **Gaug indicates 'Empty' at all times.**
   Wires reversed on dash unit. See that connections are made as indicated above on diagram.
   Dash unit is not grounded. See that dash unit is properly grounded. Check by supplying special test ground to car frame. If dash unit does not register correctly, it must be replaced.

SERVICING:—No service operations required other than to see that wires are properly connected and terminals are tight. Defective units (as determined by tests given below) should be replaced.

AC GASOLINE GAUGE TESTING

NOTE: Manufacturer recommends that AC Gas Gauge Tester, Part 1516000, or HMO-204 be used to make tests. Tester similar to gas gauge Tank Unit equipped with test leads and an operating handle by which the resistance can be cut in and out of the gauge circuit in a similar manner to the operation of the tank unit on the car.

TESTING: Make the following tests in order given which will completely check all gas gauge units and wiring.

DASH UNIT

With ignition switch 'off', disconnect tank wire at terminal on back of dash unit, connect RED tester lead to this terminal, ground BLACK tester lead to frame. Turn ignition switch 'on', move Tester arm up and down. Gas gauge dash unit should register 'Full' and 'Empty'. If operation is O.K., disconnect tester and reconnect tank wire. If dash unit pointer does not register correctly, check feed wire by connecting 6 volt test lamp between dash unit Ignition Terminal (second terminal on back of dash unit) and ground. If test lamp does not light, circuit from ignition switch is defective and ignition switch and connecting wire should be checked or replaced. If lamp lights (gauge circuit O.K.) and dash unit does not operate, replace dash unit and reconnect wires.

GAUGE WIRING

Disconnect tank unit wire at nearest point to tank unit (bayonet type snap connector or junction block). Attach Red tester lead to wire running back to dash unit, ground BLACK tester lead to the car frame. Turn ignition 'on'. Move tester arm up and down and watch dash unit pointer which should move from 'Empty' to 'Full'. If dash unit reads 'Empty' at all times, or if reading is lower than when dash unit tested alone (dash unit test above), check wire for shorts or leaks (broken insulation, short junction block terminals, un-insulated connectors touching body or frame, etc.). If dash unit reads above 'Full' at all times, or if reading is higher than when dash unit tested alone, check wire for open-circuits (break in wire, loose connections, corroded terminals, etc.). If dash unit and wire tests O.K., check tank unit.

TANK UNIT

Remove tank unit, clean tank unit terminal and mounting flange thoroughly, connect tank unit to wire running to dash unit, ground tank unit by connecting jumper wire from tank unit mounting flange to car frame. Turn ignition 'on'. Move tank unit float arm up and down. Dash unit pointer should move from 'Empty' to 'Full'. If dash unit reading indicates tank unit defective, replace tank unit. Always check tank units before installing in tank and make certain that float arm is free (check for freedom of movement by noting that float arm falls back to empty position when released in various positions). See that gasoline tank and tank unit mounting flange are clean (tank unit grounded to frame through tank) and that a good ground contact exists between tank and frame.

AUTOLITE "TWO-WIRE" TYPE

► CAUTIONS

►*IMPORTANT SERVICE NOTE:* Three dash unit types have been used as described below and special precautions must be observed when tightening connections at dash unit terminals on each model. Excessive tightening will loosen terminal stud and destroy the accuracy of the gauge requiring replacement of the dash unit (see also Calibration Adjustment below).

First Type Dash Unit - No identification marks. No terminals staked to prevent turning. Use great care when tightening connections, particularly at "IGN.SW" terminal.

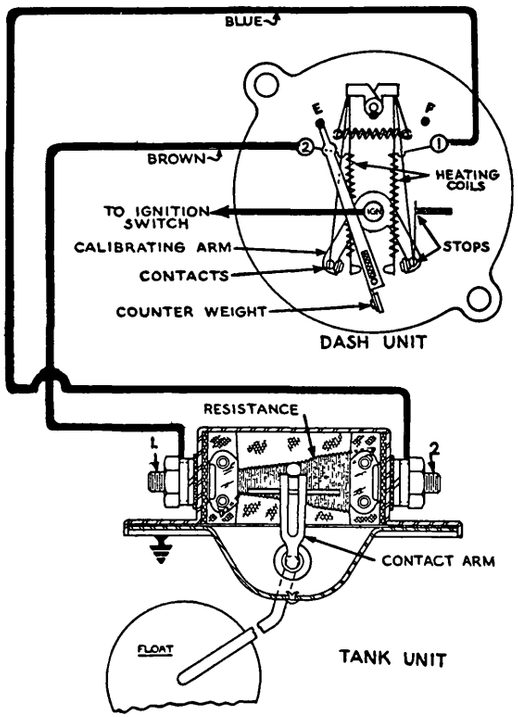
Second Type - May be identified by radio resistor terminal at top of gauge between "1" and "2" terminals and use of round insulating washers on each of these terminals. The "IGN.SW." terminal is staked to prevent turning. Other terminals are not staked.

Latest Type - May be identified by radio resistor terminal and insulating strip extending across between "1" and "2" terminals (replaces individual insulating washers used on other types). All three terminals staked to prevent turning.

DESCRIPTION: Gauge consists of a bimetal or thermostatic arm dash unit and a rheostat type tank unit connected together by two wires.

Dash Unit - Pointer actuated by the two bimetal arms on which heating coils are wound (these arms hinged at upper end with lugs to engage pointer at lower end). The two outer bimetal arms (without heating coils) compensate the dash unit for temperature changes (left hand arm controls dash unit contacts, right hand arm has insulated stop at each side to limit motion in each direction) and the contacts compensate for battery voltage variations (remain closed at 5 volts or less, open and close at voltages above 5 volts to maintain constant gauge input). The circuit through the dash unit is from the "IGN.SW". terminal through the contacts and then through each heating coil to terminals "1" and "2".

Tank Unit - Consists of a resistance coil wound on a flat form and connected between the two tank unit terminals. Contact arm is grounded and circuit from each terminal is through the resistance to ground at the contact arm. Contact arm is mounted on the float lever and moves across the resistance as the float rises and falls so that resistance is cut out of one dash unit heating coil circuit and in on the other heating coil circuit with this movement



OPERATION: When ignition switch is turned on, current flow through heating coil on each bimetal arm in the dash unit depends on contact arm position in tank unit (contact arm controls amount of resistance in each heater coil circuit) and the unequal current flow through each coil causes an unequal deflection of the bimetal arms so that the pointer is moved on the scale. Any change in the position of the tank unit contact arm (caused by float movement) causes a like change in the bimetal arm deflection and pointer reading of the dash unit. When voltage at gauge exceeds 5 volts, or if bimetal arms become overheated, contacts open and close to maintain constant input so that readings are accurate regardless of voltage fluctuations (pointer position entirely dependent on division of current between heating coils on bimetal arms as controlled by tank unit. Contact opening and closing is sufficiently rapid so that pointer does not change). External temperature changes (affecting outer unwound bimetal arms) cause a slight rotation of the hinge so that position of inner bimetal arms and pointer remains unchanged. Gauge design results in a lag or damping action so that pointer fluctuations due to fuel tank surges are minimized. When ignition switch is turned off, bimetal arms flex away from pointer which is then returned to the empty position by the counterweight at the lower end.

TESTING: Disconnect leads from No. 1 & No. 2 terminals of dash unit and turn on ignition switch. Any movement of the gauge indicates an internal ground in dash unit. With ignition switch in "ON" position, ground No. 2 terminal, and allow approximately one minute for gauge to complete movement. It should read full. Ground both terminals. Gauge should read ½ full. If gauge does not read correctly remove it for check and adjustment.

If gauge reads correctly reconnect leads to both terminals of dash unit and disconnect leads from tank unit. Gauge should not move. Any reading of the gauge with both wires disconnected indicates a ground in one or both wires. If no reading with wires disconnected, ground No. 2 wire, and proceed with test as given above. Failure to have correct reading indicates open circuit or broken wire. If gauge reads correctly for both tests given above, any misoperation of the system can be attributed to a defective tank unit.

NOTE - Should No. 1 & No. 2 wires be crossed on units, readings will be reversed.

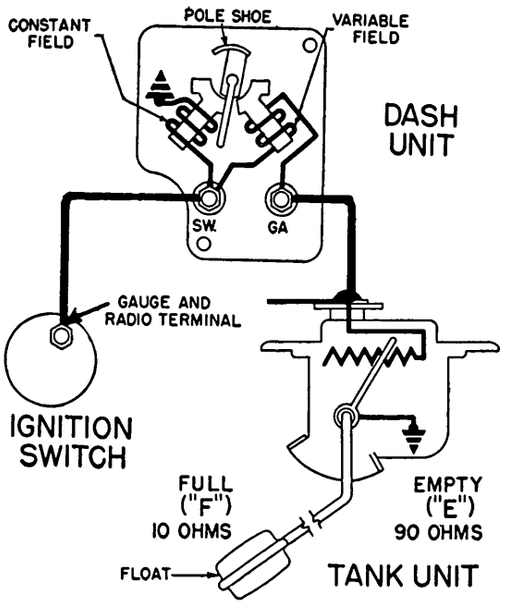
TROUBLE SHOOTING: Erratic or incorrect indications may be caused by a loose connection or ground in the wiring or terminals, while a fluctuating pointer is usually caused by dirty contacts in the dash unit. Sticking pointers may be caused by a bent pointer or frame or by interference between the gauge and panel. Remove the gauge from the panel and inspect for a bent pointer or pointer bearings. Check to see that there is a slight amount of endplay in the pointer shaft and that the pointer turns freely. Clean the contacts by drawing a strip of bond paper between them.

AUTO-LITE "TWO-WIRE" GAUGE WIRIN DIAGRAM

CALIBRATION ADJUSTMENT: If pointer position not correct Empty or Full or if gauge reads inaccurately, dash unit should be calibrated as follows: Remove dash unit from car, connect to tank unit known to be in good condition and to a battery (see illustration for connections). Loosen both nuts on "IGN.SW." terminal (inner nut is staked on later type units) to release calibrating arms. Set tank unit float in Empty position, move left hand calibrating arm (on which stationary contact is mounted) to right to raise pointer reading, or to left to lower pointer reading. Move tank unit float arm to Full position, move right hand calibrating arm to right to raise pointer reading, or to left to lower pointer reading. Recheck gauge at Empty position (setting may be changed by the Full adjustment). Tighten nuts on "IGN.SW" terminal to lock calibrating arms in position using extreme care not to shift arms while tightening inner nut.

►*CAUTION:* When making this adjustment, or when testing dash unit on the bench, unit must be shielded from air currents which might cause unequal cooling of the bimetal arms and affect the gauge reading. Allow 1 minute for bimetal arm heating coils to heat up, after moving tank unit float, before checking dash unit pointer position.

AUTO-LITE "ONE-WIRE" TYPE



DESCRIPTION: This electro-magnetic fuel gauge has only one wire between the dash unit and tank unit This type gauge responds instantly to any change in fuel level in the tank, and when driving on rough roads or turning sharp curves the needle will fluctuate A radio suppressor is not required for this type gauge, since no contacts are used in the dash unit

TESTING: See diagram for connections All terminals must be clean and electrically tight and both units properly grounded

Dash Unit: Disconnect lead from "GA" terminal With ignition switch "ON" gauge should show empty Ground terminal "GA" Gauge should show full Reconnect lead to "GA" terminal and disconnect lead at tank terminal Repeat above test Failure of gauge to read full with lead grounded indicates open circuit or broken wire

Tank Unit: Connect tank unit (known to be good) or unit removed from tank if none available Ground tank unit, and operate float arm Gauge should read empty to full as arm is operated If gauge does not operate correctly recalibrate dash unit No movement of gauge indicates defective tank unit *NOTE - If constant field winding is open in dash unit, gauge will read full over most of movement of arm*

CALIBRATION (DASH UNIT): Moving the pole shoe toward the armature increases its effect For example, decreasing gap between the armature and variable field pole increases the readings over the entire range, while decreasing the gap at the constant field decreases the indications, and decreasing the gap at the upper pole reduces the amount of pointer movement Proper calibration is obtained by adjusting all three poles to give correct readings over the entire scale

AUTOLITE "ONE-WIRE" GASOLINE GAUGE

KING-SEELEY ELECTRIC TELEGAUGE

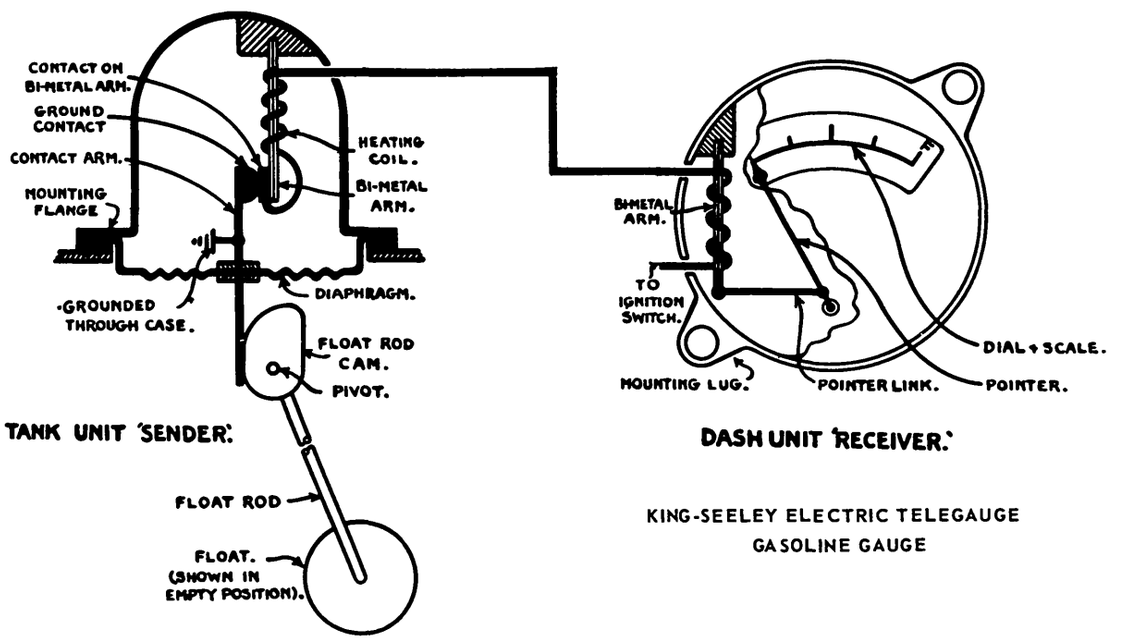
DESCRIPTION: This is an electric type gauge using bi-metal arms on which heating coils are wound in both the tank or engine unit "Sender" and the dash unit "Receiver" The two heating coils are connected in series and the gauge circuit is completed to ground through a set of contacts in the Sender unit (one of which is mounted on the bi-metal arm) The feed wire on the Receiver unit is connected to the accessory terminal of the ignition switch so that the gauge registers only with the ignition on

Gasoline, Oil, Water Level - For this purpose the ground contact in the Sender is mounted on a movable arm (arm mounted through diaphragm forming lower cover of Sender unit and flexes diaphragm as it is moved) The lower end of the ground contact arm is actuated by a cam on the upper end of the float rod pivot When the float moves up to follow the gasoline, oil, or water level, the cam moves the arm so that contact pressure and length of time contacts remain closed is increased

OPERATION: When the Sender contacts are closed a current flows through the heating coils of both the Sender and Receiver units This causes the bi-metal arm in the Receiver to bend, moving the pointer, and indicating a reading on the gauge dial At the same time the heating coil in the Sender unit causes its bi-metal arm to bend, opening the contacts and interrupting the current flow When this occurs the heating action stops and the cooling of the bi-metal arm causes it to flex in the opposite direction and again close the contacts In operation, this cycle takes place very rapidly (approximately once each second for the gasoline gauge with tank empty), and a steady reading is obtained on the Receiver dial

TROUBLE SHOOTING: Gasoline, Oil, Water Level Gauges - Manufacturer recommends use of extra or test Sender and Receiver to check operation of units which do not perform satisfactorily Make tests as directed below

Testing Sender: Disconnect lead of Sender unit on car, connect this lead to test Sender and ground this Sender to the car frame Turn on ignition, move Sender float up to "full" position and note reading on Receiver Receiver should read full or "F" after 10-15 seconds time If Receiver reading is correct, check following points before replacing Sender unit



1) Ground. Sender is grounded through case See that all paint and grease are removed under flange and both surfaces make good contact

2) Radio Bypass Condenser Shorted. If bypass condenser is connected at Sender on cars with radio, test for short-circuit by disconnecting condenser and noting gauge operation If gauge is satisfactory, replace condenser Use only condenser of 05 microfarad capacity

NOTE - If reading secured with test Sender is same as that with Sender on car, check wire connecting Sender and Receiver and replace if found to be open-circuited or grounded

Testing Receiver: Disconnect wires on Receiver on car and connect to same terminals on test Receiver Turn on ignition switch and note reading on gauge If test Receiver reading is correct, replace Receiver on car If test Receiver reading is same as Car Receiver, repeat tests on Sender and wiring

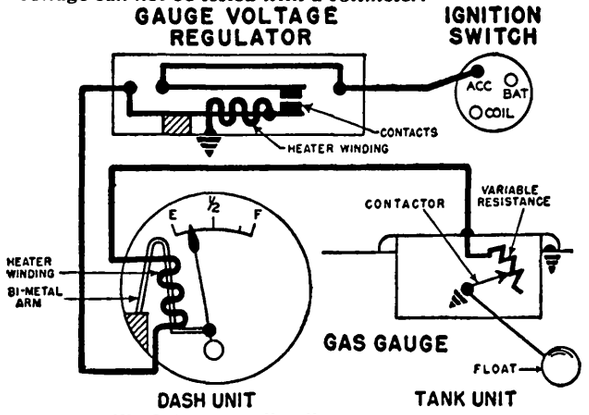
SERVICING: No service operations are required other than to see that wires are properly connected and terminals are tight No repair operations are possible and defective Senders and Receivers should be replaced

KING-SEELEY ELECTRIC TELEGAUGE
GASOLINE GAUGE

KING-SEELEY "CV" TYPE ELECTRIC TELEGAUGE

DESCRIPTION & OPERATION: King-Seeley "CV" or constant-voltage gauges differ from previous types in that the tank unit (sender) consists of a variable resistance (rheostat) which regulates the current in the heating coil of the receiver (dash unit) and controls the deflection of the bi-metal arm linked to the gauge pointer. All dash units are of similar design. The feature of these gauges is the "Gauge Voltage Regulator" which regulates input voltage in the gauge circuits and insures accurate gauge readings regardless of the line voltage fluctuations.

Gauge Voltage Regulator: Consists of a vibrating unit (contacts controlled by bi-metal arm on which a heater winder is located), connected in the line between the ignition switch and the gauge. Regulator produces a pulsating voltage, at an effective constant amperage value, of 5.0 volts for all normal input voltage variations (between 5.6 and 8.0 volts). Input voltages lower than 5.0 volts will result in proportionately lower gauge readings while voltages greater than 8.0 volts will not affect gauge accuracy but will overload regulator contacts and may cause premature wear. Regulator is temperature compensated and is intended to be mounted near the gauge dash unit and at the same ambient temperature.



Gauge Indicator (Dash Unit): Gauge pointer is linked to a bi-metal arm on which a heater coil is wound. This coil is connected in series with the tank rheostat so that the gauge reading is in proportion to the current in the circuit.

Fuel Tank Gauge Unit: The rheostat contactor acts as a ground for the gauge circuit and is linked to the gauge float so that it sweeps across the resistance as the float follows the level of fuel in tank. When tank is empty, entire resistance is in gauge circuit and current is at a minimum. When float rises as tank is filled, resistance is cut out of gauge circuit and the increase in current causes dash unit to read higher.

TROUBLE SHOOTING: Units should not be removed from car until testing has been done to determine which unit is defective. See Testing (following).

Gauge Reads Too High or Too Low—Gauge regulator defective (see Voltage Regulator below) or not properly grounded (regulator must be grounded). Battery voltage at regulator (or ignition switch) below 5.0 volts (check with voltmeter).

CAUTION—Gauge Voltage Regulator provides an intermittent voltage averaging 5.0 volts and regulator output voltage can not be tested with a voltmeter.

KING-SEELEY "CV" GASOLINE GAUGE

TESTING: Use a Fuel Level Gauge Tank Unit that is known to be OK, as a test unit. Connect one test lead to terminal on tank unit and a second lead to gauge case to act as a ground. (Gauge will not operate if not properly grounded.) Make test as follows.

Voltage Regulator: Requires use of an OK dash unit also. Connect these test units together in normal manner and ground tank unit. Connect the other dash unit terminal to the output terminal of voltage regulator. Check battery voltage (must be within operating limits). Hold tank unit float in EMPTY position, turn on ignition switch, note reading on test dash unit (should read EMPTY). Start engine and run at faster than normal idle speed. Gauge reading should not change if voltage regulator functioning normally. Move tank unit float to FULL position. Dash unit gauge should read FULL. If voltage regulator not operating correctly, replace unit.

Gauge Unit: Disconnect lead at tank unit on car and hook test unit in circuit at this point. (Make certain test unit is grounded). Move test unit float to EMPTY position, turn on ignition switch, note dash unit reading (gauge pointer should be at lower end of scale). Move float to FULL position, gauge pointer should then be at upper end of scale. If dash unit reads OK in both positions, replace original tank unit with correct type unit. If dash unit does not test OK, connect test unit directly to terminal on dash unit (eliminating the car wire). If dash unit then tests OK, check lead between dash unit and tank for broken wire or shorted wire. If dash unit still does not function normally, replace original dash unit with correct type unit.

REPAIRING UNIT: Repair or calibration of units is not practical in the field and defective units should be replaced.

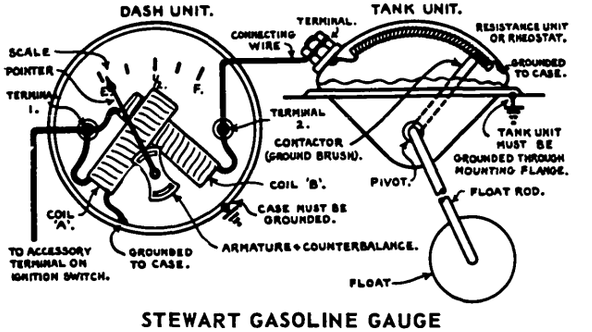
STEWART GASOLINE GAUGE

DESCRIPTION: This electric gauge is of the "balanced" coil type and consists of a dash unit or recording device and a tank unit or measuring device. The two units are connected by an insulated wire and each unit is grounded. The feed wire on the dash unit is connected to the accessory terminal of the ignition switch (or coil side of switch) so that the gauge is operative only with the ignition turned "on".

OPERATION: The two coils in dash unit are connected in parallel to the switch terminal (1) on the gauge case. Coil (A) is grounded to the gauge case so that the current flow through this coil is constant. The other end of coil (B) is connected to the tank terminal on the gauge case so that the coil is in series with the resistance unit in the tank unit. The resistance unit is grounded through the contactor on the upper end of the gasoline tank float rod so that the resistance is cut in or out of the coil (B) circuit as the float rises and falls.

MOUNTING: Both the dash unit and tank unit are grounded through the case and a good ground must be provided when they are mounted on the car. Remove all paint and grease from under the mounting flange.

TANK UNIT NOTE: Tank units furnished in both gear type (for tanks greater than 12" in depth or where baffles prevent installation of lever type) and Lever Type (for tanks of 12" depth or less). Tank units furnished with floats not attached to arm and should be installed as follows:



Gear Type - Travel limited to 52½° above and below horizontal position of arm. When installing, cut off float arm to correct length required for depth of tank and solder float on arm in horizontal position.

Lever Type - Furnished with float arm 12" long. Cut off float arm to correct length and solder float on arm at right angles to arm and with long diameter of float horizontal.

TROUBLE SHOOTING: If gauge operation not satisfactory, make following tests:

GAUGE READS "FULL" AT ALL TIMES

1) Lead between dash unit and tank unit is grounded.

STEWART GASOLINE GAUGE

Check by disconnecting lead at each end and substituting a test jumper wire. If gauge operates correctly, replace lead.

2) Connections on dash unit reversed. Reverse wires and note performance.

3) Coil (A) in dash unit open-circuited. To check, disconnect tank unit lead on dash unit momentarily. Pointer should move to "Empty" end of scale. This coil should draw .13 ampere at 6.0 volts (between switch terminal on dash unit and ground on case with tank unit lead disconnected).

4) Resistance unit in tank unit short-circuited. Check with voltmeter and battery between tank unit terminal and ground on case with dash unit lead disconnected. Resistance of unit should be 110 ohms.

GAUGE READS "EMPTY" AT ALL TIMES

1) Dash unit not grounded. Examine ground contact or run extra ground lead from case to car frame.

2) Open-circuit between dash unit and tank unit. Check by connecting jumper wire between terminals on units and noting gauge performance.

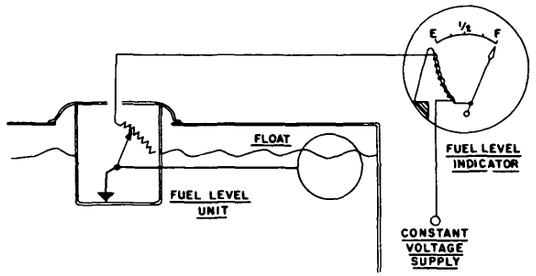
GAUGE READING INACCURATE

Mechanical defect in dash unit or tank such as tight pivot bearings, armature counterbalance binding or incorrectly positioned, bent dial pointer or bent float rod.

SERVICING: Replace all defective dash units and tank units.

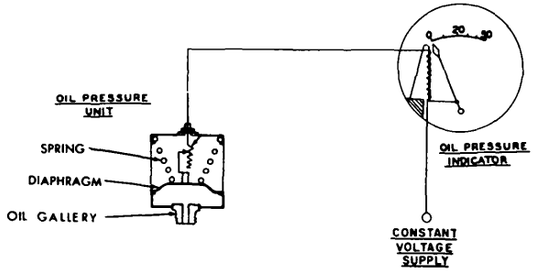
1960 CHRYSLER CORP. ELECTRIC TYPE

►CHANGES, CAUTIONS, CORRECTIONS



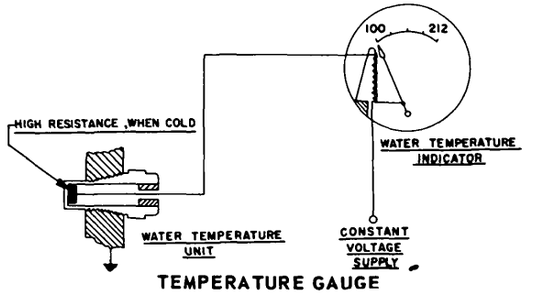
►*1960-61 CHRYSLER & IMPERIAL INACCURATE TEMPERATURE INDICATOR READING CORRECTION (AIR COND. CARS):* May be caused by temperature indicator sending unit grounding on air conditioning compressor. To correct, install special Air Conditioned Car Temperature Indicator Sending Unit, Part No. 2256302.

►*1960-61 CHRYSLER & IMPERIAL INACCURATE FUEL GAUGE READING CORRECTION:* If desh unit, tank unit, and wiring are in good condition, trouble may be caused by high resistance between fuel tank and car body. To correct, install Fuel Tank Grounding Clip, Part No. 2258412, over rubber hose connector of fuel supply line at tank gauge unit. This clip installed in production on 1961 models.



►*1960 CHRYSLER GAUGE VOLTAGE REGULATOR PRODUCTION CHANGE & OIL PRESSURE GAUGE INSTALLATION CAUTION:* External type gauge voltage regulator mounted on speedometer case beginning Serial No. 03148732 with Prefixes 81, 82, 83, 84, 85, 87. New type oil pressure gauge without internal voltage regulator also used. In case of oil pressure gauge failure on later cars, early type gauge, Part No. 2258138, may be installed if short auxiliary wiring to external voltage regulator is removed and instrument panel wiring connected directly to oil pressure gauge.

►*1960 DE SOTO FUEL GAUGE RADIO CONDENSER CAUTION:* A .5 mfd. condenser is installed on fuel gauge on radio equipped cars to suppress rapid clicking noise in radio caused by gauge voltage regulator in fuel gauge. When installing condenser, ground negative side of condenser to fuel gauge and install positive lead at ignition terminal of gauge with a pal nut to allow gauge wiring connection to be installed properly.



DESCRIPTION: Thermal type, constant voltage units operated by variable resistance type sending units which are sensitive to fuel level, engine temperature, and engine oil pressure. Constant voltage is supplied by a Constant Voltage Regulator built into one of the dash units (except some Chrysler cars – see "Production Change" above) and connected in series to each gauge which provides the same regulator voltage to each gauge regardless of line voltage fluctuations. *See individual Car Model pages for gauge application, part numbers, and to determine which gauge has the internal voltage regulator.* The gauge with the internal constant voltage regulator also may be identified by three terminals marked "A" (output voltage from regulator), "I" (input voltage to regulator), and "S" (connection to gauge sending unit). Other gauges have only "A" and "S" terminals. *NOTE – On Chrysler and Imperial cars with Panelescent Instrument lighting, there is an additional terminal on each gauge for lighting connection.*

GASOLINE GAUGE

OIL PRESSURE GAUGE

TEMPERATURE GAUGE

►*GAUGE TESTER NOTE:* A special Gauge Tester, Tool C-3826, is available for testing gauge dash and sending unit. Procedures for use of tester are detailed below.

►*TESTING CAUTION: DO NOT ground tank or engine sending unit or wire as dash unit will be damaged.*

ALL GAUGES: Trouble – High (against peg), no, or inaccurate reading after ignition switch turned on.

Cause – Defective constant voltage regulator, or open circuit on input side of regulator. Replace dash unit in which regulator is located or correct open circuit in wiring connections.

Testing – Check voltage output at "A" terminal of regulator. Voltage should fluctuate between 0 and 7.0 volts. A steady voltage reading of 12 volts indicates faulty regulator.

FUEL GAUGE: Trouble 1 – Higher or lower fuel level reading than actually exists.

Cause – Defective tank or dash unit. Replace as necessary.

Testing – Connect Tester C-3826 to disconnected tank unit wire and to ground at car body; or connect a known good tank unit to disconnected tank unit wire and to ground at car body. Move tester knob to "L" or tank unit to empty and turn on ignition. Dash gauge unit reading should be "E" to -1/32". With tester knob at "H" or tank unit moved to full, gauge reading should be "F" to +1/32". *NOTE – With tester knob at "M", gauge reading should be Half-way ± 1/16".* If dash unit readings are correct, replace tank unit. If dash unit readings are incorrect, replace dash unit.

Trouble 2: Fuel gauge erratic operation.

Cause – Loose or dirty connections, or faulty tank unit.

Testing – Clean and tighten all connections. Test sending unit (see Trouble 1 above). Make sure tank unit is grounded to tank and tank is grounded to frame. *See "Inaccurate Fuel Gauge Reading Correction" abov for installation of grounding clip.*

TEMPERATURE GAUGE: Trouble 1 – Higher or lower temperature reading than actual engine temperature.

Cause – Defective dash or engine units.

Testing – Connect Tester C-3826 to disconnected sending unit wire and to ground on engine; or connect a known good fuel tank sending unit to disconnected wire and ground. Turn on ignition switch and move tester knob to "L" or tank unit to empty. Dash gauge should read "C" ± 1/8". Move tester knob to "H" or tank unit to full. Dash unit should read "H" ± 1/8". *NOTE – With tester knob at "M", dash unit sh uld read Half-way ± 1/8".* If dash unit reads correctly, replace engine unit. If dash unit reads incorrectly, replace dash unit.

OIL PRESSURE GAUGE: Trouble – No or low oil pressure reading.

Cause – Faulty dash or sending unit or engine oiling system.

Testing – Make sure engine oil is at proper level and that engine oiling system is functioning properly *(see Car Model pages for correct oil pressure).* Connect Tester C-3826 to disconnected oil pressure engine sending unit wire and to ground on engine; or connect a known good fuel tank sending unit to disconnected wire and to ground. Move tester knob to "L" or tank unit to empty. Dash gauge unit should show no pressure. Move tester knob to "H" or tank unit to full. Dash unit should show high pressure. If dash unit operates correctly, replace engine unit. If dash unit not correct replace dash unit.

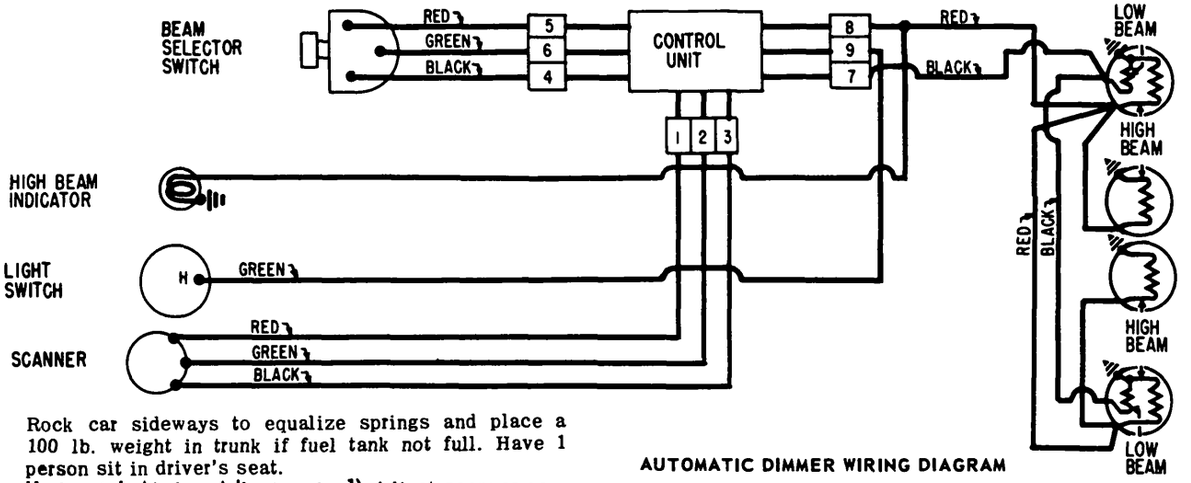
CHRYSLER, DE SOTO, DODGE PLYMOUTH AUTOMATIC DIMMER

Chrysler & Imperial, All Models (1959-60)
De Soto, All Models (1959-60)
Dodge & Dodge Dart, All Models (1959-60)
Plymouth, All Models (1959-60)

DESCRIPTION: An automatic headlight control unit consisting of a scanner (phototube) mounted on instrument panel and a control unit mounted on left hand side of body behind kick panel. Unit wired through dimmer switch which has override control. A knob on rear of scanner permits sensitivity adjustments by driver for varying road and light conditions.

OPERATION: Light entering scanner generates a current which causes control unit to dim headlights when an oncoming car is approximately 1200 feet away. Upper beams come on within ½ second after car has passed. Foot dimmer switch can override unit and driver can change sensitivity control (see below).



DRIVER ADJUSTMENT: Sensitivity adjusted by a knob at rear of scanner. Center graduation painted red. For initial setting, knob should be at 1 o'clock position for clear glass, at 3 o'clock for tinted glass. If headlights do not change quickly enough, sensitivity is too low; if beams change too quickly, sensitivity is too high. Turn knob clockwise to increase sensitivity, counterclockwise to decrease.

AIMING ADJUSTMENTS: Make adjustments in the order indicated below.

Pre-Aiming Instructions - Place car on level floor, check and adjust front spring height (see "Suspension & Wheel Alignment Section"), check tire inflation (tires must not vary more than 3-5 lbs. from each other). Rock car sideways to equalize springs and place a 100 lb. weight in trunk if fuel tank not full. Have 1 person sit in driver's seat.

Horizontal Aiming Adjustment - 1) Adjust scanner sensitivity knob between 8 and 10 o'clock (depending on light in room), so high beam comes on, but so a flashlight directed straight into scanner from a distance of 5 feet will not change beam. Establish centerline of car. 2) Direct flashlight into scanner from a spot about 5 feet in front and 6 feet to left of car, and walk slowly to right side of car until headlights dim. Mark spot on floor. Reverse procedure, starting from right of car. 3) Center point between two marks made above will be horizontal center of scanner and should be parallel to centerline of car. If scanner aimed to right or left, remove it and its base and ream base attaching holes with 5/32" drill. Remount and recheck alignment.

Vertical Aiming Adjustment - Mount Scanner Aiming Tool C-3697 on top of scanner with adjusting screw towards rear of car. Loosen locking screw in base of scanner to permit scanner to move through its 6° arc. Use floor level finder from Headlight Aiming Tool C-3674 to determine level of floor. Move scanner forward or backward on its base (through arc) so **leading edge** of bubble is in line with "plus" or "minus" reading obtained from aimer kit transit. Tighten locking screw and recheck bubble. If base must be shimmed to obtain alignment, recheck horizontal aiming.

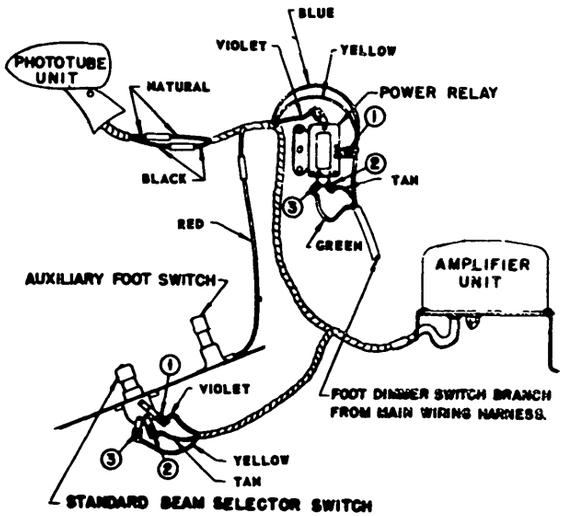
►CHANGES & CAUTIONS

►*PARTS INTERCHANGEABILITY CAUTION:* 6-Volt and 12-Volt Power Relay and Amplifier Unit assemblies are not interchangeable. When replacing parts be sure proper 6-volt and 12-volt types are used.

►*1954 FUSE ELIMINATION PRODUCTION CHANGE:* 14 ampere fuse used previously in Amplifier Unit no longer used.

►*1954 TESTING EQUIPMENT CHANGE:* AE Tester replaces testing equipment previously used. Testing procedures are greatly simplified. Aiming element replaces Phototube Unit cover for testing purposes.



DESCRIPTION: Automatic beam changer consisting of phototube, amplifier, power relay & foot control switch.

ADJUSTMENTS: Proceed in order as follows:

Phototube Aiming: Car unloaded, trunk empty except for spare tire, tires at correct pressure, and gas tank at least half full. Place car on level floor (level within ¼" fore and aft). Rock car to normalize springs. Adjust dial on Aiming Device to number stamped on name plate on bottom side of Phototube Unit. Position Aiming Device on top of Phototube Unit, using care to center it on raised ridge. Then move it to rear until it contacts lens. Adjust Phototube Unit aiming screw until bubble is centered in level. If level floor is not available, perform operations above and mark location of front and rear wheels on floor. Turn car end for end, placing front wheels where rear wheels were, and rear wheels where front wheels were. Readjust aiming dial until bubble is centered in level. Difference in two readings made is twice error in floor level. Adjust aiming dial midway between the two readings and adjust phototube aiming screw until bubble is centered in level again. **NOTE—Phototube must be accurately aimed. If too low, back reflections from car on which Autronic Eye is installed will hold headlamps on lower beam. Also, unit must be aimed as low as possible to allow maximum tolerance for car loading.**

Sensitivity Adjustments: Proceed as follows:

(1) Lower Beam Sensitivity Adjustment—With test lamp in place, turn headlamps "ON" for at least four minutes to allow amplifier to stabilize. On tester, turn zero corrector on face of meter until pointer on zero set line, turn intensity rheostat all the way counter-clock-

AUTRONIC EYE WIRING DIAGRAM

CONTINUED ON NEXT PAGE

wise and selector switch to "DIM" position. *(NOTE–*Be sure to use correct "DIM" position for clear or tinted windshields). Insert Tester connector into cigar lighter receptacle *(CAUTION–*Push straight in). Check car battery voltage. If less than 6 volts (6 volt battery) or 12 volt (12 volt battery), operate engine at fast idle when making sensitivity adjustment. Turn intensity rheostat clockwise slowly just to point where headlamps switch to lower beam. Meter pointer should fall within "DIM" sensitivity adjustment line. If not, adjust rheostat to high side of "DIM" sensitivity adjustment line. Rotate phototube unit sens tivity control counter-clockwise to end of adjustmert with special 1/16" screwdriver provided in Tester. Momentarily switch selector switch to "off" position so headlamps are on upper beam; then turn selector switch to "DIM" position. Carefully and slowly turn phototube unit sensitivity control clockwise just to point where headlamps switch to lower beam. *D n t g beyond this s tting.* Turn intensity rheostat all the way counter-clockwise, momentarily switch selector switch to "off" position and back to "DIM" position. Turn intensity rheostat clockwise slowly just to point where headlamps switch to lower beam. If "DIM" sensitivity has been adjusted correctly, meter pointer should fall within "DIM" sensitivity adjustment line. If not, repeat adjustment beginning with rotation of phototube unit sensitivity control.

(2) Holding Sensitivity Adjustment–Turn on headlamps and wait four minutes to allow amplifier to stabilize. Turn hold control on bottom (outside) of amplifier unit clockwise to end of adjustment (Use small offset screwdriver). Rotate intensity rheostat clockwise to end of adjustment. Turn selector switch to "DIM" momentarily to switch headlamps to lower beam; then switch selector switch to "HOLD" position.*(NOTE–*Be sure to use correct "DIM" position for clear or tinted windshields). Adjust intensity rheostat until meter pointer is in center of the "HOLD" sensitivity adjustment bar on meter scale. Turn "HOLD" control on amplifier counter-clockwise slowly just to point where headlamps switch to upper beam. If headlamps do not switch to upper beam when the "HOLD" control is turned completely counter-clockwise, rotate intensity rheostat counter-clockwise until headlamps switch to upper beam. If meter pointer is within "HOLD" sensitivity adjustment bar, amplifier unit is within tolerance. Again check "HOLD" sensitivity adjustment by rotating intensity rheostat clockwise to end of adjustment. Turn selector switch to "DIM" position momentarily to switch headlamps to lower beam, then turn selector switch to "HOLD" position *(NOTE–*Be sure to use correct "HOLD" position for clear or tinted windshields). Turn intensity rheostat counter-clockwise carefully and slowly just to point where headlamps switch to upper beam. Meter pointer should fall within the "HOLD" sensitivity adjustment bar on meter scale, if adjustment was made correctly. Turn off headlamps, disconnect Tester. Remove test lamp, replace lens, cover and screws.
